[384] Among the criteria, the most important were: (1) that there had to be an exchange of common shares for common shares (no cash or other consideration) for at least 90% of the shares of the combined company, and (2) that the transaction had to be completed in one step.

because the purchase method records a business combination based on the values exchanged, thus users are provided with information about the total purchase price paid, allowing a more meaningful evaluation of the subsequent performance of that investment;

2. *Comparability*: Because all business combinations must be accounted for in the same way, the purchase method improves the comparability of financial information. Users can evaluate reported financial results on a comparable basis because the assets acquired and the liabilities assumed are recognized and measured in the same way regardless of the type of consideration exchanged;

3. *Better information on intangibles*: The specific criteria for recognition of identifiable intangible assets and acquisition goodwill and the expanded disclosure requirements provide more information about the assets acquired and liabilities assumed. This additional information provides users with a better understanding of the resources acquired and improves their ability to assess future profitability and cash flows;

4. *Unlevel playing field*: Requiring one method of accounting reduces the costs of accounting for business combinations, in particular the costs incurred by entities in positioning themselves to meet the 12 criteria for use of pooling under APB 16.

Statement No. 141 was based on the following understanding of the underlying economics of business combinations:

a) "Virtually all business combinations are acquisitions"; therefore, it is necessary to identify an acquiring company and an acquired company. The focus is on accounting for the change in ownership that is takes place in the acquired company;

b) All business combinations involve a clearly identifiable price;

c) The purchase price is the best evidence of the values exchanged;

d) If the purchase price exceeds the fair values of the net assets acquired, goodwill must be recognized as a permanent asset of the combined company.

e) Acquisition goodwill is not amortized; instead it is tested periodically for impairment.

f) Goodwill is recognized regardless of the extent of ownership acquired; however, a change of ownership control is a pre-condition to the recognition of a business combination;

g) Goodwill is measured by subtracting the fair values of the net assets of the acquired company[385] from the purchase price;

h) For accounting measurement purposes, it is assumed that the operations of the acquired company are discontinued; carryover of retained earnings of the acquired

---

[385] Either the assets already recognised by the acquiree and the other assets that the acquiree was unable or prohibited to recognize; in addition, if assets are acquired in groups, the cost of the group must be allocated to the single assets (FAS 141, par 7).

company is not permitted, and the acquired company's earnings during the period preceding the date of the combination are not recognized.

The business combination is then assumed to be a market exchange at a certain market price that is fixed at the coincidence of values exchanged and purchased. In adopting Statement No. 141, the FASB articulated therefore the following arguments:

"The Board noted that in a business combination, the fair value of the asset acquired – the acquired entity – is established through a bargained exchange transaction" (B163).

"Substantially all business combinations are exchange transactions in which each party receives and sacrifices commensurate value" (B187).

"Like other exchange transactions, acquisitions are measured on the basis of the fair values exchanged. In exchange transactions, the fair values of the net assets acquired and the consideration paid are assumed to be equal, absent evidence to the contrary" (FASB 141, paragraph 5).

"Exchange transactions in which the consideration is cash are measured by the amount of cash paid. However, if the consideration given is not in the form of cash, measurement is based on the fair value of the consideration given" (FASB 141, paragraph 6)

It is evident from these arguments that the FASB understood the underlying economics of a business combination as being exemplified by a (efficient) capital market transaction in which the primary consideration paid is cash, the owners of the acquired company are liquidated, the activities of the acquired company are discontinued, and the assets of the acquired company are combined with those of the acquiring company. The purchase method effectively assumes a discontinuity in both (i) the ownership interests and (ii) the activities of the acquired company, as evidenced by the accounting procedure of revaluing the net assets of the acquired company to their fair values and measuring goodwill as the difference between the purchase price and the sum of the fair values of the net assets acquired. The discontinuity of ownership interests (point i) justifies the recourse to fair value valuation of the target, since the acquirer becomes the new owner and needs a fresh start of the target. The discontinuity of the business (point ii) justifies the recourse to a piecemeal liquidation approach, because the single elements of the business are acquired, not the business as a whole. Absent the discontinuity of the business, the target might be valued as a unique financial investment and thus accounting for as a single value to the owner, the acquisition goodwill being still obtained by difference with the purchase price. This discontinuity is explicitly mentioned in paragraph B29 of FAS 141 and repeated by E37 of the revised FAS 141r:

"Under the purchase method, one of the combining entities is viewed as surviving the transaction and is considered to be the acquiring entity. The other combining entities that do not survive the combination as independent entities are considered to be the acquired entities."

"The acquisition~~purchase~~ method is based on the premise that in an ~~purchase~~ acquisition, the acquired entity (Company B) ceases to exist and only the acquiring entity (Company A) survives."

The FASB's pronouncements were therefore based on a particular understanding of the underlying economics of a business combination, an understanding focused on properly representing a capital market transaction where the acquisition price represents the best measure of the values exchanged. The key features of the FASB's understanding are summarized in Table 3 (Purchase Column).

*** Insert Table 3 here ***

However, this understanding does not address virtually all types of business combinations, and, worst, fails to develop a comprehensive approach capable of addressing the whole accounting for the economics of business combinations in a coherent and understandable way. As the column two of the Table 3 testifies, the eliminated pooling approach actually suggests a different family of business combinations. This suggestion may open the way to a broader perspective on the matter.

DISCUSSION AND CRITIQUE

This section takes the arguments of the resistant parties seriously. The Chinese approach to accounting for business combinations will separated from the special context of Chinese industrial development, and utilized instead as a comparative basis for a constructive critique of the FASB and IASB joint approach.

With respect to the underlying economics of business combinations, the problem was and still is primarily related to the representation of a business combination as a capital market transaction among unrelated parties at fair market prices. Relying on this perspective, the FASB and IASB reached the conclusion that "virtually all business combinations are acquisitions" where ownership control of one of the combining entities changes hands. However, as the new releases testify, it is sometimes difficult to determine whether a change of ownership control has actually taken place, for two main reasons. First, ownership control is a matter of degree and factual control may be obtained with less than the majority of legal voting rights. More generally speaking, ownership control may not to be the best criterion for discriminating different types of business combinations. In particular, a number of business practices exist to obtain control without a change of ownership, as IFRS 3 (§11 and §12) and FASB 141 r (49) recognize, and as the seminal work of Berle and Means (1932) insightfully suggested (Biondi et al. 2007 eds.). Furthermore, "a business combination may be structured in a variety of ways for legal, taxation or other reasons" (IFRS 3, §5), even apart from an acquisition of ownership control. Consequently, a choice of accounting methods based on the criterion of a change of ownership control may be contradicted by actual business practices.

The Chinese position presents an alternate framework, based on the notion of "common control" rather than a "change of ownership control". Common control is here a matter of continued relationship among involved entities. Pursuant to the Chinese perspective, the underlying economics of many business combinations reflect a continuity of business activities. This continuity may involve a change in strategies, organizational structures, shareholding interests, or management, but its primary purpose is the enhancement of the ongoing activities of the combining entities. Many business combinations - in China and elsewhere - are reorganizations among related entities, rather than capital market transactions. "Common control" may in fact be the main case rather than the exception, because continuity of the underlying financial and operating activities is expected to occur. Control is therefore a matter of continued "coordination" rather than a change of "ownership control".

When issuing Statement No. 20, the CASC and the MOF did not focus on the representation of a business combination as a capital market transaction. Rather its focus was on the reorganization of the combining economic entities. This perspective is consistent with the entity theory of accounting. While both the FASB and the IASB start with the entity theory, they quickly move to an acquirer's perspective (i.e. proprietorship theory), which views a business combination as a takeover of a target company through an acquisition of ownership control of

the target's shareholders' equity (FASB 1999; IFRS 3, BC50-BC53; G4+1 1998: 6, 11-12).[386] This proprietorship perspective is exemplified by paragraph 39 of FASB 141:

> "The net assets of one entity are transferred to another, which issues its shares in exchange, and that transaction should be accounted for on the same basis that would be used to record an *investment by owners* in the form of cash—that is, on a fair value basis. From the *perspective of the acquired entity's shareholders*, that transaction is an exchange transaction, a sale on their part and a purchase on the part of the surviving entity" (emphasis added).

A proprietorship perspective reflects the viewpoint of the shareholders of the acquiring company who would like to have more information about the values of the accounting elements of the target entity, including previously unrecognized goodwill. However, in order for this information to be relevant and reliable, the fair values of the net assets of the target company, as well as the total consideration paid, must be "fair," (i.e., the whole process must take place in complete and efficient markets). This viewpoint reflects (hostile) takeovers in active financial markets where a controlling part of the shareholders' equity is acquired by one entity which is independent from the target entity. However, as the FASB (1999) has recognized, this viewpoint may be misleading when: (i) a significant premium is paid for the acquired firm above its pre-acquisition market value, (ii) a significant amount of goodwill is recognized, or (iii) the method of payment consists of the acquirer's shares. In particular, this viewpoint scarcely fits the combination of entities which are under common control.[387]

Furthermore, it should be noted that the shareholders of the acquiring entity do not actually acquire the net assets or the shares of the target entity. The underlying economics of a business combination does not involve an "acquisition" but rather a "combination" of previously separate entities. A business combination is therefore a matter of operational continuity rather than a change of ownership interests. Operational continuity involves a coordination of

---

[386] According to the new release, including a not fair value measurement at least in some cases, the IASB's position on the matter is perhaps more prudent, but it is not yet fully disclosed or applicable, so any conclusion is provisional.
[387] The measurement problems with the fair value approach are categorically stressed by dissenting comments from national standards setters and various constituents.

operations and activities among entities. If the combining entities are related, and if they share their business activities in some way, then the pooling of interests approach may be more appropriate. Consequently, the CASC and the MOF took a distinctly different view of the underlying economics of business combinations, one which was based on an entity perspective. In a quite similar way, the Japanese accounting regulatory body quoted in the introduction appears to draw upon the economic distinction between the markets and the business firm, and then make an accounting representational distinction between business investments and financial investments. When applied to business combinations, this distinction would imply that combinations made for *business* reasons (seeking for integration and coordination between involved entities) may be understood as mergers and accounted for by a pooling approach, whilst combinations made for *financial* reasons (seeking for acquiring disbanded net assets or a financial rent) will understood as purchases and accounted for by an acquisition approach.

In this way, the position taken by advocates of pooling, including the special viewpoint adopted by Chinese regulatory bodies (CASC and MOF), may be generalized in order to reach a more comprehensive understanding of the accounting and economics of business combinations. In an economic system characterized by competing business entities, a business combination is probably best understood as reorganization between entities whose governing parties want to combine their activities in order to pursue them in an enhanced way. This economic substance does not correspond with the purchase method. Many business combinations occur in a relational economic context, and those combinations are not based on arm's length bargaining in a competitive marketplace. When combinations occur among related entities, or in the absence of efficient capital market transactions, the values exchanged do not reflect the underlying economics of the combination process. In such cases the use of the purchase method leads to recognition of internally generated goodwill (FASC 2004: 60) and the capitalization of uncertain future benefits, as well as a failure to match the amortization of recorded goodwill against future revenues.[388] According to Busse von Colbe (2004: 212), the recognition of the discounted present value of uncertain future benefits may lead to unrealized profits being distributed as dividends. In addition, this accounting recognition can lead to a confused tax basis. In a combination among related economic entities, it is highly unlikely that the recognized goodwill or the "fair values" of the net assets of the combined entity will fairly represent the values implied by the underlying economics. If the pooling of interests method were used instead, the net assets of

---

[388] The latter point is emphasized by the minority dissenting opinions of Geoffrey Whittington and Tatsumi Yamada to IFRS 3 (IFRS 3, DO1-DO16).

the combining entities would be accounted for using book values, and the problem of unfair "fair values" would be avoided.

It is important to remember here that, according to Jackson and Miyajima (2007), in 1991-2005, only a small minority of the business combinations in leading economies concerned publicly listed target companies (7,8% in Germany, 14,9% in USA, 9,5% in UK, 23,3% in Japan, 14,4% in France), and this proportion was decreasing, whilst one half were private companies (including in the USA and UK) and one third were subsidiaries (including in USA and UK). According to these statistics, based on the Thomson Deals database, at least one third of the combinations are intra-group reorganizations, whilst one half occurs in a private setting where the representational focus on an (efficient) capital market transaction scarcely applies.

In addition, the alleged relevance for capital market intermediation of the new approach fostered by the FASB and IASB was questioned by several empirical studies. From the informational viewpoint, these studies have concluded that the lack of recognition of acquisition goodwill does not necessarily affect value relevance in capital markets. Hopkins et al. (2000) present evidence suggesting that analysts assign a lower post-acquisition value to a purchase combination in which the parent company records and amortizes an acquisition premium (i.e. goodwill), compared with either a purchase combination in which the parent expenses the entire premium as in-process research and development, or a pooling-of-interest combination. Furthermore, Mintchik (2006) has attempted to disentangle the impact on earnings forecast errors by eliminating pooling from accounting for goodwill and other disclosures. She provides evidence that pooling does not create additional problems to accurate forecasting, while at the same time the improved disclosure is beneficial. The pooling approach may therefore be preferred, even by capital market participants.[389]

The arguments advanced by the FASB and IASB in favor of a single method of accounting for business combinations appear to be questionable when considered in light of this comprehensive perspective. The FASB's four arguments mentioned above (underlying economics, comparability, better information on intangibles, unlevel playing field) were largely based on an assumed independence of the accounting method from the type of consideration used in undertaking the combination, and on the assumption that all business combinations are acquisitions. More generally speaking, both the FASB and IASB argue for purchase accounting

---

[389] Pursuant to efficient market theory, market prices are the best representation of value, and accounting must follow them. However, the accounting information received by the capital markets is based on the earnings of the firm generated mainly in the past (Biondi 2005). This information plays an important role by providing a common knowledge base available for subjective valuation and decision-making (Sunder 2001). This is a particular type of information that complements and does not follow the information provided by the price system (Biondi 2003).

because of its presumed value relevance for capital market participants because the consideration paid is the best measure of the value of the net assets and the goodwill acquired measured at the acquisition date.

Regarding the underlying economics argument (i.e. that all business combinations are acquisitions), the FASB essentially ignored the existence of mergers and focused exclusively on acquisitions, even though both mergers and acquisitions exist in actual economic settings. Many respondents to the FASB and IASB exposure drafts argued that mergers should be accounted for differently from acquisitions because of the differences in the underlying economics (FASB 141, B36). According to Ramanna (2007; table 4 at p. 49), a majority of firms commenting on the FASB 141 exposure draft wanted to maintain the pooling method. Paragraph B41 of FASB 141 argued that all business combinations are effectively acquisitions by stating that shares could be issued for cash and then the cash could be used to effect the combination, with the end result being the same as if shares had been used to effect the combination. However, when cash is used, the acquiring company provides the cash, and the former shareholders of the target company are liquidated. When a combination is effected through an exchange of shares, the acquiring company does not provide cash, and the former shareholders of the target become shareholders of the combined entity. Consequently, the two types of transactions are not the same either in their underlying economics or their results.

With respect to the discontinuity that is effectively assumed when using the purchase method, the FASB itself recognized that there is continuity in a merger (B40). In addition, the Board recognized that "all business combinations entail some bringing together of commercial strategies" (B40). These observations contradict the discontinuity assumption of the purchase method. Furthermore, the elimination of the pooling method may not be sound from an empirical perspective because it is possible to identify business combinations that are not acquisitions (B42), but mergers instead.

Regarding the comparability argument, if the existence of different kinds of business combinations remains an open question, comparability becomes effectively a claim for accounting uniformity, which is not necessarily justifiable if there are different kinds of business combinations in actual practice.[390] When certain features of a transaction distinguish between transactions, then it is appropriate to account them in different ways.

Regarding the unlevel playing field, a choice among methods may be preferred if the intentions of management with respect to the underlying transactions are different. By choosing

---

[390] As a matter of fact, the uniformity argument could just as easily be advanced in favor of the pooling method.

among alternatives, managers send signals to investors and analysts, thus providing useful information about strategies and policies adopted. In addition, pooling is less expensive to implement when compared with the costly appraisals that are required by the purchase method (FASB 141, B66).

Last but not least, with respect to the better information about intangibles argument, if a business combination is effected through an exchange of equity interests or without any consideration at all, it is questionable whether anything of economic substance has occurred which would lead to the generation of goodwill. The most persuasive prior argument in favor of the pooling of interest method was that reflected a transaction in which there was only a change in the legal structure of shareholding interests which was not economically relevant from an accounting perspective.

In sum, the FASB admits that "accounting information cannot avoid affecting behavior, nor should it" (FAS 141, B72). However, if business combinations are felt to be too complex to be properly accounted for through an international convergence of accounting standards, accounting regulation might just as well be reduced to providing general guidance and permitting managerial choice regarding the specific accounting methods operation by operation. Therefore, the presumption that "virtually all business combinations are acquisitions" ought to be removed with the emphasis being instead on the need to consider the individual circumstances of each combination in determining whether it represents a merger or an acquisition. If the existence of different types of business combinations is nowadays conceded by all the participants in the accounting arena, accounting regulation, especially if *based on principles*, may easily accept to leave preparers choose, and concentrate then on careful guidance that shall avoid opportunistic switch among methods through time. In addition, this freedom of choice between methods may offer relevant signals about the managerial intents to capital market participants and shareholders.[391]

In conclusion, the current state of resistance and confusion in the transnational accounting for business combinations requires abandoning the adjustments at the margin through scope exceptions, in order to seek instead for a comprehensive framework capable of encompassing difficulties and addressing preparers and users in a thoughtful and understandable way.

---

[391] If the risk of opportunistic behaviours and misleading representations are feared to be too high as the result of such accounting flexibility, then it may be more prudent to allow only one method; but in that case it seems that the pooling of interests method deserves greater consideration.

SUGGESTIONS FOR IMPROVING ACCOUNTING FOR BUSINESS COMBINATIONS

Two main problems in the current approach adopted by the FASB and IASB need to be reconsidered: the existence of combinations that are mergers, and the measurement issues involved by the purchase approach. These problems relate to the overall position of the standard on business combinations in the accounting conceptual framework, as stressed by the German regulatory body as quoted in the introduction.

Both FASB 141 (BC29, BC57-B62) and IFRS3r (BC41–BC43) argue that there is congruence between the purchase method and the historical cost accounting model. This argument is based on an analogy between a business combination and the purchase of a single asset:

> "The purchase method produces results that are comparable with those of entities that grow by acquiring similar assets in a number of smaller purchases that are not business combinations. The Board agreed with those who stated that the purchase method is consistent with how other asset acquisitions are accounted for" (FAS 141, B48).

The analogy is driven by the image of a transfer of ownership control where the right to exercise control is paid for in a lump sum. The acquired entity is therefore considered to be an acquired asset in its entirety. However, from an accounting measurement perspective, the net assets of the acquired entity are combined on a piecemeal basis. Consequently, the primary rhetorical image underlying the purchase method is at odds with the concept of the firm as an economic entity and a going concern. Continuity in the operations of the entity is a necessary condition for a going concern. Continuity of operations is also a useful criterion for distinguishing between a merger (continuity) and an acquisition (lack of continuity). When a business combination takes place among entities under common control, continuity of operations is evident because the enterprises are related components of the same economic entity. When combinations occur among economically independent entities, the continuity of operations depends largely on management's strategic intentions as in, for example, the desire to enhance the continuity of a brand; however, continuity in many cases is the desired strategic objective.

The economic entity assumption and the going concern principle are central concepts in virtually every country and regulatory context (Hoarau 2006, 43).[392] These principles provide the basis for historical cost accounting. Historical cost accounting does not however purport to provide a current valuation for the firm; instead it reflects the income generating processes of the

---

[392] See for example, FASB 141, paragraph B53.

firm over time. The purchase method is therefore not consistent with the historical cost accounting principle (contrary to FASB 141, B58), especially when there is continuity in the operations of the combining entities. Moreover, when the complexities of the underlying economics of a business combination are accounted for using the purchase method, the reported values are subjective estimates. There is a disregard of the continuity in the activities of the combined enterprises and the generation of joint incomes through time. This casts doubt upon the relevance of fair values either for assessing managerial accountability or for purposes of share valuation (contrary to FASB 141, B44).

In sum, the rationale for eliminating the pooling of interests method appears to be questionable. While the FASB concluded that "virtually all business combinations are acquisitions", this conclusion effectively ignored the existence of mergers, even though at least one third of business combinations in leading economies actually are mergers. In fact, business combinations are complex and significant events in the current economic organization and dynamics of business firms. This complexity should lead to a search for the distinctive features of business combinations that distinguish between different types of transactions. It factually appears that this recognition has led both the FASB and IASB to revise their previous positions and to release new standards that adopt a more cautious approach. However, the implicit notion of "change in ownership control" that they have adopted to distinguish between types of combinations actually fails to address the underlying issues properly. In addition, the "net assets approach" that is retained is opaque and less informative that the pooling approach.

The elimination of pooling was based on a proprietorship perspective, which considers the underlying combination to be an exchange of ownership interests between the owners of the combining entities (see FASB 141, B39). This accounting representation has merit when the combination is effected exclusively through an exchange of shares, and it may be understood to be a mere change in legal form. But, when a significant change in ownership interests is involved (see FAS 141, B40), something of economic substance has occurred, especially when a significant premium is paid in the exchange ratio. In order to recognize this economic event, the purchase method came to be defined as the best solution to the problem of accounting for business combinations. This decision was motivated by a capital market perspective which conflates the consideration paid with a change in ownership control.

However, from the Chinese perspective, which focuses on the combination of ongoing business entities, the main point to be considered is the distinction between shareholders' equity and entity equity (Biondi 2007). If a distinction is made between shareholders' equity and entity equity, the "mere change in legal form" argument no longer holds, and the continuity in the

operations becomes the cornerstone of the pooling approach. From this perspective, the traditional non recognition of acquisition goodwill allows for the maximum consistency in accounting reports (and related measures of performance). At the same time, this continuity of operations perspective may actually constitute a coherent basis for recognizing goodwill.[393] The pooling method is able to distinguish entity equity from shareholder equity, and thus to recognize the difference between the consideration paid and the net book value of the acquired firm as a variant of "acquisition goodwill" which does not require estimating fair values. The acquired company's shareholders essentially receive a form of consideration directly from the entity for ratifying the merger, especially when the business combination takes place among entities not under common control. By making a distinction between shareholders' equity and entity equity, the pooling approach could charge or credit the acquisition differential to entity equity. This approach would account for the implicit financial resources management is paying for by effecting the merger.[394]

In sum, a new comprehensive approach to accounting for business combinations may be characterized by the following line of reasoning, which may lead to harmonize and enhance both the Chinese approach and the FASB and IASB's joint approach. The first step would be to distinguish clearly between combinations among related or unrelated entities. The status of the relationship between the entities should not be limited to ownership control (or other criteria base on legal form and structure), but rather it should include influence and other economic indicators of group dependence. Focus in there on common control, economic integration, administrative interdependence, financial interdependence, commercial interdependence, employee interdependence, and common public persona (Strasser and Blumberg 2008). In the case of related entities, some variants of pooling ought to be preferred. In case of unrelated entities, the second step would be to check for continuity in the operations of the combining entities. Continuity may make pooling preferable, while a discontinuity of one of the combining entities may lead to purchase accounting. In addition, pooling ought to integrate the distinction between shareholders' equity and entity's equity, which may recognized the net economic consideration

---

[393] Many respondents agreed that, if goodwill is also capitalised, it should be amortised, to make management responsible of the investment of entity resources that might be utilised otherwise, or distributed to stakeholders.

[394] The consideration paid to bring the previously separate entities together comprises either an issuance of equity instruments (shares-driven consideration), or a transfer of cash or cash equivalents (cash-driven consideration), or a mix thereof. The cash-driven consideration may be effected by increasing debt (debt-driven combination). From the entity viewpoint, the overall consideration should be recognized as an outflow from the entity towards the relevant parties (usually, the shareholders), and the management should be held accountable for this transfer as a charge or an investment.

involved by the combination (goodwill) even in case of pooling. The question of how to measure goodwill under pooling would remain open.

More generally speaking, the standard on business combination should be considered together with the overall approach to accounting for enterprise groups. The suggested notions of relatedness and continuity should then correspond with the criteria adopted for related party disclosures, investments in associates (long-term equity investments), and consolidated statements.

CONCLUSION

The accounting treatment of a business combination as a purchase transaction requires the identification of an acquiring entity, the identification of an acquired entity, and the measurement of an acquisition price. While this seems to be a straight forward exercise, the satisfaction of these three requirements underestimates the complexities associated with the synergistic transformation taking place in a business combination through time. The measurement of the acquisition price requires an excessive reliance on the consideration paid as the proper measure of value, and it forces an unreliable estimation of fair values as the basis for future accountability in a way that may be detrimental to the firm (Ramanna and Watts 2007). The exceptions introduced by recent releases do not change this conclusion. The fair value approach is generally reinforced in the new releases. The inclusion of minority interests in shareholders' equity continues the "change of ownership" concept adopted by the FASB and partially by the IASB. As a result, it is practically impossible to distinguish fair value from book value. Moreover, transactions between shareholders and the acquiring company – such as exchanges of non controlling interests - are considered to be transactions among shareholders that will be accounted for as "equity transactions". The latter method presents a problem because it is a variant of pooling; and if the transaction has a cost for the entity (i.e., involves a payment to minority shareholders from entity resources), the payment will not be recognized or accounted for.

More generally speaking, the elimination of the pooling method appears to have been based on a particular understanding of the underlying economics of business combinations. The Chinese accounting standards setting body sought to develop a distinctly different understanding of business combinations, one which reflects the likelihood that there will be reorganizations among ongoing entities under common control and that these types of combinations should be accounted for using the pooling of interest method. In any case, a new comprehensive

framework for accounting for business combinations seems to be needed to overcome the current state of resistance and confusion in the transnational accounting for business combinations. The notions of relatedness between and continuity in the combining entities ought to be central to the development of this new framework, which should be considered in the context of accounting for enterprise groups that dominate the economic and financial scene.

IS THE CAPITALIZATION OF DEVELOPMENT COSTS ACCORDING TO IAS 38 REALLY CONSISTENT WITH THE FRAMEWORK?

Carsten Winkler, Heinrich-Heine-Universität
Torsten Mindermann, Heinrich-Heine-Universität Düsseldorf
Nadine Walther,Technische Universität Ilmenau Postfach

Abstract

There is no doubt research and development costs exert an essential influence on company's economic situation. As a result the discussion around the opportunity to capitalize intangible assets has always been very vigorous in the accounting literature. International Accounting Standards deal with accounting for intangible assets in IAS 38 which purpose is to prescribe the recognition and measurement criteria for intangible assets. According to the framework of the IFRS the objective of financial accounting is to provide information about financial position, performance and changes in financial position of an enterprise that is useful for decision making. To be useful, information must be relevant, understandable, reliable and comparable. This paper investigates whether the capitalization of development costs under the rules of IAS 38 is consistent with these principles.

Introduction

Research and development activities are found to be an important contributor to firm's income and capital market value. As a result, the discussion around the opportunity to capitalize intangible assets has always been very vigorous in the accounting literature (Lev and Sougiannis, 1996; Litan and Wallison, 2000; Healy, Myers and Howe, 2002; Kothari, Laguerre and Leone, 2002; Dawo, 2003; Bentele, 2004; Hepers, 2006; Wulf, 2007; Mindermann, 2009). International Accounting Standards deal with accounting for intangible assets in IAS 38 which purpose is to prescribe the recognition and measurement criteria for intangible assets. According to the framework the objective of financial accounting is to provide financial information that is useful for decision making. To be useful, information must be relevant, understandable, reliable

and comparable. The information is designated as **relevant** when it affects the economic decisions of users by helping them evaluate past, present or future events, as well as confirming or correcting their past evaluations (IFRS F.26). Information must be **understandable** to enable users, who have a reasonable knowledge of business and economic activities and accounting, and who study the information with reasonable diligence, to comprehend the real meaning of the information. Relevant information should not be excluded because it is too complex or difficult for certain users to understand (IFRS F.25). **Reliability** is given if the information is free from material error and bias and can be depended upon by users to represent faithfully that which it either purports to represent or could reasonably be expected to represent (IFRS F.31). In order to assess a company's performance the investors must be able to **compare** the financial statements of a company through time and to compare financial statements between firms, i.e. the investors need information which is consistent across firms and over time (IFRS F.39-41).

This paper investigates whether the capitalization of internally generated intangible assets under the rules of IAS 38 is consistent with the principles mentioned above. A short overview on the accounting rules of internally generated intangible assets of IAS 38 is given in chapter two. Chapter three considers whether these rules really meet the principles of decision usefulness. The paper concludes by recommending how the capitalization of internally generated intangible assets can be improved with regard to the decision usefulness.

Recognition and Measurement of internally generated intangible assets

Recognition

IAS 38.8 defines an intangible asset as an identifiable non-monetary asset without physical substance. This means, that in addition to the usual characteristics of an asset according to the framework an intangible must also be "non-monetary" "without physical substance" and

"identifiable". Consequently in combination with the attributes of an asset the criteria of an intangible asset are:

1. **Non monetary:** Subject to IAS 38.8 monetary assets are money held and assets to be received in fixed or determinable amounts of money. All assets which do not meet this definition are to classify as intangible assets.

2. **Without physical substance:** Sometimes an intangible asset may be contained on or in a tangible item. According to the examples in IAS 38 the asset should be classified as an intangible asset if the intangible component is the most significant element.

3. **Identifiability:** This criterion demands, that the intangible can distinguish from goodwill arising from a business combination (IAS 38.11). That is the case when the asset arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or other rights (IAS 38.12 (a)). Identifiability can also be demonstrated by the fact that the asset is separable from rest of the business. Separability exists if the enterprise could sell, transfer, license, rent or exchange the future economic benefit attributable to the intangible asset, either individually or together with a related contract, asset or liability (IAS 38.12 (a)).

4. **Control:** The provisions of IAS 38 require that the intangible asset is controlled by the firm. Control relates to an enterprise's capacity to benefit exclusively from the benefit (or certain of the benefits) embodied in the intangible asset. Control implies the power of both, to obtain future economic benefits flowing from the underlying resource and to restrict the access of others to those benefits.

5. **Future economic benefit:** The future economic benefit embodied in an asset is the potential to contribute to net cash inflow of an enterprise (F.53).This recognition criterion is also derived from the framework and entails that the expected future benefits to the company from controlling the asset must be probable.

An item may be recognized as an intangible asset when it meets the definition of an intangible asset mentioned above as well as corresponds to the following recognition criteria: To recognise an intangible asset, the enterprise must deem it probable that future economic benefits associated with that asset will flow to the enterprise, and it has a cost or value that can be measured reliably (IAS 38.21). If an intangible item does not meet any of the criteria for definition and recognition as an asset, the expenditure is recognised as an expense when incurred. Expenditure that was initially recognised as an expense is not included in the cost of an intangible asset at a later date (IAS 38.71).

It lies in the nature of internally generated intangible assets that they are more uncertain than separately acquired intangible assets. Firstly, problems arise in identifying whether there is an identifiable intangible asset which will generate a future economic benefit (Egginton, 1990; Kothari, Laguerre and Leone, 2002; Wulf, 2007). Secondly, it is more difficult to measure the cost or the value of these assets because there are usually no market prices available for internally generated intangible assets (Ballwieser, 2006; Küting and Dawo, 2003).

As a result, the IASB defined rules for the recognition of internally generated intangible assets which are more demanding. In order to determine if an internally generated intangible asset qualifies for recognition, the IASB distinguishes research from development activity. Research is defined as original and planned investigations to gain new scientific or technical knowledge. The application of such knowledge to the plan or design of new products or processes is considered as development. IAS 38.54 requires research costs to be expensed as incurred because a firm can never demonstrate that expected future benefits from such outlays are probable.

In contrast to the research phase, the development stage is further advanced. At this more advanced stage of the innovation process, an enterprise might possibly identify an intangible asset and demonstrate its probable future economic benefits. If the enterprise fulfils the following

2119

six restrictive requirements, the standard allows recognition of an intangible asset during the development phase (IAS 38.57):

1. The technical feasibility of completing the intangible asset so that it will be available for use or sale;

2. its intention to complete the intangible asset and either use it or sell it;

3. its ability to use or sell the intangible asset;

4. the mechanism by which the intangible will generate probable future economic benefits;

5. the availability of adequate technical, financial and other resources to complete the development and to use or sell the intangible asset; and

6. the enterprise's ability to reliably measure the expenditure attributable to the intangible asset during its development.

The recognition criterion of **technical feasibility** is barely illustrated in the specifications of IAS 38 so that the enterprise has the opportunity to base decisions on whether or not a project is technically feasible on its subjective point of view. Because of its similarity the definition of technical feasibility generally follows the US-GAAP rules of accounting for the costs of software in SFAS 86 (Baetge and Keitz, 2002; Lutz-Ingold 2005). Accordingly, a software program has established technical feasibility when a detailed program design or working model has been completed (Lev, 2001). However, the following of SFAS 86 may substantiate the technical feasibility for software but it is not adequate for other intangible items. Furthermore, the recognition criterion of technical feasibility is only sufficient for traditional product or process development. For other intangible items (like brands) the question of technical feasibility is negligible (Dawo, 2003; Baetge and Keitz, 2002; Hepers, 2005; Schreiber, 2005).

To meet the second criterion for recognition, the company has to **intend completing** the intangible asset for internal usage or external selling. Strictly speaking, this criterion results from the application of the framework and IAS 1. Because without an intention of production or

commercialisation, there is no possibility to get an economic benefit of the development. The intention of completion is sufficiently proven if development is continued until the point of preparation of the annual financial statement. This is based on the argument that a businessman would never continue development if he did not intend to finish it (Dawo, 2003; Baetge and Keitz, 2002; Lutz-Ingold, 2005).

The third criterion for capitalisation recognition is the **ability to internal use or external sale** which results from the basic economic principles. These economic principles imply that companies would not develop an intangible asset unless it was internally used or externally sold. This criterion is met, if legal or effective measure lead to presumption that the potential benefit is accessible (Dawo, 2003). More precisely, the evidence has to be given on the ability as well as on the intention of internal usage or external selling. The reason for this provision is that a completed intangible asset may intentionally not be used in order to prevent a decrease in value of existing inventory (Lutz-Ingold, 2005).

The fourth criterion requires a **verification, in which terms the asset is likely to yield benefits.** Whereas an increase of benefits has to be proven for internally generated intangible assets, for derivative acquired intangible assets it is sufficient to expect benefits. Therefore, the requirements for the capitalization of internally generated intangible assets are more restrictive (Fülbier, Honold and Klar, 2000). Following IAS 38.60 this proof has to be documented according to IAS 36. In case of selling intangible assets or products which were produced with the aid of intangible assets, the existence of a related market has to be based on market research. In case of internal use the intangible assets´ potential benefit depends on the technical and economic consistence and is therefore mainly determined by the criterion of feasibility. In case of an internal use future economic benefits have to be based on the estimation of the net present value of payment flows (Baetge and Keitz, 2002; Schreiber, 2005).

The criterion of possessing **adequate technical, financial and other resources for completion and the subsequent utilization** can be met – according to IAS 38.61 – by presenting a business plan showing the needed resources and the companies´ ability to mobilize these resources. Regarding the availability of debt capital a letter of intent from the lender is accepted as a qualified proof (Küting and Dawo, 2003).

The last criterion for capitalization recognition requires a **reliable valuation** of all expenditures connected to the developed intangible asset. This is when an appropriately equipped costing system is able to reliably determine the cost of production.

Measurement

When the recognition criteria are satisfied, intangible assets are initially measured at cost (IAS 38.24). The standard states, that after recognition, intangible assets may be measured using either the cost model or the revaluation model (IAS 38.72). After initial recognition, the cost model suggests that intangible assets should be carried at cost less any amortisation and impairment losses (Wulf, 2007). If the revaluation model is selected, intangible assets shall be carried at its fair value less any subsequent accumulated amortisation and impairment losses; fair values are to be determined by reference to an active market (IAS 38.75). In this respect, an active market is one in which the items traded are homogeneous, willing buyers and sellers can be found at any time, and prices are available to the public (IAS 38.8). Such active markets are expected to be uncommon for intangible assets (Küting and Dawo, 2003; Ballwieser, 2006; Mindermann, 2009). Therefore, in most instances, the revaluation model would not be a realistically usable model. Nevertheless, if fair value information can be obtained from active markets, and the enterprise opts for the revaluation model, it will be essential to perform revaluations on a regular basis, such that the carrying amount does not differ materially from its fair value at balance sheet date.

Assessment of decision usefulness

While the requirements of understandability appear uncontroversial, the requirements of relevance, reliability and comparability have to be more carefully examined.

Relevance

As opposed to other accounting standards (like US-GAAP or HGB) the IFRS allow the capitalization of development costs, which is most welcome under the relevance aspect (Aboody and Lev 1998). Development expenses have to be capitalized with regard to aforementioned premises. Consequently at first glance, financial statements according to IFRS should be able to give much more information about internally generated intangible assets than other financial statements (like US-GAAP or HGB). However, the capitalization rules for development costs as provided in IAS 38 are prudence-driven. The underlying reason being that financial accounting shall emphasise the aspect of information reliability (Healy, Myers and Howe, 2002). The trade-off between relevance and reliability causes that only a small amount of development cost can be capitalized if the requirements are too restrictively interpreted (Mindermann, 2009). For example, the technical feasibility of completing an asset cannot be verified until the final stage of a development process. The same is true for the evidence that all resources are available, which are necessary to finish the development (Dawo, 2003).

Furthermore, the codified prohibition of reinstatement that is mentioned in IAS 38.71 is unsatisfying with regard to the aspect of relevance because only a relatively small part of the development expenditures can be considered for capitalization (Lutz-Ingold, 2005). If the asset fulfils the capitalization criteria for the first time its value in the balance sheet will be too low, because only parts of the whole development costs may be capitalized. The users of financial statements will not be informed about the real value of the asset and will not be able to appraise it by themselves. So the balance sheet value is meaningless (Bentele, 2004). Due to the fact

that there are explicit capitalization prohibitions for certain internally generated intangible assets (such as research costs), the contingent of internally generated intangible assets which are allowed to be capitalized is manageable. Finally, there are not many more internally generated intangible assets capitalizable according to IFRS in comparison to other accounting standards which do not allow the capitalization of internally generated intangible assets (Lutz-Ingold, 2005).

Reliability

Financial statements information have to be reviewable which means that third parties must be able to verify if the information are true and in accordance with actuality. Scopes of discretions and options to capitalize lower the objectivity of financial statements. The capitalisation of expenditures for intangible assets requires that costs are assigned solely to the development phase. Therefore, the differentiation between costs for research and those for development is the first step in order to determine the expenditures to be capitalized. If the company cannot distinguish the research phase from the development phase, the scope of discretion is limited: the expenditure is treated as if it only were incurred in the research phase. Of course, a statement that an explicit distinction cannot be made is an area of discretion in itself (Keitz, 1997). This remaining scope of discretion can be indirectly limited by additional documentation containing reasons why a project is already in the development phase (Hepers, 2005).

Furthermore, the additional recognition criteria in IAS 38.57 which should guarantee objectivity can be influenced by the balancing enterprise, because IAS 38 does not determine how the evidence on the fulfilled capitalization criteria has to be provided. Pursuant to the principles of objectivity evidence provided by a third party (for example in the form of an expert testimony) would be favourable. External references enhance the verifiability. It would be consequent, if these requirements were also part of the capitalization rules of development cost (Bentele, 2004; Baetge and Keitz, 2002). But even if an enterprise is able to demonstrate all definition and

recognition criteria, eventually it will be the company's choice whether or not it externalizes them, i.e. the obligation to capitalize de facto turns into an option to capitalize internally generated intangible assets (Keitz, 1997; Ballwieser, 2006).

After recognition the standard allows for intangible assets to be carried at their fair value. However, the fair value is not estimated as a reliable valuation rate. IAS 38 claims that the fair value shall be determined by reference to an active market. The distortion of prices by speculative effects could, however, interfere with reliability (Dawo, 2003; Bentele, 2004; Hepers, 2006). Basically, perfect markets must be a precondition for a definite fair value. Only in this case the existence of a unique market price, which includes all valuation relevant information, is warranted. Imperfect markets show a difference between the purchase price and the retail price (Barth and Landsman, 1995). If the intangible asset will only be used for internal purposes, the reference to a market price is inappropriate and leads to a pretended objectivity (Dawo, 2003; Bentele, 2004).

The principle of reliability also postulates that the information about the internally generated intangible assets is complete. Thus, a financial statement should inform about all intangible items of an enterprise. Of course, it is not possible to specify all intangible assets in the balance sheet because some items do not meet the definition criteria of an (intangible) asset and other items are prohibited to be capitalized (for example the IAS 38.15 disallows the capitalization of customer lists or market shares). In these cases the principles of completeness would be met doubtless if IAS 38 requires information about these non-capitalizable items in the notes (Mindermann, 2009). But IAS 38 does not demand information about these items, and thus IAS 38 does not adhere strictly to the principles of completeness either (Bentele, 2004; Hepers, 2006).

Comparability

Comparability is only warranted, if every enterprise interprets the capitalization criteria in the same way. Due to the fact that there are no rules, how an enterprise shall demonstrate the additional recognition criteria for internally generated intangible assets, it is inevitable that companies proceed in different ways and therefore no comparable information is delivered (Keitz, 1997; Dawo, 2003; Bentele, 2004; Hepers, 2006).

With regard to comparability, the choice between benchmark treatment and allowed alternative treatment is problematic. These valuation rates are derived from fundamentally different origins and are therefore not suitable for comparisons of the accounts' content. Increasingly drastic is the development of the discrepancy in valuation over time as asset prices continually increase (Baetge and Keitz, 2002; Hepers, 2006). Within the scope of benchmark treatment, deductions of depreciations are made and thus the valuation rate decreases. As opposed to this, with the allowed alternative treatment the continuous revaluation leads to an increasing valuation rate (Bentele, 2004; Mindermann, 2009).

Recommendations

Reliability and comparability could be improved if the rules of IAS 38 would determine how an enterprise shall demonstrate that an internally generated intangible asset will generate probable future economic benefits. Pursuant to reliability evidence provided by a third party would be favourable. At least the standard should commit enterprises to state in the notes, why and how the capitalized internally generated intangible asset meets the recognition criteria (Mindermann, 2009). This would enable users of financial statements to assess whether an enterprise is conservative or liberal in the capitalization of its internally generated intangible assets (Høegh-Krohn and Knivsflå, 2000).

Relevance could be improved if IAS 38 would allow the reinstatement of previously expensed costs (Lev and Zarowin, 1999; Høegh-Krohn and Knivsflå, 2000; Dawo, 2003). When an enterprise starts research and development activities the future economic benefits of these activities are usually very uncertain, and if an internally generated intangible resource does not meet the criteria at this early stage its cost should be expensed when incurred. But if the enterprise is able to demonstrate the future economic benefits in a subsequent period, the previously expensed cost should be capitalized and amortized over its remaining life (Lev and Zarowin, 1999).

Given the fact that intangibles resources are difficult to verify, and that the management of an enterprise could use them to manage or manipulate reported earnings, stringent rules for reinstatement of previously expensed costs are required. *Høegh-Krohn* and *Knivsflå* suggest, that an enterprise should initially disclose in its notes when research and development activities were started and that a possible intangible asset might be created in a subsequent periods, but at this early stage the uncertainty of the future economic benefits prohibits capitalization. By doing this the enterprise does not only brief the users of financial statements but also creates an off-balance sheet portfolio of potential intangible assets (Mindermann, 2009). The reinstatement of previously expensed costs should be only allowed if a potential intangible asset was disclosed in advance and was added to the portfolio of potential assets. This would disallow enterprises to arbitrarily capitalize previously expensed costs (Høegh-Krohn and Knivsflå, 2000).

Session 7.1: Financial Reporting

THE INFLUENCE OF COMPANY CHARACTERISTICS ON CORPORATE REPORTING ON THE INTERNET BY TURKISH LISTED FIRMS

Ali Uyar*, Fatih University

Abstract

The main objective of this study is to investigate the influence of company characteristics on corporate reporting on the internet by Turkish listed firms. The study was conducted on 44 companies of which 30 are randomly chosen and 14 are listed in the Corporate Governance Index (XCORP) of the Istanbul Stock Exchange (ISE). The methodology of the study is content analysis which was applied to the web sites of the companies included in the sample. The results of univariate test indicated significant association between information disclosure level on corporate web sites and the variables; ownership structure, auditor size, page rank, and being listed in XCORP. But, no significant association was found between information disclosure level and leverage. In addition, multivariate analyses proved that ownership structure, page rank, and being listed in XCORP are significant explanatory variables for the disclosure level on the corporate web sites.

Keywords: Corporate reporting, internet, audit size, ownership structure, leverage, Turkey

Introduction

Besides mandatory disclosures, firms make voluntary disclosures as well both by traditional tools such as hard copy publications (e.g. annual reports) and corporate web sites. Voluntary disclosure and its determinants have been identified as an important research area in financial reporting since the 1970s (Ho and Wong, 2001). Many studies have been conducted in different countries to find out the determinants of voluntary disclosure. Previously, these studies were conducted mainly by analyzing corporate annual reports. However, as internet usage becomes widespread,

corporations tend to disclose information electronically on corporate web sites. Therefore, corporate web sites have emerged as a new medium to conduct research studies.

In prior studies, researchers have used univariate and multivariate analyses to determine firm characteristics that influence voluntary disclosure level. In those studies, some of the variables that are investigated to have a likely effect on voluntary disclosure are firm size, ownership structure, auditor size, profitability, leverage, intangible assets percentage, industry type, listing status etc.

Although, prior studies provide information about the determinants of voluntary disclosure in developed countries, there is a need to make investigations of the subject in developing countries. Because, the characteristics of developed and developing countries are different from each other. This difference may result in variations in voluntary disclosure practices. This study aims to contribute to the existing literature in this way.

The remaining of the paper is organized as follows. Second section provides literature review. Third Section presents scope and methodology of the study. Hypotheses are developed in the fourth Section. The results are analyzed and discussed in the fifth Section. Finally, conclusions are drawn in Section six.

Literature review

Prior studies can be categorized as either descriptive studies (i.e., providing statistics on disclosed items) or association studies (i.e., providing evidence of independent variables associated with the level of disclosure) addressing the determinants of corporate reporting on the internet (Abdelsalam *et al*., 2007).

Descriptive studies

In the following paragraphs, findings of some prior descriptive studies conducted in various countries are summarized. There are variations among companies operating in different countries

in terms of web site usage for information disclsure. This may be atributable to country effect, timing difference among studies, or some other factors.

Deller *et al.* (1999) found in their study that 95% of the US corporations had a homepage, compared with 85% of the UK corporations and 76% of the German corporations. In the USA, substantially more corporations used the internet for investor relations activities (91%), compared to the UK (72%) and Germany (71%).

Marston (2003) conducted a study on the top 99 Japanese firms. She found that 91 companies (92 percent) had a web site and 78 companies (79 percent) had a web site with English version.

Hurtt *et al.* (2001) showed that 99 out of the Fortune 100 companies studied had web sites with some form of investor relations/financial information found on 93.

Abdul Hamid (2005) examined 100 stock market index-linked firms listed on the Kuala Lumpur Stock Exchange and showed that 74 companies (74 percent) had web sites. Out of these 74 firms 70 (95 percent) disclosed investor-related materials on firm web sites. Among those 70 firms, 23 (33 percent) had specific section on investor relations.

Gowthorpe and Amat (1999) found that out of a total of 379 quoted companies on the Madrid Stock Exchange, seventy (18.5%) are listed as having web sites. As a result of examination of web sites of firms, they proved that certain company sectors are far more likely to use websites for communication than others such as electricity and gas (83 percent), insurance companies (80 percent), and services (71 percent). Another significant finding of their studies was that larger companies are far more likely to have a web site: twenty-six of the IBEX-35 companies (74.2%) have sites. The authors concluded that Spanish companies still lag behind those in some other advanced economies in communicating with stakeholders via electronic means.

Oyelere and Mohamed (2007) analyzed 142 companies listed on the stock market in Oman, and found that only 84 of these companies maintain web sites, and only 31 of them provide financial information. Majority of these companies use the PDF format to publish the financial information. Hence, they expressed that the findings reveal a seemingly limited use of the internet for financial reporting purpose in Oman.

Ettredge *et al.* (2001) compared the disclosure levels of U.S. companies in 17 industries. Out of 490 U.S. companies, 402 (82 percent) had a web site in 1998. The most commonly disclosed items were quarterly reports (54 percent) and news releases (80 percent). Their comparative study also revealed that larger, more established firms tended to provide more information than smaller, emerging technology firms.

Association studies

In addition to descriptive studies referenced above, researchers conducted some empirical studies about the association of information disclosure level or content and firm characteristics. While those studies used mandatory or voluntary information disclosure levels as dependent variables, they used the following as independent variables: firm size, profitability, leverage, ownership structure, auditor size, chief executive officer duality, industry type, listing status and so on. Table 1 summarizes the findings of association studies.

Table 1:Ooverview of studies addressing determinants of voluntary disclosure

Author(s)	*Intermediary*	*Country*	*Number of firms*	*Significant influence*	*Not significant influence*
Camfferman and Cooke (2002)	Annual reports Multivariate	Netherlands	161	Trading companies, conglomerates, size, debt-to-equity ratio, current ratio	Return on equity, manufacturing companies, net income margin,

					audit firm
Camfferman and Cooke (2002)	Annual reports Multivariate	United Kingdom	161	Manufacturing companies, conglomerates, size, net income margin, and audit firm	Return on equity, debt-to-equity ratio, current ratio
Patton and Zelenka (1997)	Annual reports Univariate	Czech Republic	50	Size, auditor size, leverage, listing status, number of employees	Industry, profitability, operational risk (intangible assets percentage)
Singhvi and Desai (1971)	Annual reports Univariate	USA	155	Size, auditor size, listing status, profitability, ownership structure	
Singhvi and Desai (1971)	Annual reports Multivariate	USA	155	Listing status, profitability,	Size, auditor size, ownership structure
Malone *et al.* (1993)	Annual reports Multivariate	USA	125	Leverage, ownership structure, listing status	Size, diversification, profitability, audit firm, listing status, foreign operations, proportion of outside directors
Marston and Polei (2004)	Internet Univariate	Germany	50	Size, free float, listing status, systematic risk	Profitability

Oyelere *et al.* (2003)	Internet Multivariate	New Zealand	229	Size, liquidity, ownership spread, industry	Profitability, internationalization, leverage
Bonsón and Escobar (2006)	Internet Multivariate	Countries of Eastern Europe	266	Size, industry, auditor size	Country
Marston (2003)	Internet Univariate	Japan	99	Size	Profitability, industry, listing status

Scope and methodology

This study investigates the corporate reporting practices of Turkish companies listed on the Istanbul Stock Exchange (ISE). The ISE which was established in early 1986 is the only securities exchange in Turkey (ISE, 2009). The ISE Corporate Governance Index (XCORP hereafter) which includes 14 companies as of the first quarter of 2009 is one of the ISE Stock Market Indices. The Index is composed to measure the price and return performances of the companies traded on the ISE markets having corporate governance rating grades determined according to the "Corporate Governance Principles (CGP)" (can be obtained from http://www.cmb.gov.tr) issued by the Capital Markets Board (ISE, 2009). The sample of this study consists of 44 companies of which 14 included in the XCORP and 30 randomly chosen non-XCORP (N-XCORP hereafter) companies for comparative purposes. Web site of 1 company out of 30 randomly chosen was under construction at the time of the study conducted, and therefore, the analyses were conducted based on 43 companies.

The search engine Google and the web site of the CMB were used to find the companies' web addresses. The web sites of the companies were analyzed in the month of February 2009.

Content analysis method was used on the sample in order to collect data, and then the collected data was transferred onto Excel sheet. A list of criteria has been developed to evaluate the web sites of the companies in the sample. These criteria are based on literature review (Pirchegger and Wagenhofer, 1999; Marston and Polei, 2004; Marston, 2003; Khadaroo, 2005) and Public Disclosure and Transparency section of the CGP (CMB, 2005). Based on these criteria, a checklist was prepared consisting of six sections and 61 items that were measured on a yes/no bases, encoded as 1 and 0, respectively (see Table 6 in Appendix). The web site attributes were analyzed under the following six headings: general web page attributes, financial reports, general assembly, corporate governance, presentation of investor relations information, and social responsibility.

Hypotheses

A firm's disclosure level may be affected by factors such as psychological, sociological, economic, political, legal, institutional (Patton and Zelenka, 1997). Past studies investigated the influence of size, profitability, leverage, listing status, auditor size, liquidity, ownership structure, industry, risk, free float etc.

In the preliminary unpublished study which is currently under review for a journal, the author of this paper investigated industry, firm size, being listed in XCORP, and profitability influence on disclosure level on the internet. In that study, the results indicated no significant association between disclosure level and the variables; industry and profitability. However, the results indicated a positive association between disclosure level, and being listed in XCORP and firm size (measured by log of total assets).

More in-depth literature review motivated the author for more variables to be investigated about the subject; hence, this study came out. In this complimentary study, the association between the level of corporate reporting on the internet and the following variables are investigated:

2136

- *The ISE Corporate Governance Index (XCORP)*

- *Leverage (debt to equity ratio)*

- *Auditor size (Auditor-Big-4 or not)*

- *Ownership structure (percentage of shares held by unknown shareholders)*

- *Public exposure (measured by Google's PageRank)*

The ISE Corporate Governance Index (XCORP)

XCORP is composed to measure the price and return performances of the companies traded on the ISE markets having corporate governance rating grades determined according to the "Corporate Governance Principles" issued by the Capital Markets Board (ISE, 2009). The companies listed in this index is said to have best practices of corporate governance principles including public disclosure and transparency. As shown in Table 3, since the companies listed in the XCORP are superior to N-XCORP companies in disclosing information on corporate web sites, the first hypothesis was developed:

> H1. There is a positive association between XCORP listing and the total score of disclosed items on corporate web sites.

Leverage

The leverage ratio is a proxy for the financial risk of the firm. The higher the leverage ratio, the higher the risk of the firm, and the greater the expected extent of disclosure (Patton and Zelenka, 1997). Malone *et al*. (1993) and Inchausti (1997) also hypothesized that firms with a high rate of leverage disclose more information than those with low rate. The arguments that support this hypothesis are that information may be used to avoid agency costs in the relationship between owners and managers to reduce information asymmetries (Inchausti, (1997). Thus the following hypothesis was stated:

H2. Firms with high debt/equity ratios disclose more information than do firms with low debt/equity ratios.

Auditor size (Big-4 or non-Big-4 audit firm)

Past studies examined possible influence of external auditor on information disclosure level of firms (Patton and Zelenka, 1997; Singhvi and Desai, 1971; Malone *et al.*, 1993). Malone et al. (1993) argue that smaller CPA firms are more sensitive to client demands because of the economic consequences associated with the loss of a client, on the other hand, larger firms have a greater incentive to require adverse disclosures by the client.

The alternative hypothesis tested was thus stated:

H3. Firms that work with larger audit firms disclose more information than those that work with smaller audit firms.

Public exposure

Public exposure expresses the level of intensity that a web page is visited by public. Based on some prior studies (Patten, 2002; Tilling, 2004), Gutierrez-Nieto, Fuertes-Callén, and Serrano-Cinca (2008) states that the more visible the entity, the more information it will disclose in accordance with legitimacy theory.

Therefore, the following hypothesis was stated:

H4. A positive association exists between a firm's public exposure on the internet and the total score of disclosed items on corporate web sites.

To test H3, Google's PageRank (PR) was chosen as the measure of public exposure on the internet (Gutierrez-Nieto, Fuertes-Callén, and Serrano-Cinca (2008). Google algorithms assign a PR, which ranges from 0 to 10 to each webpage. The more visible a webpage is the higher PR it receives.

Ownership structure

Some studies have examined the ownership structure that may influence voluntary disclosure practices of the companies (Malone et al, 1993; Singhvi and Desai, 1971; Raffournier, 1995). Raffournier (1995) states that agency relations are likely to play a major role in the disclosure policy of companies, because annual reports can be used to reduce monitoring costs. Hence, he argues that managers of firms whose ownership is diffuse have an incentive to disclose more information in order to help shareholders in monitoring their behaviour. Singhvi and Desai (1971) state that there may be positive relationship between the number of stockholders and the quality of disclosure in annual reports. Malone *et al*. (1993) also state that as the number of shareholders increases, one would expect financial disclosures to increase.

H5. A positive association exists between a firm's ownership diffusion and the total score of disclosed items on corporate web sites.

In this study, ownership diffusion is defined as the percentage of shares not held by known shareholders (Raffournier, 1995).

Discussion and analysis of the results

Descriptive statistics

Table 2 shows the distribution of the variables used in the study. There are large variations in ownership structure. The portion of unknown shareholders ranges from 0.02 to 0.84. There is a wide range in the level of voluntary scores in the sample. The highest disclosure score obtained is 52, and the lowest is 3. Almost half of the companies are the customers of Big-4 auditing firms. Page rank also indicates wide range, from 1 to 8, in the level of public exposure. On average, leverage is 1.92 among the sample companies in Turkey.

Table 2: Descriptive statistics

	N	Minimum	Maximum	Mean	Std. Deviation
OWNERSHIP (OSHIP)	43	.02	.84	.3530	.18917
AUDITOR (ADTOR)	43	0	1	.51	.506
PAGERANK (PRANK)	43	1	8	4.67	1.569
LEVERAGE (LRAGE)	43	.0042	18.7942	1.92	3.281
TOTAL SCORE (TSCORE)	43	3	52	33.21	11.755
Valid N (listwise)	43				

Disclosure items

The findings with respect to the existence of disclosure items which totals 61, on corporate web sites are presented in Table 3. The results are given separately for XCORP and N-XCORP companies so as to make comparison. In addition, the percentages and ranking of items are also given for the whole sample under TOTAL and Rank columns respectively. Comparison of disclosure levels reveals that XCORP companies are superior to N-XCORP companies in almost all disclosure items. There are a few exceptional items.

Table 3: Disclosure of items on corporate web sites

	XCORP (N=14)	N-XCORP (N=29)	TOTAL (N=43)	Rank

Foundation	21.43%	10.34%	13.95%	56

Univariate analysis

Table 4 presents the results of the univariate analysis conducted by the Pearson correlation analysis for the dependent and independent variables. According to the results, the dependent variable total disclosure score is significantly associated with PRANK (at a level of 0.01), ADTOR (at a level of 0.01), and OSHIP (at a level of o.05). This means the more visitor attracts the web page of the corporation, the more information it discloses on the internet. Secondly, the companies who work with Big-4 auditing companies are more likely to disclose more information on corporate web pages. Thirdly, the ownership diffusion is negatively associated with total score of information disclosure. This means the higher the percentage of unknown shareholders, it tends to disclose less information on the web page, contrary to expectations. Lastly, LRAGE is not significantly associated with the information disclosure on the internet. Furthermore, the correlation analysis revealed the following significant associations for XCORP companies:

- XCORP companies & ADTOR (significant at 0.01 level). This means XCORP companies are more likely to work with Big-4 auditing firms.

- XCORP companies & PRANK (significant at 0.01 level). Since PRANK is a measure of public exposure, XCORP companies' web sites are more exposed to public.

- XCORP companies & TSCORE (significant at 0.01 level). This significant association is likely to be explained with the previous two significant associations. Big-4 auditing firms

may be encouraging and motivating their customers to disclose more information to stakeholders. In addition, XCORP & PRANK association also may mean that corporations whose web sites attracting more visitors tend to disclose more information on the web sites.

Table 4: Pearson correlation results

		OSHIP	ADTOR	PRANK	LRAGE	XCORP	TSCORE
OSHIP	Pearson Correlation	1	-.281	-.291	-.217	.016	-.352*
	Sig. (2-tailed)		.068	.058	.163	.921	.021

	Sig. (2-tailed)	.021	.003	.000	.520	.000	
	N	43	43	43	43	43	43

* Correlation is significant at the 0.05 level (2-tailed).

** Correlation is significant at the 0.01 level (2-tailed).

Multivariate analysis

To test the 5 hypotheses established earlier, multivariate regression analysis was performed on the 5-variable multiple regression model.

The model which consists of five independent variables and the dependent variable is as follows:

$$TSCORE = \alpha + \beta_1 (OSHIP) + \beta_2 (ADTOR) + \beta_3 (PRANK) + \beta_4 (XKURY) + \beta_5 (LRAGE)$$

Where,

TSCORE = total disclosure on corporate web site

OSHIP = ownership diffusion (percentage of shares held by unknown shareholders)

ADTOR = auditor (0 if non-Big-4, 1 if Big-4)

PRANK = page rank (ranges from 0 to 10)

LRAGE = debt to equity ratio

The multivariate regression results are shown in Table 5. The model is significant at $p < .000$ (adjusted R^2 = .56). The findings support H1, and H4 provide evidence that the page rank, and being XCORP company, are significantly associated with disclosure level on the internet. Contrary to H5, negative significant association was found between ownership diffusion and information disclosure level. No support was found for a significant association for the varibles; leverage (H2) and Big-4 auditing firm (H3).

Hypothesis 1 predicts an association between being an XCORP company and disclosure level on the internet; I found a significant positive association.

Hypothesis 2 predicts an association between leverage and disclosure level on the internet; I found no significant association. This is in line with Oyelere *et al*. (2003), contrary to Malone *et al.* (1993).

Hypothesis 3 predicts an association between auditor size and disclosure level on the internet; I found no significant association. This finding contradicts some previous studies (Camfferman

2145

and Cooke (2002), Patton and Zelenka, 1997; Bonsón and Escobar, 2006) and parallels some others (Malone *et al.*, 1993; Singhvi and Desai, 1971).

Hypothesis 4 predicts an association between public exposure and disclosure level on the internet; I found significant positive association as hypothesized. The finding supports Gutierrez-Nieto, Fuertes-Callén, and Serrano Cinca (2008).

Hypothesis 5 predicts an association between ownership diffusion and disclosure level on the internet; I found significant negative association surprisingly. In the hypothesis, the sign was predicted as positive. This finding contradicts with (Raffournier, 1995) who found no significant association for ownership diffusion and disclosure level.

Table 5: Multivariate regression analysis results

R Square = .612

Adjusted R Square = .560

F = 11.669

Significance = .000

	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
Dependent Variable: TSCORE

Conclusion

Regulatory bodies in Turkey such as the ISE and the CMB play an important role in encouraging the utilization of corporate web sites as a communication tool for investors. For example, CMB has issued corporate governance principles in 2003 for the first time and amended in 2005. The principles state that company's website should be actively used as a means of public disclosure. Among principles, significant information to be published on the company's website is provided as well.

The steps taken by regulatory bodies seem to have served the purpose. Because, the percentage of corporate web site existence among the sample companies is 100 percent. It can be said that having corporate web site is a common practice for Turkish listed companies. However, there are variations among sample companies. For example, companies that are customers of Big-4 auditing firms, and are listed in XCORP disclose more information that others. Hence, there is a need to increase the level of information disclosure on corporate web sites, especially, for non-Big-4 and N-XCORP companies. Because, the more information disclosed, the more transparent the firm is.

Furthermore, to test company characteristics that influence information disclosure level, five hypotheses were set up. The results of univariate test indicated significant association between disclosure level and the variables; ownership structure, auditor size, page rank, and being listed in XCORP. But, no significant association was found between disclosure level and leverage. In addition, multivariate analyses proved that ownership structure, page rank, and being listed in XCORP are significant explanatory variables for the disclosure level on the corporate web sites.

What implications the study has for the companies are that they should improve level of information disclosure on corporate web sites, especially in some areas such as investor relations,

corporate governance, and social responsibility. This study sets as benchmark for what to be disclosed on corporate web sites.

ROADMAP TO FUTURE MANDATORY APPLICATION OF IFRS IN JAPAN —FROM THE PERSPECTIVE OF FINANCIAL STATEMENTS PREPARERS

Yao Jun, Kobe University

Chitoshi Koga, Kobe University
Norio Igarashi, Yokohama National University

Abstract

After ten years' efforts on producing high-quality accounting standards which can represent Japanese style of business activities and on exploring its own way to converge with global financial reporting standards, Japan makes a major step forward towards adopting International Financial Reporting Standards (IFRS) by publish the Interim IFRS Roadmap. This shows a stance for acceptance of adoption. However, there are still quite a lot issues to be taken into consideration before the last determination of mandatory application of IFRS is made. The current research explores these issues from the perspective of financial statements preparers— in this paper, accounting managers or CFOs in leading Japanese companies which are most possible to be subject to mandatory application. The background of Japan' stepping towards adoption is introduced, the feature of Japanese accounting that might influence the adoption by Japanese companies are analyzed. Based on the this, a survey was made investigating their opinions on IFRS implementation, as well as the source of finance of and actual application in these companies at the present time. The results of the survey acquired in the current paper are expected to have implications for regulation making and IFRS adoption training programming.

1．**Introduction**

The current research tries to investigate issues concerning the adoption of international accounting standards (refers to IAS or IFRS) from the perspective of financial statements preparers.

When we were preparing this paper, the "Interim Report: Application of International Financial Reporting Standards (IFRS) in Japan" (the "Interim IFRS Roadmap") was published which is based on the exposure draft published on February 4, 2009. It seems that after ten years' efforts on producing high-quality accounting standards which can represent Japanese style of business activities and on exploring its own way to converge with global financial reporting standards, Japan makes a critical step forward towards adopting International Financial Reporting Standards (IFRS). The main points of the report concern the acceptance of voluntary adoption of IFRS in consolidated financial statements from fiscal years ending 31 March 2010 for "companies with global financial / operating activities" and the considerations for the possibility of mandatory application of IFRS in Japan.

As we know, there are two-pronged approaches to achieving a single set of global accounting standards: adoption and convergence. Japan, as well as U.S. has been regarded as examples of convergence countries. However, The Interim IFRS Roadmap indicates a future approach foreseeing the possibility that IFRS can be used and that Japan should adopt IFRS in some way in the future. Therefore, the issuance of the Initial IFRS Draft Roadmap would signify great regulatory change and proposes some important issues that should be considered and dealt with. For example, before the final decision on mandatory adoption is made, questions such as whether to adopt IFRS in both consolidated financial statements and non-consolidated financial statements or only adopt IFRS in consolidated financial statements, what kind of companies should be required to prepare financial statements in compliance with IFRS, the incentive and obstacles of companies to implement IFRS and other related questions should be answered based on comprehensive investigation. Since these issues are closely related to

preparers of financial statements, it is relevant to explore their understanding of IFRS and opinion towards the adoption of IFRS and preparation for the application.

We made the survey investigating leading Japanese companies' view on IFRS application before the publication of the Initial IFRS Roadmap when Japan still stood on the crossroad of convergence and adoption. We aimed to provide evidence for adoption or against adoption from the standpoint of preparers of financial statements. However, this result of our survey is also quite relevant right now because it provides reference for the issues proposed in the Interim IFRS Roadmap. The result of the survey is expected to provide implications for future standards setting concerning mandatory application of IFRS and provide evidence for the establishing training and supporting program for the application of IFRS in Japanese companies.

The following section firstly introduces background of Japan moving towards IFRS adoption to indicate the importance of strategy about the structuring of accounting system based on comprehensive understanding of situation of Japanese company and accounting context. Then section 3 specifies the significance of Interim IFRS Roadmap and important issues concerning adoption that is to be taken into consideration. In section 4, the most important influential factors that effect accounting practices of Japanese company, the feature of Japanese accounting and difference between IFRS and Japanese GAAP which direct relate to the problems concerning application of IFRS in Japanese companies. In section 5, based on the analysis in section 3and 4, we investigate Japanese managers' opinions on issues concerning IFRS application and the perceived proper way of application. Finally, some problems facing companies will be identified and concluding remarks are provided. .

2. Background --Accounting development towards adoption

Since 1997, Japanese government made the decision on the basic policy of Japanese Financial Big Bang, trying to sweep away the lack of transparency that has been said to characterize the Tokyo market and to improve the globalization by a constant devotion to global standards instead of a focus on domestic logic. In the following ten years, Japan has conducted

extensive reforms in its accounting system and commercial code towards the International standards, which is well known as "Accounting Big Bang". By these reforms, Japanese accounting becomes quite similar to the IAS / IFRS. Notwithstanding, there are still some difference left in specific accounting standards.

However, since there was a lack of a clear strategy about the structuring of the accounting system, the regulator's opinion towards IAS/IFRS adoption kept changing. In 2002 and 2003, Japanese Financial Services Agency, the Ministry of Justice and Nippon Keidanren[395] expressed negative opinion towards the adoption of IAS. In contrast, there appeared a international trend of convergence with IFRS during that time and this trend spread since then. On 29 October 2002, the International Accounting Standards Board and the US Financial Accounting Standards Board jointly issued a memorandum of understanding formalizing their commitment to the convergence of US and international accounting standards. Moreover, in the following year 2005 which might be seen as the beginning of a new era for financial reporting, International Accounting Standards (IAS)/ International Financial Reporting Standards(IFRS) were required to be applied in EU countries. Then in this trend, in Japan on March 2005, a joint project on the convergence of Japanese GAAP and IFRS was established to analyze and discuss the equivalent of Japanese GAAP and IFRS (Koga and Rimmel 2006). Nippon Keidanren changed its opinion in favor of convergence with IAS in 2006, 3 years after they expressed negative opinion towards adoption. But there was still no real progress. In 2007, the publication of SEC's *Concept Release on Allowing U.S Issuers to Prepare Financial Statements in Accordance with International Financial Reporting Standards (the Concept Release)* and its proposal, *Acceptance from Foreign Private Issuers of Financial Statements prepared in accordance with International Financial Reporting Standards without Reconciliation to US GAAP*, made Japan find itself dropping out in the global trend. Therefore, generally speaking, after the

---

[395] Nippon Keidanren (Japan Business Federation) is a comprehensive economic organization born in May 2002 by amalgamation of Keidanren (Japan Federation of Economic Organizations) and Nikkeiren (Japan Federation of Employers' Associations). Its membership of 1,662 is comprised of 1,343 companies, 130 industrial associations, and 47 regional economic organizations (as of June 22, 2007).

Big Bang, Japan seems lagged behind compared with its European and US counterparts in converging with IAS / IFRS. The changing opinion of the regulators seems to caused by external influences of international trend and the lack of strategy based on comprehensive understanding of the state of Japanese company, its accounting environment .

3. The publication of Interim IFRS Roadmap

What represent Japan's major step towards adoption is the publication of the "Interim IFRS Roadmap" which represents positive attitudes of the Financial Service Agency towards the adoption of IFRS. The Business Accounting Council (BAC), a key advisory body to the Commissioner of the Financial Services Agency (FSA), approved the roadmap for the adoption of International Financial Reporting Standards (IFRSs) in Japan. Sir David Tweedie, Chairman of the IASB commented on announcement:

this is a landmark decision, both for Japan and for IFRSs. For Japan, it signals the eventual adoption of IFRSs. For the IASB, adoption of IFRSs by the world's second largest national economy underscores the truly global nature of IFRSs and the acceptance of these standards by all major economies.

In the Interim IFRS Roadmap, continuing convergence is emphasized. At the same time, the directions for Japanese GAAP are indicated, covering topics on issues concerning the application of IFRS in Japan and the required approach. These issues include optimal application and considerations for the mandatory application of IFRS in Japan, for example, scope and methods for mandatory application, treatment on non-consolidated financial statement and etc.

One of the arguments for adoption of IFRS is that adopting IFRS can improve the comparability of accounting information and improve the transparency. The mission of IASB is to develop a single set of high-quality, global accounting standards that are accepted worldwide. Though IFRS provide possibility to improve the comparability, it should be noted that

comparability should not be confused with uniformity as comparability means that like things should look alike and different things should look different(Barth 2008). It is obvious that there are major international differences existing in accounting practices and the possible causes of differences might not be completely deleted even if we adopt the international accounting standards(Alexander, and Nobes 2009). Therefore, IFRS, if to be adopted in Japan, must faithfully reflect the economic reality of businesses and trade practices in Japan, as well as the global financial and capital market. So the continuing convergence is still emphasized in the Interim IFRS Roadmap.

On the other hand, though the interim IFRS Roadmap show a stance of acceptance of IFRS, there still left a lot of problems to be tackled including the above issues indicated in the report because of existing differences between IFRS and Japanese GAAP and the cause of the difference which may not be deleted entirely. As we know, accounting standards can be regarded as fully functional only if financial reports are appropriately prepared. Therefore, when the way of adoption, especially mandatory application is to be determined, the feature of Japanese accounting, the situation of Japanese companies, the difference between IFRS and Japanese GAAP, and other related issues should be understand, just as it is made clear in the Interim IFRS Roadmap:

……*Japan must be prepared to take on the issue of mandatory application of IFRS from a broad range of perspectives, defining the path to be taken in the case of making the use of IFRS by a certain range of Japanese companies mandatory, while attending to the various aforementioned conditions in Japan and abroad*……

4. The feature of Japanese accounting

In this section, we will analysis the major environmental factors that influence companies' accounting practices – to be specific, factors that directly influence the incentive to implement IFRS, the feature of Japanese accounting, and the major difference between IFRS and

Japanese GAAP so that we can acquire an understanding of relevant issues which should be considered in making the final decision on whether and how IFRS should be required to be complied with.

First, a large list of possible causes of international differences can be found in the writings of previous researchers (e.g. Choi and Meek, 2005, Nobes C and R Parker, 2008). For example, the most frequently referred factors that might influence the accounting development are cultures, legal environment, providers of finance, taxation, profession of accounting profession and other external influences such as economic, political events and international influences. Though international influence seems to be the most influential factor which spurred the adoption of IFRS in a world wide scope, in both countries with a strong equity market and weak equity market, however accounting standards are not set to follow the fashion.

Among all the above factors that affect accounting development, financing system, to be specific, the providers of finance, apart from international influences has been regarded as the main explanatory variable for the most important international differences in financial reporting. In countries, where capital provided by banks or family company is very important, the banks or family company may nominate directors and thus be able to obtain restricted information and to affect decisions. In this case, the need for published information is much smaller because of this access to private information. In other countries where the major source of corporate finance has been the share capital and loan capital provided by large numbers of private investors, especially foreign investors, there is relatively strong requires for unbiased information about the success of a business and its state of affairs. It is reasonable to assume that companies with different capital structures might have different opinion on IFRS.

Japan seems to be a unique case. It has a fairly important equity market, although not as important as that in the US or the UK. Furthermore, many Japanese companies own shares in each other, and so the total number of listed companies and market value is exaggerated when making an international comparison. Thus, to understand the major finance resource of

Japanese company and their perception on the importance of domestic and foreign equity market is a way to decide whether there is a need for mandatory adoption.

Second, Japan accounting has both German and US features. The Japanese accounting system consists largely of a commercial code borrowed from Germany in the late nineteenth century, overlaid with US-style securities laws imposed in the late 1940s. Japan accounting standards are characterized as rule-based which are similar to U.S. GAAP, while contrast to IFRS which are characterized as principle-based. In converging an accounting standard to the IAS, there are two approaches: the"Principle based approach" and the " Rule based approach". Under the former, the accounting standards are set based on general principles and the professional judgment of the financial statements makers while under the latter the accounting standards are set based on more detailed and clear rules. Continuing convergence with IFRS should solve the confliction between rule-base and principle-based accounting standards. On the other hand, complete adoption of IFRS might mean a change from rule-based to principle-based accounting standards which are assumed to have great impact on financial statement preparers.

Third, the major difference in accounting standards between IFRS and Japanese GAAP are concerning recognition of revenue, R&D, financial instrument, lease accounting and etc. These differences are rooted in basic accounting idea in the two set of accounting standards. The basic ideas of IFRS are principle-based, statement of financial position-focused, and fair value accounting, while Japan accounting are rule-based, attach great importance to income statements. While the resulting concrete differences in standards have different importance to Japanese companies, it is relevant to understand the relative importance of all the difference in accounting standards.

5. Investigation on manager's opinion on IFRS adoption

With the above consideration in mind, we made a survey trying to acquire some knowledge on the necessity of adoption and possible problems concerning adoption from the view of financial statement preparers – in this paper, we refer to CFO and accounting managers of Japanese companies. In a postal questionnaire, we asked questions investigating their understanding of and attitude towards IFRS adoption and present situation of IFRS application in Japanese companies.

5.1 structure of investigation questionnaire

Since provider of finance is one of the most important factors that influence the accounting practice, it is helpful to know the capital structure and major finance sources of investigated companies. It is also relevant to understand how the accounting managers are prepared for adoption, for example to explore how important they think of the difference in accounting standards between domestic accounting standards and IFRS, how they prefer IFRS to be adopted, present adoption of IFRS in their company, the difficulties or other considerations that concerning the application of IFRS. Furthermore, as Japanese accounting are rule-based while IFRS are principle based, if IFRS is to be adopted, this contradiction should be relieved. It is also important to understand the accounting manager's opinion on principle-based and rule-based accounting because the character of accounting standards directly affects manager's judgment and their accounting practice. Therefore, our questionnaire was made up of four parts:

(1) Major finance sources and users of financial statements

(2) attitude towards and opinion on the adoption of IFRS

(3) the present situation of IFRS application

(4) The convergence approach of accounting standards

5.2 Sample selection and collection of responses

The sample selection and collection of responses of each investigation are summarized as follows. The investigation selected 500 companies within which 67 are Japanese companies according to the sales rank of Fortune Global 500 of 2007. The questionnaires were sent to the CFO or senior managers of these companies. 115 useful responses were received (the response rate 23%) within which 57 are Japanese companies (response rate is 89%). In the current paper, we only analyze the data of Japanese companies. The companies which are permitted to optimally apply and are possible to be required to apply IFRS to their financial statements in the Interim IFRS Roadmap are those which have global financial or business activities. The investigated companies are possible to fall into the scope of optimal application and future mandatory application of IFRS.

5.3 Results and analysis

The respondent percentages reported in this paper are based upon the total number of responses to the questions. The design of the questionnaire allowed multiple answers for some questions. Consequently, the combined responses for some questions may exceed 100 percent.

(1) Major finance sources and users of financial statements

The first question asked the managers' views on the importance of domestic and overseas stock markets to their companies, as well as the importance of the stock market and bond market. 5 point Likert scale was used for measurement ranging from 1= not important at all, 3=not so important. 5= very important).

As is shown in Figure 1, domestic market was regarded by the largest category, 65% respondents, as being very important to their business activities. 42% respondent indicated that domestic bond market was very important. 23% respondent rated the overseas stock market as either important or very important. Though the majority of respondents rated the overseas

2163

markets not as of the same importance as the domestic markets, in general, they do regarded

overseas market as important.

Figure 1   Importance of markets to Japanese business operations (2008)

Table 1   Importance of Markets

	2008 average
Domestic stock market	4.508772 (n=57)
Domestic bond market	4.175439 (n=57)
Overseas stock market	3.614035 (n=56)
Overseas bond market	3.54386 (n=56)

Compared with domestic market, the perceived less importance of overseas markets may

suggest that Japanese companies are relatively lack of attention to overseas users of financial

statements that may lead to the lack of incentive to adopt international accounting standards.

To confirm this, the second question in the questionnaire use 5point Likert scale as previously

described, to sought how CFOs or senior managers view on the importance of financial

statements to various users.

Figure2　Perceived Importance of Financial Statements to Users (2008)

Table2　Comparison of Perceived Importance of Financial Statements to Users

	2008 average
Domestic institutional investors – stock market	4.631579 (n=57)
Domestic institutional investors – bond market	4.157895 (n=56)
Domestic individual investors – stock market	4.263158 (n=57)
Domestic individual investors – bond market	3.839286 (n=56)
Overseas institutional investors – stock market	4.385965 (n=57)
Overseas institutional investors – bond market	3.982143 (n=56)
Overseas individual investors – stock market	3.614035 (n=57)
Overseas individual investors – bond market	3.321429 (n=56)

Table 2 shows that the respondents as a whole think financial statements are important to most of the users. Generally, the respondents expressed an assessment that financial statements are more important to domestic investors than overseas investors. Even for overseas investors, financial statements are important. 42% respondents think that financial statements are very important to individual investors in stock market, while 70% think that the

financial statements are very important to institutional investors. But for investors in the

overseas stock market, 60% respondents think financial statements are important to institutional

investors while only 26% regard them to be very important to individual investors.

We had made a similar survey in 1997, by comparing the result, we find that the managers'

perception that financial statements are most important to domestic institutional investors

compared to other users kept unchanged during the past decade .

We also investigate the foreign ownership of each company.   Almost 10% respondents

stated that their overseas investment are 0 percent while 48% respondents, the largest group,

stated that the foreign ownership is within "1～10％", 12% respondents choose "11%~20%",

20% respondents choose "21%~40%", while 10% respondents said their foreign ownership is

"over 40%".

(2) Attitude towards and opinion on the adoption of IFRS

The fourth question asked the respondent ways by which they prefer IFRS to adopted. There

are show three options. The three options are (1) only adopt IFRS or US GAAP, (2) use both

IFRS (for overseas use) and Japanese GAAP (for domestic use), (3) use international

accounting standards as supplementation to Japanese GAAP. 41% respondents preferred to

adopt only IFRS as the basic financial statements standards. 29% respondents preferred to use

IFRS as supplementation to Japanese GAAP. Those who selected to use both IFRS and

Japanese GAAP only occupies 11%, that may be resulted from the high cost of using double

standards and the complication of practices.

Then, the survey asked the respondents' understanding of the difference of IFRS and

Japanese accounting standards.

Figure 3 Importance of IFRS versus Japanese GAAP Difference by Areas

Table 4   Importance of Differences in Accounting Standards between Japanese GAAP and IFRS

Accounting standard	2008 (average)	Accounting standard	2008 (average)
Goodwill	4.636364	Allowance	3.545455
Comprehensive income	4.327273	Fixed tangible assets	3.509091
The recognition of revenue	4.018182	Consolidated/SPC	3.490909
Business combination	3.981481	Investment property	3.363636
R&D	3.857143	Foreign currency	3.127273
Financial instrument	3.636364	Lease	2.872727
Impairment *		Employee payment*	

*additional indication by respondents

The results show that differences between Japanese GAAP and IFRS which are thought to

the most important are standards for goodwill, comprehensive income, recognition of revenue.

The different in accounting standards for business combination and R&D are also regarded as

important.   In addition to those listed in the questionnaire, some respondents indicate that

significant differences existing in accounting for standards for impairment and payment to

employee are also important.

We also asked respondents to state their opinions on the change concerning the application

of international accounting standards 5 years from now. Most of the respondents expected that

IFRS would be increasingly used only in consolidated financial statements or in both

consolidated and parent company's separated financial statements. The minority of the

respondents considered that IFRS would be adopted only in the parent company's account or

and as well as supplementary disclosure. If the expectation of these respondents is correct,

they will need to plan for the switch to IFRS.

Table 4 Expectation of Future Application of IFRS

	2008 average
Application only in Consolidated financial statements	1.5818 (n=55)
Application only in parent company's separate financial statements	2.3208 (n=53)
Application in both consolidated and parent separate financial statements	1.8545 (n=55)
Application only in supplementary disclosure	2.4717 (n=53)

The survey then asked whether the respondents agree with the statement that it would be

difficult to change from Japanese GAAP to IFRS. As is illustrated in the following figure, 55%

respondents think that it would be difficult to change from Japanese GAAP to IFRS.

Figure4   Views on whether changing from Japanese GAAP to IFRS will be difficult (2008)

(3) The present situation of IFRS application

Only 2 out of 57 usable respondents reported that they are currently adopting IFRS when

asked. There are other 2 Japanese companies answered that they are going to adopt IFRS

though they are not using at the moment. However, the vast majority(93.0%) of the respondents

noted that IFRS are not being adopted and they are not sure whether they will adopt it or not in the future.

　　We asked respondents who indicated that they are not yet adopting IFRS to explore the main reason why IFRS were not being adopted. The reasons suggested by respondents are as follows: (1) the cost is too high (10.5% respondents)、(2)there is inadequate staff training system(24.5% respondents)、(3)the international accounting standards are inconsistent with Japanese accounting standards (38.5%respondents)、(4)there is little benefit from the adoption of International accounting standards (22.8%respondents)、(5)it was not legally required to adopt IFRS (52.6% respondents)、(6)others (14.0%respondents）。Multiple choices are allowed. And respondents could cite other reasons. It became clear that the lack of legal requirement is the main reason for the uncertainty in the future adaptation of IFRS.

　　We then use the 5 point Likert scale to measure the respondents' perceived importance concerning the benefit of adopting IFRS. The expected benefits are: (1) improve the trust and understanding of securities investors, （2）improve the trust and understanding of bond investors, (3) make it easier to issue securities in international markets, (4)reduce the cost of raising bond capital, (5)improve the international image of the company、(6) reduce the barriers to list in overseas stock market,(7) to reduce the cost of making financial statements. The majority of the respondents perceived that the most important benefits of IFRS adoption were to make it easier to issue securities in international markets(61%), " improve the trust and understanding securities investors"(58%), "reduce the barriers to list in overseas stock market"(51%). It is obvious that the greatest benefit of IFRS adoption is related to international market, international status and international fund-raising. Only 9% respondents think "reduce the cost of making financial statements" as important or very important factors.

　　It is interesting that the perceived benefits over years changes. To be specific, respondents in 2008 investigation think more negatively about the IFRS adoption and they perceived less

benefit than those did in 1997. For example, in 1997, Japanese managers regarded "improve

the trust and understanding of stock investors" as very important benefit while in 2008 they did

not attached great importance to it. One of the reasons for it may be that the managers have

fully realized the achievement of accounting convergence towards IFRS through the Accounting

Big Bang after 1997.

Table 5   Perceived benefit of IFRS adoption

	2008 average
Improve the trust and understanding of stock investors	3.754386 (n=57)
Improve the trust and understanding of bond investors	3.684211 (n=57)
Make it easier to issue securities in international markets	3.929825 (n=57)
Reduce the cost of raising bond capital	3.245614 (n=57)
Improve the international image of the company	3.473684 (n=57)
Reduce the barriers to list in overseas markets	3.789474 (n=57)
Reduce the cost of making financial statements	2.263158 (n=57)

Then the questionnaire asked the accounting managers to state their perception on the

relationship of cost and benefit. The respondents showed some kind of skeptical about the

benefit of IFRS adoption. Indeed, 63% respondents thought that cost would exceed benefit,

while 15% indicate that cost would almost equal benefit, only 1.8% expected that benefit would

exceed cost should the IFRS be adopted.

Figure 5 Cost-benefit analysis of IFRS adoption (2008)

- benefits greatly exceed costs
- benefits slightly exceed costs
- benefits equal costs
- costs lightly exceed benefits
- costs greatly exceed benefits

(4) The convergence approach of accounting standards

Furthermore, as for the approach – by principle-based approach or rule-based approach— to adopt international accounting standards, 60% respondents regarded principle-based approach as more appropriated. The main reason was described as the accounting under principle standards reflects the substance of economy and it is easier to implement IFRS in practice because detailed rules which might impediment usage of IFRS in Japanese context. In contrast, only 25% think rule-based approach is better with the main argument being that the accounting method is clearly prescribed so that it is easier for compliance in practice and the comparability of accounting information will be improved.

4　Conclusion

The present research investigated issues concerning the application of IFRS in Japan from the perspective of managers of Japanese companies—the preparers of financial statements.

In the first 3 sections of the paper, we have indicated that provider of finance, difference in the basic idea and concrete standards between the IFRS and Japanese GAAP might influence the financial statements preparer' application of IFRS. These aspects should be taken into consideration when the scope and approach of mandatory application of IFRS are to be decided. By investigating the major finance of leading Japanese companies, the manager's opinions on adoption, and present adoption by Japanese companies and reasons for no adoption, we get to know:

(1) Over half of these largest companies have rather low foreign ownership (less than 10%). It is obvious that the greatest benefit of IFRS adoption is related to international market, international status and international fund-raising. Thus the Japanese companies expressed an assessment that financial statements are more important to domestic investors than overseas investors. Though the majority of respondents rated the overseas markets as being not so important relative to the domestic markets, in general, they still regard overseas financing market as important.

(2) The major differences in accounting standards concern recognition of revenue, R&D, lease and financial instrument, while the differences thought to the most important by Japanese companies are standards for goodwill, comprehensive income, the recognition of revenue. The different in accounting standards for business combination and R&D are also regarded as important.

(3) Most of the respondents expected that IFRS would be increasingly used only in consolidated financial statements or in both consolidated and parent company's separated financial statements.

(4) The main reasons why Japanese companies have not adopted IFRS include that there is not legal requirement that IFRS be adopted, there are inconsistence exist between IFRS and Japanese GAAP and inadequate training system. The reason why Japanese companies show negative attitude towards IFRS adoption may be that the Japanese managers expect that the application of IFRS would be difficult. Furthermore, with the convergence of Japanese standards with IFRS, Japanese companies in 2008 are more confident to prepare their financial statement under the domestic standards than before. Even without adopting IFRS, they assume that they can get the trust and understanding of investors. And Japanese managers expected that the cost would exceed the benefit for IFRS adoption.

(5) Principle-based accounting is thought to superior to rule-based accounting by managers of

Japanese companies.

The above survey results provide some implications for regulation consideration and training programming. The following points call attention of regulators.   Firstly, though the globalization of Japanese economy and the filtering global standard (accounting standards, corporate governance) has made steady progress, Japanese companies still kept prudent and passive in IFRS adoption. This may be connected with the relative low foreign ownership in leading Japanese companies. Though the investigated companies are all leading companies in Japan, the fund-raising policies and proportion of foreign ownership are various. The Initial IFRS Roadmap suggests a phase-in approach based on criteria such as the gross market value of each company-- a scheme proposed in the US roadmap, the survey result may suggest for the phase-in approach based on criteria of both foreign ownership and gross market value, as the greatest benefit of IFRS adoption is related to international market, international status and international fund-raising.

Secondly, one of the most important considerations concerning adoption of IFRS is that the cost of adoption is expected to excess the benefit. The adoption of IFRS does not only influence accounting practice, it also has an effect on other aspects of business such as the operating process, management system, strategy making. For example, we have known that there are differences in two set of accounting standards, one of which concerns standards for revenue recognition. In Japanese GAAP, sales revenue is recognized at the time of shipment, while IFRS prescribe that sales revenue can be recognized when risk and benefit of the goods have been transferred to the buyer so that the revenue may not be recognized at the shipment time. If IFRS is required to be adopted, Japanese companies which have recognized sales revenue on a shipment basis might have to change the time of revenue recognition. This might result in changes in the internal control system, information system, distribution system of the company and the amount yearly sales revenue which further influence the business plan and strategy. These costs are beyond the direct costs only related to accounting system. Cost-benefit tradeoff

is one of the most important considerations of preparers of financial statement so that it should also be important issues to be considered in deciding mandatory application.

Furthermore, lack of training system has been regarded as an important cause of Japanese companies' prudent attitude towards IFRS. The training should not only concentrate the detailed accounting standards, but also include content concerning the total influence IFRS adoption might have on the whole business. Moreover, principle-based accounting standards are regarded by a majority of companies as reflecting economic substance, thus to be superior. However, it requires higher judgment capacity of preparers of financial statements. This not only requires a comprehensive training program but also increases the cost of adoption.

In addition, the investigated companies has indicated several differences in accounting standards that are important to their companies-- goodwill, comprehensive income, recognition of revenue, which imply that in making a decision on mandatory application regarding whether to apply IFRS as developed by the IASB or to make partial modifications or exclusions of IFRS, not only the content of IFRS and the status of the setting of IFRS should be reviewed, but also these influence on Japanese companies should be carefully investigated.

The current paper is written mainly from the standpoint of preparers of financial statements. There are other perspectives should be taken into consideration when deciding application scope and methods for example the standpoint of accounting information users, auditors and other interested parties. In addition, research shows some evidence that the adoption of IFRS itself does not lead to high-quality information. Therefore, adoption will not necessarily lead to increased transparency and the trust of accounting information. Effective enforcement combined with high quality standards leads to high value relevance information. Strong equity market is connected with strong investor protection. Overall, international value-relevance of accounting information studies provide some support for the argument that accounting information is more value-relevant in countries with strong legal protection of outside investors(Habib 2007). Japan has a unique equity market and accounting system which is

discussed in section 4, therefore adoption of IFRS should also be supplemented with

consideration of enforcement which can be analyzed in other future papers.

COMPANY CHARACTERISTICS, DOMINANT PERSONALITIES IN BOARD COMMITTEES AND INTERNET FINANCIAL DISCLOSURES BY MALAYSIAN LISTED COMPANIES

Mustafa Mohd Hanefah, Universiti Sains Islam Malaysia, Malaysia
Ali Saleh Alarussi, Universiti Sana'a

Abstract

This paper investigates whether the internet financial disclosure can be explained by company's characteristics and dominant personalities in board committees of Malaysian listed companies. Ten hypotheses were tested using data collected from 194 Malaysian listed companies' websites. Specifically, this paper examines the relationship between the internet financial disclosures (IFD) and ten variables namely internationality, leverage, foreign shareholders, level of technology, firm age, and number of shareholders, listing status, dominant personalities in the audit committee, chairman of audit and nomination committees. It is found that level of technology, firm age, number of shareholders and listing status significantly affects the level of IFD. However, the dominant personalities in the audit and nomination committees affects negatively on the level of IFD in Malaysia. The study provides some evidence to support signaling theory and cost and benefit hypothesis in relation to internet disclosure.

Keywords: Internet reporting, Dominant Personalities, Board Committees, Internationality

Introduction

Since 1990s, companies are utilizing the Internet as a medium to disclose their information. Currently, the level of Internet disclosure varies between companies worldwide. This phenomenon has attracted many academic researchers in the disclosure field. It is argued that Internet reporting is the efficient instrument to communicate information to the external users at a minimum cost. Information on the Internet can be presented in different forms of dynamic presentations such as draws, multimedia, audio, video and others (Ettredge et al., 2002; Ashbaugh et al., 1999).

Despite the growing usage of Internet by companies, professionals and practitioners, but researches perceive that IFD is still in its infancy in the developing countries such as Malaysia (Hassan at el, 1999; Noor Azizi et al., 2000; Mitchell and Ho Wern Pei, 2000; and Khadaroo 2005). Therefore, this paper aims to investigate factors that influence the extent of IFD in Malaysia. The remainder of this paper is structured as follows. Section 2 provides overview of IFD development, while section 3 reviews the factors that affect the IFD. The research method is described in section 4. Section 5 presents the results of this research. Finally, section 6 provides the conclusions, limitations, and recommendations for future research.

The Development of Internet Financial Disclosure

The nature and the extent of the disclosure problem involves a consideration of the persons to whom the disclosure is being made, an assessment of user needs and the medium of disclosure which is used to communicate with the user groups (Kreps, 1990). The main concern is that accounting reports should disclose information which is necessary to the users so that they would not be misleading (Moonitz, 1961).

It has been argued that equity markets require comprehensive and transparent disclosures of the firm's value and their performance in order to run efficiently (Levitt, 1999; and Richardson and Welker, 2001). Theoretically, the level of disclosure should benefit the firms by lowering the cost of capital. The decrease in the cost of capital is results from two factors; first, the higher the disclosure by the firms the less transaction costs for investors and in turn creates greater liquidity of the market and greater demand for the firm's securities (Diamond and Verrecchia, 1991). Second, the additional disclosure reduces the risk estimation or the uncertainty regarding the distribution of returns (Clarkson et al., 1995).

Portes and Rey (2005) argue that companies started to report via the Internet as the traditional paper-based disclosure has its limitations. The increase in global investments and investors results that the paper-based disclosure becomes more expensive and limited in capacity to reach investors in a timely manner. In contrast, the Internet disclosure has been found cost effective, fast, flexible in format, and accessible to all types of users within and outside national boundaries (Debreceny et al., 2002). Thus, the Internet has more advanced benefits than other media of disclosures such as newspapers, journals or other printing media. The Internet offers easy and equal access to all firms' information users and presents the image of the firm that the firm would like to be on the eyes of the Internal or external parties. Thus, the more information disclosed by a firm, the more chances the firm will be noticed by potential shareholders and investors.

In a more advanced usage of the Internet, some companies employ technological advances to display information such as streaming audio and video on their websites (Rosli Mohammed et al. (2003). Streaming audio allows interested individuals to listen to analysts' conference classes, annual meetings and similar presentations; to broadcast conference calls live; or to provide an

archive of presentations from which the Internet user can select. Some companies also provide video together with the streaming audio (Hurtt et al., 2001).

In addition, it is argued that the investors who are concerned with return on investment will not use historical financial data as a means to evaluate companies' future performance. Instead they will search and consider recent and real-time indicators of management competence such as the ability of corporation to support and increase customer loyalty and retain and leverage the knowledge of employees (Wheeler and Elkington, 2001).

Debreceny et al. (2002) argued that the primary foundation of IFD is to eliminate the notion of information asymmetry between management and ownership, supported by the view that the level of information asymmetry is an important driver of investor uncertainty. Modern corporations have adopted various mechanisms, including voluntary disclosure, to mitigate the effects of information asymmetry. Empirical studies on voluntary disclosure suggest that managers voluntarily enhance the visibility of their firms' financial profiles to: (1) reduce agency costs or contracting costs (Chow and Boren 1987); (2) reduce the cost of capital (Botosan, 1997), (3) enhance the value of the firm (King et al., 1990; Yeo and Ziebart, 1995; Frankel et al., 1999),(4) enhance the level of transparency (Lodhai, 2004), (5) enhance the communicating with firms' stakeholders (Hassan et al., 1999), (6) record higher market liquidity (Welker, 1995), and (7) increase interest shown by institutions and analysts in the firm's stocks (Lang and Lundholm, 1996; Heldin, 1999). IFD can also improve timeliness and verifiability. Timeliness too can be improved by increasing the frequency of disclosure, since the costs for making such disclosure is low and using devices such as hyperlinks to multiple sources of information can improve verifiability (Debreceny, et al., 2002).

Groff and Pitman (2004) propose three approaches that can be used by the companies to improve the financial section of their website which are as follows:
- Increasing the cases of using technological improvements and website design changes.
- Expanding the types of information provided including conference call, transcripts, speech text and slides, web casting conference calls, investor questions and answers and industry highlights.
- Observing other companies' websites occasionally in order to see what other firms are providing in their websites and to get ideas as what should be included on their own websites.

In short, with the Internet financial reporting, the communication with the investors is expected to be very effective and interactive and in turn adds real value to the stakeholders and facilitates the companies in controlling their marketplaces.

The Determinants of Internet Financial Disclosure

A large number of studies in different countries attempt to find out the determinants of the extent of financial disclosure (see e.g, Tariq, 2001; Da Silva and De Lira, 2004; Hassan et al., 1999; Khadaroo, 2005). They come up with different determinants and factors that may affect the extent of disclosure. These determinants could be in the form of internal determinants such as firm characteristics or external determinants such as regulations and government roles. However, there is no consistency on the findings due to different nature of studies. This encourages the researcher to examine ten variables with the IFD. These determinants are discussed in the following subsections.

Internationality

When an organization becomes famous and known globally, the extent of its information disclosure will be increased due to the increase in foreign stakeholders and the obligation to fulfill different requirements and regulations in different countries (Meek el al., 1995). Meek et al., (1995) examine annual reports of 280 multinational firms in 1989 and find that there are significant differences in financial reporting between international listed companies and local listed companies. The annual reports of multinational companies are more detailed than the annual reports of local companies. Similar results are obtained by Susanto (1992) who analyses the annual reports of 98 listed companies in the Jakarta Stock Exchange in 1990.

Raffournier (1995) finds that the size and the degree of internationalization are related to disclosure practice. Foreign companies tend to comply with the rules of countries in which they operate (Bureau and Raffournier, 1989). Cooke (1992) supports this by saying that internationality is positively related to the extent of financial disclosure. The current study attempts to examine the impact of internationality variable on the IFD. The internationality is measured by using the exports-on-sales ratio (emulating Garcia and Monterrey,1992;

Raffournier, 1995). Therefore, based on the above discussion, the proposed hypothesis to be tested is:

H1: The extent of financial disclosure on the Internet is positively related to the level of International activity of the company

Leverage

The results of the impact of leverage on the extent of voluntary disclosure are mixed. Naser et al. (2002) and Laswad et al. (2005) find a positive relationship between them. It supports the argument that more debts in the company's financial capital push creditors to ask for more information due to higher asymmetry information. However, Chow and Boren (1987) and Ahmed and Nicholls (1994) find no significant association between them. Dichev and Skinner (2002) argue that the inconsistent results are due to the fact that leverage is a poor proxy for a company's risk. This study intends to examine the impact of external debt on the extent of financial performance amongst Malaysian companies. Previous studies have measured leverage in terms of debt to equity ratio (Roberts, 1992; Katsuhiko et al., 2001). Other studies measured leverage by comparing total of long term liabilities to the total of assets (Haniffa and Cooke, 2002; Laswad et al. 2005; Alsaeed, 2005). In this study, leverage will be measured by using the percentage of long term liabilities on the total assets. Based on the above discussion, the study proposed the following second hypothesis:

H2: The extent of financial disclosure on the Internet is positively related to leverage

Foreign Shareholders

Haniffa and Cooke (2002) find a significant positive relationship between foreign ownership and the level of paper-based disclosure. The results support the argument that the higher the foreign ownership in an organization is, the higher the asymmetry information will be. This becomes critical if the regulations of the investment- received country is not understood. This in turn pushes foreign shareholders to ask for more information which is initially not required by the regulations and eventually leads to more voluntary disclosure (Leung, Morris and Gray, 2005).

However, Xiao et al. (2004) find no significant relationship between foreign ownership and Internet disclosure by the companies in China. This discrepancy motivates the researchers to

study the impact of foreign ownership on the extent of voluntary disclosure on the Internet in other countries. This variable is measured by using the ratio of total shares that are owned by foreigners to total number of issued shares (Haniffa and Cooke, 2002).

Based on the above discussion, the proposed hypothesis to be tested is as follows:

H3: The extent of financial disclosure on the Internet is positively related to the existence of foreign shareholders.

Level of Technology

The existence of technological services in the companies such as department of technology are beneficial to them especially for the Internet disclosure (Lodhai., 2004). The responsibility to maintain the website such as uploading and updating information on the website goes to information technology department of the company. The website, unlike paper-based reporting, has many features and formats such as PDF, hyperlink, audio, video and others that require experts to operate it. This is to ensure that the website provides the needed information properly.

Although the cost to disclose information on the Internet is cheaper compared with other media, the web setting and maintaining it is costly (Joshi and Jawaher, 2003; Lodhai, 2004) especially if it is outsourced. Therefore, information technology department is important in order to reduce such costs and to attain ideal information system practice. Debreceny et al. (2002) examine the association between the level of technology and the extent of voluntary disclosure through the Internet and find a significant positive relationship between them.

This study attempts to study the relationship between the extent of Internet financial disclosure and the level of technology in Malaysian listed companies. The involved variable is measured by using dummy measurement. Thus, the proposed hypothesis is as follows:

H4: The extent of financial disclosure on the Internet is influenced by the level of technology.

Firm Age

There are a few studies that concentrate on time factor as a determinant of voluntary disclosure. For example, Haniffa and Cooke (2002) examine the impact of listing age on the level of voluntary financial disclosure amongst Malaysian listed companies. The result is quite surprising whereby the variable shows a high positive correlation with disclosure but not to voluntary disclosure. Similar result is also obtained by Alsaeed (2005). Camfferman and Cooke (2002) in their study also suggest that the age of company may have a significant impact on the extent of Internet disclosure. This is also because of the expectation that old companies might improve their annual report and level of disclosure overtime.

As this variable has never been tested in terms of the level of Internet disclosure, this study aims to examine this variable by counting the number of operating years since the company is listed on the stock exchange. In other words, the impact of the firm age on the extent of Internet financial disclosure will be examined. The proposed hypothesis is as follows:

H5: The extent of financial disclosure on the Internet is influenced by the firm age.

Number of Shareholders

Debreceny et al. (2002) argue that external environment has an important role in the level of internet disclosure. The level of internet usage by the public and the environment of disclosure in the operating country are two important internet disclosure determinants. For the first determinant, if the usage of the Internet is common in one country, the users expect more company information to be placed on the Internet. Similarly, if the companies believe that there is a large internet audience amongst their local stakeholders, they tend to disclose more information on the Internet. Oyelere et al. (2003) find that spread of shareholding has a significant positive relationship with the extent of voluntary financial disclosure on the Internet by New Zealand listed companies. However, Naser et al. (2002) find no significant relationship between the number of shareholders and the extent of voluntary disclosure.

Therefore, it is interesting to examine this variable in the Malaysian context that is to test the impact of number of shareholders on the level of internet disclosure. The following hypothesis is proposed:

H6: The extent of financial disclosure on the Internet is influenced by the number of shareholders.

Listing Status

Wallace, Naser and Mora (1994) examine the impact of listing status on the level of voluntary disclosure amongst Spain listed companies. Multivariate regression analysis was employed to analyze the data. The result shows a significant positive relationship between listing status and the extent of voluntary disclosure.

In Bursa Malaysia, there are two types of listing boards that are main board and second board. The main board companies have a minimum paid-up capital of Ringgit Malaysia (RM) 60 millions while the second board companies are those that have a minimum paid-up capital of RM40 millions in capital in order to be qualified to be listed (Yatim, Kent and Clarkson ,2006). The companies that do not meet the criteria of main board can apply to be listed on the second board. Due to the difference in size and capital, the companies on the main board inclined to disclose more information on the Internet than those that are listed on the second board. This is due to the following reasons:

- The requirements that the company should fulfill if it wants to be listed on the main board. Those requirements are not similar to that of second board such as the level of transparency (Wong, 1996).
- The competition amongst main board companies is stiffer than those on the second board as investors are keen on them (Abdul Samad ,2002).

This variable has never been tested in the previous studies and therefore should be of interest to examine whether the practicing listing status of Bursa Malaysia has any influence on the level of internet disclosure. In other words, this study examines the impact of an organization's listing status in Bursa Malaysia on the extent of voluntary financial disclosure on the Internet. Therefore, the following hypothesis is proposed:

H7: The extent of financial disclosure on the Internet is influenced by firm's listing status.

Dominant Personalities in the Audit Committee

The role of audit committee is critical in the decision making process because it has the authority to examine sensitive issues and irregularities and give report to the board with recommendations. The board ultimately makes decision after examining the report meticulously. The primary objective of the audit committee is to assist board of directors in fulfilling its responsibilities in relation to accounting and reporting practices of the company and its subsidiaries, and to determine the adequacy of the company's administrative, operating and accounting controls (Haron et al., 2005; Cohen et al.,2007). The audit committee also reviews the adequacy and the effectiveness of corrective actions that are taken by the management in resolving reported audit issues and discusses the appropriateness of adopted accounting policies and treatment and assumptions that are raised by the external auditors (Collier, 1997).

It is argued that if the chairman of the company holds several positions in the company's committees such as audit committee then the decision on disclosure will be affected significantly (Mangena and Pike 2004). The chairman may use his/her position to influence such decision. This study attempts to provide empirical evidences regarding this issue by examining the extent of voluntary financial disclosure on the Internet if the chairman of board directors is also the chairman of audit committee of the company. Thus the following alternative hypothesis is proposed:

H8: The extent of financial disclosure on the Internet is influenced if the chairman of board directors is also the chairman of audit committee in the company.

.**Chairman of Audit and Nomination Committees**

The nominating committee has a number of duties and responsibilities that has to be fulfilled. The duties are such as reviewing annually the attendance and performance of the individual directors, reviewing the compensation of directors and makes recommendations to the board of directors as to such compensation, recommending to the board of directors nominees who meet criteria approved by the board of directors for nomination or election as directors, developing and overseeing corporate governance principles for the corporation and performing other duties that may be assigned to the committee by the board of directors overtime (Vafeas, 1999). It is argued that if the chairman of audit committee and nominating committee is not the same person their independence might be enhanced as committees members are "Independent Directors" by

virtue of the rules of stock exchange and in accordance with the corporate governance concepts and policies (Chtourou el al., 2001).

As audit committee and nomination committees are functioning as monitoring committees and in turn influence the process of decision making, an understanding on their role in financial disclosure on the Internet is considered critical. This study aims to examine this theoretical information in a real life setting. To ease this process, the following hypothesis is identified:

H9: The extent of financial disclosure on the Internet is influenced if the chairman of audit committee is also serving as the chairman of nomination committee in the corporation.

Dominant Personalities in the Audit and Nomination Committees

As discussed above, there is a clear demarcation between the function of audit committee and nomination committee. Each committee is responsible for critical and sensitive tasks and therefore must be separated. This is to ensure that the quality of the company's internal control is always at a satisfactory level. The chairman of the company, on the other hand, is responsible for ensuring that the board is always running effectively, the organizational members obtain relevant information and the company's policies are always observed. It is expected that if the chairman of the company is also the chairman of any of audit committee or nomination committee or both, the decisions that are made in both committees will be negatively affected (Shivdasani and Yermack 1999). This may include the decision on the extent of financial disclosure. Since this relationship has not been tested in the previous studies, this research attempts to examine it from the perspective of the extent of financial disclosure on the Internet. Thus, the following hypothesis is proposed:

H10: The extent of financial disclosure on the Internet is influenced if the chairman of board directors is also the chairman of audit and nomination committees in the company.

Research design

This study examines the determinants of IFD by Malaysian public listed companies on the bursa Malaysia's main and second boards. The data for this study is secondary in nature and derived from the information disclosed in the companies' websites. A total of 194 companies which have websites were chosen randomly after excluding banks and financial institutions due to their

different regulations. Furthermore six companies were also excluded from the sample because they were identified as outliers in the initial analysis. Regression Model is utilized to find out the results of this study and this is in tandem with the previous studies (e.g. Chen and Jaggi ,2000; Ho and Wong, 2001; Camfferman and Cooke, 2002; Archambault and Archambault, 2003; Oyelere; Laswad; and Fisher , 2003; Marston and Polei, 2004; Gul and Leung, 2004; and Laswad, Fisher, and Oyelere, 2005).

Descriptive Statistics

 The frequency for IFD index items is shown in Table 1. The table shows that 60%-63% of companies disclose some financial information on the websites. About 62.9% of companies disclose both current release and news operation review items. Another 60.8% of the companies disclose their annual reports and 58.8% of companies disclose financial highlights items. These are the most common disclosed items on the websites. This is followed by the annual reports for the past years (51%), quarterly reports (46.9%) and its contents such as statement of income, balance sheet, cash flow statement and accounting notes. However, only 12.4 % and 7.7% of the companies are concerned with half year reports and performance charts respectively. As this information is critical for the investors, this finding shows a significant deficiency of Malaysian listed companies' financial reporting in the Internet.

Table 1: The Internet Financial Disclosure index (%)

N	Financial characteristics	Frequency	Percent	N	Financial characteristics	Frequency	Percent
1	Current Release or news	122	62.9	9	Cash Flow Statement in Quarterly report	80	41.2
2	Operation review	122	62.9	10	Accounting notes in Quarterly report	66	34
3	Annual report	118	60.8	11	Current share price	47	24.2
4	Financial highlights	114	58.8	12	Financial review	31	16
5	Annual reports for the past years	99	51	13	Financial calendar	28	14.4
6	Quarterly report	91	46.9	14	Half year report	24	12.4
7	Statement of Income in quarterly report	81	41.8	15	Share Performance chart	15	7.7
8	Balance sheet in quarterly report	80	41.2

Results

In tandem with the previous studies of voluntary disclosure, (e.g. Cooke, 1989b; Hossain et al,1994; Raffournier, 1995), and due to one dependent variable and ten independent variables, multiple regression analysis is used to test the hypotheses after adopting quality tests for normality, correlation analysis and multicollinearity. The results from the regression analysis show that several variables have significant positive relationships with IFD. These variables are level of technology, firm age, number of shareholders and listing status. However, the dominant personalities in the audit and nomination committees show a significant negative relationship with IFD. The rest of the variables do not show significant relationship with the extent of IFD (see Table 2).

The productive ability of analysis were $R^2 = 478$ and Adjusted $R^2 = .448$ which is good.

Discussion of Results

The above results suggest that company's characteristics variables: level of technology, firm age, number of shareholders, listing status and the dominant personalities in the audit and nomination committees are significant variables for the extent of IFD in Malaysia. This finding is not surprising for several reasons. Firstly, since the paper investigates Internet disclosure (the most advance technology in communication) it is expected that firms that have technology department are more likely to disclose more financial information through their websites. Secondly, old companies are more familiar with the disclosure practices through the Internet than newly established companies. Based on signaling theory, old firms are generally disclosing more information in order to differentiate themselves from the new ones on the stock exchange (Morris, 1987; Watts and Zimmerman, 1986; Skinner, 1994). In addition, as the old firms have more control over the market, they are in a better position to provide reliable forecasts (Hughes, 1986). Therefore, it is natural that old company discloses more financial information than new one. Thirdly, it is logical to observe that number of shareholders is positively significant with the IFD because the internet has wide coverage and low reporting cost when compared to other printing media. This advantage motivates the companies that have a large number of shareholders to use the Internet as a medium for disseminating their financial information. Fourthly, listing status is a new variable and never been tested before in the previous studies. The results of regression analysis indicate that if the companies are listed on the main board of Bursa Malaysia, they are more likely to have websites and disclose more financial information on them when compared to the companies that are listed on the second board. In other words, there is a gap between the companies that are listed on the main board and the companies that are listed on the second board. This gap in turn influences the level of transparency and the usage of advanced technology such as the Internet. Nevertheless, it is not surprising to observe this phenomenon because of different requirement of Bursa Malaysia in relation to main and second boards. The difference is due to the fact that companies listed on the main board are big companies (financial capitals more than RM60 million), and therefore capture more public and government concern in relation to the level of transparency, technology development and environment. This results in the policy makers of Bursa Malaysia to set more strict requirements and regulations for main board companies. Internet reporting is an option to fulfill all the requirements in cheap and fast manner.

Last, but not least, the results of regression analysis reveal that the level of IFD is negatively affected if the chairman of two committees (audit and nomination) is also the chairman of the

company. In this case the chairman influences the independence of two committees which in turn impede them from fulfilling their responsibilities effectively. This is normally followed by a low level of information being disclosed.

From the analysis, it can be seen that significant support can be found for hypotheses H4, H5, H6, H7 and H10, However, there is no support for hypotheses H1, H2, H3, H8 and H9. Nevertheless, information disclosed involves human judgment element and therefore can never be explained completely by the company's characteristics. Within this context, however, the paper provides some evidence to support signaling theory and cost and benefit hypothesis in relation to disclosure.

Conclusion and future research

This paper examines the relationship between ten variables under two groups (company characteristics and dominant personalities in board committees) and the extent of IFD by Malaysian listed companies. The results provide evidence that there is a significant positive relationship between each of level of technology, firm age, number of shareholders, and listing status and the extent of IFD. However, the dominant personalities in the audit and nomination committees negatively affect the level of IFD. The other variables did not show any significant relationship with IFD. Therefore, it is recommended that Malaysian government should give more consideration to the negative association with the extent of IFD and impose a new regulation that prohibits the executive directors from being the chairman or a member of audit committee in the company. It is also recommended that the establishment of audit committee is mandatory for the listed companies. The criteria for the appointment of the chairman of audit and nomination committee should also be regulated.

It can be concluded that, there are number of procedures that Malaysian government, policy maker in industrial sector, and regulatory authorities may take in order to enhance the level of transparency amongst Malaysian listed companies. The results of this group of independent variables provide the important characteristics in Malaysian companies that motivate them to be more transparent and high technology usage. The regulatory bodies have the opportunity to impose the necessary rules and regulations that obligate companies to take advantages of the internet technology in the business area. This step seems to draw the guideline for Malaysian

listed companies to be in the same direction with the government policy that seeks for achieving developed country plan 2020.

Future research may undertake panel study to examine whether these variables consistently have a significant influence on the extent of disclosure, since this research was carried out for one particular year only.

TAX KNOWLEDGE DIMENSIONS UNDER SELF ASSESSMENT SYSTEM IN MALAYSIA

Noraza Mat Udin & Kamil Md Idris

Abstract

Knowledge of taxpayers in taxation is believed to be important under Self Assessment System (SAS). However, due to the nature of taxation i.e. complex and rapid change what should be the composition of necessary knowledge for lay taxpayers is questionable. This study explores specifically on the necessary aspects of knowledge in taxation which permit taxpayers to determine correct tax liability and adhere to the tax laws and regulations as necessitated under SAS. The findings from a survey on tax professional's views are presented with the aim to identify dimensions of individual tax knowledge as the basis to develop tax knowledge measure.

1.0   INTRODUCTION

Empirically, it has been proven that taxpayers; knowledge in taxation is indeed important especially in Self Assessment System (SAS) (Barjoyai, 1992; Hajah Mustafa, 1997). For instance, when the system was first introduced to taxpayers in the United Kingdom, Australia and also Malaysia, it demanded knowledgeable taxpayers to perform the primary function of SAS (Barr, James and Prest, 1977; Mohd Shukor, 1994; Siti Mariam, 1994; Hajah Mustafa, 1998; Loo and Juan, 2005). This so called primary function is mainly related to the operation of income tax which includes determining the correct amount of tax liability and submitting error free return to the tax authority. In contrast, under the former system i.e. official assessment system (OAS), this primary function is carried out by well trained tax officers. However, with the introduction of SAS this function had been transferred to the taxpayers who are not been trained formally to carry out the tasks of the professionals. Thus, it may thwart the main purpose of SAS as its successful implementation relies mainly on the acceptance and cooperation from

taxpayers to perform the said responsibilities (Sandford and Wallschutzky, 1994; Barr et al., 1977; Hajah Mustafa, 1998).

The importance of tax knowledge has attracted many researchers. Recent literatures suggested that tax knowledge is one of the important psychological variables in the tax compliance environment (Kirchler, 2007; Hofmann, Hoelzl and Kirchler, 2008 and Kirchler, Hoelzl and Wahl, 2008). In this regards, the knowledge of taxpayers under SAS is required to ensure the system works smoothly. Apparently, it has been noted that the implementation of SAS, despite its benefits to the taxpayers, has indeed placed an arduous burden on taxpayers especially in term of ensuring that they possess sufficient level of knowledge in taxation (Saad, Mansor and Ibrahim, 2003). In other words, taxpayers will have to learn and understand the tax laws which have been labelled as complex especially for the ordinary taxpayers (McKerchar, 2001). Failure to comprehend the tax laws might lead to the difficulty in performing the required tasks. For instance, it was reported that in the first year of SAS implementation in Malaysia, majority of taxpayers failed to submit accurate tax returns[396]. The similar phenomenon was also reported in Japan when SAS was first implemented (Hajah Mustafa, 1998). As a matter of fact, the issue of whether taxpayers are able to perform their responsibilities has been a central debate among researchers (Jackson and Milliron, 1986; Marshall, Smith and Armstrong, 1997; Sakurai and Braithwaite, 2003). This is because the implementation of SAS requires a complete change in taxpayers' compliance obligations and mind sets.

However, regardless of its complication, SAS has introduced a shift of paradigm in terms of responsibility towards taxpayers' knowledge in regards to the accuracy of their tax returns. SAS introduces a new phase of tax responsibility by transferring the obligation of providing accurate information to taxpayers as the information reveal by them will be accepted as genuine and at

---

[396] Sources: www.thestar.com.my/news, 20 May 2005 (Friday)

face value by the tax authority. Under SAS, the tax returns submitted by taxpayers will be deemed as the notice of assessment stating the amount of tax liability. The notice of assessment was issued by the tax authority under the former system. With this shifting of responsibility, taxpayers are required to comprehend relevant knowledge embedded in the tax laws, rulings, regulations, guidelines and administrative procedures in order to fulfil the criteria for appropriate compliance under SAS, which manifested the correct computation of tax liability (Loo and Juan, 2005). This notion indicates that taxpayers face greater responsibilities under SAS as compared to that of under OAS which only requires taxpayers to declare their income and provide relevant supporting documents to the tax authority with regards to their income.

It has been opined that SAS demand time and effort from taxpayers in preparing their tax returns as it is subject to certain level of tax knowledge requires from the taxpayers (Alexander, 1974; James, 1994; Williams, 1999). In addition, information provided by taxpayers is assumed by the tax authority to be accurate and bona fide, hence added pressure for taxpayers in defining accuracy of information revealed. Nonetheless, to reduce the complication of the filing process, tax authority has arranged various programs to educate taxpayers in preparing themselves to carry out the assessment of their income. Taxpayers must be made understand of the sequential steps to compute their tax liability including determining the total income, identifying qualified deductions, understanding taxable income and calculating the tax payable (James, 1994). The sequential steps would be beneficial for taxpayers as it would help them to perform the tasks well and comply voluntarily with the tax laws. Further, it has been viewed that in order to achieve voluntary compliance, taxpayers need to be informed (Singh and Bhupalan, 2001). Apart from seeking knowledge, taxpayers are also required to keep proper documents and records besides understanding the content of the tax returns as a whole (Brand, 1996; O'Connor, 2001; Loo and Juan, 2005).

Many previous studies have addressed the issue of the level of taxpayers' knowledge. However, issue on what constitute tax knowledge for a lay taxpayers is still lacking in the literature. Barjoyai (1992) for instance, highlighted that the features of taxation has made the knowledge more difficult to be comprehended by non-tax background individual. Although taxation has been claimed to be universal, the territorial factors have made tax system diverse. This divergent is mainly due to the different tax application practices in different countries which make it very localized. Furthermore, the rapid change in tax laws has made the individual tax knowledge outdated and less useful. These limitations have made the tax knowledge ambiguous thus highlight the issue of the composition of necessary knowledge requires by taxpayers in order to keep them equipped and parallel with the latest development of tax updates. Hence, to fill up the existence of gap in this field, this paper examines the dimensions of tax knowledge needed by non-business taxpayers[397] in assessing their income according to the requirement of tax laws and SAS. The remainder of this paper is organized as follows: literatures cited to support the study, methodology used to collect data, findings, discussions, recommendation and conclusion of the study.

2.0   LITERATURE REVIEW

Taxpayers' Responsibilities

Under the former assessment system known as official assessment system (OAS), taxpayers are required to declare their incomes in the return form and submit the completed form to the Inland Revenue Board (IRB). The IRB on the other hand is responsible to raise the assessment of the income declared by taxpayers to determine the tax liability for each taxpayer. However, with the introduction of SAS, there is a switch of responsibilities between the taxpayers and IRB officers. Under the new system, the responsibilities of taxpayers have been broadened to include[398]:

---

[397] In the first year of SAS implementation on individual taxpayers in Malaysia i.e. year 2004, 86% of Malaysian taxpayers was individual taxpayers and 57% of the total was individual with non-business income (2004 IRB Annual Report).

[398] Source: http://www.netax.demon.co.uk/response.htm (March 16, 2005) and 2003 IRB Annual Report.

- Prepare own tax returns accurately including assessing own income to determine correct tax liability;

- Understand and follow all procedures defined by IRB which include complying to relevant provisions in the Income Tax Act 1967 (as amended) (ITA 1967);

- Inform the IRB of all their financial affairs;

- Interpret IRB schedules and forms;

- Getting their submissions right first time as the self-completed returns are deemed as the notice of assessment;

- Adhere to strict timetables and deadlines which include submitting the returns together with correct tax payment on the prescribed date i.e. 30 April each year or else will be subject to penalties; and

- Keep detailed records and documents pertaining to annual tax computation for the period of seven years.

With the new responsibilities placed on taxpayers, it is viewed that SAS emphasises and works on knowledge-oriented basis. Alexander (1974) listed the necessary aspects for taxpayers to perform their responsibilities which include the following:

- Mathematical accuracy;

- Familiarity of allowable exemptions and deduction;

- The format of tax return form;

- Simple tax laws and regulations; and

- Taxpayer assistance provided by tax authority.

Knowledge on the above-listed are necessary as the preparation of tax returns involves income assessment and computation of tax liability which is considered quite cumbersome (Alexander,

1974; James, 1983). Under the old assessment system, it is the tasks previously carried out by a well-trained person i.e. the Inland Revenue officers who possess the knowledge of an expert.

In Malaysian, the process of assessing income is specified under Section 5 of the ITA 1967. It involves various steps with four main calculations as follow:

      (i)   total income;

      (ii)   total allowable deductions i.e. personal relief;

      (iii)   chargeable income by subtracting (ii) from (i); and

      (iv)   tax payable.

In order to assist and facilitate taxpayers in interpreting the relevant provisions of ITA 1967 correctly, the IRB issues various Public Rulings. Public Ruling is a statement issued to inform the taxpayers of the acceptable manner to interpret certain provisions in the ITA 1967. Each Ruling consists of (i) the relevant tax law that is to be applied; (ii) the application of the Ruling; (ii) the correct manner to apply the law and (iv) interpretation of key words used in that particular Ruling.

It is therefore, in assessing their income, it is compulsory for taxpayers to refer and comply with the Public Rulings. In fact, they are required to acknowledge in the return form whether in completing the form they had complied with the relevant Public Rulings. This is to ensure that they have followed and understood the relevant Rulings governing their tax matters or else the form is considered as inaccurate. A penalty will be imposed if a taxpayer disregarded certain Public Ruling. However, it is not easy for ordinary taxpayers to fully understand the Rulings and

to keep themselves up to date with all the Public Rulings issued by the IRB (Veerinderjeet, 2005)[399].

In addition, taxpayers must keep proper records and documents in order to facilitate them to perform the income assessment tasks i.e. to complete their tax return form correctly. Each item appears in the tax return must be supported with a valid document. For instance, a valid receipt of payment is needed to support the deduction made for purchasing reading materials. The records and documents must be kept for seven years from the last date of each assessment year. They have to be produced upon request by the IRB such as during an enquiry in tax audit. In Australia, it was reported that the record-keeping requirement is the major cost for individuals in complying with their personal income tax obligations (Turner, Smith and Gurd, 1998).

Realizing the responsibilities under the new assessment system, taxpayers might need assistance from tax agents. Based on the Australian experience, taxpayers do need assistance from tax agents upon the implementation of SAS. It was reported that more than 70% of taxpayers placed heavy reliance on tax agents to handle their tax matters due to their inability to perform their duties themselves (Sakurai and Braithwaite, 2003; Marshall et. al., 1997). However, seeking assistance from tax agents denotes incurring extra compliance costs (Walpole, Evans, Ritchie and Tran-Nam, 1999; Sandford and Wallschutzky, 1994).

Although there is a small number of taxpayer might be willing to pay for the extra costs, majority of them reluctant to spend extra money as this will affect their financial standings. Empirically, studies by Hajah Mustafa (1997) and Loo and Juan (2005) found that more than 60% of employment income earners completed their own tax returns. This is certainly encouraging as the IRB emphasizes that under SAS, the Board will ensure that taxpayers are able to perform

---

[399] To date, IRB has issued 42 Public Rulings in relation to individual tax matters including 19 for non-business individuals.

the responsibilities themselves with minimum help from tax agents[400] in order to avoid burdening them with extra costs. However, in order to accomplish this objective, imparting knowledge to taxpayers is an essential effort. The question of which aspects of tax knowledge are necessary and must be made familiar to each taxpayer has to be of concern.

Tax Knowledge Definitions and Measures

Tax knowledge has been studied by various researchers in relation to tax compliance with various focus and interests. However, it is noted that different researchers employed different definition and measurement of tax knowledge, thus leading to the inconsistent findings. This is evidenced by the claim made in Richardson and Sawyer (2001) and Devos (2005) as they concluded that the main reason for mixed findings and the failure of previous studies to demonstrate an obvious effect of tax knowledge on taxpayer compliance was due to the measurement used in the studies. For instance, Song and Yarbrough's (1978) measured tax knowledge in terms of the extent of taxpayer's knowledge about fiscal and tax matters. Similar definition has also been used in Groenland and Veldhoven (1983). Specifically, they defined tax knowledge as the degree of general fiscal knowledge and knowledge concerning realistic possibilities to commit fiscal frauds. This measurement consisted of a number of questions regarding the structure of income tax and value-added tax apart from the amount of tax payable and deduction possibilities.

A different definition is used in the study by Cullis and Lewis (1985) as tax knowledge is assessed based on knowledge regarding sources of government revenue, preferences whether to increase taxes in order to improve services and whether the increase in taxes should be based on income or expenditure. This measurement of tax knowledge was specified within the economics perspectives.

---

[400] Annual Report 2001, Inland Revenue Board of Malaysia.

In the early 1990s, many researchers employ experimental method to examine the impact of tax knowledge. In this kind of study, tax knowledge is assessed based on the attendance to a formal tax class. For instance, White, Curatola and Samson (1990) and Christensen, Weihrich and Newman (1994) measured tax knowledge using attendance to the introductory federal income tax course for undergraduates in a few universities in the United States. In these studies, tax knowledge is referred to the knowledge of tax laws. It is measured by conducting pre-test and post-test to students attending introductory class in individual taxation.

Another study which also falls under this category is Eriksen and Fallan (1996). They used a questionnaire to measure tax knowledge of individuals before and after attending tax class. The questions were constructed based on two aspects i.e. deductible expenses and taxable income. Similarly, Hughes and Summers (2004) also followed the same method. Nevertheless, their tax knowledge measurement consists of 31 items which were divided into nine different groups according to Adam Smith's Canon of Taxation (1776). Subjects were asked to response to each statement on a one to five Likert scale where one indicates 'strongly agree', three indicates 'neutral' and five indicates 'strongly disagree'.

In Malaysia, the first attempt to measure tax knowledge is reported in Barjoyai (1992). There were two different sets of tax knowledge measured in the study i.e. perceived and actual knowledge in taxation. The first set measuring perceived knowledge used a series of perception questions about the necessary basic rules and regulations on taxation to calculate tax liability. The second set of measurement was a tax quiz to test taxpayer's actual understanding of rules and regulations on taxable receipt and allowable expenses. These two aspects tested in Barjoyai (1992) were similar to those tested in Eriksen and Fallan (1996) however the method of

testing is different. The former used quiz questions while the latter employed Likert-type perception statements.

Another study that examined tax knowledge of individual taxpayers in Malaysia was the study by Hajah Mustafa (1997). In his study taxpayer is considered to possess the necessary knowledge in taxation if he/she understands the tax laws and able to compute tax payable. However, one of the limitations acknowledged by the researcher was concerning the measurement of tax knowledge. It was noted that the knowledge variable was not operationalised to the fullest extent and it was not captured as a separate variable in the study. Rather, it was measured as part of the other variables under study such as perception towards tax fairness, tax administrative system and tax law complexity.

Apart from Hajah Mustafa (1997), there was another study on tax knowledge by Kasipillai (1997) which adapted a measurement introduced by Price (1992) to measure taxpayer understanding and knowledge in taxation. Price's measurement was designed to assess knowledge on basic tax responsibilities in filing and paying federal income taxes of taxpayers in Texas, United States. The measurement consisted of 20 test items with seven multiple-choice and 13 true and false questions. Kasipillai's (1997) measurement assessed the understanding and knowledge of Malaysian income tax laws focusing on taxable income, allowable deductions, tax rebates and tax administrative aspects. It contained 26 items of multiple-choice and true false questions.

Another study on tax knowledge in Malaysia was carried out by Palil (2005). He measured knowledge using 33 statements regarding general income tax administration, business income, employment income, dividend and interest income, personal relief and rebates. Respondents were asked to choose 'Yes' if the statement was correct and 'No' if it was incorrect or the respondents could choose 'Do not know' if they were uncertain of whether the statement is

correct or incorrect. Each correct response was given one mark and zero for incorrect or 'do not know' response. The maximum mark was 33 which represent the maximum total score for the test.

Adding to the list, there was a study by Loo and Juan (2005) which measured tax knowledge of salaried and non-business income earners in Malaysia. The measurement consisted of statements on relief, rebates, tax credits, type of assessment, chargeability of income and exemptions. The respondents were required to indicate 'Yes', 'No' or 'Not sure' towards the particular statements. The study also measured knowledge on tax liability computation, chargeable income remitted to Malaysia and correct year to charge bonus income using scenario questions. The respondents were required to indicate 'Yes', 'No' or 'Not sure' for the first two scenario while for the last one, they were asked to state the correct year to charge bonus income.

There were also studies in Malaysia which employed experimental method. Similar to some overseas studies such as White et al. (1990) and Christensen et al. (1994), a study by Kasipillai, Aripin and Amran (2003) also used attendance to undergraduate tax class as a measure of tax knowledge. The similar approach of assessing individual tax knowledge has also been used in Loo (2006), however instead of using students who attended tax classes, Loo (2006) chose two groups of undergraduate students that had not studied any subject related to income tax and delivered special two-hour lectures pertaining to individual income tax. One group was given a lesson on income tax for non-business income earner while the other was given lesson on income tax for business income earner. The subjects were asked to fill in the tax return form including computing tax liability based on a given case. Tax knowledge was measured based on the score calculated on the answers to the case.

So, it is obvious that not many literatures discussed on the issue of what tax knowledge for a layman should be constituted. These divergent of definitions among the researchers lead to the difficulty in comparing the findings and as such would develop a mixture of what is known (Churchill, 1979). Realizing this deficiency, it is viewed that in order to ensure successful implementation of SAS, there is a need to establish a generally accepted tax knowledge measure for individual taxpayers. The measurement should consist of the necessary aspects of knowledge in taxation for ordinary taxpayers to assess their own income. This measurement will benefit not only the researchers but also the policy makers. It could be used for the purpose of developing and structuring education programs and providing relevant services to various groups of taxpayers depending on their level of knowledge. Besides, it can be used by researchers in their studies which will reduce ambiguity in comparisons of the findings.

3.0   METHODOLOGY

Necessary Aspects of Tax Knowledge

Knowledge of an individual could be measured using true-false and multiple choice questions (Fowler, 1995).   Nevertheless, in order to construct the measurement, it is necessary to determine the content of the measurement (Churchill, 1979; Nunnally, 1978; Kwok and Sharp, 1998).   This study proposed individual tax knowledge be measured in terms of the declarative knowledge aspect (Robert and Ashton, 2003).   According to Adaptive Control of Thought-Rational (ACT-R) theory (Anderson, 1993), declarative knowledge is referred to knowledge that can be recalled consciously such as facts, instructions, examples and concepts.   This notion is taken as the basis to identify composition of tax knowledge.

Different sources of information and literatures related to declarative aspect of tax knowledge were sought to determine the necessary aspects and to define the tax knowledge construct for individual taxpayer in Malaysia.   As the result of the literature search, 24 items have been found as necessary aspects for individual taxpayer to perform the assessment tasks as required under SAS (as listed on Appendix A).   Next, expert opinions were sought to confirm that the above items are necessary aspects of individual tax knowledge and to establish face validity[401].   A mail survey was carried out for this purpose.   The respondents consisted of the tax agents registered with the IRB and IRB officer in-charge of education programmes at all IRB branches throughout the country.   The selection of tax agents was made randomly from the list provided on the IRB website.

---

[401] According to Kwok and Sharp (1998), both content and face validity depend on subjective interpretations of the suitability of the items to the construct under study.   Content validity is established from the point of the researcher gathering knowledge from the literature while face validity from the expert grounded in practice.

However, before the questionnaires were mailed, a pilot test has been carried out by distributing the questionnaires to the academic staffs of Faculty of Accountancy, Universiti Utara Malaysia. This pilot test was carried out to assess the understandability and readability of the questionnaire besides assessing its reliability and validity criteria.

Reliability of an instrument refers to the extent to which a variable or a set of variables is consistent in what it is intended to measure (Hair, Black, Babin, Anderson and Tatham, 2006). There are several ways of assessing reliability of a scale. However, for the present study, reliability is assessed in terms of its internal consistency which refers to the degree of inter-correlation among items that measure the same concept (Hair et al., 2006). The internal consistency reliability of the scales is estimated by coefficient alpha or also known as Cronbach's alpha.

For the questionnaires distributed in the pilot study, the Cronbach's alpha value was 0.95 which indicated that there is a high level of consistency in the responses provided by respondents. According to the claimed made by Nunnaly (1978), the reliability coefficient of 0.70 and above is considered sufficient. Consequently, a factor analysis was utilized to check the validity of the scale. The analysis reveals that Bartlett test of sphericity was significant (Sig. = 0.000) and that the Kaiser-Meyer-Olkin measures of sampling adequacy was 0.76 indicated adequate measure of sampling as it was greater than 0.60 as suggested by Coakes and Steed (2001).

Eventually, 500 questionnaires were mailed with a postage-paid return envelope to randomly selected tax agents and the similar 34 questionnaires to IRB education officers at all branches throughout Malaysia. A covering letter with the University Utara Malaysia logo on the top of the page was also included at the front of every questionnaire explaining the purpose of the survey and the importance of the responses and guaranteed anonymity. The covering letter is also the

main chance of motivating the respondents to complete the questionnaire (De Vaus, 1993). The questionnaire was prepared in English and the translation in Bahasa Malaysia was also provided. Using a 5-point Likert scale, the respondents were asked to indicate how much they agree or disagree on each aspect that a non-business taxpayers must know in order to assess their own income. The scale ranged from 1 to 5 representing strongly disagree to strongly agree.

4.0   Findings

Of the total 534 mailed questionnaires, 43 were returned due to change of tax agents' addresses. One hundred and thirty-four questionnaires were received from respondents within two weeks of mailing period. A reminder card was sent to each respondent in the third week. Another seven questionnaires were received after the reminder providing a response rate of 29 percent. Two of the questionnaires were rejected due to two responses provided for one of the items listed, leaving a total of 139 usable responses.

Reliability and Validity Results

Consequently, the analysis of data was carried out on the usable questionnaires received. Similar to the analysis on pilot test data, the reliability of the measures was assessed using internal consistency indicated by a Cronbach's alpha value which is based on the average correlation of items within a test if the items are standardised (Coakes and Steed, 2001). This method is used as it is suitable in field studies because it requires only one administration of a single measuring instrument besides it is the most basic form of reliability estimation (Nunnally, 1978). The value of Cronbach's alpha for the items listed as necessary aspects of tax knowledge were 0.96. This value exceeds the Nunnally's (1978) guidelines which suggested that the minimum alpha value of 0.70 could be considered sufficient and consistent with the value obtained in the pilot test. The construct validity of the measures was later assessed using

factor analysis. The Bartlett's Test of Sphericity for the 24 items was significant (Sig. = 0.000) and measure of sampling adequacy with Kaiser-Meyer-Olkin (KMO) showed a value of 0.90 indicated that the appropriateness of the construct as "meritorious" (Hair *et al.*, 2006).

Descriptive Statistics

Table 1 below shows descriptive statistics for all 24 necessary aspects of tax knowledge. Mean for all items were positive with values above 3.00. Item with the highest standard deviation was 'the amount of relief' (1.52) while the lowest was 'types of assessment (i.e. joint or separate)' (1.01).

Table 1

Descriptive Statistics of Items (N= 139)

Item No.	Items	Mean	Standard Deviation	Minimum	Maximum
1	Tax return submission date	4.12	1.23	1	5
2	Due date to settle tax payment	3.91	1.33	1	5
3	Types of assessment (i.e. joint or separate)	4.22	1.01	1	5
4	Person chargeable to income tax	4.02	1.06	1	5
5	Types of income subjected to tax	4.07	1.08	1	5
6	Types of income exempted from tax	3.62	1.25	1	5
7	The amount of income exempted from tax	3.43	1.36	1	5
8	Meaning of income terms in taxation such as aggregate income, total income and chargeable income	3.51	1.25	1	5
9	The steps involve in computing tax payable	3.81	1.17	1	5
10	Assessment period for employment income	3.97	1.12	1	5
11	Types of employment income	3.93	1.06	1	5
12	Types and amount of allowable	3.31	1.35	1	5

donation and gifts

13	Types of relief	3.45	1.45	1	5
14	The amount of relief	3.29	1.52	1	5
15	Entitlement to relief	3.49	1.36	1	5
16	Types of individual tax rebates	3.39	1.34	1	5
17	The amount of tax rebates	3.33	1.33	1	5
18	Tax rates	3.21	1.45	1	5
19	Use of tax rate table	3.83	1.08	1	5
20	The length of period to keep proper record and documents	3.45	1.44	1	5
21	Types of record and document to keep	3.62	1.29	1	5
22	Relevant public rulings	3.18	1.36	1	5
23	Requirement to comply with the public rulings	3.17	1.42	1	5
24	Types of offences subjected to penalty	3.29	1.42	1	5

Factor Analysis

The next step was to run factor analysis on the item to identify the possible components for the 24 items in the measure. Table 2 presents the result of rotated component matrix in factor analysis. Similar to Md Idris and Ayob (2001), this study chose Principle Component Analysis (PCA) followed by a varimax rotation of all the items in the measures as it is an effective and widely accepted as a mean of exploring the interdependence among variables. As a result, four components that have Eigenvalue of 1 or more were attained. Each component that had an Eigenvalue of 1 or more is considered as significant (Hair et al., 2006) with component 1 has the highest Eigenvalue i.e. 13.15. The percentage of the total variance from these four components is 74% which is considered as satisfactory with the highest percentage of total variance also comes from component 1 which accounts for 54.81%. The guidelines provided in Hair et al. (2006) were applied for choosing the items for a component. Given the number of sample in the study, the guidelines suggested that the items in each component with rotated factor loadings of 0.45 or higher were considered as significant. Since each item have rotated factor loadings which fell under the specified category, all items were accepted and grouped under four components as shown in Table 2.

Table 2

Rotated Component Matrix[a] for Necessary Aspects of Tax Knowledge (N=139)

Items	Item No.	Components			
		1	2	3	4
Deductions & Tax Liability Computation (10 items)					
The amount of relief	14	.877			
Types of relief	13	.855			
Entitlement to relief	15	.819			
Types of individual tax rebates	16	.785			
Types and amount of donations and gifts	12	.782			
The amount of tax rebates	17	.778			
Tax rates	18	.724			
The amount of income exempted from tax	7	.695			
Types of income exempted from tax	6	.589			
Use of tax rate table	19	.535			
Income Assessment Principles (7 items)					
Assessment period for employment income	10		.854		
Types of assessment (i.e. joint or separate)	3		.810		
Types of employment income	11		.722		
Meaning of income terms in taxation such as					

aggregate income, total income and chargeable income	8	.690	
Person chargeable to income tax	4	.522	
The steps involve in computing tax payable	9	.502	
Types of income subjected to tax	5	.491	
Rulings, Record Keeping & Offences (5 items)			
Public rulings	22	.827	
Requirement to comply with the public rulings	23	.801	
Types of record and document to keep	21	.663	
The length of period to keep proper record and document	20	.606	
Types of offenses subjected to penalty	24	.600	
Due Dates (2 items)			
Tax return submission date	1		.780
Due date to settle tax payment	2		.755

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 6 iterations.
Eigenvalue of the components = 1 or more.

These four components represent the dimensions of tax knowledge required by non-business taxpayers in order to assess their income as required under SAS. By looking at the likely similar characteristics of the items under each dimension, the dimensions were named as deductions & tax liability computations, income assessment principles, rulings, record keeping & offences and due dates respectively. Deductions & Tax Liability Computation dimension has 10 items with the rotated factor loadings range from 0.53 to 0.88. Income Assessment Principles dimension (7 items) has rotated factor loadings that range from 0.49 to 0.85 while Rulings, Record Keeping & Offences (5 items) has rotated factor loadings from 0.60 to 0.82. The fourth dimension i.e. Due Dates (2 items) have rotated factor loadings of 0.75 to 0.78.

Further, the construct reliability of each dimension was assessed. However, before assessing the internal consistency of the measures, an item inter-correlation matrix was constructed to examine the extent to which some common trait was present in the items. If there is low inter-item correlations the associated items are likely to have been inappropriately selected (Nunnally, 1978 and Churchill, 1979). In this regards, Flynn, Schroeder and Sakakibara (1994) suggested that items having relatively low correlation i.e. ≤ 0.30 with other items have to be dropped from the measure. All inter-item correlations for each dimension of tax knowledge were above 0.40. The analysis also reveals that a considerable number of correlations exceed 0.30 which showed that the items were suitable for the instruments (Coakes and Steed, 2001).

Next, an internal consistency was assessed separately for each dimension of tax knowledge. The Cronbach's alpha values of the four dimensions were 0.95 (deductions & tax liability computations), 0.89 (income assessment principles), 0.92 (rulings, record keeping & offences) and 0.86 (due dates). The alpha value for each dimension shows that the reliability was adequate. Ang (2000) suggested that measures with high alpha value i.e. at least 0.80 and consistent item inter-correlations could be accepted without any modification. As the alpha

value for each dimension in tax knowledge measure is above 0.80 and the inter-correlations between items in the dimensions were consistent and above 0.40, the measure of tax knowledge was acceptable.

5.0   Discussions

The objective of this study is achieved as the results from factor analysis showed that there are four dimensions in individual tax knowledge. They are named as deductions & tax liability computation, income assessment principles, rulings, record keeping & offences and due dates. The names were allocated by observing the similar characteristics of items grouped in each respective dimension. The items in the dimensions represent the necessary knowledge that must be possessed by all taxpayers if they were to assess and calculate their own tax liability. Taxpayers must understand not only on the technical calculation aspect but also the basic concepts such as types of income subjected to tax, whether to assess income separately or joint with their spouse's income and the whole process of assessing income which involve various terms and concepts. In addition, taxpayers also need to be aware of tax laws and rulings that they must adhere to besides keeping sufficient documents and records as proofs of claims and deductions. It is also beneficial if taxpayers understand the different types of offences that they might be trapped into and the penalties that awaiting them.

The results also indicate that knowledge of taxation is multi-dimensional and it is complex in nature. However, by determining dimensions of tax knowledge may lead to a more practical and specific definition of the concept itself. Prior studies had not address this issue leaving the researchers to employ own definitions and use different measures of tax knowledge which eventually lead to inconsistent and incomparable findings (Devos, 2005; Richardson and Sawyer, 2001).

Contrary to the old assessment system, SAS assumes taxpayers to have sufficient knowledge to assess own income and compute correct tax liability. Since the beginning of SAS implementation, taxpayers were not given any option. Regardless of the level of their knowledge, they have to furnish correct tax returns and pay the correct amount of tax. Under such assessment system, it is necessary to educate taxpayers and ensure that they possess necessary knowledge to perform their duties. The results in this study demonstrate the necessary knowledge that must be possessed by all taxpayers. Indeed, it is believed that a general and well accepted measure of tax knowledge could be developed and used by tax authority in order to evaluate the level of tax knowledge among taxpayers. This could be done based on the dimensions of tax knowledge identified in this study.

6.0   Recommendation and Conclusion

Taxpayers' responsibilities have been drastically expanded with the introduction of SAS. For an ordinary taxpayer who has not received formal tax education, the new task will more or less places burden and requires time and efforts to ensure that it is well performed (Saad et al., 2003). In fact, taxation is complex and with the rapid change in tax provisions, it is not possible for taxpayers to comprehend fully all tax laws and regulations governing their tax matters. Hence, due to lack of knowledge in taxation, taxpayers may be exposing themselves to tax risk. This is because under SAS, tax authority will carry out tax audit to determine whether taxpayers had complied with the tax laws and regulations. Thus, any violate from the laws and regulations are regarded as non-compliance and will be penalised.

Even though tax knowledge is complex and become obsolete easily due to changes in tax provisions, nevertheless, it can be divided into less complex elements as reflected by the results in this study. Each aspect in the dimensions will form as the basic knowledge that must be made known and understood by all taxpayers. Later, any changes can be easily updated form time to time. This basic knowledge is also the basis for planning own tax matters i.e. legal ways

to minimise tax liability. Thus, this study may provide useful insight to policy makers or tax authorities. It has shown the basic knowledge in taxation that should be imparted to all taxpayers. In addition, taxpayers must be made aware that learning taxation is a continuous process because it needs to be updated regularly. Thus, better strategies have to be designed and implemented to inculcate tax knowledge based on the dimensions identified.

Appendix A

NECESSARY ASPECTS OF TAX KNOWLEDGE

- Tax return submission date.
- Due date to settle tax payment.
- Types of assessment (i.e. joint or separate).
- Person chargeable to income tax.
- Types of income subjected to tax.
- Types of income exempted from tax.
- The amount of income exempted from tax.
- Meaning of income terms in taxation such as aggregate income, total income and chargeable income.
- The steps involve in computing tax payable.
- Assessment period for employment income.
- Types of employment income.
- Types and amount of allowable donation and gifts.
- Types of relief.
- The amount of relief.
- Entitlement to relief.
- Types of individual tax rebates.
- The amount of tax rebates.
- Tax rates.
- Use of tax rate table.
- The length of period to keep proper record and document.

- Types of record and document to keep.
- Relevant public rulings.
- Requirement to comply with the public rulings.
- Types of offences subjected to penalty.

USING MATHEMATICS TO TEACH ACCOUNTING PRINCIPLES

Sony Warsono, Universitas Gadjah Mada
Arif Darmawan, Cherry Corner, Yogyakarta
Muhammad Arsyadi Ridha, Cherry Corner, Yogyakarta

ABSTRACT: As widely acknowledged, Luca Pacioli discussed accounting in his mathematics book *Summa de Arithmetica, Geometria, Proportioni et Proportionalita*. Using the perspective of mathematics, this paper shows that the majority of available accounting principles literature employs accounting equations positioning the elements of both assets and expenses in opposite accounting equations, rather than placing the two elements in the same side of the accounting equation. More than just offering consistent rationality, the use of mathematics rationality will make it much simpler to explain why the elements of assets and expenses should receive the same treatment in relation to debits and credits. Furthermore, this paper shows that the rules of debits and credits are entirely based on mathematical logics. Finally, this paper proposes the need for learning accounting from the perspective of mathematics, in addition to those of GAAP and engineering skills.

Keywords: Accounting education methods; definition of equity; expanded accounting equations; mathematics rationality; rules of debits and credits; mathematics-oriented study of accounting principles

INTRODUCTION

A large number of accounting software generate information which is reliable and relevant, comply with generally accepted accounting principles (GAAP), and fulfill the various needs for corporate financial information. The development of the accounting software must have involved many professionals other than accountants, including programmers who are used to mathematical thinking. These programmers are able to understand the workings of accounting even without having to study it in detail. Accordingly, there must be some methods which can be employed to teach accounting principles at college level to supplement the current teaching because the latter has been questioned in terms of its effectiveness due to some inappropriateness in the methods of learning accounting principles. This paper employs the perspective of mathematics in solving crucial issues which typically come to the surface in class discussions about accounting principles.

Discussions about accounting principles teaching methods are always appealing. The traditional teaching of accounting has been criticized in many countries (Duff and McKinstry 2007) because they are considered either too narrow procedural (Patten & Williams 1990; Nelson 1995) or unable to catch up with current development in business to the extent that students can hardly receive any perfect picture of the real business world (Adler 1999).

A number of experts have questioned the importance of teaching of debits and credits in classes of accounting principles because it is considered too mechanical, unintuitive, and forcing the student to rely on memory only (Ingram 1998), and susceptible of providing an incorrect picture about accounting to students who do not major in accounting (Pincus 1997; Diller-Hass 2004). Furthermore, the double-entry system in accounting has experienced a significant decrease in relevance with the advent of software which is capable of providing a variety of information without having to set up general ledgers (Elam 1995 in Pincus 1997). On the other hand, a number of other experts have tried to maintain the teaching of debits and credits in accounting principles because debits and credits are believed to be "part of the vocabulary in our language" (Wallace 1997, 230), and because debits and credits are an indispensable part in the learning process of accounting (Vangermeersch 1997).

A great number of experts have been discussing the need of changes in the teaching methods of accounting (Rankin et al. 2003; Hartnett et al. 2004). Albrecht and Sack (2000) stated that the study of accounting needs to be modified to catch up with changes in technology

and globalization. Saudagaran (1996) and Springer and Borthick (2004) noted that the traditional curriculum of accounting, which emphasizes memorizing skills, may actually hinder the student's effort to develop the requisite competencies in accounting, such as critical thinking. The AECC has suggested the needs for restructuring accounting principles through learning by using a user model instead of a preparer model (in Lee and Bisman 2006). The user model was perceived to be able to provide the student with a better understanding of the concept of accounting (Baldwin and Ingram 1991; Bernardi and Bean 1999). Other researchers suggested the use of information technology to improve the effectiveness of accounting study (Elliot, 1992; Pincus 1997; Mohamed and Lashine 2003; David et al. 2003; Goldwater and Fogarty 2007).

Even though the business has experienced dynamic changes, the study of accounting remains essentially the same (Albrecht and Sack 2000; Sangster, et al. 2007), passive (Bonner 1999; Boyce et al. 2001), procedural (Dempsey and Stegmann 2001), inadequate in equipping the student with the necessary competencies (Mohamed and Lashine 2003), and relying merely on a one-way direction of knowledge distribution (Williams 1993; Saunders and Christopher, 2003). This traditional learning of accounting makes accounting books look similar to one another (Sullivan and Benke 1997) which in turn make accounting less than appealing to the student. For the next ten years there will be a shortage of faculty members with Ph.D's (AACSB 2003). The shortage of American lecturers and doctorate students in accounting "already exists and may grow" (Plumlee et al. 2006, 113). Fogarty and Markarian (2007) indicate that there has been a decrease in the number of accounting lecturers – one that may escalate to a serious problem of sustainability for the discipline of accounting. Furthermore, there is an increasing number of students who decide to major in accounting after enrolling in a university (Nelson et al. 2008).

The Teaching and Curriculum Section of the American Accounting Association states that research into the history of accounting may provide a precious lesson to comprehend the discipline of accounting (in Sangster et al. 2007). In line with this idea, this paper employs the perspective of mathematics to discuss important topics in accounting principles. As widely acknowledged, Luca Pacioli is a university professor of mathematics who discusses accounting in his book *Summa de Arithmetica, Geometria, Proportioni et Proportionalita* (Sangster et al. 2007). Using the perspective of mathematics, this paper presents solutions which would make the goal of learning accounting attainable, that is, by introducing the student to the fact that accounting is in reality a much appealing knowledge that would encourage the student to try to find out more about it.

Actually, the mathematical perspective has been employed in a number of accounting books, but it is seldom mentioned explicitly, and sometimes it is used inconsistently. On the basis of some observations on the majority of literature on accounting principles, the present paper concludes that only a few books state with enough emphasis that accounting is one of the sciences that based on mathematics. This paper also concludes that the majority of available literature employs accounting equations positioning the elements of both assets and expenses in opposite accounting equations, rather than placing the two elements in the same side of the accounting equation, even though both equations are mathematically correct. Furthermore, this paper shows that the rules of debits and credits are entirely based on mathematical logics. Finally, this paper discusses the need for learning accounting from the perspective of mathematics, in addition to those of GAAP and engineering skills.

THE DEFINITION OF EQUITY

Accounting is based on the basic equation that assets equal to liabilities plus equity. Equity is a residual interest, namely the arithmetic difference between assets and liabilities (Alfredson et al. 2007). This definition of equity is intended to maintain a balance between the left side and the right side of the accounting equation. However, most books of accounting principles simplify the definition of equity as "owner's equity," which reflects the owner's claim

over the firm. The use of the term "owner's equity" narrows the real meaning of equity. In general, primarily at the formation of a firm, the element of equity is likely to be the owner's investment. Under certain circumstances, however, equity may come from grants, donations, or aids from the government or other outside parties which may not be categorized as owners. In other words, the use of the term "owner's equity" is very likely to raise a dilemma: that the balance in the accounting equation cannot always be attained due to the reception of grants, donations, or government aids which do not meet the criteria either liabilities or owner's equity. Of course accounting teachers have their own ready answers to this dilemma, but should they give any advanced answers to simple questions posed by accounting novices?

A number of textbooks provide an additional description of owner's equity as a residual value so that assets always equal the total amount of liabilities and owner's equity (Horngren et al. 2002; Williams et al. 2005; Anthony et al. 2007; Weygandt et al. 2008). FASB and IASB define equity or net assets as "the residual interest in the assets of an entity that remains after deducting all its liabilities" (FASB 1985, par. 49; IASB Technical Summary 2008). Thus, both standards emphasize that equity is merely a mathematical rule intended to maintain a balance in the accounting equation. Therefore, it is appropriate to use the terms equity, net assets, or residual interest of assets in the study of accounting principles, instead of the term "owner's equity" commonly used in accounting principles textbooks.

THE RATIONALITY OF ACCOUNTING EQUATIONS

Assets are resources under the firm's control, whose funds come from liabilities and equity (sources of funds). Accounting conveys the elements of revenues, expenses, and dividends in the accounting equation (called expanded accounting equation) because the firm conducts business and distributes dividends. The three elements are part of equity; revenues increase equity, while expenses and dividends decrease equity. That is the rationality of the accounting equation employed in most accounting textbooks. The rationality is primarily based on the balance-sheet approach so that other accounting variables (including revenues and expenses) are "considered secondary and derivative" (Dichev 2008, 454). The emphasis on the balance-sheet approach is "unclear" (Dichev 2008) and "requires revaluations that often are not trustworthy" (AAA's Financial Accounting Standards Committee 2007).

The basic accounting equation can be expressed as equation 1 (see Figure 1), and the expanded accounting equation can be expressed as equation 2 (see Figure 2).

Insert Figure 1 and Figure 2 here

Many textbooks employ the basic accounting equation (equation 1) to analyze transactions which result in changes in the element of revenues, expenses and dividends (Ainsworth et al. 2000; King et al. 2001; Porter and Norton 2001; Warren et al. 2002; Libby et al. 2004; Williams et al. 2005; Anthony et al. 2007). Several of these textbooks write down the expanded accounting equation (equation 2) in their books (Horngren et al. 2002; Weygandt et al. 2008).

Is there any rationality inappropriateness in the existing textbooks in their explanations of the accounting equation? Although the expanded accounting equation (equation 2) is mathematically correct, the rationality which applies to equation 1 is applied in an inconsistent manner to equation 2 because the elements of expenses and dividends are not sources of funds. In other words, the rationality employed to explain basic accounting equation is different from that employed to explain expanded accounting equation. Learning which employs different rationalities to explain two things which in essence are closely related is liable to confuse students.

Ingram (1998) employs equation 3 (see Figure 3) to simplify the understanding of the logics of debits and credits. However, it is hard to find textbooks which express accounting equation as expressed in equation 3 although mathematically equation 2 and equation 3 are both correct. Therefore, it is interesting to find the rationality of the accounting equation expressed in equation 3 because mathematically it is more proper to place elements with the same signs (positive or negative) on the same side. For the sake of simplicity, this paper calls the rationality of equation 3 as mathematical rationality, while this paper calls the rationality of equation 2 as conventional rationality.

Insert Figure 3 here

Subramanyam and Wild (2009) and Anthony et al. (2007) state that the basic accounting equation can be perceived as sources and uses of fund. Therefore, by using the mathematical rationality, the left side of equation 3 reflects the uses of fund, while the right side reflects the sources of fund. The company uses the funds to acquire assets, pay expenses and/or distribute dividends with funds taken from the sources of liabilities, equity, and/or revenues. This mathematical rationality can consistently explain both the basic accounting equation (equation 1) and the expanded accounting equation (equation 3).

Vangermeersch (1997) noted that revenues and expenses are separate elements, and not subdivisions of equity. Therefore, the placement of revenues, expenses, and dividends on the same side (equation 2) is a compulsion that runs the risk of confusing the student. Besides raising the problem of inconsistency in the rationality of accounting equation, two additional reasons make the use of equation 2 unacceptable. First, by definition equity is limited to a residual interest or net assets to the effect that there is no appropriate justification for an explanation as to why the element of revenues, expenses, and dividends should belong to equity. Secondly, the attachment of one element to the other may result in their being less than optimal. Analogizing the approaches of data management in the computer system, the database approach provides information which is more up-to-date, standardized, and easier to access than the application-oriented approach because the database approach separate data from their application software (Romney and Steinhart 2009).

More than just offering consistent rationality, the use of equation 3 will make it much simpler to explain why the elements of assets and expenses should receive the same treatment in relation to debits and credits even though by definition assets and expenses markedly differ from one another; assets represent sources which provide future benefit, while expenses represent a sacrifice of assets (FASB 1985). Moreover, the use of equation 1 or 2 forces the student to think twice when identifying changes in the accounts due to expense transactions and dividend transactions; the recognition of expenses (dividends) make expense (dividend) accounts increase, but must be recorded as a decrease because expenses (dividends) decrease equity. This is an unnecessary step and is liable to raise confusion to the student especially when he or she should identify accounts which must be debited or credited). Unlike equation 1 or 2, the use of equation 3 dispenses with this unnecessary step and minimizes confusion in the student's mind when identifying debit or credit accounts.

THE RULES OF DEBITS AND CREDITS

The rules of debits and credits have been much debated by experts. In their consideration, the mechanism of debits and credits does not make sense ("debits and credits are nothing more than pluses and minuses", Ingram 1998, 411), demands the student simply to memorize (Pincus 1997), is too narrowly procedural (Patten and Williams 1990; Nelson 1995),

and is liable to convey a mistaken picture about accounting to the student (Pincus 1997; Diller-Haas 2004). As far as we know, all accounting textbooks discuss these rules of debits and credits. A number of textbooks state that the rules of debits and credits are arbitrary (Anthony et al. 2007), a rule of thumb (Williams et al. 2007), or customs "like the custom of driving on the right-hand side…" (Weygant et al. 2008, 49). Other textbooks briefly describe these rules by providing mathematical illustrations expected to facilitate the student's understanding (Ainsworth et al. 2000). Nevertheless, the description ends up with an appeal that the student simply memorizes the rules (Walther 2009).

From the mathematical perspective, this debit and credit mechanism actually has an argument which is very clear and easily understandable to the student. In essence, this debit and credit mechanism represents a consequence of the accounting equation whose recording is reflected in the double-entry system.

Why should the asset accounts be debited when they increase and credited when they decrease? We can get an answer to that question by taking a close look at the following figures and its two illustrative cases.

Insert Figure 4 here

Figure 4 indicates the position of each element in the accounting equation: assets, expenses, and dividends on the left (debit) side of the equation, while liabilities, equity, and revenues on the right (credit) side.

Insert Figure 5 here

Case A (see Figure 5): Suppose Company A purchases supplies on account. This transaction engenders changes in the Supplies account and the Account payable account; both accounts increase. The Supplies account is recorded on the debit side, while the Account payable account is recorded on the credit side. This is in line with the position of each account in the accounting equation.

Insert Figure 6 here

Case B (see Figure 6): Suppose Company A purchases supplies in cash. This transaction engenders changes in the Supplies account and the Cash account; the Supplies account increases, while the Cash account decreases. In this case, both accounts are assets. To maintain internal consistency mathematically, the Supplies account must be debited because the supplies account is an element of assets; assets have positive values, and are on the left (debit) side of the accounting equation. Next, following mathematical rules, the Cash account must be credited because of a decrease in cash as a result of the transaction.

Insert Figure 7 here
Case C (see Figure 7): Suppose Company A converts its notes payable into bonds. This transaction engenders changes in the Notes payable account and the Bonds payable account; the Bonds payable account increases, while the Notes payable account decreases. In this case, both accounts are liabilities. To maintain internal consistency mathematically, the Bonds payable

The worksheet is viewed as the "connector" between accounting topics that are taught early in the semester and accounting topics taught later in the semester. As the connector, the worksheet helps develop the process of compiling financial statements, which constitutes one of the most important topics in accounting.

The treatment of net income (or loss) in the worksheet reflects inconsistency in the application of mathematics. When the firm earns profits (net income), the amount of net income is recorded on the debit side of the Net Income column and on the credit side of the Balance Sheet column. This practice violates the mathematical rule which requires that the amount of any item should be recorded on the same side, be it debit or credit. Students who use mathematics to understand accounting may find it difficult to accept this inconsistency.

THE DEPRECIATION OF FIXED ASSETS

Depreciation is another important topic in accounting principles. There are some approaches that can be used in measuring the amount of depreciation expense per period. The use of these approaches can yield different amounts of depreciation expense.

The existence of a variety of methods for the measurement of depreciation expense indicates the flexibility that is inherent in accounting. This flexibility is made possible because accounting is affected by various considerations, such as economic considerations, legal considerations, and so on. The existence of a variety of depreciation methods reflects the accommodation of mathematical applications in accounting.

The following is a brief description of the common methods used in the measurement of depreciation expense. The methods are: the straight-line method, the units-of-production method, and the double-declining balance method.

The straight-line method allocates the cost of an asset on the basis of the passage of time. The amount of depreciation expense per period is constant. The formula for the straight-line method is as follows:

The units-of-production method allocates the cost of an asset on the basis of the productivity of the asset. The amount of depreciation expense per period varies in accordance with the productivity of the asset.

One way among many that can be employed to dispense with this inconsistency is the use of a 12-column worksheet, consisting of a 10-column worksheet plus 2 columns for closing entries. In addition to its usefulness to dispense with the inconsistency of the 10-column worksheet, the 12-column worksheet is also useful for the study of accounting. Firstly, the provision of the 2 columns for the closing entries indicates that closing entries are among the important activities in accounting (without which the balance of nominal accounts would be carried to the next period). Secondly, the 12-column worksheet engenders the Income Summary account, which comes out due to the existence of the closing entries. This Income Summary account is important to show the firm's profit or loss. Thirdly, the 12-column worksheet conveys the up-to-date balance of the retained earnings account so that the Balance sheet column in the worksheet helps a lot in compiling the financial statements (see Table 2).

Insert Table 2 here

MATHEMATICS-ORIENTED STUDY OF ACCOUNTING PRINCIPLES

There are still many important topics about the accounting principles that can be explained mathematically. Our experience indicates that when told that the primary working of accounting is based on mathematics, the student can understand accounting topics more easily, including adjusting entries –whose debits and credits have often become an object of complaint on the part of the students (Pincus 1997) – and the crucial problem of closing entries.

Accounting is a tool to attain a particular aim (Ingram 1998). In other words, accounting should be treated like technology. As a technology, accounting can be made analogous to aircrafts, computers, or any other technological products. Those technologies are developed systematically, logically, and on the basis of sciences whose validity has been so well established that they are capable of growing even further and giving a vast contribution to the humankind.

We argue that the development of accounting is affected by three interrelated pillars:

a. Mathematics; this pillar should be firmly founded upon which accounting may grow.

b. Generally accepted accounting principles (GAAP); this pillar serves to ensure that the

   development of accounting could be well understood and accepted by the users.

c. Engineering skills; this pillar provides a space for the user for developing the kind of

   accounting that is most suitable to his wants and needs.

The development of accounting should be done through the development of the three pillars mentioned above.

The tremendous growth of the business world has likewise increased the complexities of accounting and financial reporting. Up to now the development of accounting (GAAP) regulations has been intensively done with the hope that such a development may provide the necessary solutions to existing problems. Nevertheless, "we cannot expect regulation to completely protect investors" (Scott 2009, 15). Therefore, it is expected that a development that gives preeminence to the mathematical pillar would enable accounting to give a significant contribution to mankind.

The addition of the revenues and expenses elements would make accounting study dynamic (Vangermeersch 1997). By using the mathematical perspective, it is expected that accounting study would be more dynamic and capable of inviting the student to develop

accounting knowledge, rather than to be content with understanding accounting simply as a rule of play established by the business game. The use of the mathematical perspective can also be an initial step toward the development of new models of determining monetary values in financial statements, which up to now have been considered within the competence of other fields.

CONCLUSION

Historically, accounting was based on mathematical knowledge as codified in Luca Pacioli's book of mathematics. Using the mathematical perspective, the present paper reviews several basic issues in textbooks of accounting principles commonly employed so far, and presents a rationality based on clear arguments over the rules of debits and credits. By designing a mathematics-oriented learning, it is expected that the study of accounting principles would be dynamic and capable of developing the capacities for inquiry, abstract logical thinking, and critical analysis (AECC 1990).

The development of the mathematical pillar in accounting would enable it to develop faster rather than remaining just a tool to provide information as it essentially is right now. As a result, the way is open wide for the addition of the elements of accounting equations as well as new accounting topics developed mathematically.

FAMILY SUCCESSION AND PERFORMANCE AMONG MALAYSIAN COMPANIES

Noor Afza Amran & Ayoib Che Ahmad
Universiti Utara Malaysia

ABSTRACT

Family succession is one of the prevalent topics discussed in family management. However, there is lack of research on the issue of succession in Malaysia despite the fact that about 70% of listed companies in Malaysia are owned by family related business. Thus, this study aims to examine the relationship between family succession attributes and firm performance. This study adopted balanced panel data analysis for 975 companies listed on Bursa Malaysia for the year 2003 to 2007. The findings indicate that some of the family succession attributes do influence firm performance. Family ownership was found to be positively related with firm performance. Families are motivated to work efficiently when more shares were in their hands. Furthermore, the results reveal that successors-managed firms have better firm performance than founder-managed firms. The findings provide evidenced that Malaysian family firms do plan for their successions. More importantly, it opens up the possibilities for further study of family succession, both in Malaysia and on global basis.

1.0 INTRODUCTION

One of the most prevalent topics in the family business management literature is succession planning (Chua, Chrisman & Sharma, 2003). Succession planning should be initiated at a very early in the offspring's life (Davis, 1968; Stavrou, 1999). A proper succession process affords family firms the opportunity to select effective leaders who are capable of rejuvenating their firms (Ward, 1987). But it is a difficult tasks to accomplish. Usually, founders either fail or refuse to plan for the succession of the family business (Danco, 1982; Ward, 1987). It is also difficult to find a competent family member who is willing to take over the control of the family firm, or the offspring of family managers may be reluctant to join the firm (Blotnick, 1984).

Other reasons that contribute to failure in succession are that founder's reluctance to plan for succession, founder's strong sense of attachment to the firm (Kets de Vries, 1993), fear of retirement and death, lack of other interests by the offspring (Levinson, 1971; Stavrou, 1999), offspring life stage (Ward, 1987), gender and birth order (Goldberg & Wooldridge, 1993), the offspring competency, involvement in the family firm (Davis, 1968) and personality traits (Goldberg & Wooldridge, 1993).

Moreover weaning children to take over the wheel of a firm has become a lot more challenging. There will be a tough challenge for family firms seeking to pass the torch to their children in the future (Gabriel, 2007). For instance, the Khind Holdings Bhd Group Chief Executive Officer (CEO) Cheng Ping Keat, who is the son of the company founder, also

admitted that keeping a family business alive is the toughest management job on earth (Damodaran, 2006).

There is a Chinese saying that claimed "wealth does not endure three generations". Whether the statement is a coincidence or not, many Asian family firms tend to suffer from this phenomena (Ngui, 2002). Wong (1985) argued that a Chinese family firm could seldom last longer than three generations because of the offspring would take their propensity for granted and lack of motivation to sustain the firm. For examples, Tan Chong Motor Holdings Bhd and the Hong Leong Group were firms that faced this kind of conflicts in their second generations. In Tan Chong case, the two Tan brothers (Tan Sri Tan Yuet Foh and Datuk Tan Kim Hor) have established the Tan Chong Bhd in 1958. Later the conflicts started when Datuk Tan Heng Chew, the eldest son of Yuet Foh, openly clashed with his uncle and cousins in a legal tussle in the Malaysian courts. As a result, family wealth had been divided. Tan Heng Chew was awarded 16.7% stake in Tan Chong Consolidated Sdn Bhd (TCCS), the private holding company for Tan Chong Motor Holdings Bhd. His uncle and family patriarch Datuk Tan Kim Hor was given a smaller 10.29% stake. However, Heng Chew's brothers, cousins and mothers were also shareholders of TCCS. Heng Chew was also the chairman of two listed firms within the group: APM Automotive Holdings Bhd and Warisan TC Holdings Bhd. The court judgement strengthen Heng Chew's position at the expense of the other family member (Datuk Tan Kim Hor).

Many of the third-generation in the West has also evolved into managerial corporations. But among Asian families, total professional management in a family company is rare. Nevertheless, the move towards hiring professionals into the family firms is gaining popularity. Therefore, Malaysian family firms have started considering bringing professionals in managing the family firms. For example, Lee Kong Chian, who founded Lee Rubber-OCBC Bank Holdings Ltd, was one of the first family patriarchs to incorporate professional managers in their family firm. That was way back in the 1940s and 1950s. Today, a largely professional team runs the OCBC Bank with little influence by the Lee family, although family members still sit on the board. Another case is that of Public Bank Bhd which is controlled by Tan Sri Teh Hong Piow. The bank is now professionally managed by Teh and his team of managers. Although Public Bank is seen as Teh's creation, but none of his children hold significant positions within the group. Thus, based on the above discussion, are Malaysian family companies ready for succession planning? Does family succession affect the firm performance?

Thus, the issue of family succession has motivated the researchers to carry out this study. In Malaysia, a study by Shamsir Jasani Grant Thornton (2002) has briefly

discussed on succession planning. However, the study only provides a brief review on the current practice of family succession descriptively without analyzing the impact of the succession planning and other important business issue such as business financial performance. Hence, this factor has enthusiastically motivates the researchers to carry out this study.

The objective of this study is to examine the family succession attributes with firm performance for family firms. This study aims to find out the answers whether there is any association between firm performance and succession attributes.

In term of the contribution, this study is expected to increase the level of understanding with regards to family business firms especially in Malaysia. Particularly, this study uses sample of Malaysian public listed firms and the findings may be useful to Malaysian family businesses and the comparison can be made with family firms in other countries. Next, there is a lack of study carried out on family succession in Malaysia and elsewhere. Therefore the findings may explain the current situation on succession planning in Malaysia. It can also provide signals and guidance to the owners of family firms on the readiness of succession planning in Malaysia.

In term of the organization of this paper, it is structured as follows. In the introduction section, an overview on family successions is discussed. This is followed by the discussion on the motivation, objective and contribution of the study. The next part discusses the theoretical framework and hypothesis developments. Then research methodology is then explained in the next section. Followed by a section on results and discussions. The last section concludes and provides the implications of the study on academic and practice.

2.0 THEORETICAL AND HYPOTHESES DEVELOPMENT

2.1 FAMILY SUCCESSION

Family firms need to plan ahead in making sure the family firms will sustain for next generations. In planning for succession, factors such as family ownership, hiring professional manager or family director, successor's education level, founder/successor's age and gender need to be considered in ensuring a successful family business succession.

Family ownership

Based on the agency theory, family ownership is claimed to be efficient in minimising agency

problems because shares are in the hands of agents who have special relations with other

decision agents that allow agency problems to be controlled without separation of the

management and control decisions. Further, family members have many dimensions of

exchange with one another over a long horizon, and therefore, have advantages in monitoring

and disciplining the agents (Fama & Jensen, 1983).

In family firms, ownership is concentrated in the hands of family firms, therefore the risk of free riding is likely to diminish (Shleifer & Vishny, 1997). Jensen and Meckling (1976) and Fama and Jensen (1983) supported that a family's involvement in ownership and management could shun the problem of possible exploitative behaviour of the agent towards the principal, and minimise the supervision costs. While Gorriz and Fumas (1996) evidenced that agency costs are minimized when shares are concentrated in a few owners and these owners do all the decision process.

According to stewardship theory, ownership and control concentration is one of the factors that influence the effects of family relationships in family firms. Indeed, this variable helps explain the motivation for members to act as stewards of the firm versus their propensity to act destructively (Corbetta & Salvato, 2004). Researchers believed that family ownership do motivate directors to work in line with firm's objectives, thus maximise the shareholder wealth. Family directors are also able to avoid the exploitative behaviour of the agent. Therefore, family ownership may influence firm performance in a positive way. Thus, we hypothesize that:

H_1: Ceteris paribus, family directors that hold higher percentage of share ownership encourage higher firm performance than family directors with lower percentage of share ownership.

Owner or Professional Manager

Studies have found that family-owned and managed firms reach higher performance than those that are professionally managed (Monsen, Chiu, & Cooley, 1968; Daily & Dollinger, 1992). Previous studies also showed that the agency costs are significantly higher when professionals manage the firms (Ang et al., 2000). Nevertheless, professional directors play an important role in the family firms (Ibrahim et al., 2001). The professionals may have particular knowledge of the firm that may be proved to be valuable in mentoring of future-generation leaders, or filling in the leadership role (Lee et al., 2003). In larger firms, professionals have been found to play a critical role in strategic decision-making in family firms (Chua et al., 2003). Studies by Lauterbach and Vaninsky (1999) in Israel and Chittoor and Das (2007) in India found that management succession to a professional manager has a positive impact on the performance. Based on the above literatures, there were mixed results although the majority of studies showed that family managers outperform professional managers. Hence, this study hypothesizes that:

H_2: Ceteris paribus, family firm that is managed by family CEO has higher firm performance than family firm managed by professional manager.

Successor Education

Education background of the CEO that manages the company is also vital in ensuring the survival of the family firms. Today, the trend for enhancing successor education level has changed. Future prospective successors have been sent abroad by their parents for education. Successors also are opting for college in addition of working with someone else. In the past, families CEOs were found to posses fewer academic credentials (Brockhaus & Nord, 1979). Instead, the informal training received by children within the family may be a substitute to formal managerial training received through educational institutions (Lentz & Laband, 1990). Nowadays family firms need to give more attention to successor's education in ensuring the survival and growth of firms in the globalised world (Ibrahim & Ellis, 1994). Based on the above arguments, researchers expected that education to play a vital role in the family firm survival. Family firms need to have successors that are well educated, knowledgeable and well-equipped with current business situations. Then only the family firms can sustain in this competitive business atmosphere. Therefore, we hypothesize that:

> H_3: Ceteris paribus, successor with higher education level enhance firms' performance than successor with lower education level.

Founder/Successor Age

Brockmann and Simmonds (1997) argued that managerial success is positively correlated with age. It is argeud that when the manager is older in age, thus the chances of firm's managerial success is higher as compared to younger manager. This may also be due to the level of experience that the manager's possess. Older executives also tend to be more risk averse than younger executives (Carlsson & Karlsson, 1970). According to Smith and Amoako-Adu (1999) in Canada, the stock market reacts negatively to the appointment of young family successors. This reaction showed that due to successor's young age, investors seem to have less confidence and it also reflects a lack of management experience in the successors. Thus, age is also an important element in succession planning. Based on the arguments, it is hypothesize that:

> $H_{4:}$ Ceteris paribus, founder/successor that is more matured in age lead to higher firm performance than founder/successor that is young in age.

Gender

The successor's gender is also being a debated issue in family succession. Who shall be the next leader in the family firm? Most companies would prefer to select male compared to female successor. Alcorn (1982) suggested that family firms are similar to monarchies in which the eldest son becomes the uncontested successor. A study carried out by Kuratko (1993) in Korea found that for succession purposes, firms prefer a son to take over the firm. Kets de Vries (1996) observed that some family firms in the US still see the choice of a daughter as rather undesirable. In Chinese family business, male is also preferred more than female because the male successor will carry the family name. Moreover, male managers tend to be more competitive, have larger networks, more supportive, tough and able to faced competition. There is also a perception that male perform better than female. Moreover, male gets more supports from families such as from parents and wife.

Female successors, on the other hand are more nurturing, supportive in the work environment, do not focus on the financial performance as an important element for firm survival, but they are more likely to focus more on the primary objectives of the firm (Butner & Moore, 1997). Dumas (1989) and Hollander and Bukowitz (1990) suggested

that the father-daughter relationship is more harmonious and different in nature. Daughters willingly assumed the role of caretakers for both of the father and the business. They are less likely than sons to be in conflict with their fathers. A study by Fahed-Sreih and Djoundourian (2006) found that more than two-thirds of the Lebanese firms favor female CEOs in managing the family firms. The daughter-father relationship appears to be more mutually supportive and daughters appear to prepare more thoroughly than sons to take the control of the family business (Hartman, 1987). Nelton (1998) stated that daughters and wives are rising to leadership positions in family firms more frequently than in the past, and that the occurrence of daughters taking over businesses in traditionally male-dominated industries is increasing rapidly. Since the arguments about gender and performance are mixed, we hypothesize (in null form) that:

H_5: Ceteris paribus, there is no difference in performance between male and female successor.

Generations

Planning need to been made in ensuring that companies do have potential successors that can manage the firms for the next generation. Previous studies have claimed that family members often commit deeply to the mission of the firms, treasure its employees, stakeholders and feel motivated to do their best for the family and the organizational as a collective decision makers (Davis, Schoorman, Mayer & Tan, 2000; Miller & Le Breton-Miller, 2005). However, Morck and Yeung (2003) argued that the successor is likely to be less able to manage the firms when corporate control passes from the founder to the next generation. A study by Rodsutti and Makayathorn (2005) evidenced a strong influence of the founder when the firm was in the first generation, but not in later generation. Firm performance also increased when founding family members were involved in the management (Lee, 2006). McConaughy & Philips (1999) evidenced that the founder-controlled firms grow faster and invest more in capital assets and research and development. While the descendant-controlled firms generate more profit because of the experience of earlier generation. Therefore, based on the above arguments, researchers expected that later generation to have less impact on firm performance as compared to the founder generation. Moreover, in the later generations, family firms have already been established and there was plenty of capital. Thus, successors do not need to work hard from the scratch to create the image, reputation and market shares of the firms. With plenty of capitals and stable businesses, some successors may spend the business money excessively without proper planning. Therefore, we hypothesize that:

H_6: Ceteris paribus, founder (first generation) managed firm have higher firm performance than successor (later generation).

3.0   Research Method and Design

3.1   Sample Selection
This study utilised secondary data on the Malaysia public listed firms. The sample size used in this study were 975 Malaysian family firms listed on Main Board and Second

Board of Bursa Malaysia (excluding banking and finance, and insurance sectors)[402] over the period of 2003 to 2007. In determining the family firms, the data on family directors' profile, ownership, qualification, education level, age, gender, generation are obtained from the annual reports, company announcements and business magazines. All the data was hand collected. The financial data was gathered from the Thomson Financial Datastream Advance. A cross-checking is done with the annual reports to make sure the reliability of the data.

3.2 Research Model and Measurement

The research model is discussed as below.

$$Firm\ Performance_{it} = b_0 + FAMOWN_{it} + PROF_{it} + DIREDUC_{it} + DIRAGE_{it} + GENDER_{it} + GEN_{it} + DEBT + FAGE + FSIZE + v_i + e_{it}$$

Where:

FPERF	= Tobins Q
FAMOWN	= Family managerial ownership
PROF	= Professional non-family member
DIREDUC	= Successor education level
DIRAGE	= Founder/successor age
GENDER	= Successor gender
GEN	= Generation
DEBT	= Debt
FAGE	= Firm age
FSIZE	= Firm size
v_i	= Specific error
e_{it}	= Idiosyncratic error

3.3 Model Specification
Family firm was measured using dummy variable (0,1) to differentiate between family and non-family firm. The definition of family firm is in line with the previous studies (Villalonga & Amit, 2007; Anderson & Reeb, 2003). Family managerial ownership was measured using a continuous variable (percentage of direct and indirect shares). For succession variables, family manager/professional hired manager, successor education level, founder/successor age, successor gender and generations were measured using dummy (0,1) variables. The control variables were debt, firm age and firm size. Debt was defined as the book value of long-term debt divided by total assets. Firm age was defined as the number of years since incorporation. Firm size was measured as natural log of book value over total assets.

4.0 Results and Discussions
4.1 Univariate Tests

---

[402] The industry is regulated under The Banking and Financial Act (BAFIA), 1989. The BAFIA (1989) allow Financial Institutions (FIs) to make portfolio investments in non-financial business up to a maximum of 20% of a FIs shareholders' funds and up to 10% of the issued share capital of a company in which the investment is made. The FIs are not allowed to assume any management role to take up a board position (Chu & Cheah, 2004).

Table 1
Profile of the Sample Based on Sectors (n= 975)

	Frequency	%
Consumer products	195	20.0
Industrial products	325	33.3
Plantations	75	7.7
Trading services	120	12.3
Constructions	100	10.3
Infrastructure projects	5	.5
Technologies	20	2.1
Hotels	10	1.0
Properties	125	12.8
Total	**975**	**100.0**

Based on Table 1, 33.3% of family firms in Malaysia involved in industrial products. The second highest is the consumer products sector with 20% involvement. The next sectors are the properties (12.8%), trading services (12.3%), constructions (10.3%) and plantations (7.7%). Others sectors such as technologies, hotels, properties and infrastructure projects have seen a small involvement by the family firms.

Table 2
Descriptive Statistics for Variables (n= 975)

	Min	Max	Mean	SD
TOBINS Q	0.189	0.999	0.799	0.112
FAMOWN	.00	84.14	42.798	1 5.747
PROF	0	1	0.52	0.5
DIREDUC	0	1	0.56	0.496
DIRAGE	20	85	49.87	10.766
GENDER	0	1	0.96	0.194
GEN	0	2	1.28	0.461
DEBT	0	1	0.08	0.117
FSIZE	10.102	17.339	12.731	1.158
FAGE	0	53	7.79	9.536

Table 2 explains the mean for Tobins Q is 79.9%. ROA only show a smaller mean of 3.2% as compared to Tobins Q. For family ownership, the average shareholdings by family members are around 43%. Interestingly, about 24% of Malaysian family firms have started to hire professional managers in managing the family firms. This indicates that family firms have considered accepting ideas and outside manpower in making sure that family firms will sustain for the future years. In term of founder or successor age, the average age is about 50 years. In term of generations, most of Malaysian family firms are in the second generations and only few companies that are in third generations.

Table 3
T-test for the Hypotheses Variables (n=975)

GENDER	-.297
GEN	-2.558**

Note: For univariate analysis, FAMOWN is dischotomized by splitting the sample into high family ownership (.50%) and low family ownership (<50%). For DIRAGE, mature CEO is defined as those with the age of 40 years and above. Other variables are dummy variables.

Based on the t-test results, Table 3 reveals that there is a difference between family ownership and firm performance when Tobins Q was used as the performance indicator. Meanwhile other variables such as FAMOWN, PROF and GEN also shown a significant different with firm performance. The result shows that the higher the percentage of ownership owned by family managers, the higher the firm performance. This is because the interests of the managers are in line with the incentives that they deserved. Also, result shows that professional manager do enhance firm performance. However, this study found that Malaysian family firms do favour younger generations in managing the firm than the older generations. The young generations may be able to take higher risk, more creative, innovative and their ideas are in line with the current business environment.

F Stat (9, 771)		3.81
Prob > F		.0001

Table 4 reveals the results from this study using panel data regression approach. Interestingly, the results from this study do support hypotheses H_1, H_3 and H_4. However H_2, H_5 and H_6 were not supported. In this analysis, Tobins Q was used as a firm performance indicator. It was found that family ownership do positively relate with firm performance. This finding supported previous studies that family ownership minimized the agency costs in the firms positively affect firm performance. Moreover, family managers were stewards of the companies, so they worked seriously to maximise the shareholders wealth. Thus, the firm value was enhanced (Fama & Jensen, 1983; Shleifer & Vishny, 1997; Gorriz & Fumas, 1996; Corbetta & Salvato, 2004). Next, result also indicates that director's education is negatively related with firm performance. This finding contradicts with previous literatures. In term of successor age, it was found to be significant, but in the opposite direction. It shows that younger successors perform better than older. Perhaps, younger managers are more energetic and eager to show their potential to their family members and hence this increases the firm performance level. Young managers were claimed to be more aggressive as compared older owners (Carlsson & Karlsson, 1970). Control variables (debt, firm size and firm age) were found to be significantly related with firm performance. In term of debt, the higher the debt value, the higher the firm performance. Also, result found that older the firms operated in the business have higher firm value. But in term of the firm size, large firm do have lower firm value as compared to small firm size.

5.0 Conclusion

Overall, family ownership do positively affect the firm performance. It shows that ownership is one of the mechanisms that help increase family firms performance. Moreover, younger managers perform better. They are more energetic, visionary individuals and risk takers as compared to older managers. In term of the implication of this study, further studies can be research out on the topic of family succession because it is still new in Malaysian context. Clearly, Malaysian family businesses have started to plan for their succession in ensuring that firms sustain for next generations. Furthermore, standard setters and policy makers need to be aware that family firms do have certain characteristics (i.e. high familiness and family ties) that make them different from non-family firms. Thus, the implementations of rules and regulations need to consider these unique characteristics.

7.3 Social and Environmental Accounting

DETERMINANTS OF NON-REPORTING OF SOCIAL AND ENVIRONMENTAL INFORMATION BY MALAYSIAN COMPANIES: EMPIRICAL EVIDENCE FROM THE PERSPECTIVE OF PROPRIETARY AND INFORMATION COSTS
Noriah Che-Adam, Lian Kee Phua, Fauziah Md Taib

Abstract

This study attempts to identify factors influencing non-reporting of comprehensive social and environmental information in the annual reports of Malaysian listed companies from the perspective of proprietary costs and information costs. Several proxies for proprietary costs and information costs have been used in this study to investigate the factors influencing non-reporting of such information. It is found that profitability, capital intensity, size of company, leverage, concentrated ownership, trading volume and reliance on capital market have significant relationship with non-reporting of comprehensive social and environmental information. The result of this study reveals that the costs of disclosure and the benefits of disclosure from information costs saving influence the non-reporting of social and environmental information.

INTRODUCTION

Despite evidence of low level of social and environmental disclosure among Malaysian companies (see for example ACCA, 2004; Bursa Malaysia, 2008; Hasnah, Ishak & Sofri, 2007), very limited studies have attempted to examine factors influencing non-reporting of social and environmental information among the listed companies. To the contrary, most studies have instead focused on the practices of the minority group of companies by investigating factors motivating reporting of social and environmental information. Such phenomenon is partly resulted from influence of research findings reported by leading researchers in the developed nations. Nevertheless, it is critical to understand that the level of social and environmental reporting is very high among developed nations (Aerts, Cormier & Magnan, 2006; Cormier & Magnan, 2003; KPMG & University of Amsterdam, 2005), hence, it provides a good avenue to understand such practices in greater depth. Much research, however, concluded that reporting of social and environmental information in Malaysia is still at infancy stage.

It is undeniable that social and environmental problems have emerged to be a major global issue. Such information is even more critical and highly relevant among developing countries following their aggressive development plans to transform into developed nations. In view of the low level of social and environmental disclosure among developing countries, it creates an urgent need to address the issues of non-reporting of social and environmental information among companies in these countries. Some of the policies makers have clearly indicated their concerns over such matters. For instance, Malaysian government has expressed deep concerns over the issues of sustainable development following a number of environmental problems caused by industrial activities such as dumping of toxic, ecological damage, river pollution, air pollution and landslides. As an attempt to encourage Malaysian companies to report social and environmental information, the Ministry of Science, Technology and Environmental has launched the Environmental Reporting Guidelines for Malaysian companies that were published by the ACCA in 2003 and Sustainability Guidelines in 2004 as an incentive for corporations to start their social and environmental reporting.

Recent study by Noriah, Phua and Fauziah (2009) found that 61 percent of Malaysian main board companies do not report their social and environmental information in a separate statement of their annual reports. This indicated that even majority of big size companies did not show their interest or concern about environmental and social reporting which can contribute to sustainable development for future generations. Given that social and environmental reporting has captured considerable attention worldwide in view of the importance of such activities on long run sustainability of resources and well

being of society, it is thus of interest to understand why majority of Malaysian companies is not providing comprehensive social and environmental reporting. This study examines the determinants of non-reporting of social and environmental information in annual reports by Malaysian companies. Specifically, this study attempts to fill the research gap by investigating whether the non-reporting of comprehensive social and environmental information is associated with the proprietary costs and information costs.

This study analyses the content of 368 annual reports of Malaysian companies for the financial year 2006 to investigate the status of non-reporting of social and environmental information in a separate section of their annual reports. Then, this study examines the variables measuring proprietary costs (e.g. profitability, capital intensity, size of company and leverage) and information costs (e.g. systematic risk, foreign ownership, concentrated ownership, trading volume and reliance on capital market) and investigates their relationship with non-reporting of social and environmental information.

This study found that companies with lower profitability, lower assets, lower capital intensity, higher leverage, lower trading volume, higher concentrated ownership and less reliance on capital market are more likely not to report their social and environmental information comprehensively in their annual reports. Thus, the result of the study provides empirical evidence that the non-reporting of social and environmental information is associated with the costs and benefits of disclosure.

This paper is organized as follows: Section two discusses the previous studies and development of the hypotheses. Section three explains the research design. Section

four presents the findings of this study. The last section is discussion and conclusion of the study.

PRIOR STUDIES AND HYPOTHESIS DEVELOPMENT

The proprietary costs theory suggests that existence of proprietary costs will motivate managers to withhold certain information (Verrecchia, 1983). According to Soffer (1998), in situation where legitimacy gap does not exist, the disclosure of social and environmental information involves higher costs and it will thus lead to non-disclosure of such information. Similarly, Foster (1986) indicates that the cost of disclosure, such as collecting, processing, litigation, political and competitive disadvantage cost, is one of the important factors that company's managers consider whether or not to disclose more information. Further, he argues that the cost of collecting and processing the information would be significant if a company never disclose such information in prior years. Similarly Li, Richardson and Thornton (1997) suggest that a company's decision to disclose or not social and environmental information is influenced by the cost of disclosure.

Although society perceived that non-disclosure of social and environmental information indicated that the management of companies are not efficient (Diamond, 1985), however, managers are reluctant to disclose such information when greater direct costs in terms of gathering and distribution of social and environmental report incurred (Leuz & Wysocki, 2006). Furthermore, Leuz and Wysocki (2006) also argue that the amount of time managers spend to prepare a report is a significant opportunity costs for them especially for small companies.

In addition, a company will also incur additional cost which is referred to as proprietary costs or competitive disadvantage costs when their stakeholders such as competitors, suppliers, customers, labour group and regulator use their reporting information for their personal benefit which can give a negative impact to the reporting company (Leuz & Wysocky, 2006). For instance, the above parties can use the information disclosed by companies to reassess their contractual relationship with the company which in turn may reduce the company's cash flow (Cormier & Magnan, 1999). Social and environmental information such as environmental liability, ecological activity, energy saving program, community involvement, human capital training are proprietary information because they are not easy to produce and the disclosure of such information may be used by their stakeholders for their own benefit which can give a negative effect to a company's share price and debt agreement (Cormier & Gordon, 2001).

Earlier study by Gray and Roberts (1989) found that competitive disadvantage and the cost of preparation of information are the major constraint of voluntary reporting among multinational companies. Later, Edwards and Smith (1996) through a questionnaire survey and in-depth interviews with financial directors of companies found that their concerns about competitive disadvantage ranked second among reasons given for deciding not to disclose more voluntary segmental information. The manager of companies perceived that their reported information will be observed by their competitors and customers and then use this information in a way that may harm the firm's prospects. Similarly, a study by Prencipe (2004) confirmed that proprietary costs reduce the motivation of companies to disclose more information about their segment. She argues that voluntary information is difficult to generate, thus the reporting of this

information will benefit their competitors. Moreover, study by O'Dwyer (2002) found that managers perceived that the cost of social and environmental disclosure is high, therefore, they only report minimal information. The extent of collection and proprietary costs depend on the profitability of companies, size of companies, capital intensity and leverage (Cormier & Magnan, 1999; Cormier & Gordon, 2001).

Leuz (1999), Mohammad, Abdullah and Junaini (2007) and Robert (1992) reveal that proprietary costs are high for low profitability companies as reporting of social and environmental information could diminish the confidence of their stakeholders. Cormier and Magnan (1999) argue that the tendency of company's stakeholders to re-examine their contractual relationship with low profitability companies which reported their social and environmental activities is high because they perceive that these companies are not able to finance such extra activities. The companies' stakeholders may assume that companies suffering from bad financial condition will reduce the daily operation of the business and other potential investments in order to funding their social and environmental activities. Therefore, Cormier and Magnan (1999) indicate that low profitability companies are reluctant to report social and environmental information.

H1: There is a negative relationship between profitability of company and the non-reporting of social and environmental information.

Proprietary costs theory asserts that the disclosure of additional information can be used by their competitors for their own benefit such as replicating the innovative activities presented by companies (Prencipe, 2004). In a situation where the capital intensity of companies is high, they are motivated to report more information because the barrier of

entry is high (Darrough & Stoughton, 1990; Leuz, 1999). However, when the capital intensity of companies is low, the proprietary costs for the reporting company are high since the barrier to avoid the competitors to implement similar activities decreased. Therefore, a company with low capital intensity is not motivated to report social and environmental information.

H2: There is a negative relationship between capital intensity of company and the non-reporting of social and environmental information.

Leuz (1999) and Mohammad et al. (2007) state that the costs of collecting, processing and disseminating information are small for big companies due to a large number of fixed components. Similarly, proprietary costs are found to be small in large companies compared to the benefits of disclosure, therefore they are motivated to report additional information (Craswell & Taylor, 1992). Jensen and Meckling (1976) point out that the existence of political costs such as additional regulations, increased tax and social commitment limit the reporting of social and environmental information. Therefore, no additional disclosure will be made by a small company because the costs of preparation and proprietary costs for a small company are high.

H3: There is a negative relationship between the size of company and the non-reporting of social and environmental information.

According to proprietary costs theory, the competitive disadvantage costs in highly leveraged companies are significant; therefore they will not report additional information (Cormier & Gordon, 2001). They argue that the reporting of social and environmental information especially environmental liability and commitment expose the area of a company's risk. Hence, if the reporting company has a high leverage, the proprietary

costs is increased as existing lenders may revise their debt contract or potential lenders may be reluctant to finance the company's project, thus non-reporting of additional information will increase. Cormier and Magnan (2003) argue that for low leveraged company, the proprietary costs are not significant compared to the benefits from disclosure of additional information; therefore they will disclose more additional information. Hence, in such situation, non-reporting of additional information is low.

H4: There is a positive relationship between leverage of company and the non-reporting of social and environmental information.

Several authors have emphasized that the disclosure of social and environmental information will provide a lot of benefits such as increasing the company's profitability (Balabanis. Phillips & Lyall, 1998; Robins, 2005), decreasing the cost of capital (Richardson & Welker, 2001), decreasing operating costs, attracting and maintaining good employees, increase customer loyalty, increasing corporate image, strengthening their relationship with stakeholders and increasing the company's value (ACCA, 2005; Fraser, 2005). However, most companies still refuse to disclose additional information because they perceived that social and environmental reporting will not give a lot of advantages to their companies (Nik Nazli & Nor Liana, 2003).

One of the benefits of public disclosure is a reduction in the costs of information collection by individual investors, which in turn increases the liquidity of the market, raises the current stock price and reduces the cost of capital (Botoson, 1997). Therefore, in situation where numerous investors privately collect the information, the companies are motivated to disclose voluntary information to save information cost (Cormier &

Magnan, 1999). On the other hand, he reveals that companies will not disclose additional information if less investors collect the information themselves since there is no potential costs savings.

The reporting of social and environmental information is a strategy used by companies if they perceived that the disclosure of information can benefit them in terms of increasing their legitimacy and managing risk (Khor, 2005). Previous studies by O'Dwyer (2002) and Perry and Sheng (1999) found that social and environmental information disclosure by companies is based on their perception about the benefit from the disclosure. Specifically, they found that companies are reluctant to disclose more information if they perceived that the disclosure cannot improve the relationship with their stakeholder. Azlan (2005) also found that the management of a company is very selective and only disclose the information about social and environment which can give economic benefits to them. The reporting of social and environmental information by companies can also benefit them through the reduction in the information collection cost of individual investors, hence increasing the share price and reduce the cost of capital (Diamond & Verrecchia, 1991). According to Diamond (1985), the information cost savings are equivalent to the sum of the production costs by individual investors. He indicates that the companies will not disclose voluntary information if only a small number of investors need the information since there is no possible cost savings. The extent of information cost saving depends on the company's risk, ownership structure, trading volume and reliance on capital market.

Balabanis et al. (1998) indicate that market performances of the companies are considered stable if their systematic risks are low; therefore it is easy for investors to access the value of the firm. Consequently, no additional information will be collected by individual investors. In this circumstance, Scott (1994) argues that companies will not report voluntary information because no information costs saving will be gained by a reporting company. Moreover, the reporting of additional information can only increase the proprietary costs (Cormier & Magnan, 1999).

H5: There is a negative relationship between systematic risk and the non-reporting of social and environmental information.

The existence of a large proportion of equity ownership by foreign investors in developing countries is due to the increase demand for capital to finance their business operations (Gillan & Starks, 2003). Foreign investors will collect more information about social and environmental activities because they are more concern with sustainability issues. Therefore, the disclosure of such information by companies can decrease the cost of collection by individual foreign investors, thus will provide benefits to the reporting company (Cormier & Magnan, 1999). In contrast, if the proportion of foreign investors in the companies is low, not much information about social and environmental information will be generated by this type of investors. Therefore the companies are not motivated to report such information since the benefits of disclosure from information costs saving is low compared to the proprietary cost incurred (Scott, 1994).

H6: There is a negative relationship between foreign ownership and the non-reporting of social and environmental information.

In closely-held ownership structure, major investors acquire information directly from companies since most of them are executives or sit in the board of directors of those companies (Leuz, 1999). In concentrated ownership, only limited shareholders will obtain benefits from public disclosure, hence the information cost saving is minimal (Aerts et al., 2006; Cormier & Magnan, 1999; Leuz, 1999) and the proprietary cost is high (Scott, 1994). Similarly, Diamond (1985) indicates that the welfare improvement and risk sharing from the public disclosure will not evolve if the investors only incurred a low cost to acquire the information. Therefore, closely-held companies are reluctant to report additional information including social and environmental activities (Cormier & Magnan, 1999).

H7: There is a positive relationship between concentrated ownership and the non-reporting of social and environmental information.

One of the indicators for liquidity of company's share is based on the number of trading volume (Leuz, 1999). Higher trading volume specifies that a company is followed by substantial shareholders, thus more information will be produced by individual investors (Cormier & Magnan, 1999). Since individual collection of information is costly, the release of public information by companies will benefit them in term of reducing the information costs (Leuz, 1999; Scott, 1994). On the other hand, in a situation where trading volume is low, not much information will be generated by individual investors, hence non-reporting of social and environmental information will be adopted by companies because the benefits of disclosure is less than the cost of disclosure.

H8: There is a negative relationship between trading volume and the non-reporting of social and environmental information.

Botoson (1997) and Leuz and Wysocki (2006) reveal that companies which rely on capital market will report more voluntary information to satisfy the demand of capital market participants, it will in turn increase the price of the share and reduce the cost of capital. In the absence of additional disclosure, market participants will presume the worst condition regarding such companies, as a result, corporate image of these companies may drop (Cormier & Gordon, 2001). Cormier and Magnan (1999) specify that the benefit of disclosure outweighs the costs in this situation. Alternatively, non-disclosure of social and environmental information will be made by companies which are not too relying on capital market because the collection and proprietary costs are high compared to the benefit from the disclosure.

H9: There is a negative relationship between reliance on capital market and the non-reporting of social and environmental information.

METHODOLOGY

Identifying Non-reporting

Non-reporting of comprehensive social and environmental information is conceptualized as the non-reporting of voluntary information about environmental, human resources, community, product and energy in a separate heading or separate section or sustainability section in the annual report. According to Gray, Kouhy and Lavers (1995) the reporting of information about social and environmental activities in a separate section of an annual report or separate booklet exhibits the significance of that information. Besides, the reporting of such information in sustainability reports such as the sustainability section in the annual report or stand-alone sustainability report

indicates high commitment of companies in contributing to sustainable development (Commonwealth of Australia, 2005). Therefore, social and environmental information which is not presented in a separate heading or separate section or sustainability section of an annual report is considered as a non-reporting in this study since it has not really captured the company's commitment to sustainable development (Global Reporting Initiative (GRI), 2006).

Mandatory human resources information such as employee expense (salary, wages, bonus) (FRS 101), employee benefits (FRS 119 & 126), the number of employees (FRS 101) and employee share purchase option (ESOS) (FRS 2) are excluded from the definition of social and environmental disclosure as this study only focuses on voluntary information.

Non-reporting Model

Binary logistic regression was tested to examine the relationship between dependent and independent variables. This study proposed the following model:

$$NDISCL_i = \beta_0 + \beta_1 PROFIT + \beta_2 CAPITAL + \beta_3 SIZE + \beta_4 LEV + + \beta_5 RISK + \beta_6 FOREIGN + \beta_7 CONCENT + \beta_8 VOLUME + \beta_9 RELIANCE + e_i$$

Non-reporting of social and environmental information (NDISCL) which is the dependent variable is dichotomous and takes the value of either 1 (non-reporting) or 0 (reporting). The independent variables in the model consist of four proxies for proprietary costs and five proxies for information costs. The proprietary costs are proxied by profitability (ROA), capital intensity (CAPITAL), size of company (LNASSET) and leverage (LEVERAGE). Profitability is measured by return on assets (Freedman & Jaggi, 2005), capital Intensity is net property, plant and equipment divided by total assets (Leuz, 1999), size of

company is based on natural log of total assets (Hackston & Milne, 1996) and leverage is measured by total debt divided by total equity (Oyelere, Laswad & Fisher, 2003). The information costs are proxied by systematic risk (RISK), foreign ownership (FOREIGN), concentrated ownership (CONCENT), trading volume (VOLUME) and reliance on capital market (RELIANCE). Systematic risk is measured by time series least squares regression on monthly stock price (Botoson, 1997), foreign ownership is the percentage of ordinary shares held by foreign shareholders in the list of thirty largest shareholdings (Fauzias & Zunaidah, 2007), concentrated ownership is the percentage of ordinary shareholding of 5% or more (Yue-Duan et al. 2007), trading volume is measured by annual trading volume divided by total shares outstanding (Cormier & Magnan, 2003) and reliance on capital market is a dummy variable which takes the value of '1' if change in firm debt to equity ratio is more than 20% or '0' otherwise (Cormier & Magnan, 2003).

Data Collection and Sample Description

This study drew on all companies listed on the Main Board of Bursa Malaysia at the end of the year 2006. Year 2006 was chosen because this was the final year for which social and environmental reporting is voluntary. From year 2007 onwards, the Bursa Malaysia Listing Requirement requires all Malaysian public listed companies to report their social and environmental information (Bursa Malaysia, 2007). The total number of companies listed on the Main Board in year 2006 was 648 (Bursa Malaysia, 2006b). However, this study excluded those PN4 and PN17 companies due to their financial problems. The total number of PN4 and PN17 companies at the end of 2006 was 9 and 12 respectively. The companies' annual reports were downloaded from the Bursa Malaysia website. There were some companies whose annual

reports were not available; therefore this study excluded such companies from the analysis. Information about social and environmental activities, financial characteristics and ownership structure were gathered from annual reports and datastream. After excluding companies with missing data, the final sample consists of 368 companies.

The characteristics of the sample based on industry classification are displayed in Table 1. The table shows that the total number of non-reporting companies is 252 whereas the number of reporting companies is 116. The sample represents 57 percent of the Bursa Malaysia Main Board companies inclusive all industry types namely Industrial Product, Consumer Product, Trading/Service, Plantation, Technology, Construction, Finance, Properties, Hotel and Infrastructure. The table shows that Industrial Product represents the largest number of companies in the sample which is 89, followed by Properties (71), Trading/services (70) and Consumer product (49). There are three industries which the number of companies represented in the sample are low such as Hotel (4), Technology (4) and Infrastructure (6). Although the number of companies in these three sectors is small, however they represent 100 percent of Hotel sector, 25 percent of Technology sector and 67 percent of Infrastructure sector.

<center>(INSERT TABLE 1 HERE)</center>

EMPIRICAL RESULTS

Univariate Analysis

Table 2 gives the descriptive statistics of continuous independent variables included in the study, partitioned by non-reporting companies and reporting companies. Comparing

between non-reporting and reporting companies using t-test shows that non-reporting companies have lower return on assets, lower profit margin, lower total assets, lower total sales, lower foreign ownership, lower concentrated ownership and higher trading volume than reporting companies. With the exception of trading volume, the difference in means for the above variables is statistically significant at 1% level. On the other hand, the test statistics suggests that the mean difference for trading volume is only significant at 5% level. Comparatively, the mean values for return on assets, trading volume and concentrated ownership are almost identical between non-reporting and reporting companies. By contrast, the mean of foreign ownership for non-reporting companies is two times lower than reporting companies while the mean for profit margin in non-reporting companies is five times lower than reporting companies. As for total assets, the mean is ten times lower and for total sales the mean is nine times lower in non-reporting companies compared to reporting companies. Statistically, there is no significant difference between non-reporting and reporting companies, in terms of return on equity, reliance on capital market, leverage and systematic risk.

Table 3 reports the chi-square test for dichotomous variable which was performed to test the difference in reliance on capital market between two groups of companies. Result shows that there is no significant difference in reliance on capital market between non-reporting and reporting companies.

<center>(INSERT TABLE 2 AND TABLE 3 HERE)</center>

Multivariate Analysis

Table 4 presents the Pearson Correlations between the continuous independent variables. The results show that the explanatory variables which have significant correlations are between systematic risk and return on assets (-0.354), and between trading volume and concentrated ownership (-0.362). Return on assets which has a negative significant correlation with systematic risk shows that companies with high return on assets has a lower risk. In addition, trading volume which has a negative relationship with concentrated ownership indicates that the percentage of shares traded by company's decreases as the percentage of shareholders who own five percent or more shares increases. Other independent variables have the correlation coefficients less than 0.3. Further analysis using ordinary least squares regression shows that the variation inflation factors (VIF) are less than 10 and tolerance values are more than 0.10 indicating absence of multicollinearity problems among the independent variables.

(INSERT TABLE 4 HERE)

Table 5 depict the results of binary logistic regression. The results show that the full model containing all predictors was statistically significant with a strong explanatory power (χ^2 = 315.163; d.f = 9; p = 0.000) indicating that the model was able to distinguish between companies which do not report and companies which report social and environmental activities. The model as a whole explained between 57.5 percent (Cox and Snell R Square) and 80.8 percent (Nagelkerke R Squared) of the variance in non-reporting status. In addition, McFadden Pseudo-R^2 shows that 68.7 percent of the independent variables were able to explain the variance in non-reporting of social and environmental information.

The percentage accuracy of classification (PAC) for the model is 90.8 percent which shows an improvement from 68.5% before the inclusive of all independent variables. The model was able to correctly classify 94.4 percent of companies which do not report social and environmental activity and 82.8 percent companies which report social and environmental activities correctly predicted to report this activity.

<div align="center">(INSERT TABLE 5 HERE)</div>

Results from Table 5 reveals that profitability (ROA), capital intensity (CAPITAL), size of company (LNASSET), leverage (LEVERAGE), concentrated ownership (CONCENT), trading volume (VOLUME) and reliance on capital market (RELIANCE) are significantly associated with non-reporting of social and environmental information. ROA, LNASSET, LEVERAGE and CONCENT are significant at 1 percent level, whereas other independent variables (CAPITAL, VOLUME and RELIANCE) are only significant at 5 percent and 10 percent level. Only systematic risk (RISK) and foreign ownership (FOREIGN) are not associated with non-reporting of social and environmental information.

<div align="center">

DISCUSSION AND CONCLUSION

</div>

Profitability was found to be significantly and negatively related to the non-reporting of social and environmental information. The finding of this study suggests that when the profitability of companies is low, they are more likely not to report such information comprehensively in their annual reports. This result is expected because in the situation when companies do not make large profit, they are likely tend to hide certain activity

which is not related to their bottom line in order to reduce the proprietary costs. This result contradicts with previous studies carried out by Azlan (2005), Hackston and Milne (1996) and William (1999). Their studies which focused on the disclosure of social and environmental information found that profitability does not influence the level of corporate social responsibility disclosure. However, this study provides evidence that profitability is an important factor for non-reporting of this information by Malaysian companies.

Cormier and Magnan (1999) mentioned that conducting corporate social responsibility activities are not free and it involves a lot of money especially for environmental activity. Furthermore, companies are also trying to avoid investors from thinking that companies have used their limited fund to finance corporate social activities. Moreover, in poor financial condition, investors are likely to expect that companies will use their scarce resources to invest in other potential investment in order to increase future profitability. On the other hand, if companies report more social and environmental activities they will be questioned by their stakeholders on how they finance all those activities. Due to all these problems, shareholders and investors will have lack confidence to maintain their investment and this will cause reduction of companies' cash flow and increase of proprietary costs (Cormier & Gordon, 2001; Cormier & Magnan, 2003).   Although several authors and practitioners argue that corporate social responsibility can indirectly increase the profitability of companies in the long run (ACCA, 2005b; Robin (2005), however, in Malaysia, most of the stakeholders especially investors are only concern about the profitability of companies in the short run. Additionally, they tend to ignore about the responsibility of companies to contribute to the quality of life for future

2269

generations. As mentioned by Che Zuriana (2008) in her interview with the management of hotel industry in Malaysia, the main interest of Malaysian stakeholders is report of financial performance report rather than corporate social responsibility report. Therefore, the managements of companies are reluctant to report comprehensively their environmental management practices to their stakeholders.

Capital intensity was found to be significantly and negatively related to the non-reporting of social and environmental information. This result suggests that company which has low capital intensity is more likely not to report their social and environmental information in an annual report. The result clearly evidence that capital intensity is a vital determinant of non-reporting of such information. Aerts et al. (2006) and Leuz (1999) support the result in that they suggest that capital intensity is an important indicator which is considered by companies whether to report or not to report certain voluntary information. Capital intensity represents the amount of physical assets such as property, plant and equipment used by companies to run their operation in order to generate revenue. High capital intensity imposes entry barriers into certain industry (Street Authority, 2009). Therefore, companies with low capital intensity signify that there is absence of barrier of entry, this means new companies can easily establish their business and compete with those existing companies. Since social and environmental information are proprietary information which can be used by other companies for their own benefits such as to enter a market, hence, the incumbent companies are reluctant to provide additional information when their capital intensity is low. Under such circumstance, low capital intensity companies are motivated to withhold that information in order to protect their future benefits.

The logistic regression result indicates that size of company influences the non-reporting of social and environmental information. The coefficient is significantly negative which suggests that small size company is more likely not to report such information in a separate statement of an annual report. The result is consistent with previous empirical study, Hossain and Adam (1995) which reveals that the size of company is one of the significant reasons in explaining the reporting and non-reporting of voluntary information. Furthermore they argue that the costs of collection, publishing and competitive disadvantages are higher for smaller companies compared to larger companies, therefore smaller companies are not motivated to report such additional information. In addition, small companies are not relying comprehensively on capital market to finance their operations as compared to larger companies (Oyelere et al., 2003), therefore small companies are not motivated to report such information because the benefit of disclosure is less than the cost of disclosure. In contrast, Mohammed et al. (2007) argue that proprietary costs in larger companies are lower because they have minimal competitors and received a complete support from their various stakeholders. Therefore, larger companies are more motivated to report comprehensive social and environmental information in their annual report.

The result of logistic regression clearly explains that leverage is a significant indicator for non-reporting of social and environmental information. It seems to suggest that highly leverage companies are more likely not to report such information at length in their annual reports. This result reinforces the viewpoint proposed by proprietary costs theory that large amount of proprietary costs in high leverage companies resulted in higher

non-reporting of such information (Cormier & Gordon, 2001). As mentioned by Ahmed (1996), companies with large amount of borrowing will be scrutinized thoroughly by their financial providers in order to assess the ability of those companies for repayment of their loans. Rabelo and Vasconcelos (2002) also indicate that companies in developing countries mostly rely on debt to finance their business. Similarly, in Malaysia, banking institutions play a vital role in corporate financing (Thilainathan, 1999). Since the engagement of social and environmental activities involve certain amount of companies' fund, therefore banking institutions may speculate that highly leverage firms which shows a high commitment in such activities are not able to pay their debts. Furthermore, the reporting of environmental activities and obligations by companies will likely expose companies' weaknesses and problems. Proprietary costs will exist in situation where banking institutions are not confident with the financial condition of highly leverage companies and in turn they will reevaluate their debt contracts or refuse to provide additional financing to those companies. In this circumstance, the future cash flow of those companies will reduce and give a negative impact to their overall operations. Hence, non-reporting of social and environmental information is more likely to be a regular practice in a highly leverage firm.

Regression result does not provide evidence that systematic risk influence the non-reporting of social and environmental information. The result contradicts with proprietary costs theory which believes that the low risk companies are more likely not to report social and environmental information due to limited benefit as compared to the collection and proprietary costs (Cormier & Magnan, 1999). The insignificant result might be due to the preference of Malaysian investors which only look at accounting performance rather

than stock market performance to evaluate the companies' value. Moreover, Thilainathan (1999) reveals that Malaysian companies have lower risks or higher returns due to the nature of shareholdings in Malaysia which are concentrated ownership and also there is a constraint on competitions in Malaysian business environment. Descriptive statistics in Table 2 shows that the mean for systematic risk for non-reporting and reporting companies is only 1 percent. Realizing this circumstance, Malaysian companies are more likely not to depend on the risk in deciding whether or not to report their social and environmental activities.

Foreign ownership was found not to be significantly related to non-reporting of social and environmental information. This result suggests that foreign ownership does not act as an indicator of non-reporting practice. Hence, the result seems to imply that the role of international investors is not really functioning as argued by the literature in corporate governance (Fauzias & Zunaidah, 2007; Haniffa & Cooke, 2005; Yue-Duan et al., 2007). Although it is argued that low proportion of foreign ownership in local companies will lead to non-reporting of social and environmental information due to low benefit received by the companies as compared to proprietary cost incurred, this situation does not exist in Malaysia. The unexpected result can be explained by looking at the nature of foreign investors. In Malaysia, most of foreign investors are foreign institutional investors or fund managers (Thillainathan, 1999). Further he states that these types of foreign investors did not play their role to enhance corporate governance of companies, however, they are more interested to observe the performance of their invested companies through their own research or visit the companies personally. Therefore, it shows that public disclosure by companies in Malaysia is not the most important source of information

used by foreign owners to gather information about corporate social responsibility performance.

Concentrated ownership was found to be negatively related and contribute to the non-reporting of social and environmental information, however its direction is unexpected as this study anticipates a positive coefficient. The result of this study clearly implies that non-reporting of social and environmental information is more likely to occur in companies with low concentrated ownership whereas highly concentrated ownership companies are more likely to report this information. Therefore, it is not consistent with most of previous studies and proprietary costs theory which argue that companies with high concentrated ownership are reluctant to report social and environmental information because the benefits of disclosure through information costs saving is less than their costs (Aerts et al., 2006; Cormier & Magnan, 1999). The contradicting direction as reported by this study is believed to be influenced by the controlling power held by shareholders who owns large percentage of voting shares in those companies. Although the reporting of voluntary information can reduce the information costs in low concentrated ownership or dispersed ownership, however, individual shareholders in this type of ownership have less control over the companies' strategies including reporting policies and practices (Zeckhauser & Pound, 1990). Therefore, non-reporting of social and environmental information is more likely to be found in low concentrated ownership companies.

Ahunwan (2002) states that ownership concentration of developing countries corporations is high and Claessens, Djankov and Lang (2000) found that half of the East

Asian companies are family-controlled firms. Likewise, shareholding of Malaysian public listed companies is highly concentrated with family as a dominant shareholder (Thilainathan, 1999). Therefore, these family companies which is also known as owner-managers are so dominant and have the entrenchment power (Morck & Yeung, 2003) which can influence the companies' decision making. Specifically, Tsamenyi, Enninful-Adu & Onumah (2007) conclude that concentrated block ownership does affect the amount of voluntary item to be disclosed by companies. Hence, even though the benefit of reporting of additional information in highly concentrated ownership is argued to provide only minimal benefit in term of information costs saving since less investors generated the information from these companies (Leuz, 1999), however the increased reporting of such information may be due to lack of experience or expertise of their managers which are mostly appointed among their family members (Schulze, Lubatkin, Dina & Buchholtz, 2001; Hendry, 2002). This is consistent with recent study by Wan Nordin (2009) which found that family firm in Malaysia which their ownership is concentrated is less likely to withhold additional information.

Trading volume was found to be significantly and negatively related with non-reporting of social and environmental information. Based on the results, it shows that trading volume is an important element in determining the non-reporting of such information by Malaysian companies. Trading volume is one of the indicators of the liquidity of companies' share (Leuz, 1999). Companies with lower trading volume indicates that they are not followed by a large amount of investors which means that only limited investors will scrutinize additional information about these companies. Therefore, the benefits from information cost saving which will be received from reporting of voluntary

information is minimal compared to the cost incurred. Hence, low trading volume companies are more likely not to report their proprietary information about social and environmental activity in their annual reports.

The regression results shows that reliance on capital market is significantly influence the non-reporting of social and environmental information. However, its direction is contradicts with proprietary theory consideration which believes that companies which do not rely on capital market are more likely not to report this information. In rebuttal, the result of this study provides evidence that companies relying more on capital market to finance their activities are more unwilling to report their social and environmental activities comprehensively in the annual reports. Therefore, this result is not consistent with the finding of study by Cormier and Gordon (2001) and Cormier and Magnan (2003). One plausible explanation to the contradictory findings between this study and the proprietary costs theory are more likely to be due to the fact that corporate social responsibility is a new agenda to Malaysian business environment. Although reliance on capital market in Malaysia was on increasing trend (Thilainathan, 1999), however, Malaysian companies may believe that their financial market participants are not appreciating social and environmental activity as value added information. Moreover, they may assume that the reporting of this information especially environmental liabilities can only increase the companies' risk and in turn will reduce their future cash flow. Hence, in situation where their changes in debt to equity ratio are high, Malaysian companies are more likely to withhold that information.

As a conclusion, this study found that proprietary costs and information costs influence the non-reporting decision. This study provides evidence that profitability, size of company, leverage, capital intensity, concentrated ownership, trading volume and reliance on capital market have a significant relationship with non-reporting of social and environmental information. The disclosure of additional information involves costs such as collection, dissemination and proprietary costs. Therefore, when the benefit of disclosure is minimal, companies are reluctant to report social and environmental information comprehensively in the annual report. Hence, this study suggests that proprietary costs theory is appropriate in explaining the non-reporting of social and environmental information by Malaysian companies.

As this study employed various proxies, future study may extend the framework suggested in this study by using different dimensions of measurement for proprietary costs and information costs. Instead of using proxies, further research can develop a construct to measure these two costs.

ENVIRONMENTAL DISCLOSURE, CORPORATE CHARACTERISTICS, AND FIRM PERFORMANCE: EVIDENCE FROM THAILAND

Aim-orn Jaikengkit, Chulalongkorn University
Duangmanee Komaratat, Chulalongkorn University
Nopmanee Tepalagul, Boston University & Chulalongkorn University

ABSTRACT

Environmental reporting has become more popular internationally for many years. It can be either qualitative or quantitative and can be provided to readers as an integral of an annual report or via separate report in other media such as website and company newsletters. In Thailand, environmental reporting has received considerable attention since 1992. There are some standards, acts or guidelines which involve environmental disclosure for companies in Thailand. However, environmental disclosure in Thailand is still mostly voluntary.

This study explores voluntary environmental disclosures in annual reports of firms listed on the Stock Exchange of Thailand. It employs univariate and multivariate analyses in examining the relationship between environmental disclosures by Thai listed firms in 2006 and corporate financial and characteristic variables.

Consistent with previous research findings, the results suggest significant positive relationship between the disclosure and firm size. This indicates that large firms in Thailand tend to have utilized environmental disclosure than do small firms even after controlling for their systematic risk. Moreover, after controlling for systematic risk, firms that are more efficient in utilizing their assets are more likely to disclose environmental matters in their annual reports. However, the results also suggest that disclosing firms with higher capital intensity or growth opportunity tend to have lower firm performance than non-disclosing firms with the similar characteristics.

I. INTRODUCTION

Environmental matters have received considerable attention in Thailand, perhaps mainly due to several major conflicts occurred in power-generating and gas pipeline projects (Connelly and Limpaphayom, 2004) and public concern about natural resources, especially energy. However, environmental reporting is mostly voluntary for companies in Thailand.

There are some standards, acts or guidelines which involve environmental disclosure of firms in Thailand (see Table 4)[403] but those mainly have limited requirements. For example, National Environment Quality Promotion and Maintenance Act B.E.2535 requires the Environmental Impact Assessment (EIA) to be done and reported by organizations whose projects or businesses have impacts on environment. However, the EIA report is required only upon requests for permission or renewal and is restricted to projects with types and sizes as specified by the Ministry, for example, those involving more than 160,000 square meters of land. Companies that conform to ISO 14001 Standard[404] for environmental management system should also document their environmental control procedures. United Nations Conference on Trade and Development (UNCTAD) issued a manual which give guidelines on environmental performance indicators in order to standardize the presentation and disclosure of corporate environmental performance but the guidelines have not been made compulsory in Thailand. Thai Accounting Standard No. 53 (TAS 53) on provisions, contingent liabilities and contingent assets requires firms to disclose their material contingent liabilities and provisions in their financial statements. This may apply if firms have environmental liabilities or contingencies.

[Insert Table 1 here]

Due to voluntary nature of the environmental disclosure, the research on the matter has been very limited in Asian countries, including Thailand (Connelly and Limpaphayom, 2004;

---

[403] Drawing upon Gray et al (1995b).

[404] ISO 14001 is an internationally accepted specification for an EMS. It specifies requirements for establishing an environmental policy, determining environmental aspects and impacts of products/activities/services, planning environmental objectives and measurable targets (Capaccio Environmental Engineering, Inc, 2005)

Kuasirikun, 2005). This study intends to provide additional evidence on the environmental disclosure in Thailand by using listed companies as a sample. Although the first two mentioned act and standard require mandatory disclosures which could be used for the research, they are limited to companies under their scope. Moreover, environmental information disclosed in both cases mainly involves operational data which are not available to public. For the purpose of this research, the UNCTAD's and TAS 53's requirements are taken into account.

As there is currently no officially effective requirement for environmental disclosure for listed firms, environmental disclosures are scattered across various media, including annual report and separate environmental report. In this study, annual reports are employed since they are major reporting documents for listed companies in Thailand and available to general public.

The next section reviews some previous research primarily related to corporate environmental disclosure and financial performance and provide hypotheses. Section 3 provides information about methodology employed in this study, including specific details on sample and data analysis. Finally, Section 4 presents summary and analysis of the findings and compares the results to those of previous research in relevant areas. Results are then discussed and implications, limitations and recommendations for future study conclude the paper.

II. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

Literature Review

Previous research reported that there are many factors correlated with environmental disclosure. As summarized in Table 2, there are two major categories of factors; firm characteristics and firm performance. In environmental disclosure literature, firm characteristics are used either to distinguish between disclosing and non-disclosing firms or as control variables. Ullmann (1985) noted that demands for increased social performance probably are influenced by the size and the industry of the company. As for firm performance, the view and

evidence are mixed with regards to whether environmental disclosure relates to superior firm performance.

[Insert Table 2 here]

<u>Firm Characteristics</u>

Previous studies have suggested that larger firms tend to provide more social responsibility activities and/or information than smaller companies, probably due to their market dominance (Eilbert and Parket, 1973) or high magnitude of political cost (Watts and Zimmerman, 1978). In other words, less or insufficient social responsibility actions may not only bring about loss of good public image but also lead to potential legal and regulatory problems (Anderson and Frankle, 1980). Trotman and Bradley (1981) found that firm size, represented by total assets and total sales, is positively associated with social responsibility disclosure. Spicer (1978) also reports that size is positively related to the pollution control of firms in the pulp and paper industry. In addition, size is evidenced to have significant intermediating effect on the relationship between financial and environmental performance (King and Lenox, 2001; Mathur and Mathur, 2000). However, several studies such as Russo and Fouts (1997) and Connelly and Limpaphayom (2004) report that sizes are not significant control variables for such relationship.

In Russo and Fouts' (1997) study, they investigate the moderating effect of industry growth rate on the relationship between environmental and financial performance. They argue that firms in high growth industries are more concerned with establishment of reputation and may use 'green' strategies to secure their competitive advantage. The results of their study indicate that for firms in high-growth industries, the relationship between environmental performance and profitability is relatively stronger than for firms in lower-growth industries. Such findings also apply to individual firm growth. That is, the relationship between environmental performance and profitability is relatively stronger for high-growth firms.

Most environmental disclosure literatures did not place specific consideration on the relationship between the disclosure and leverage/debt ratio. However, Ullmann (1985) suggest that in low profitability and high debt situation, firms would tend to place emphasis on economic over social matters. This implies the negative relationship between leverage/debt ratio and environmental disclosure.

Trotman and Bradley (1981) reasoned that management of firms with high systematic risk[405] may perceive social responsibility disclosure as a means of reducing the risk. They found that the betas of socially-disclosing companies are found on average to be higher than the betas of non-disclosing companies. However, consistent with Alexander and Buchholz (1978), the results of their study indicate no significant relation between systematic risk and the amount of social responsibility information disclosed.

Environmental disclosure relates to the industry or the market segment of the firms. This can be reasonably expected since business operations of some industries have higher environmental impacts than others. Consider, for instance, firms in manufacturing sectors would bring about much higher water and air pollution as compared to firms in low environmentally-impacted in service sectors. To account for industry differences, previous environmental research mainly limits their samples to high environmentally-impact industries (Spicer, 1978) or uses industries or market segments as control variable (Connelly and Limpaphayom, 2004). Ingram (1978), among others, found that the information content of social responsibility disclosure, including environmental, is conditional upon the market segment of the firm.

Apart from aforementioned corporate characteristics, some research also indicates that country of the disclosing organization, age of business, and capital intensity are related to social responsibility reporting (Gray et al, 1995a). There have also been attempts in examining the relationship of environmental disclosure and financial performance using some other control

---

[405] Systematic risk (or non-diversifiable risk) can be defined as the risk of a security that is attributable to general market conditions. It is represented by a beta which is a measure of the responsiveness of a security's returns to movement in the return on the market portfolio. (Cuthbertson and Nitzsche, 2001)

variables including advertising intensity and asset turnover, but such control variables do not exhibit significant coefficients (Russo and Fouts, 1997; Connelly and Limpaphayom, 2004).

<u>Firm Performance</u>

There are two major opposing views on the relationship between environmental disclosure and firm performance. First, Porter and van der Linde (1995) argue that environmental regulations encourage innovations which can lead to improved efficiency of operations, for instance, by better utilization of materials in the manufacturing process. The Porter hypothesis, therefore, suggest the positive relationship between firm performance and corporate responsibility disclosure. On the other hand, other groups of researchers believe that activities which are not aimed towards profit maximization will adversely affect efficiency, especially in the short run (Simon et al, 1972; Connelly and Limpaphayom, 2004). For example, investments in environmental-friendly machine may influence short-term cash flows management and production efficiency of inexperienced labor. This contradictory view implies the negative association between firm performance and the disclosure.

The results of the studies on the directions of associations between firm performance and disclosure are also mixed (See Table 2). Such contradictory evidence may be contributed to their difference in definitions of financial variables (e.g. accounting versus market performance[406]), disclosure variables (e.g. environmental versus social reporting), periods, samples, or methodologies used. For example, Roberts (1992) uses lagged profits while the earlier studies which found no correlation employ profits of the same period (Abbott and Monsen, 1979; Cowen et al, 1987; Gray et al, 1995a).

---

[406] Connelly and Limpaphayom (2004) contend that accounting measures represent the short-term performance of the firm while the market measures indicate the long-term performance as perceived by investors. Previous researchers mainly used profitability (e.g. returns on assets, returns on equity) as a proxy for accounting performance while market performance is represented by a variety of measures such as Tobin's Q, expected returns, price/earnings ratio. (See Ullmann, 1985; Connelly and Limpaphayom, 2004; Spicer, 1978)

Apart from positive and negative correlation, several previous research also suggest non-linear between social disclosures and firm performance. For example, Stanwick and Stanwick (2000) found that in their sample, firms with medium accounting performance had the highest level of environmental policies. Connelly and Limpaphayom (2004) provide evidence that medium level of disclosure is associated with the best market performance.

Hypothesis development

Previous literatures discussed above have suggested that environmental disclosure is related to both corporate characteristics and performance. Hypotheses are developed and tested to provide additional evidence to existing literatures.

Firstly, the simple, univariate relationship between environmental disclosure variable and corporate characteristics performance is investigated. Similar to Trotman and Bradley (1981), the first hypothesis tests whether there is a difference in each firm characteristics or performance variable between firms which disclose environmental information and those which do not. The first alternative hypothesis is therefore:

H1: The distribution of each corporate characteristic or performance variable of the environmentally disclosing and non-disclosing companies is different.

Selected corporate variables include firm size, growth rate, leverage, capital intensity, accounting performance and market performance[407].

Next, this study tests which corporate characteristics or performance variables, from the first hypothesis, best differentiate environmental disclosing from non-disclosing firms. The second alternate hypothesis is stated below.

H2: Corporate characteristics and performance variables can be used to differentiate environmentally disclosing from non-disclosing companies.

---

[407] Variables are from the literature review as discussed earlier. We also examine capital intensity since it is the causal variable that relates to both industry and performance. As for industry and systematic risk, we intend to use them as control variables.

Lastly, following Connelly and Limpaphayom (2004), the relationship between environmental disclosure and corporate performance is specifically investigated. Firm characteristics are employed as control variables. The alternative hypothesis is as follow:

H3: There is a relationship between corporate performance and environmental disclosure, after controlling for corporate characteristics.

III. RESEARCH METHODOLOGIES

Population and Samples

The population covers all firms listed in the Stock Exchange of Thailand (SET) in the fiscal year 2006 which was the latest year for which annual reports were available. The samples for this study are firms which meet the following preliminary conditions:-

(a) The financial year ends in December[408].

(b) Annual report of the year 2006 must be available.

(c) Necessary accounting and market data items must be available.

(d) Financial firms are excluded.

(e) The companies are not in non-compliance or non-performing group during the period[409].

Furthermore, observations in the extreme 1% were removed. Those with negative or zero earnings per share or book value of equity would also cause trouble in calculating and/or interpreting ratios and were also removed.

Two samples are used in this research. The first sample (Sample A) includes all the firms that meet all of the above criteria. The second sample (Sample B) is a portfolio of matched-pair firms, primarily based upon firms' beta[410] and industry[411]. The above criteria result in the final

---

[408] In order to minimize effects that may arise from time differences.
[409] Financial ratios of these companies are mostly extreme cases or outliers.
[410] Based upon Anderson and Frankle (1980) and Gonedes et al (1976), the use of equivalent systematic risk portfolios assists in controlling for other firm characteristics relevant to the valuation of the sample firms.
[411] Prior research indicates that corporate financial ratios vary systematically with industry (Livingston and

samples of 234 and 86 firms for Sample A and Sample B, respectively. Table 6 summarizes the research samples for this study.

[Insert Table 3 here]

Data Collection

Environmental disclosure is extracted from corporate annual reports which are major reporting documents in Thailand. Moreover, annual report disclosure levels are found to be positively correlated with the amount of disclosure provided via other media (Lang and Lundholm 1993). Accounting variables are obtained from annual reports. Market variables are obtained from Compustat Global database.

Definitions of Variables

Environmental disclosure definition list is established based upon UNCTAD's environmental reporting framework for the annual report (UNCTAD Secretariat, 1997) and the disclosure index summarized in Razeed et al's (2004) paper with some modifications[412]. Firms disclosing any of the information in Table 7, Panel A are considered environmental-disclosing firms in this research[413]. The definitions of financial variables used in this study are summarized in Panel B. Firm industry variables are based on the Stock Exchange of Thailand's industry classification as of 2006, namely agro and food industry (AGRO), consumer product (CONSUMP), industrial (INDUS), property and construction (PROPCON), resource (RESOURC), service (SERVICE) and technology (TECH). The industry variables are dummy variables, i.e. each industry variable is assigned value of 1 if a firm is in the specified industry and assigned value of 0 otherwise). For example, for a company in resource industry, the RESOURC dummy variable is assigned value of 1 while the rest of industry dummies are

---

Henry, 1980). SET sector/industry classification is used to identify match-paired firms.
[412] The UNCTAD's manual on eco-efficiency indicators is used as general guideline.
[413] We did not use disclosure index because annual report is the only source employed in this study. Gamble et al (1995) found that the overall quality of the annual report's environmental disclosures was low. Less than 25 percent of environmental disclosures in their list were presented in the annual report.

assigned values of zero. Industry variables are mainly used as controlling variables. In the regressions, service industry is used as the reference category.

[Insert Table 4 here]

IV. EMPIRICAL RESULTS AND DISCUSSION

Table 5 shows descriptive statistics of the major variables used in this study.

[Insert Table 5 here]

Hypotheses' Results and Related Statistics

The first hypothesis tests the difference between environmentally disclosing and non-disclosing firms with regard to their characteristics and performance. The Wilcoxon test is employed to test the first hypothesis[414]. Table 6 presents a summary of the first hypothesis's results. Panel A illustrates the variable mean of environmentally disclosing versus non-disclosing firms and respective Wilcoxon statistics. Statistics includes those of pooled sample (Sample A) and beta-controlled sample (Sample B). Panel B further reports, based on the pooled sample, the summary results by industry.

[Insert Table 6 here]

Results from the pooled sample indicate that on average, the size of the disclosing company is larger than that of non-disclosing. This is in line with most previous studies that larger firms tend to disclose social responsibility issues, including environmental, than smaller firms (e.g. Trotman and Bradley, 1981). The remaining variables, for the pooled sample, are not found to be significantly associated with environmental disclosure. It is noteworthy, however, that on the industry basis, some variables do have significant relationship with the environmental disclosure. Consider, for example, the growth for the service firms for disclosing firms is relatively higher than the growth for those firms that are non-disclosing firms, consistent

---

[414] Nonparametric statistics are used since the distributions of most financial variables are generally non-normal.

with previous research (Russo and Fouts, 1997). The net profit margin of disclosing firms is relatively higher than the net profit margin of non-disclosing firms in industrial sector, indicating that environmentally-conscious firms may be able to control cost better or they could charge higher for their products. In addition, the capital intensities of technology firms which disclose environmental information are higher than those of non-disclosing firms, but only marginally. The results also show that price earnings ratio of non-disclosing firms is relatively higher than price earnings ratio of disclosing firms. It is probable that non-disclosing companies may have relatively lower earnings per share (low profitability) which leads to higher price/earnings ratio.

With regard to the equivalent-risk sample (Sample B), it can be observed that the significant relationship between environmental disclosure and firm size still exists. The results, therefore, suggest evidence that even after controlling for systematic risk and industry, size does matter in environmental disclosure behaviours of firms in Thailand. In accordance with Spicer (1978) and Trotman and Bradley (1981), Thai firms which disclose environmental information typically are larger than those which do not disclose.

The second hypothesis studies whether firm characteristics and performance can be used to classify firms into environmentally-disclosing and non-disclosing firms. Before testing the hypothesis, the correlations among variables are analysed. The correlations presented in Table 7 are mostly consistent with the results of the first hypothesis (i.e., Table 6, Panel A). Before controlling for other variables, only firm size exhibit significant associations with disclosure. However, such significant correlation become a little weaker when industry and beta are controlled (Sample B). This may be partly because most disclosing companies belong to industries of which size is relatively larger.

[Insert Table 7 here]

The binary logistic regression is used to test whether all the factors together can be used to differentiate environmentally-disclosing and non-disclosing firms. Firm value is dropped from the regression due to its multicollinearity with other variables. Price/Earnings ratio is the only

2295

market measure included in the model. The estimated model for the second hypothesis is as follows.

P (DISCLOSE) = $1/(1+e^{-W})$ *….(Model 1)*

Where:

$W = a_0 + a_1\ SIZE + a_2\ PROFIT + a_3\ PER + a_4\ LEV + a_5\ GROWTH + a_6\ CAPINT + a_k\ INDUSTRY + e_t$

Presented in Table 8 are the results of the above equation. Return on assets (ROA) is used as a measure of profitability (PROFIT). ROA is then decomposed into net profit margin (NPM) and asset turnover (ATO) for further analysis. We also provide results of the industry dummies which are used as control variables for reference.

[Insert Table 8 here]

From Table 8, the model chi-square is significantly different from zero (p <.05) for Sample A, but not Sample B, possibly because of small sample. The results from the logistic regressions are similar to those from the first hypothesis and the correlation analyses. Size is evidenced to be the best variable that can distinguish firms with environmental disclosure from those without. The results for Sample B suggest that after controlling for systematic risk, asset turnover ratio seems to better able to discriminate disclosing and non-disclosing firms. The positive coefficient suggests that firms with higher asset turnover are more likely to disclose environmental information in their annual reports. However, the rest of the explanatory variables do not exhibit significant coefficients. The significance of constant terms in both samples suggest that there might be any other possible explanatory variables which are omitted from the analysis.

The third hypothesis investigates the relationship between environmental disclosure and corporate performance, measured by market variables and accounting variables. Corporate characteristics are used as moderating variables[415]. To test this hypothesis, we examine the

---

[415] According to Capon, Farley and Hoenig (1990), seven causal variables most prevalent in previous research on performance were industry concentration, firm growth rate, firm size, capital intensity,

direct relationship between the disclosure variable and corporate performance, as well as the indirect relationship of the disclosure with corporate performance, via the interaction terms of the disclosure and corporate characteristics. The following equations are estimated for this hypothesis.

$Y = a_0 + a_1\ DISCLOSE + a_2\ SIZE + a_3\ PER + a_4\ LEV + a_5 GROWTH + a_6 CAPINT + a_k\ INDUSTRY + e_t$

….(Model 2)

$Y = a_0 + a_1\ DISCLOSE + a_2\ SIZE + a_3\ PER + a_4\ LEV + a_5\ GROWTH + a_6\ CAPINT$

$+ a_7\ DISCLOSE{*}SIZE + a_8\ DISCLOSE{*}PER + a_9\ DISCLOSE{*}LEV$

$+ a_{10}\ DISCLOSE{*}GROWTH + a_{11}\ DISCLOSE{*}CAPINT + a_k\ INDUSTRY + e_t$ *….(Model 3)*

Where Y = Market value of equity (VALUE) or profitability (PROFIT).

Table 9 presents the results of the above equations. The results of Model 2 and Model 3 are illustrated in Panel A and Panel B, respectively.

[Insert Table 9 here]

As can be seen from the coefficient of the disclosure variable in both panels, we are unable to reject the null hypothesis that environmental disclosure is unrelated to company performance, after controlling for corporate characteristics for the direct association. However in Panel B, the interaction terms between disclosure and capital intensity (DISCLOSE*CAPINT) has significantly negative coefficient for Sample A. This indicates that, for firms with similar capital intensity level, those disclosing environmental information would, on average, have lower market and accounting performance or stated differently, for the disclosing firms, higher capital intensity is associated with inferior firm performance. For Model 3.1 of which the dependent variable is market value of equity, this could mean that high-capital intensity firms that disclose environmental matters are, on average, penalized by the stock market. This could be because these firms have less profitability, as suggested by Model 3.2 and 3.3 which may result from the

research and development intensity, advertising intensity, and market share. However, we encountered lots of missing data for the last three aforementioned variables so they are not included.

higher depreciation of their assets. There is also evidence that the interaction terms of the disclosure and price/earnings ratio (DISCLOSE*PER), which proxies for growth opportunity, are negatively related to profitability but the results are weaker.

Discussion, Implication and Limitations

Previous research indicates that environmental disclosure is related to corporate characteristics and performance. This study is built upon prior literatures to examine the relationship between environmental reporting and firm size, profitability, growth, debt ratio, price/earnings ratio, capital intensity, and firm value of companies listed on the Stock Exchange of Thailand. Three hypotheses are formed and tested and the results as summarized in Table 10 are obtained.

[Insert Table 10 here]

Consistent results on strong relationship between environmental disclosure and firm size are obtained from testing Hypothesis 1 and 2. This indicates that, as previous research suggests, large firms in Thailand tend to have utilized environmental disclosure as a tool for retaining good corporate image in the public more than do small firms, even after controlling for systematic risk. There is also some evidence that, after controlling for systematic risk, firms that better utilize their assets (higher asset turnover) are more likely to include environmental disclosure in their annual reports. However, the tests on the relationship between environmental disclosure and corporate performance suggest that the disclosing firms with higher capital intensity or higher growth opportunity tend to have inferior corporate performance.

Several limitations should be noted for this study. The first limitation arises from data collection method because annual report is the only one source used. However, there are many other possible, perhaps better, mediums for environmental disclosure such as separate environmental reports, press release, public relations activities and product labels. Another limitation is about the sample used. This study does not involve all listed companies in Thailand due to unavailability of some specific data items and cover only a single period of 2006. Had

disclosure index or different sample been employed, the results might have been different. Inclusion of other control variables and non-linear tests, as suggested in prior research and different variable specification would have been useful to test robustness of results.

This research, to some extent, not only provides additional evidence on environmental disclosure of Thai listed companies but also highlights the environmental responsibility efforts of large companies, although at the expense of their financial performance.

Table 4 *Overview of important regulations, standards, guidelines which affect environmental disclosure in Thailand*

Regulations/Standards /Guidelines	Area of disclosure	Information to be disclosed	Where to be disclosed	When	Year
National Environment Quality Promotion and Maintenance Act B.E.2535 (by Department of Environmental Quality Promotion, Ministry of Natural Resources and Environment, Thailand)	Environmental Impact Assessment (EIA)	Impact of project or business on environment (project types and sizes as specified by the Ministry)	Report to National Environmental Committee	Upon requests for permission and renewal	1992 (B.E.2535)
ISO 14001 by International Organization for Standardization	Environmental Management System (EMS)	Environmental control procedures which cover controls over exceptions, monitoring and compliance reviews	Report to International Organization for Standardization	Upon request for certification and reassessment every 3 years	1996 (latest revision in 2004)
UNCTAD's manual for the preparers and users of eco-efficiency indicators	Environmental performance	Environmental performance indicators on water and energy use, global warming contribution, ozone depleting substances and waste	Supplementary to financial statement or as a separate report	Annual	2004 but not formally activated in Thailand
Thai Accounting Standard No. 53 Provisions, Contingent Liabilities and Contingent Assets (equivalent to International Accounting Standard No. 37)	Environmental contingent liabilities and provisions	Liabilities which are reasonably likely and material	Financial statement	As of balance sheet date	2005

Table 10 *Sample of Factors Correlating to Environmental Disclosure*

Factors	Direction of Associations	Sample of References
Firm Characteristics		
Firm Size	+	Spicer (1978)*, Trotman and Bradley (1981)
Growth Rate	+	Russo and Fouts (1997)*
Leverage/Debt Ratio	-	Ullmann (1985)
Systematic Risk	-	Spicer (1978)
Industry/Market Segment	N/A	Spicer (1978)*, Ingram (1978), Connelly and Limpaphayom (2004)
Firm Performance		
Accounting Performance	+	Spicer (1978), Ullmann (1985)
	U-Shaped	Stanwick and Stanwick (2000)
	0	Abbot and Monsen (1979), Cowen et al (1987), Connelly and Limpaphayom (2004)
Market Performance	+	Spicer (1978), Anderson and Frankle (1980), Clarkson et al (2004)
	-	Mathur and Mathur (2000), King and Lenox (2001)
	U-Shaped	Connelly and Limpaphayom (2004)

Note: * The study investigates the relationship of the factor and environmental performance.

Table 6 *Research Samples*

Total Net Income (Million Baht)	**467,369**	**165,176(35%)**	**45,639(10%)**

Notes to the table:
* Source: the Stock Exchange of Thailand
** Beta values which are employed to construct an equivalent-risk portfolio is the average of the weekly beta obtained from Bangkokbiznews daily newspaper in Thailand.

Table 7 *Definitions of Variables*

Panel A: **Scope of Definitions of Environmental Disclosure Variable**

Environmental-related information
Non-financial
Environmental awareness
Environmental goals or policies
Environmental stakeholders
Internal environmental divisions or department
Environmental Management System (EMS)
Compliance to the environmental regulations
Environmental audit
Environmental activities and progress
Environmental training provided to staff
Environmental awards
Environmental performance
Financial
Environmental investments or donations
Benefits derived from environmental management
Costs associated with environmental activities
Environmental fines and penalty
Environmental liabilities and contingencies
Environmental accounting policies

Panel B: **Definitions of Financial Variables**

Variables	Definitions
Accounting Measures	
Size (SIZE)	Log of book value of total assets as of 31/12/2006
Return on Assets (ROA)	Net income divided by average total assets
Return on Equity (ROE)	Net income divided by average shareholders' equity
Growth (GROWTH)	Percentage change in sales from 2005 to 2006
Leverage (LEV)	Total liabilities divided by total assets
Net Profit Margin (NPM)	Net income divided by sales
Asset Turnover (ATO)	Sales divided by average total assets
Capital Intensity (CAPINT)	Average net property, plant and equipment divided by average total assets
Market Measures	
Value of Equity (VALUE)	Log of market value of equity as of 31/12/2006 deflated by SIZE
Price/Earning Ratio (PER)	Share price as of 31/12/2006 divided by earnings per share for the year 2006

DISCLOSE is an indicator variable with a value of 1 if a company has environmental disclosures in its annual report, and 0 otherwise. SIZE is the log of book value of total assets as of 31/12/2006. ROA is net income divided by average total assets. ROE is net income divided by average shareholders' equity. GROWTH is the percentage change in sales from 2005 to 2006. LEV is total liabilities divided by total assets. NPM is net income divided by sales. ATO is sales divided by average total assets. CAPINT is average net property, plant and equipment divided by average total assets. VALUE is the log of market value of equity as of 31/12/2006 deflated by size. PER is share price as of 31/12/2006 divided by earnings per share for the year 2006.

PRESENT VALUE AND HISTORICAL COST ACCOUNTING: TOWARD THE GLOBAL CONVERGENCE AND RECONCILIATION PROCESS IN JAPAN

Noriyuki TSUNOGAYA, Kyushu University

Hiromasa OKADA, Nagasaki University

Hiroshi YOSHIMI, Hokkaido University

Abstract

In recent years, Japan and Western countries have experienced the storm of present value (discounted cash flow) through the convergence and/or adoption process of International Accounting Standards (International Financial Reporting Standards). This paper aims to clarify the transition process and facing issues of recent accounting practice through various discussions on the present value, especially from the standpoint of income measurement.

This paper has three main contributions. First, it divides the present value into four forms so as to visualizing the features of contemporary accounting. Second, it reveals the meanings of recent change from flow-and-internal oriented (historical cost) accounting toward stock-and-external oriented (fair value) accounting. Finally, we propose adequate applications of fair value and present value in the context of global convergence of accounting standards. It will serve to improve mutual understanding between countries which have different accounting architectures.

This paper proposes that an accounting architecture should balance heterogeneous concepts of historical cost, fair value or present value and equity (stewardship) or operational accounting not only from historical correlativity but also from practical correlativity.

1. Introduction

This paper aims to clarify the transition process and facing issues of recent accounting practice through various discussions on the present value (discounted cash flow), especially from the standpoint of income measurement.

For this aim, we begin with discussing the allocation basis (interest method) and try to divide it into two meaningful forms according to the different treatments of traditional accounting concepts. After that, we argue the revaluation basis (fresh-start method) and divide it into two forms by the existence or nonexistence of a cost restriction. Following these discussions, we point out significant boundary bases using contrastive concepts of *stock* or *flow*, and *external* or *internal*. It also indicates that we are changing from flow-and-internal oriented (historical cost) accounting toward stock-and-external oriented (fair value) accounting. Finally, we propose the adequate applications of fair

value and present value in the context of global convergence of accounting

standards.

   According to the FASB, the present value has been divided into two forms.

One is consistent with the cost-allocation basis and is called accounting

allocation or interest method. The other is consistent with the value-revaluation

basis and is called direct measurement or fresh-start measurement (FASB

Discussion Memorandum 1990, SFAC No.7 2000).[416] However, the FASB does

not clarify the theoretical boundary basis of this dichotomy.[417]

   In order to make clear the feature of present value, this paper divides it into

four forms (see Figure 1). Two major differences exist between FASB's

classification and this paper's.

---

[416] According to FASB's *Discussion Memorandum* (1990), "Accounting allocations recognize changes in the amount of an asset or liability working from the amount previously recorded (usually initial cost or proceeds). …… Direct measurements establish the carrying amount of asset or liability using current quantities, estimates, and assumptions." (paras.22, 24)

[417] It might be affected by the fact that while the former is derived from the internal rate of return (IRR) method in the field of investment theory, the latter is derived from the net present value (NPV) method.

First, we divide the allocation basis into two forms, cost allocation approach

[Form 1] and profit allocation approach [Form 2]. This partition clarifies the

different treatment of traditional accounting concepts (realization, matching

costs with revenues, relationship with receipts and payments). The difference is

also revealed in the matter which should be applied between balance

adjustment (catch-up) method and interest rate adjustment (prospective)

method.[418]

Secondly, direct measurement is divided into market value approach with the

restriction of cost [Form 3][419] and fair value approach [Form 4]. The former

---

[418] According to FASB's *Discussion Memorandum* (1990) the catch-up method reports the change in estimate through an adjustment to the balance at the beginning of the period, while the prospective method reports the change in estimate prospectively through an adjustment to the interest rate at the beginning of the period (par.375). Although we have other methods such as dual method and retrospective method, since prospective and catch-up have been the main methods to adjust changes in estimate, this paper deals mainly with these two methods.

[419] In this paper, "market value" is used abstractly. It includes both fair value and value in use. "Fair value" is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants as the measurement date (FASB FAS No.157, 2006, par.5). "Value in Use" is the present value of estimated future cash flows expected to arise from the continuing use of an asset and from its disposal at the end of its useful life

recognizes only capital loss (impairment loss), but the latter recognizes capital

gain and capital loss without distinction. This partition is to compare Form 3 with

Forms 1 and 2 as an allocation basis.

This paper has three contributions. First, we divide the present value into four

forms so as to visualize the features of contemporary accounting. Second, we

reveal the meanings of recent movement from flow-and-internal oriented

(historical cost) accounting toward stock-and-external oriented (fair value)

accounting. Finally, we propose adequate applications of fair value and present

value in the context of global convergence of accounting standards. It will serve

to improve mutual understanding between countries which have different

accounting architectures including political, economical, relating laws and social

environments.

(IASB's *Discussion Paper* 2005, par.86).

Figure 1 Four Forms of Present Value

	This Paper	FASB (1990)	FASB (2000)	Examples of Application
Allocation Basis (Flow-oriented)	Cost Allocation Approach **[Form 1]**	Accounting Allocation or Interest Method	Interest Methods of Allocation	Held-to-maturity securities Impairment of a loan
	Profit Allocation Approach **[Form 2]**			
	Market Value Approach with the Restriction of Cost **[Form 3]**	no reference	Fresh-start measurements	Impairment of long-lived assets
Revaluation Basis (Stock-oriented)	Fair Value Approach **[Form 4]**	Direct measurement		Trading securities

Note) In general, Form 3 is classified into revaluation basis, because it falls under direct measurement.
However, this paper classifies it into allocation basis because its feature is similar to Form 1 and 2.
In another words, because it maintains cost basis and depreciation procedure which is the symbol
of allocation basis is applied after impairment loss is recognized.

2. Difference between Cost Allocation and Profit Allocation

There are various allocation lineages. This paper shows the differences of the

cost allocation and the profit allocation on the basis of example 1. (Hereinafter,

cash flow is abbreviated as CF, cash inflow is CIF, and cash outflow is COF, if

needed.)

[Example 1]

- At the beginning of the first period, equipment was purchased at 100. Its

   useful life is two years and the salvage value is zero.

- Initially, net cash inflow was estimated to accrue 121 at the end of the

   second period and was realized as estimated.

- Internal rate is 10%.

Vatter (1966, 689) explained the difference between the straight line method which is consistent with cost allocation and the compound interest method which is consistent with profit allocation as follows. "In the straight-line case, depreciation is computed and deducted in calculating the annual income (from cash inflow) while the compound interest model reverses the process - first computing income, which when subtracted from cash revenue, yields the amortization figure." (Parentheses added by authors. See Figure 2)

On the basis of Vatter's statement, the characteristics of the cost allocation (straight line method) can be clarified in that income (2nd period 21) is calculated ex post as the difference between realized cash inflow (2nd period 121) and the matching cost (deferred cost from the 1st period 50 plus depreciation cost at the 2nd period 50). On the other hand, the characteristics of the profit allocation (compound interest method) can be found in that profit in each period (1st period 10 and 2nd period 11) is allocated (created) through the

process of discount and premium of the expected cash inflow (2nd period 121)

at the internal rate of 10%.

From above, the decisive difference between them can be found in whether

the realization concept or matching concept functions or not, even though both

fall under allocation basis. This difference can also be found in that the former

presupposes actual cash flow (ex post cash flow) and the latter presupposes

estimated cash flow (ex ante cash flow).

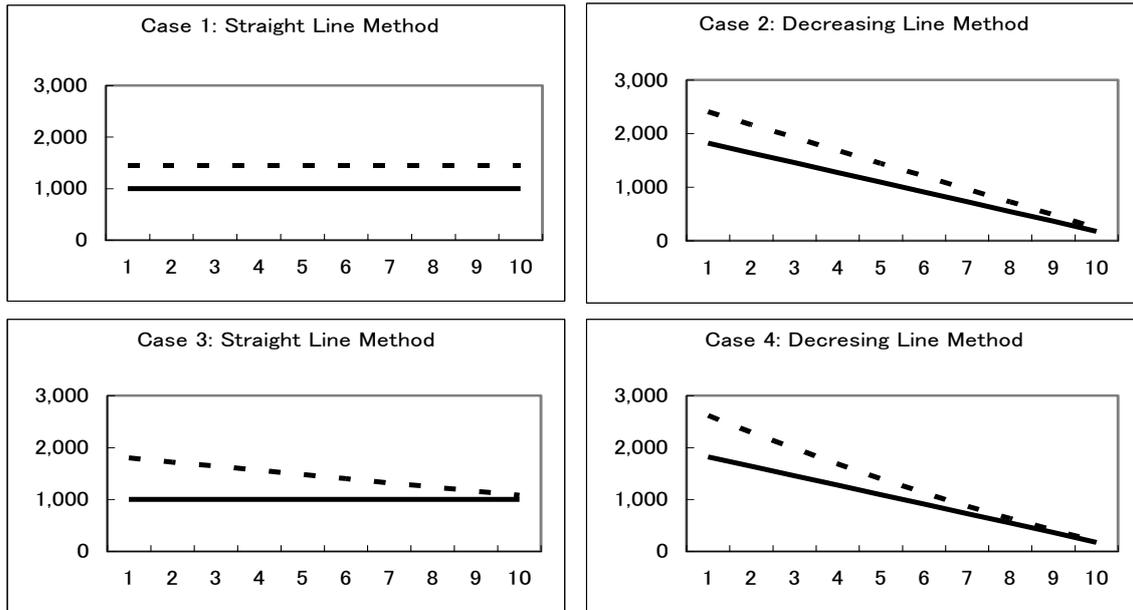
Figure 2 Cost Allocation and Profit Allocation

Time	(Net) CIF	Cost Allocation: Straight Line Method			Profit Allocation: Compound Interest Method		
		(1)Carrying amount	(2)Amortization (100÷2year)	(3)Income (Realized CIF −Expenses)	(1)Carrying amount	(2)Income (Beginning of (1)×10%)	(3)Amortization (Expected Net
0	---	100	---	--	100	--	---
1	---	50	50*	0*	110	10	△10
2	121	0	50	21	0	11	110
Totals	121	---	100	21	---	21	100

＊ Since amortization 50 is deferred to the 2nd year, the expenses of the 1st year become zero,
therefore   income also becomes zero.

3. The Feature of Cost Allocation Approach [Form 1] Compared with Profit Allocation Approach [Form 2]

In this Section, we introduce the cost allocation approach [Form 1] in the line

of following three steps, and then try to clarify the feature of Form 1 compared


with Form 2.

First step is to identify the straight line method. Vatter recognized the straight

line method as a procedure that allocates a fixed amount to each period without

regard of future cash flow patterns. In second step, the cost allocation which

takes into account future cash flow patterns will be developed. When annual

cash inflow is constant, the straight line method will be selected (See Figure 3,

Case 1). If the cash inflow is assumed to diminish, the decreasing charge

method (sum-of-the-years-digits method, etc.) will be selected (Case 2).

The third step considers time value. In this step, the straight line method can

be justified when future cash inflow is estimated to diminish linearly (Case 3).

The decreasing charge method can be justified when future cash inflow is

estimated to diminish rapidly (Case 4).

After all, the cost allocation approach [Form 1] starts from the first step and

considers cash flow patterns and time value in selection of the depreciation

method. Such ideas can be found in Anton (1956, 117-134) and Beaver (1989,

chap.3), which clarified the relationship between cash flow patterns and

appropriate depreciation patterns.

Figure 3 Cost Allocation and Cash Flow Patterns

Notes) ・ Investment Amount: 10,000 Useful Life: 10 years Salvage Value: 0
     ・ Dotted line: Cash Flow Patterns Solid Line: Depreciation Cost

The above methods are based on the retroactive income calculation as the difference of revenues (realized cash inflow) and expenses (depreciation cost etc.). While in the profit allocation approach, income is determined at first, and depreciation is subordinated to it (See Figure 2). This approach sets artificial allocation (creation) of profit above realization and matching. The intension of this approach is the ex ante allocation (creation) of profits.

4. Present Value with the Restriction of Cost: [Form 1], [Form 2] and [Form 3]

This section compares market value approach with the restriction of cost

[Form 3] to cost allocation approach [Form 1] and profit allocation approach

[Form 2], and clarify the similarity of these forms and three methods which are

relating to estimation change. Example 2 will show this case.

[Example 2]

● At the beginning of the first period, equipment was purchased at 300. Its

　useful life is three years and the salvage value is zero.

● Initially, it was expected that net cash inflow accrues 130 at the end of the

　first period, 120 at the end of the second period and 110 at the end of the

　third period.

● Internal rate is 10%.

● Net cash inflow at the end of the first period was realized as estimated.

　However at the end of the first period, the estimation was adjusted

downward at the end of the second and third periods due to lowered

profitability, as 90 and 70 respectively.

- Fair value of the equipment was 120 at the end of the first period. If market

  participants estimate fair value of the equipment, they would predict net

  cash inflow from its asset at the end of the second and third periods, as 72

  and 62 respectively (Discount rate is 8%).

Figure 4 shows the calculation result and graph of the prospective method

and the catch-up method, which have been the two main methods for

impairment of a loan.

Figure 4 Prospective Method and Catch-up Method

Time	Realized CIF	Prospective Method *1			Catch-up Method *2		
		Carrying amount	Amortization	Income	Carrying amount	Amortization	Income
0	---	300	---	--	300	---	--
1	130	160	140	△10 (---)	140	160	△30 (-----)
2	90	70	90	0 (0%)	64	76	14 (10%)
3	70	---	70	0 (0%)	---	64	6 (10%)
Totals	290	---	300	△10	---	300	△10

Notes) In the parentheses, the rate of return are shown. Impairment loss is included in amortization.

*1 ・ Here, a zero rate is applied, because the revised rate (r) that fills the following formula is negative.

$300 = 130 (1+r)^{-1} + 90 (1+r)^{-2} + 70 (1+r)^{-3}$

・ Impairment loss 10 (=300-290) is included in amortization 140.

・ In the 2nd period, it is calculated as follows.

(1) Modified Carrying amount at the Impairment: 90 + 70 = 160
(2) Carrying amount at the end: 70
(3) Amortization (difference between (1) and (2)): 160 - 70 = 90
(4) Income (realized CIF - amortization): 90 - 90 = 0

*2 ・ Here, the revised balance is calculated with a discount rate 10% as follows.

$130 (1+0.1)^{-1} + 90 (1+0.1)^{-2} + 70 (1+0.1)^{-3} = 245$

・ Impairment loss 55 (=300-245) is included in amortization 160.

・In the 2nd period, it is calculated as follows.
Consistent with cost-allocation basis
(1) Modified Carrying amount at the Impairment: $90 (1+0.1)^{-1} + 70 (1+0.1)^{-2} = 140$
(2) Carrying amount at the end: $70 (1+0.1)^{-1} = 64$
(3) Amortization (difference between (1) and (2)): 140 - 64 = 76
(4) Income (realized CIF - amortization): 90 - 76 = 14
Consistent with profit-allocation basis
(1) Income (Modified Carrying amount × 10%): 140×10％ = 14
(2) Amortization (realized CIF - income): 90 - 14 = 76

In FAS No.144 (FASB 2001), IAS No.36 (IASB 2004b) and Japanese GAAP

(BADC 2002. Hereinafter abbreviated as J-GAAP), the market value approach

with the restriction of cost [Form 3] is applied to long-lived assets. Form 3

includes two models. The fair value model in U.S.GAAP gives weight on the

assumption of market participants, while the value in use model in IFRS and J-

GAAP put much faith into company itself or management intents. Figure 5

shows the calculation results and graph of the fair value model and Value in

Use model.

Figure 5 Fair Value Model and Value in Use Model

Time	Realized CIF	Fair Value Model *1			Value in Use Model *2		
		Carrying amount	Amortization	Income	Carrying amount	Amortization	Income
0	---	300	---	--	300	---	--
1	130	120	180	△50 (-----)	140	160	△30 (-----)
2	90	57	63	27 (23%)	64	76	14 (10%)
3	70	---	57	13 (23%)	---	64	6 (10%)
Totals	290	---	300	△10	---	300	△10

Notes) In the parentheses, the rate of return are shown. Impairment loss is included in amortization.

*1 ・Here, impairment loss 80 (=200-120) is included in amortization 180 at the 1st period.

・In the 2nd period, it is calculated as follows.

Consistent with cost-allocation basis

(1) Modified Carrying amount at the Impairment: $72(1+0.08)^{-1} + 62(1+0.08)^{-2} = 120$

(2) Carrying amount at the end: $62(1+0.08)^{-1} = 57$

(3) Amortization (difference between (1) and (2)): 120 - 57 = 63

(4) Income (realized CIF - amortization): 90 - 62 = 27

Consistent with profit-allocation basis

(1) Income (Modified Carrying amount × 23%): 120×23％ = 27

(2) Amortization (realized CIF - income): 90 - 27 = 63

*2 ・Here, impairment loss 60 (=200-140) is included in amortization 160 at the 1st period.

・In the 2nd period, it is calculated as follows.

Consistent with cost-allocation basis

(1) Modified Carrying amount at the Impairment: $90(1+0.1)^{-1} + 70(1+0.1)^{-2} = 140$

(2) Carrying amount at the end: $70(1+0.1)^{-1} = 64$

(3) Amortization (difference between (1) and (2)): 140 - 64 = 76

(4) Income (realized CIF - amortization): 90 - 76 = 14

Consistent with profit-allocation basis

(1) Income (Modified Carrying amount × 10%): 140×10％ = 14

(2) Amortization (realized CIF - income): 90 - 14 = 76

There is no difference among the prospective method, the catch-up method,

the fair value model and value in use model in that cost is set as a restriction.

However, the underlying concept of income measurement differ each other.

First, the prospective method responds by adjustment of interest rate (in

Example 2, interest rate is reduced from 10% to 0%) when estimation changes

due to lowered profitability. It intends the ex post income measurement like

"recapture of the book value". Therefore, only part of the book value that cannot

be expected to be recaptured (10) is recognized as impairment loss. It belongs

to the cost allocation approach [Form 1]. Although Long-lived assets are

assumed in Example 2, the same argument can be made with a loan. FAS

No.15 (FASB 1977), which described impairment for a loan, once adopted the

prospective method.

Second, the catch-up method responds with immediate adjustment of balance

when estimation changes. It intends the income measurement like 'recapture of

the book value with normal return'. In Example 2, a normal return 10% is set out

first (2nd period 14 and 3rd period 6), before impairment loss (55) is determined.

It belongs to the cost allocation approach [Form 1], because the cost basis and

effective interest rate is applied. It also belongs to the profit allocation approach

[Form 2], because a reasonable future return is set out and impairment loss is

subordinate to it. Therefore it has both aspects of Form 1 and Form 2. At present, a predominant approach of impairment for a loan is the catch-up method which is adopted by FAS No.114 (FASB 1993a) , IAS No.39 (IASB 2004c) and J-GAAP (JICPA 2005).

Finally, as to market value approach with the restriction of cost [Form 3], there are two models within this approach. In the value in use model which is applied in IAS No.36 (IASB 2004b) and J-GAAP (BADC 2002), income measurement like 'recapture of the book value with the normal return' is intended. Therefore, a reasonable return 10% is set out first (2nd period 14 and 3rd period 6) and then impairment loss (60) is determined. Although the timing of recognition is different, as long as the normal return is unchanged, the calculation result of the catch-up method is same as the value in use model.

The difference between value in use 140 and fair value 120 at the impairment recognition means self-generating (internal) goodwill. The fair value model accounts for excessive loss at the time of impairment recognition compared to the value in use model, while it accounts for not only normal return (2nd year 14,

3rd year 6) but also excessive return (the realized part of self-generating

goodwill 20; 2nd year 13, 3rd year 7) in the subsequent periods. After all, the

fair value model which is applied in FAS No.144 (FASB 2001), income

measurement like 'the recapture of the book value with the market return

(normal plus/minus excess return)', the level of which is naturally expected in

the capital market, is intended. Figure 6 summarizes the above mentioned pints.

Figure 6 Summaries of Present Value Methods

5.　Two Significant Boundaries Characterizing Various Forms

Figure 6 has two significant boundaries. One is between *Flow* and *Stock* and

the other is between *Internal* and *External*. The meanings of two boundaries are

as follows.

| FASB (1990) | This Paper | **Error!** | | Boundaries | | Examples of Application |
			α	β	
Allocation Basis	Cost Allocation approach **[Form 1]**	Prospective Approach	*Flow*	*Internal*	(1) FAS15 (FASB, 1977)
	Profit allocation approach **[Form 2]**	Catch-up Approach	*Stock (+Flow)*		(2) FAS114 (FASB, 1993a) IAS39 (IASB, 2004c) JICPA (2005)
Revaluation Basis	Market Value Approach with the Restriction of Cost **[Form 3]**	Value in Use Model			(3) IAS36 (IASB, 2006b) BADC (2002)
		Fair Value Model		*External*	(4) FAS144 (FASB, 2001)
	Fair Value approach **[Form 4]**	(Reflected constantly)	*Stock*		(5) FAS115 (FASB, 1993b) IAS39 (IASB, 2004c) ASBJ (2006a)

Firstly, the Boundary α dividing *Flow* and *Stock* focuses on the difference between prospective method [Form 1] with the characteristics of flow and catch-up method [Form 2] with the characteristics of stock as well as flow. Main difference is whether an economic (profit-making) opportunity is built in its income calculation system or not. In catch-up method, normal economic opportunity for the company is assumed since recapture of the book value with normal return is intended. This is the reason for immediate adjustment of stock, if profitability falls as compared to normal economic opportunities. Such a premise is also applicable to the value in use model. Instead of normal return,

recapture of the book value with market return (normal plus/minus excess

return) comes to be intended in the fair value model. This approach

presupposes market (external) opportunity for investors instead of normal

(internal) opportunity for the company itself. In economics, profit-making ability

is naturally expected. If it cannot be expected, loss is deemed to have accrued

and stock is immediately adjusted. Form 2 and Form 3 are actually based on

such an economic (profit-making) opportunity.

Next, the Boundary β relating to *internal* and *external* relates to the difference

between the catch-up method [Form 2] which applies to impairment for a loan

and the market value approach with the restriction of cost [Form 3] which

applies to impairment for long-lived assets.

As to a loan, the combination of the future cash flow on which it has agreed

among the affected parties and the effective interest rate is used for the

measurement of impairment loss. Both are based on the assumption of

company itself (internal).

On the other, in the selection of future cash flow and interest rate for impaired long-lived assets, market (external) based assumption is relatively important in U.S.GAAP, while company (internal) based assumption is relatively important in IFRS and J-GAAP.

In FAS No.144 (FASB 2001), present value technique is used for the objective of measuring fair value. While in IAS No.36 (IASB 2004b), value in use is applied and management's best estimate and/or the best recent financial budgets/forecasts are used. In J-GAAP(BADC 2002; ASBJ,2003), future cash flow shall be reflected a situation peculiar to the company, and in case the risk is reflected in the discount rate, the following rates shall be used.

 i. Rate of return which reflects a specific risk to the assets or assets group of the company

 ii. Weighted average cost of capital which is required to the company

 iii. Market average rate of return which rationally reflects a similar risk to the assets or assets group of the company

iv. Rational borrowing rate when financing against the assets or assets group

of the company (so-called nonrecourse loan)

Direct measurement (fresh-start measurement) has developed with criticizing

traditional accounting. In the early debate of 1960s, researchers who supported

direct measurement which is consistent with market (external) rate and

opportunity, economic present value (economic income) and opportunity value

theory criticized traditional accounting concepts (See Bodenhorn 1961, 583;

Philips 1963, 17-18; Wright 1964, 90). It seems to be difficult to focus on

traditional accounting concepts and the external rate at the same time.

Moreover, internal rate and external rate are based on quite different logic.

Thomas once explained as follows. "Net-revenue contributions (Present value

using internal rates) …… are highly relevant for managerial profit-maximizing

purposes. But there is no reason to believe that these figures also relevant to

the decision processes of readers of financial statements." (Thomas 1976, 9-10.

Parentheses added by authors)

There is no clear evidence whether the application of external rate is useful

for decision making for investors and prevention of company fraud. Rather, the

application of external rate to the internal rate applicable situation seems to

indicate the paradigm change from historical cost accounting toward fair value

accounting.

6. Recent Trend of Present Value

As discussed above, catch-up method has superseded prospective method as

of impairment for a loan. The market value approach with the restriction of cost

(fair value model and value in use model) has taken place of prospective

method and catch-up method as of impairment for long-lived assets. After all,

the direction from *internal* (management or entity discipline) toward *external*

(proprietary or market discipline) is the recent trend. It is also the direction from

flow (revenue and expense view) toward *stock* (asset and liability view).

Economic (profit-making) opportunity is taken into consideration with catch-up

approach and market value approach. These approaches intend to allocate

(create) artificial future profit, and have greater importance to economic

concepts (efficiency, future, ex ante) than accounting concepts (allocation, past, ex post).

If we rely on economic opportunity, accounting allocation might be replaced by the fair value approach [Form 4]. In fact, as for a loan, the comprehensive fair value model is proposed to substitute catch-up method (IASC *Discussion Paper* 1997; JWG *Draft Standard* 2000). Besides as for long-lived assets, the performance report project has been promoted in a form which is difficult to understand unless comprehensive fair value measurement (revaluation) for all accounts is assumed. The Matrix format of performance report issued by IASB (2002) is a typical example of such proposal.

If such a tendency progresses, the concepts of cost, allocation, realization and matching must be retreated. The nominal capital maintenance will be replaced by a new capital maintenance, which assumes maintenance of economic opportunities and defines capital in terms of capacity to earn the current market rate of return. (IASC *Discussion Paper* 1997, Chap. 6, paras. 2.4-2.7)

2341

Moreover, SFAC No.7 (FASB 2000, paras.43, 48, 117) calls the combination

of an estimated cash flow and a rate commensurate with risk (internal rate) as

the traditional present value, and combination of an expected cash flow and a

risk-free rate (external rate) as the expected present value. The former is

suitable for assets and liabilities with contractual cash flows such as a bond,

and the latter is suitable for those without contractual cash flows such as

pensions, other postretirement benefits, some insurance obligations, impaired

long-lived assets, product warranty, postretirement health care and

environmental remediation. The recent trend from the former toward the latter

indicates the change of accounting figure from transaction-based hard figures

toward statistical-based soft figures.

7. Present Value from Auditing Perspective

Present value oriented approach in recent years reveals other issues in terms

of auditing.

Basically, audit techniques rely upon material evidence which is listed on

balance sheet. This seems that present value orientation which coupled with

comprehensive income approach is *good news* for auditing, but of course, it is not true. The new approach introduces new assets which has value but not has physical materiality. This fact means that auditing must develop new tools for these equivocal assets but we cannot assert we have such dependable tools now.

After the World War Ⅱ, Japanese audit practice and standards always has followed US one. This fact makes the Japanese auditing falling into "minor" field, but such situation is now changing because many recently detected fraud cases highlighted the role of auditing.　These audit circumstance are common in the world like Enron affair in the U.S. or BCCI, Barings and Palmalat cases in Europe. Apparently, in these cases, complicatedly produced new types of assets are related to the fraud, and audit decision was deluded in some cases.

From auditing viewpoint, traditional accounting concepts are still important and practical. When we will continue to introduce present value and the related accounting practice, the notion of them must be re-examined like four forms in this paper, and show the way to yield *hard* (auditable) amount of assets. In

[Form 1] and [Form 2], we should obtain reliable rule to allocate cost. Because managements' arbitrariness intervene in [Form 1] and [Form 2] inevitably, auditors might not find firm allocation bases.

[Form 3] heavily depends on calculation model, so auditors should also confirm the justice of the used model. It means that even if the result of the calculation itself is correct, the ambiguous constituents or assumptions of the model might influence on the fairness of the result. In this form, auditors should verify the objectivity of the model used.

The fair value approach of [Form 4] requires auditors to find the evidence of fair value. Market often offers the fair value that everyone easily distinct, but there are some cases that no reliable market exists. Auditors may face same difficulties of [Form 3] in these cases.

Historical cost accounting has been offered *hard* evidence for auditors. With fair value accounting, however, auditors should seek alternative evidence which take place of the past transaction record.

8. The Necessity of Flow and Internal Aspects in Japan

In accounting, there are two functions to maintain the order of our society.

One is the function to provide decision useful information for investors. This is

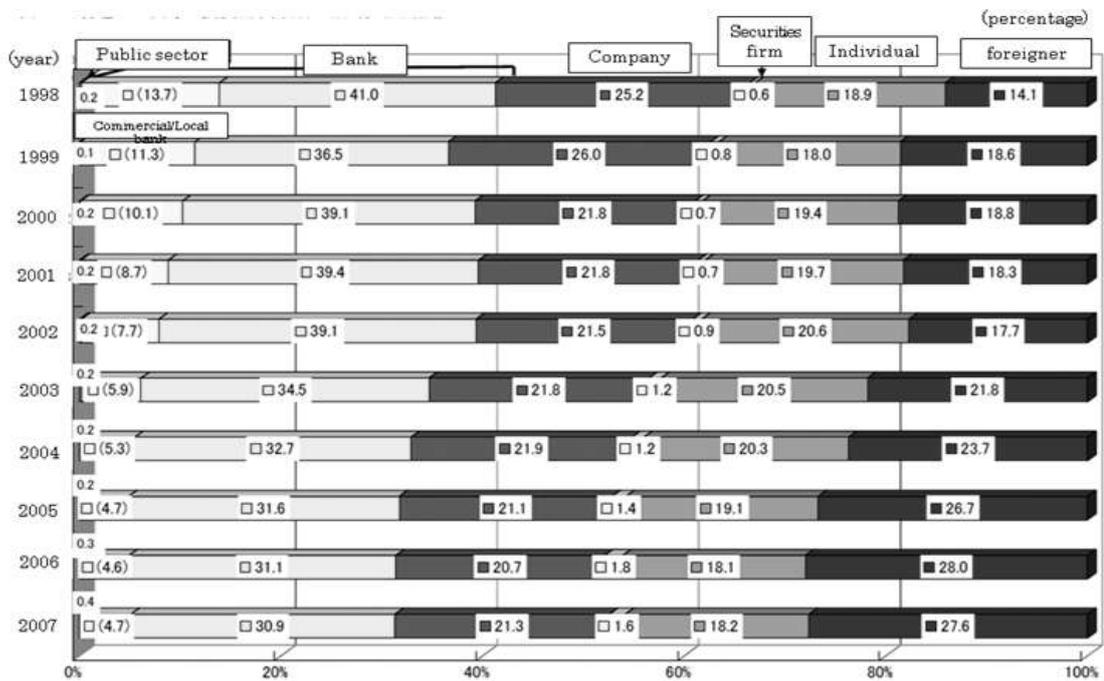
called as operational accounting. The other function is to reconcile interests

among stakeholders. This function is called as equity (stewardship) accounting.

There are three main laws regulating accounting systems in Japan: The

Corporation Law (former name: Commercial Code), The Financial Products

Exchange Law (former name: Stock and Exchange Law), and The Corporation

Tax Law. These laws have their own purpose of preparing financial statements


(financial reporting).

The main purpose of Financial Products Exchange Law is to provide decision

useful information to investors. Financial statements prepared by this law have

been affected by international accounting standards. The main purpose of

Corporation Law is to reconcile the interests between stakeholders and to

protect creditor through the calculation of distributable amount of surplus. The

main purpose of corporation tax law is to maintain the equity of taxation through

the calculation of fair income. But each law regulates accounting practice

respectively in order to achieve own purpose. In other words, each law does not

have prescriptions to cover overall accounting practice.

In Japan, Both distributable amount of surplus and taxable income are based

on the net income. We consider the reason for this fact in terms of *flow* or *stock*

and *internal* or *external* aspects of accounting systems.

Traditionally Japanese companies have held shares with each other. As

Figure 7 shows that the percentage of shareholding of companies is almost the

same as percentage of the individual investors. Through cross-holdings,

Japanese companies build up "business groups", so called "Keiretsu" such as

Sumitomo and Mitsubishi (Koga, 2007, 220).

Figure 7 Transition of share holding ratio by investor

(year)	Public sector	Bank	Commercial/Local bank	Company	Securities firm	Individual	foreigner
1998	0.2	(13.7)	41.0	25.2	0.6	18.9	14.1
1999	0.1	(11.3)	36.5	26.0	0.8	18.0	18.6
2000	0.2	(10.1)	39.1	21.8	0.7	19.4	18.8
2001	0.2	(8.7)	39.4	21.8	0.7	19.7	18.3
2002	0.2	(7.7)	39.1	21.5	0.9	20.6	17.7
2003	0.2	(5.9)	34.5	21.8	1.2	20.5	21.8
2004	0.2	(5.3)	32.7	21.9	1.2	20.3	23.7
2005	0.2	(4.7)	31.6	21.1	1.4	19.1	26.7
2006	0.3	(4.6)	31.1	20.7	1.8	18.1	28.0
2007	0.4	(4.7)	30.9	21.3	1.6	18.2	27.6

(percentage)

Source) http://www.tse.or.jp/market/data/examination/distribute/h19/distribute_h19a.pdf (in Japanese),

Latest access date: 06/13/2009.

As Figure 7 shows, the percentage of shareholding of banks are above 30% and it indicates that banks are the largest shareholder in Japan. Through lending and boil out loan, banks act as big creditors as well as shareholders of the borrowing company. It is often called as "main bank system".

In this situation, main interested parties surrounding a company are main bank and/or companies that make alliance in the business group. Especially main bank is able to get necessary information from the interested company

directly in order to monitor business affairs. This situation has led to *internal oriented accounting* in Japan.

Under the Corporation Law, in order to calculate distributable amount of surplus under the Corporation Law, it is necessary to distinguish realized and unrealized income. As long as shareholder's liability is limited, a company's asset is the only "mortgage" for creditors. If a company distributed unrealized income, company could not maintain a mortgage for creditor and reconciliation of interests could not function. And historical cost is suitable basis of distributable amount of surplus calculation, because unrealized income is not recognized in this measurement system. Under the Corporation Law, *the Regulation Concerning Calculation of Company* prescribes "net income that constitutes main resource of distributable amount as difference of revenue and expenses" (§ 94).

Taxable income adjusts the income calculated under the Corporation Law. According to article 22 in the law prescribes that "revenue and expense are recognized on the basis of J-GAAP except as otherwise provided".

Above two income calculations make Japanese accounting practice *flow* oriented. The basic features are historical cost, matching costs with revenues and the revenue and expense view.

On the other hand, accounting standards reforms have started after "Financial Big Bang" at 1996. The purpose of Financial Big Bang is to realize free, fair and global financial market. Accounting standards reforms which respond to international accounting standards have been deemed as an important part of Accounting Big Bang. Japanese government considered that in order to pull market price, it was necessary to disclose accounting information which is equivalent to the international accounting standards for foreign investors. In fact as Figure 7 shows the percentages of shareholding of foreign investor is increasing year by year. This means *external* feature of accounting has emerged apparently. IASB and many other conceptual frameworks assume that investors need information about future cash flow and income based on asset and liability view.

This aspect relates to the Financial Products Exchange Law. The purpose of this law is to provide decision useful information to investors but this law does not have its own prescriptions relating to accounting measurement. This law entrusts accounting standards setting body to establish accounting standards. To achieve this purpose, Japanese accounting standards setting bodies (BADC and ASBJ) have been preparing accounting standards so that it may not be contradictory to the international accounting standard. For example, the variance of revaluation for available-for-sale security, differed hedge gain or loss and foreign currency translation difference are recognized in the balance sheet. These items are recognized as (other) comprehensive income or recognized in net assets part of the balance sheet directly. This is the feature of *stock* oriented.

However, according to empirical studies, investors have preferred net income to comprehensive income. The Discussion Memorandum on Conceptual Framework issued by the ASBJ equates net income (flow-oriented) with comprehensive income (stock-oriented). It states "Net income has been widely

used for investors over the long period, and experiential proof which supports

the usefulness of net income has been confirmed so far. Therefore we decided

to give the independent status to net income as before." (ASBJ *Conceptual*

Framework 2006b, chap.3, par.21)

This means that although the operational accounting is important primarily,

accounting standards setting bodies cannot make slight of equity accounting.

Actually global movement of convergence has big effect on Japanese

accounting standards and now we can see *stock* and *external* oriented

prescriptions in the Corporation Law. But traditional *flow* and *internal* oriented

accounting has still effect to maintain social order through the reconciliation of

the interests between stakeholders and protection of creditor in Japan.

9. Concluding Remarks

Accounting has both aspects of historical correlativity and practical

correlativity. There is no doubt that traditional accounting concepts have played

an important role in the sense of these correlativities.

Recently a growing number of journalists, standard setters, professionals and academics in the world have been claiming that historical cost accounting should be transferred into fair value accounting in order to accomplish the global convergence of accounting standards. According to this paper, this means the movement from *internal* (management or entity discipline) toward *external* (proprietary or market discipline), and from *flow* (revenue and expense view) toward *stock* (asset and liability view).

When we emphasize *stock and external* view and the movement toward fair value accounting, the balance sheet might recognize the variance of revaluation for every account and the performance report might recognize the changes in net assets as a part of comprehensive income to provide decision useful information to investors. At the same time, however, as mentioned, a consensus about the importance of *flow and internal* exists in the context of practical correlativity in Japan.

In order to deal with a worldwide stock market plunge and financial crisis which stemmed from the nonperforming subprime mortgage, the Emergency

Economic Stabilization Act of 2008 is enacted in the U.S. In the section 132,

this law refers to the Securities and Exchange Commission (SEC)'s authority to

suspend the application of SFAS No. 157. Also in the section 133, SEC is

required to publish a research report on mark-to-market accounting as provided

in SFAS No. 157, the effects on balance sheet, and impact on the quality of

financial information.[420] As we have given much weight on mark-to-market

accounting, we do not have such negative discussion as suspension of fair

value accounting. However it might be a swing back signal towards historical

cost accounting.

This paper proposes that an accounting architecture should balance

heterogeneous concepts, such as allocation and revaluation, ex post and ex

ante, traditional present value and expected present value, external and

internal, stock and flow, and operational accounting and equity (stewardship)

accounting without overemphasizing any one of these concepts in order to

---

[420] The Securities and Exchange Commission delivered the result "*Report and Recommendations Pursuant to Section 133 of the Emergency Economic Stabilization Act of 2008: Study on Mark-to-Market Accounting*" to Congress on December 30, 2008.

maintain the order of our society. We have to emphasize these facts not only

from historical correlativity but also from practical correlativity.

THE EFFECT OF IFRS IMPLEMENTATION ON EARNINGS QUALITY: CASE IN JAPAN AND INDONESIA

Sekar, MAYANGSARI, Trisakti University

Masako SAITO, Osaka Sangyo University

Abstract

The purpose of this paper is to examine the impact of adoption of IFRS on earnings quality of Japanese and Indonesian companies in the convergence process. The examination is focused on the persistence and accrual quality model. High-quality financial reports provide investors with the information and confidence necessary to invest in the global capital markets. A high-quality set of accounting standards enables investors to receive suitable information while considering the reasonable costs of implementing those standards.   The contribution of this paper, especially for policy maker, is to give the policy maker for the future direction in standard setting. This paper also verifies the difference between the SEC rule companies and Japanese GAAP companies separated by the choice of accounting standards in Japan. There are some implications shown by the results. In Japan, it is clear that the choice of GAAPs changes the earnings quality by the development of convergence. The accrual quality has a negative impact for CFO(t-1) and CFO (t). In the other hand, Indonesian cases by persistence and accrual quality models indicate each of significant results: (1) the estimated coefficient for the incremental persistence for each of the eleven accounting standards and (2) eight of the eleven estimated coefficients for the accounting standard effect; five of which are positive.

Keywords: IFRS, U.S.GAAP, Japanese GAAP, Earnings Quality, Convergence

1. Introduction

High-quality financial reports provide investors with the information and confidence necessary to invest in the global capital markets. A high-quality set of accounting standards enables investors to receive suitable information while considering the reasonable costs of implementing those standards. Recent initiatives on convergence to a single set of high-quality global accounting standards have been well received by regulators, standard setters, the accounting profession, and business and academic communities worldwide. Companies in more than 100 countries have adopted a variation of International Financial Reporting Standards (IFRS) for their financial reporting purposes. Accounting has been regarded as "the language of business" and the question that has been recently raised is: "Can all accountants worldwide speak the same language?" In other words: "Is a set of globally accepted accounting standards feasible?" Is convergence to IFRS a real solution?[421] This study attempts to provide answers to these questions by obtaining opinions and insights from a sample of academicians regarding the relevance, benefits, and ways of possible convergence in accounting standards[422].

A recent survey conducted by the International Federation of Accountants (IFAC) reveals that convergence to a single set of international accounting standards is key to economic development as the majority of respondents (89 percent) find compliance with IFRS as very important (IFAC, 2007). The AICPA also supports the current move toward convergence to a single set of global accounting standards and the use of IFRS for financial reporting, while recognizing that "changes need to occur in the U.S. auditing, regulatory, and legal environments" (AICPA, 2007). Securities and Exchange Commission chairman

---

[421] Convergence refers to the process of minimizing differences between the national accounting standards (e.g., U.S. GAAP and IFRS).

[422] We are also in the process of expanding our sample to practitioners (e.g., CPAs, CFOs) and will present the comparative results of both samples in the next draft of this paper.

Christopher Cox, while promoting convergence by stating that "IFRS is coming" warned that "U.S. generally accepted accounting principles (GAAP) aren't going away anytime soon".

Prior research of accounting standards has considered the accounting quality of one standard. Suppose that a manager or firm chooses a single set of two and more several accounting standards, for example, IFRS and U.S.GAAP. There are race to the bottom for the quality (Dye and Sunder, 2001). The competitive standards setters, IASB and FASB, try to decline the number of accounting standards, since they make an effort to attract the company and manager better than the other standard. As a result, the possibility for a bad profit manipulation increases. Does the convergence toward IFRS keep higher-quality earnings? This study examines the impact of adoption of IFRS on earnings quality of Japanese companies in the convergence process. The contribution of this paper, especially for policy maker, is to give the policy maker for the future direction in standard setting.

2. Theory and Hypotheses Development

2.1. Prior Studies

Several studies have addressed harmonization and convergence in global accounting standards. Anderson (1993) discusses the advantages of convergence to a common set of global accounting system. Belkoui (1994) and Choi et al. (1999) present the factors that influence the development of an international accounting system and the harmonization process. Saudagaran (2001), Dunn (2002) and Mednick (1991) examine the impediments in the harmonization of accounting including the cultural and political barriers. These studies argue that the harmonization process provides several advantages: improving the comparability of international accounting information, enabling the flow of international investment, and making consolidation of divergent financial reporting more cost-effective. The most severe impediment to harmonization is the extent of differences in accounting policies and practices of various countries, lack of vigilant and effective standard-setting bodies in some countries, and the diversity

in political and economic factors worldwide. Prior studies (e.g., Barth, Landsman, & Lang, 2005; Gassen & Sellborn, 2006; Barth, Landsman, & Lang, 2007) report some improvements in financial reporting quality following voluntary IFRS adoption. Barth et al. (2005, 2007) find that a sample of firms that voluntarily adopted IFRS exhibited lower levels of earnings management and more timely loss recognition compared with a sample of firms that used local GAAP. Other studies (e.g., Goncharov et al., 2005; Vantendeloo et al., 2005) find no differences in earnings management between firms that voluntarily adopted IFRS and those that did not.

Daske, Hail, Leuz, & Verdi (2007) examine the economic consequences of requiring IFRS for financial reporting worldwide and find an increase in market liquidity and equity valuations around the time of the mandatory introduction of IFRS, whereas there is mixed evidence of the effect on firms' cost of capital. Furthermore, Daske et al. (2007) report capital market benefits were more pronounced in countries with strict enforcement regimes and for firms that voluntarily switch to IFRS, less pronounced for countries when local GAAP are closer to IFRS, with an IFRS convergence strategy and in industries with higher voluntary adoption votes. The use of IFRS is expected to improve the comparability of financial statements, strengthen corporate transparency, and enhance the quality of financial reporting. Armstrong, Barth, Jogolinzer, & Reidl (2007) argue that IFRS reporting makes it less costly for investors to compare firms across countries and capital markets. Covrig, DeFond, & Hung (2007) suggest that convergence towards IFRS reporting can facilitate cross-border investment and thus the integration of capital markets.

Prior studies pertaining to convergence towards IFRS either investigates market reactions to several events regarding the EU's movement toward mandatory IFRS reporting or examine the impact of mandatory IFRS adoption in financial reporting in different countries. Results of market event studies of the mandatory IFR reporting are mixed and inconclusive. Comprix, Muller, & Standford-Harris (2003) find

insignificant but negative market reaction to four key events associated with mandatory IFRS reporting for EU firms. Armstrong et al. (2007) report a positive (negative) market reaction to 16 events that increase (decrease) the likelihood of IFRS adoption in 2002 to 2005 with more positive effects for firms with high pre-adoption information asymmetry, lower quality pre-adoption information environments and firms that are domiciled in common law countries. Academic studies (e.g., Lang, Smith Raedy, & Wilson, 2006; Leuz, 2006) support that suggests that IFRS financial reports are not only affected by home-country institutions but also retain a strong national identity. Daske et al. (2007) find that a serious IFRSs adopter experienced significant declines in their cost of capital and substantial improvements in their market liquidity compared to label adopters. The emerging interests in convergence in accounting standards and inconclusive results of related studies motivate us to conduct a survey in determining the relevance and feasibility of such convergence.

2.2. Convergence to a Single Set of High Quality Reporting Standards

Accounting standards vary significantly worldwide, with the exception of a trend toward requiring greater reliability, transparency in financial reporting, and more accountability to investors. Management is being held accountable for the quality and reliability of financial statements and the effectiveness of related internal controls in the United States. Globalization and technological advances promote global investment and capital markets. Global capital markets demand reliable, transparent, and timely financial information generated under a single global accounting standard. Global financial reporting during the past two decades has transformed from the need for harmonization of accounting standards, to reconciliation, and now to full convergence to a single set global accounting standards. IFRS are intended to be equally applicable to financial reporting by all public companies worldwide. Proponents of convergence to IFRS call for a mandatory uniform set of globally accepted accounting standards to minimize the likelihood of informational

externalities and strengthen comparability in financial reporting practice worldwide. Nonetheless, the corporate ownership structure and corporate governance and financial reporting process vary among countries. Corporations in Europe are often owned by a controlling shareholders group, compared to the dispersed-ownership structure in the United States. While the principles-based IFRS may well work for European majority-owned corporations, U.S GAAP may best serve dispersed-ownership corporations in the United States.

The real goal of convergence should be to benefit global investors and make global accounting standards more cost-effective and efficient. As the corporate governance measures of majority-owned corporations in Europe are different from those of dispersed ownership structures of U.S. corporations, the financial reporting standards could also be different. Financial reporting irregularities and manipulations of majority-owned corporations differ from those of U.S. corporations in several respects. First, managers of majority-owned corporations are motivated by short-terms and earnings guidance because they rarely sell shares. Second, financial manipulations are done through misappropriation of the private benefits of controls. In dispersed-ownership corporations, significant portions of management compensation in terms of stock options or stock ownership are tied into stock price performance which provides adequate incentives to focus on short-term earnings manipulations. Thus, the ownership structure significantly affects the corporate governance and financial reporting processes. The U.S. GAAP is more rules-based, designed to minimize incentives and opportunities for self-serving interests of management, to focus on earnings management.

There is some evidence of a move towards convergence to IFRS as issued by the IASB including: (1) more than 100 countries have now adopted a variation of the IFRS; (2) all listed companies in EU member countries have been required to comply with IFRS in their consolidated financial statements since 2005; (3) regulators worldwide (e.g., IOSCO, SEC) have allowed their foreign issuers to use IFRS for cross-border securities offerings and listings; (4) the SEC has eliminated reconciliation

requirements for foreign issuers that use IFRS as issued by the IASB; and (5) the SEC is considering the possibility and applicability of allowing U.S. companies to use IFRS for their filing and reporting purposes. On November 15, 2007, the SEC unanimously approved amendments to its rules and forms that practically eliminate the previously required reconciliation to U.S. GAAP for foreign private issuers (FPIs) using IFRS issued by the IASB for general purpose financial reporting[423]. This ruling is viewed as the SEC commitment towards ultimate convergence in the global financial reporting process, promotion of the global capital markets, and support for the global acceptance of IFRS as issued by the IASB. It appears the momentum towards a single set of globally accepted accounting standards is gaining needed supports as U.S. GAAP will ultimately be replaced by IFRS. During the past several years more than 100 countries have adopted IFRS as accounting standards for their financial reporting purposes.

2.3. Trend for IFRS Implementation

Some challenges that need to be addressed to facilitate convergence toward IFRS are: (1) consistent interpretation and application of IFRS cross jurisdictions; (2) the feasibility of adoption of IFRS by U.S. multinational companies in general and U.S. companies in particular; (3) educating market participants regarding the differences between U.S. GAAP and IFRS; and (4) effects of switching from national accounting standards to IFRS for regulatory filing purposes and auditing. Both leaders of the IASB and FASB have predicted that by 2011 significant progress towards convergence in the global financial reporting process

---

[423] U.S. Securities and Exchange Commission (SEC). 2007. SEC Takes Action to Improve Consistency of Disclosure to U.S. Investors in Foreign Companies (November 15). Available at: http://www.sec.gov/news/press/2007/2007-235.htm. SEC Announces Roundtable Discussions Regarding International Financial Reporting Standards (November 15). Available at: http://www.sec.gov/news/press/2007/2007-261.htm.

will be made[424]. The SEC confirmed the equivalence between IFRS and U.S. or Japanese GAAP on 12 December 2008(EC, 2008), but now they need to improve the differences among them. U.S. GAAP and IFRS have yet to be converged despite continuing efforts by the FASB, IASB, and SEC rules. Japanese GAAP is also in the same condition. There are still substantial differences between U.S. GAAP and IFRS in several areas of revenue recognition, equity valuation, and industry specification, and both need significant improvements. One way to resolve these differences is to move U.S. financial reporting to IFRS by setting a timetable toward ultimate adoption of IFRS by all public companies worldwide, including U.S. companies.

KPMG surveys show that about 76 percent (60 percent) of financial analysts reported a fair amount or a great deal of knowledge about IFRS in 2006 (2005) with the best informed being those who follow companies on a global basis and have received IFRS training (KPMG, 2007). Responding analysts admitted that their understanding of the possible impact of IFRS on mergers and acquisitions was poor, whereas they had a better understanding of IFRS's effects on share options, financial instruments, and pensions, and good understanding of the presentation of the income statement.

We should expect significant changes in financial reporting. The SEC is promoting the idea of giving U.S. listing companies the choice between U.S. GAAP and IFRS compliance in their filings with the SEC and announced the "road map" for U.S. companies to apply the mandatory IFRS on November 2008. In the plan, the SEC would permit the companies to fill certain requirements to apply IFRS on financial statements after 2010 financial year, and decide whether all the U.S. companies to apply the IFRS by 2011. Both the FASB and IASB are moving toward convergence in their standards and it is also expected that U.S. companies that are interested in adopting IFRS are those that have

---

[424] AccountingWeb. 2006. IASB Chairman Calls for Accounting Standards Convergence by 2011 (June 20). Available at: http://www.accountingweb.com.

overseen subsidiaries that already use IFRS. Smaller U.S. companies whose global competitors are using IFRS in their financial reporting may also be good candidates for IFRS adoption.

Widespread adoption of IFRS by U.S. companies requires proper understanding of IFRS and readiness of those companies' management, board of directors, auditors, and investors to convert to a new set of standards. High-quality financial reports strengthen investors' decisions and their confidence in the capital markets. A high-quality financial reporting process requires: (1) the use of a single set of robust accounting standards in reflecting financial information; (2) a comprehensive business reporting system of presenting financial and nonfinancial key performance indicators (KPIs) beyond the financial statements and footnotes; (3) a set of globally accepted corporate governance measures including laws, rules, and regulations to ensure effective enforcement and compliance with these measures; (4) high-quality globally accepted audit standards to lend credibility to financial reports; and (5) effective systems of training and educating preparers, investors, analysts, and auditors about IFRS and international auditing standards.

Currently, there are three methods by which national standards setters or regulators have implemented IFRSs. The first method requires both domestic and foreign listed companies to use IFRSs in their financial statement preparation and to state conformity to IFRSs in the management's assertions, financial statements, and independent audit report. A second method would be to adopt all IFRSs for listed companies but to make changes to comply with the regulatory, legal, and business environments of the country. Finally, the third approach is to require dual reporting for listed companies where the financial statements state conformity with both national GAAP and IFRSs (New Zealand and Australia) (Rezaee, 2008).

Accounting Standards Board of Japan (ASBJ), a private accounting standards setter, has reached on the joint agreement with IASB for the convergence project plan (Tokyo agreement) and is running for the

international convergence of high-quality accounting standards (ASBJ, 2008). Their activities result in the official evaluation by CESR that Japanese GAAP is the equivalent to IFRS on December 2008 (EC, 2008). Currently in Japan, there are discussions about mandatory IFRS adoption for all Japanese listing firms or IFRS acceptance. The increase of IFRS adoption in many countries in the world and the growing movements in the United States could be full IFRS in any financial market. On September 10, 2008, the interim report has just been announced as a master schedule to require the action to find a specific outlook that Japanese companies would allow their financial statements based on IFRS (FSA, 2009). According to the report, two important possibilities are as follows; (1) the possibility of the IFRS application starting from FY2010 for Japanese listing companies (2) the possibility of the mandatory IFRS as a simple set of accounting standards by FY2012. They will be judged from the spread of IFRS worldwide in the near future.

In Indonesia there was Indonesian accounting standards (PSAKs) which has been issued by the Indonesian Accounting Standards Board of the Indonesian Institute of Accountants. Many of the older standards were developed with reference to US GAAP but newer standards are being developed based on IFRS. The Indonesian Institute of Accountants is currently considering the timing for the adoption of IAS 30, Recognition and Measurement of Financial Instruments. This is likely to have a significant impact that goes well beyond the obvious consequences in the financial statements of volatility earnings. The main areas affected by this area: risk management, systems, processes and products. The Indonesian Institute of Accountants announced plans to convergence Indonesian Accounting Standards with International Financial Reporting Standards (IFRS) with the new standards effective for accounting periods beginning on 2012. There were several standards that have adopted IFRS up to 2008 as shown in Table below:

TABLE 1. Standards that have adopted IFRS

No.	ACCOUNTING STANDARDS
1.	IAS 2. Inventories
2.	IAS 10. Events after balance sheet date
3.	IAS 11. Construction contracts
4.	IAS 16. Property, plant and equipment
5.	IAS 17. Leases
6.	IAS 18. Revenues
7.	IAS 19. Employee benefits
8.	IAS 23. Borrowing costs
9.	IAS 32. Financial instruments: presentation
10.	IAS 39. Financial instruments: recognition and measurement
11.	IAS 40. Investment property

In 2009 and 2010 Indonesian Accounting Standards Board will convergence 29 accounting standards into IFRS. Here are Indonesian Accounting Standards that will be convergenced in 2009-2010:

TABLE 2. Indonesian Accounting Standards Convergence Program 2009-2010

No.	ACCOUNTING STANDARDS
1	IFRS 2. Share-based payment
2	IAS 21. The effects of changes in foreign exchange rates
3	IAS 27. Consolidated and separate financial statements
4	IFRS 5. Non-current assets held for sale and discontinued operations
5	IAS 28. Investments in associates
6	IFRS 7. Financial instruments: disclosures
7	IFRS 8. Operating segment
8	IAS 31. Interests in joint ventures
9	IAS 1. Presentation of financial
10	IAS 36. Impairment of assets
11	IAS 37. Provisions, contingent liabilities and contingent asset
12	IAS 8. Accounting policies, changes in accounting estimates and errors
13	IAS 7. Cash flow statements
14	IAS 41. Agriculture

15	IAS 20. Accounting for government grants and disclosure of government assistance
16	IAS 29. Financial reporting in hyperinflationary economies
17	IAS 24. Related party disclosures
18	IAS 38. Intangible Asset
19	IFRS 3. Business Combination
20	IFRS 4. Insurance Contract
21	IAS 33. Earnings per share
22	IAS 19. Employee Benefits
23	IAS 34. Interim financial reporting
24	IAS 10. Events after the Reporting Period
25	IAS 11. Construction Contracts
26	IAS 18. Revenue
27	IAS 12. Income Taxes
28	IFRS 6. Exploration for and Evaluation of Mineral Resources
29	IAS 26. Accounting and Reporting by Retirement Benefit Plan

2.4. The institutional Framework and Use of "International" Standards

The institutional framework impacts on the form and content of

financial reporting. The

legal systems in a country influence on financial reporting and may influence companies' motivation to use international standards. For example; Japan as a code law country depends on their government and also tax dominated. They vary in the extent of their international resource dependence and accounting has traditionally served the needs of creditors and tax authorities. The institutional framework in each country has evolved overtime, and changed in response to demands for greater comparability in reporting. Harmonization initiatives have occurred at national, regional and international level. They have been influenced by the development of the IASC and a set of standards that are adopted or used in formulating national standards in many nations throughout the

world (IASB 2002c; 2002d). The position of the IASC as the global standard setter was strengthened by several events. In 2001, IASC, the setter of International accounting standards (IAS), was restructured to IASB, gaining support of all side including national standards setters formally, while International Organization of Securities Commissions (IOSCO) admitted officially. The power of IASB increased by the decision of EU that he members forced to report in their consolidated financial statements on mandatory IFRS (including IAS) after 2005 fiscal year.

A company's decision to use " International accounting standards" is affected by the institutional framework (the body of accounting law, rules and accepted practices as well as the institutions that formulate, administer and enforce these requirements) of its home country. Since institutional frameworks vary between countries, a company's country of origin will impact on its use of international standards. In theory and subject to meeting minimum legal requirements, a company could prepare financial statements for the public based on any accounting standards it chooses. However, in practice cost considerations mean that a company's choice of standards reflects the requirements of the institutional framework of its home country. Two countries (Japan and Indonesia) are included in this study as they illustrate a range of positions in relation to the use of international standards, as shown in TABLE 3.

TABLE 3. Use of National and International Standards in Japan and Indonesia

Country	Regulation Financial Statements
Indonesia	National GAAP and International standards are used
Japan	- National GAAP used by most firms. Specific firms have permission to lodge US GAAP consolidated financial statements - International standards are sometimes used, either instead of national GAAP or in a convenience translation to US GAAP

2.5. Accounting Standards and Accounting Quality

Despite pressure for companies to use common standards, some issues relating to their requirements and enforcement are still to be resolved. The collapse of ENRON and the subsequent demise of its audit firm Arthur Andersen have drawn attention to standard setting and regulation. Any change made in US can be expected to influence the international environment. Considering the institutional framework in each country, predictions can be made about companies' use of IFRS and choice between U.S. GAAP and IFRS. Japanese and Indonesia accounting has been influenced by U.S. accounting practices (McKinnon, 1986). Since 1970s, several Japanese firms have prepared consolidated accounts according to U.S. GAAP. However, Japanese standard setters refer to IFRS in setting standards and have announced a greater role for IFRS in their process so firms may also use IFRS.

The purpose of SEC reconciliation was to improve the quality and comparability of financial reporting of foreign listing companies, but several discussions criticized the SEC policy for re-labeling regulation in the reason why companies felt the heavy duties such strict disclosure regulations to listed in the U.S. market. Biddle and Saudagaran (1991) reported the foreign companies prefer to list on the other Stock Exchange with easier regulations than the U.S. market. And the research restated that it spend for Japanese firms listing on U.S financial market to need at least $ 100 million a year to reconcile their financial statements on the SEC force. The earlier study on the relation of the value of reconciliation (Meek, 1983; Amir, Harris and Venuti, 1993) found that the evidence that the stock price reaction to the disclosure of the reconciliation was not immediately available. Herrmann, Inoue and Wayne (1996) states the only available to U.S. GAAP does not guarantee the comparability of financial data of Japanese companies and U.S. companies based on U.S. GAAP were restated to conform to the formal U.S. We can say that the use of a single set of U.S. GAAP is not comparable between U.S. and Japanese firms (at least). TABLE 4 shows the companies taking SEC rule as of FY2008.

TABLE 4. SEC rule Companies in Japan (N=36)

No.	Security code	Company Name	Industry

It is expected that using IFRS can improve accounting quality. If Japan accepts IFRS as well as Japanese and U.S.GAAP, SEC rule companies might start for discussing about the introduction of IFRS, particularly companies financing in the big 3 markets, Japanese, U.S. and EU. And then they could disclose of their financial statements based on IFRS, a single set of accounting standards worldwide. Indeed, is it can

achieve high-quality accounting?   Webster and Thornton (2004) compares earnings quality between the US and Canada and attribute enhanced earnings quality in Canada to its principle-based accounting standards. IFRS and Japanese GAAP are principle-based in the difference with U.S.GAAP, a rule-based. This paper based on the several researches, trys to evaluate the quality of the earnings of Japanese companies using SEC rules.

3. Research Design

3.1. SEC rules vs. Japanese GAAP

In this paper, the other 36 companies are chosen by the same industry and approximate scale as SEC rule companies. An average total asset (ave.TA) is used as the measurement of the scale. Referred to TABLE 5, the *Japanese GAAP companies* are verified as the SEC rules companies by F-test analysis of variance.

3.2. Measurements

The SEC rule companies tend to be more efficient in the capital cost, because of the company size. If arbitrary application of IFRS is admitted

in the United States and Japan, some of them would choose the U.S.GAAP or IFRS. The Japanese GAAP companies would keep using Japanese GAAP approved the equivalence or change IFRS. We put the year ending March 2007 (FY2007) with the boundary changing something for Japanese and U.S.GAAP. FY2007 is the year when CESR has announced the technical advice for the equivalence of the third country. It is assumed that there are some effects given to the market favorability of Japan and U.S.GAAP.

First, we use Earnings persistence to measure earnings quality (Francis et al., 2005). Earnings persistence captures the permanence of earnings from one period to the next and it is estimated by regressing current period earnings on prior period earnings. Higher earnings persistence is considered a characteristic of higher earnings quality. Our review of the prior research suggests that persistence is expected to be increasing in growth (Collins and Kothari, 1989 and Francis et al., 2002). The persistence model is as follows:

$$EARN_{it} = \alpha 0 + \alpha 1 EARN_{it-1} + \alpha 2 MB_{it} + \alpha 3\ (EARN_{it}\text{-}1 * MB_{it}) +$$
$$\alpha 4 STANDARD_t + \alpha 5\ (EARN_{it-1} * STANDARD_t) +$$
$$\varepsilon_{it}\dots\dots\dots\dots\dots\dots\dots\dots\dots(1)$$

Where:

EARN is income before extraordinary items scaled by average total assets (ave.TA)

MB is the market to book ratio

STANDARD is an indicator variable equal to one if a company prepares the financial statements based on the SEC rule or IFRS (response to the single set has already been effective) and zero otherwise.

Second, we use accrual measurement to measure accrual quality. We follow Dechow and Dichev (2002) and Francis et al. (2005) to estimate a proxy for accrual quality that is commonly used in the literature. The total current accrual model is as follow:

$$TCA = \alpha_0 + \alpha_1 CFOi_{t+1} + \alpha_2 CFO_{it} + \alpha_3\ CFO_{it-1} + \alpha_4\ \Delta SALES_{it} +$$
$$\alpha_5 PPE_{i,t} +$$
$$\varepsilon_{it}\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots(2)$$

Where:

TCA is total accrual and can measure with the equation as follow:

ΔCURRENT ASSET$_{it}$-ΔCURRENT LIABILITIES$_{it}$-ΔCASH$_{it}$+ΔSHORT

TERM DEBT$_{it}$

CFO is operating cash flow

ΔSALES is the year to year change in sales

PPE is gross level of property, plant and equipment

All variables are scaled by average assets in year t.

Equation (2) is then estimated annually on a cross sectional basis for each of Fama and French's (1997). The firm specifc resuduals from the estimation are used to form the accrual quality metric. Specifically, the firm specific accrual quality metric equals the standard deviation of the residuals for each firm.

Following Dichow and Dichev (2002) and Francis et.al. (2005), we expect that accrual quality is negatively associated with smaller firms, greater cash flow variability, longer operating cycles and reporting of losses. Finally, an indicator variable taht capture the effect of accounting standard is included.

Our accrual qualitu model is as follows:

$$SD\_AQ_{i,t} = \alpha_o + \alpha_1 LNASSETS_{i,t} + \alpha_2 SD\_CFO_{i,t} + \alpha_3 SD\_SALES_{i,t} + \alpha_4 LOSS_{i,t} +$$

$$\alpha_5 STANDARD_t +$$

$$\varepsilon_{i,t}\dots\dots\dots\dots\dots\dots\dots \dots\dots\dots\dots\dots\dots\dots\dots(3)$$

Where SD_AQ is the standard deviation of the residual from the annual estimation of equation (2) for each industry. LNASSETS is the natural log of total assets, SD_CFO is the standard deviation of cash flow operations. SD_SALES is the standard deviation of sales. LOSS is an indicator variable equal to one if earnings before extraordinary items is negative and zaro ottherwise. STANDARD is an indocator variable equal to one if the year identified standard is effective and zero otherwise.

4. Sample Data and Hypotheses

4.1. Sample Data

The data is collected in the eol database[425] in Japan from the annual reports of companies listed on the first and second sections of the Tokyo Securities Exchange (TSE). As of March 2008, there is consolidated accounting data is for 1,474 companies on TSE section 1. First, this paper chooses the data of EARN, MB, and TA on the 36 Japanese companies using the SEC rule (SEC rule companies). Secondary, we suppose that the other group is compared with the group of SEC rule companies in the equivalent sector and scale. The group is composed with Japanese 36 companies which prepare their financial statements on the Japanese GAAP. They are called Japanese GAAP companies as TABLE 5 shown. The data set of two groups with different standards of accounting is handled by the dummy variable named STANDARD as one data set.

For Indonesia sample we use Non-Financial Public companies that has listed in LQ 45 from 2002 to 2008. We prefer to use LQ 45 firms because they have good market performance and their stock is liquid. We first eliminate observations that lack lagged data and non-December year-ends. We eliminate non-December year-ends to simplify identification of when specific standards. We eliminate extreme value observations in the persistence and valuation samples consistent with prior research. Extreme observations are defined as share prices, book value per share, or earnings per share exceeding $1,000 per share in the

---

[425] The eol is a service by eol Inc. that archive contains all the "Yuhos" for every publicly traded company (more than 4,000 firms) and roughly 1,000 privately-held companies in Japan. Yuho is required for all listed and unlisted companies all listed companies and all unlisted companies with a sufficient level of capitalization to file a semi-annual report commonly by the Japanese Government .(Refer http://www.eol.co.jp/e/service/01.html)

valuation sample. The availability of *IDX* data and variables to construct our accruals measures are the most restrictive constraints in forming our samples resulting in the forecast and accrual quality samples being the smallest. We also eliminate the firms which not consistently in LQ 45 during observation period (2002-2008). So, for Indonesian sample there were 36 firms, and the detailed of the firms' name as below.

TABLE 6. Indonesian Samples

No.	Security Code	Companies name	Industry
1.	AALI	Astra Agro Lestari	Agriculture
2.	ANTM	Aneka Tambang	Mining
3.	ASII	Astra International	Automotive
4.	BLTA	Berlian Laju Tanker	Transportation
5.	BNBR	Bakrie & Brothers	Investment
6.	BTEL	Bakrie Telecom	Telecomunication
7.	BUMI	Bumi Resources	Mining
8.	CPIN	Charoen Phokpand	Basic Industry
9.	CPRO	Central Proteinaprima	Basic Industry
10.	ELTY	Bakrieland Development	Property
11.	ENRG	Energi Mega Persada	Mining
12.	INCO	International Nickel Indonesia	Mining
13.	INDF	Indofood Sukses Makmur	Consumer Goods
14.	INKP	Indah Kiat Pulp & Paper	Basic Industry
15.	ISAT	Indosat	Telecommunication
16.	KIJA	Kawasan Industri Jababeka	Property
17.	MEDC	Medco Energi International	Mining
18.	PGAS	Perusahaan Gas Negara	Mining
19.	PTBA	Tambang Batubara Bukit Asam	Mining
20.	SMCB	Holcim	Basic Industry
21.	TBLA	Tunas Baru Lampung	Agriculture
22.	TINS	TIMAH	Mining
23.	TLKM	Telekomunikasi Indonesia	Telecommunication
24.	TRUB	Truba Alam Manunggal Engineering	Infrastructure
25.	UNSP	Bakrie Sumatra Plantations	Agriculture
26.	UNTR	United Tractors	Services
27.	ITMG	Indo Tambangraya Megah	Mining
28.	LPKR	Lippo Karawaci	Property
29.	LSIP	PP London Sumatera	Agriculture
30.	AKRA	AKR Corporindo	Trade
31.	BISI	Bisi International	Agriculture
32.	DEWA	Darma Henwa	Infrastructure
33.	MIRA	Mitra Rajasa	Transportation
34.	MNCN	Media Nusantara Citra	Media
35	SMGR	Semen Gresik	Basic Industry
36.	SGRO	Sampoerna Agro	Agriculture

4.2. Hypotheses

The first hypothesis verifies what effect of convergence process for IFRS brings the quality of earnings in consideration of the increase of IFRS implementation. The application of arbitrary or mandatory IFRS is discussed in the U.S. and Japan where national GAAPs are evaluated to be equivalent with IFRS. If achieved, Japanese firm that makes financial statements based on the SEC rules might apply IFRS. Or, the SEC rule might be keeping.   Japanese firm might change from current Japanese GAAP to IFRS. Anyway, they can make decisions about applicable accounting standards. On the other hand, stake holders would feel better their financial statements on the high-quality U.S. GAAP or Japanese GAAP by equal to IFRS. That means their earnings must be persisting with higher-quality. The following hypothesis (1) consists. That is,
H1: The persistence of earnings keeps by high-quality standards of accounting.

To verify this, we use a multiple regression model composed by five independent variables (STANDARD, a dummy variable contained). If the effect of $EARN_t$ extends to $EARN_{t+1}$, it means the higher quality of earnings continues. In addition, it is expected that the higher quality of accounting standards advance, the more the market valuation will improve.   The difference of earnings quality by the choice of accounting standards would get smaller.
The second hypothesis concerns the quality of accrual. It is assumed that the operating cash flow (CFO) would influence the quality of accrual, if the persistence of earnings quality remains. Hypothesis (2) is:
H2: The operating cash flow improves the quality of accrual by higher-quality of accounting standards.

This hypothesis is proven by sample data (N=70 for Japan firms, N= 252 firm years for Indonesian sample) application to research design (2). The multiple regression model composed of six independent variables

verifies the impact of the operating cash flow to the quality of accrual (TCA) by the proxy variable generally used. This paper uses the characteristic that the quality of TCA is related negative in the smaller-scale firms and the cash flow changes more greatly. TABLE 7 shows the scale of Japanese GAAP companies are smaller than SEC rule companies. Therefore, the more the difference of those scales loses, the more the operating cash flow influences positive for accrual. That is, it is inferred that a negative effect of the operating cash flow would improve.

TABLE 7. Mean of EARN, MB and Ave.TA

	FY 2008 (t+1)			FY 2007 (t)			FY 2006 (t-1)		
	EARN	MB	Ave.TA	EARN	MB	Ave.TA	EARN	MB	Ave.TA
SEC rule firms	-0.067	5.590	5,771,777	-0.067	4.683	6,047,366	-0.068	2.340	5,550,431
Jap.GAAP firms	-0.182	1.305	1,879,085	-0.191	2.257	1,767,183	-0.168	0.470	1,606,634
IFRS Indonesian firms	1.260	1.511	18,602,888	1.255	1.825	20,657,334	1.262	2.254	23,296,250

In the persistence model for EARN, sample data is fitted into a multiple regression model composed with 5 independent variables, $EARN_{t-1}$, MB_t, $EARNt-1*MB_t$, $EARN_{t-1}*STANDARD$, STANDARD. The analysis is used in two periods, FY2007 and 2008. The sample data fitted in the equation (2) is excluded the data of not only Nomura Holdings, Inc, SEC rule companies but also The Daiwa Securities, Japanese GAAP companies. The quality of accrual (TCA) is verified in the equation (2) with 70 firms. Basically, this paper treats the same period about March and December ending FY. It is expected that the impression of Japanese and U.S.GAAP in the market would get better after the CESR announcement, remarkably appeared since EC approval on December 2008.

5. Results and Implications

In the TABLE 7 and 8, there are several implications shown concerning the hypothesis. The SEC group's Mean of income before extraordinary items scaled by average total assets (EARN) are lower

through three years than Japanese GAAP companies. It is found that SEC rule companies are influenced by severe U.S. GAAP, a rule-based regarding the lower EARN. The market to book ratio (MB) and ave.TA of SEC rule companies exceed Japanese GAAP companies in all fiscal year. For instance, the Mean of MB and ave.TA of SEC rule companies in 2008 is bigger as the other group. Moreover, the Mean of MB_{t+1} is 5.590, about 4 times compared with the Mean 1.305 of Japanese GAAP companies. MB shows how many times the stockholders' equity (net assets) on measured the corporate value (aggregate market value). The market evaluates the capital efficiency of the enterprise. It is likely to be used as an investment standard by which the corporate value is measured. Therefore, it means that the increase of Mean MB_{t+1} of SEC rule companies from 2.340, the Mean MB_{t-1} contributes the rise of those corporate value. F-test is effective for verifying the difference between both groups.   It is found that each F value of MB_t, MB_{t+1} are statistically significant at the significance level 1% in TABLE 8. Obviously, there are some differences in the market valuation of SEC rule companies compared with Japanese GAAP companies.

There were some steps before Japanese and U.S.GAAP have been evaluated the equivalence of IFRS. CESR, an advisory panel of EC, has published two or more drafts to approve the equivalence between IFRS and accounting standards of the third country. We suppose that the evaluation might give one of good news in the market to Japanese firm prepared their financial statements based on the Japan or U.S.GAAP. And it is assumed that the CESR announcement of the equivalence is effective specifically on SEC rule companies, Because of their representing scale in Japan, they would have more incentive to finance in the financial market named Tokyo, New York, London. Therefore, IFRS would be willingly replaced from the SEC rules, if it is officially admitted in Japan.

TABLE 9 verifies the outcome of two models. Obviously, the persistence of the earnings has been proven. The numerical value of the result shows the following two significant points. One is that $EARN_t$ and

EARN $_{t+1}$ have been influenced from EARN before one term respectively. In the persistence model, the two independent variables, EARN $_{t-1}$ (earnings before one term) and EARN $_{t-1}$*STANDARD $_t$ (one that the dummy variable by the difference of the standard multiplied by the profit before one term) are statistically significant in 0.1% level for EARN $_t$. That means the difference of earnings quality by the choice of GAAPs. In addition, t values of the two independent variables, MB $_t$ and EARN $_{t-1}$*MB $_t$ are significant in 5% level.   The other is that the influence of the independent variable for EARN $_{t+1}$ with the data of nearer closing year gets smaller.

According to the comparison, the independent variable, EARN $_t$ is significant in 0.1% level.   However, it was not significant for the independent variable, EARN $_t$*STANDARD $_t$ by which the dummy variable by the difference of standards of accounting multiplied.   Two independent variables related to MB are statistically significant in 5% level.   This result appears no difference of earnings quality by the application, because U.S. and Japanese GAAP have developed higher-quality.   In the equation (2), the quality of accrual was evaluated by using the business cash flow.   As a result, a negative effect was confirmed as for CFO $_{t-1}$ and CFO $_t$. Oppositely, CFO $_{t+1}$ has changed in the effect of the plus.   It is assumed the one factor that the difference in the scale of between SEC rule companies and Japanese GAAP companies became smaller.   Those implications are proven usefully for hypotheses 1 and 2.

The convergence of accounting standards aims at making of higher-quality international standards. It is clear that the development have seen in the case of Japanese firms in this study.   Both of U.S. and Japanese GAAP have already raised the quality of earnings and the favorability in the market valuation. A worldwide expansion toward IFRS results in improving the reliability of the third country (U.S. and Japan, at least). The attempt to a single set of "International accounting standards" leads in the convergence process that accounting standards progress in each country.   The higher quality of earnings in financial statements persists when higher-quality accounting standards exists. There is a meaning in

above all can endure financial statements user's indication needs. This paper has some limitation for the number of sample data. The data set of Japanese companies applying SEC rules (U.S.GAAP) is just only 36, while selected the other Japanese firm based on the Japanese GAAP by the scale.   It is necessary to develop this study, improving the data.

TABLE 8. Difference of SEC rule and Jap.GAAP Companies

For Indonesia case there is different approach that we conducted. We use different method for Indonesian case because for Indonesia, we want to know the effect of several standards that has align with IFRS on earnings quality. So, we investigate the effect of each standard on persistence and accruals quality. The results for Indonesia sample show in TABLE10 and 11.

We identified twelve accounting standards for our study for Indonesian samples and focus on the period before and after each accounting standard. However, more than one standard became effective in certain years. In this situation, we jointly consider all accounting standards implemented during a year as one event. We therefore

investigates The effect of IFRS implementation on earnings quality with Indonesian sample use accounting-based measures: persistence, and accrual quality. We first consider the accounting standard's incremental effect on persistence (the interaction of prior period's earnings and the accounting standard variable). Equation (1) is estimated for each accounting standard and we report the results in TABLE 10. The mean adjusted R^2 for the persistence model is 45.5%. The estimated coefficient for the incremental persistence is significant for each of the eleven accounting standards. However, there is no consistency as to direction; the overall mean is not significant.

TABLE 10. Persistence Model

$$EARN_{i,t} = \alpha_0 + \alpha_1 EARN_{i,t-1} + \alpha_2 MB_{i,t} + \alpha_3 (EARN_{i,t-1} * MB_{i,t}) + \alpha_4 STANDARD_t + \alpha_5$$
$$(EARN_{i,t-1} * STANDARD_t) + \varepsilon_{i,t}$$

Mean adjusted R ^{2}	45.5%
Number of Standards with Significant Positive Coefficients	6

* / ** / *** significant at the 0.10 / 0.05 / 0.01 level.

Variables are defined as follows: EARN is income before extraordinary items scaled by average assets, MB is market-to-book ratios, and STANDARD is an indicator variable equal to one if the year identified standard (that align with IFRS) is effective and zero otherwise.

Second, we examine changes in accrual quality. We estimate equation (2) and report

our results in TABLE 11. The mean adjusted R^2 is 42.5%. Eight of the eleven estimated coefficients for the accounting standard effect are significant; five of which are positive. Overall, the mean effect is significant and positive (1.9279, p-value < 0.10) indicating decreasing quality. Combined, the overall evidence is that the accounting standards are associated with decreasing accounting quality (lower accrual quality). These results do not support our hyphoteses but consistent with the FASB's increased focus on the balance sheet where more variability may then be introduced to the income statement.

TABLE 11. Accrual Quality Model

ACCOUNTING CONSERVATISM AND FUTURE BAD NEWS: THE CASE OF SINGAPORE AND PAKISTAN

Zuhrohtun, SE, M.Si

(Universitas Pembangunan Nasional "Veteran"&

Ph.D Student Universitas Gadjah Mada, Yogyakarta, Indonesia)

Abstract

This study investigates the benefits of accounting conservatism to the share holder. In particular, this study examine whether higher levels of conservatism are associated with lower levels of future bad news. To address whether conservatism leads to lower likelihood of future bad news, this study examine the association of accounting conservatism with 1) likelihood of future earnings decreases, and 2) likelihood of future dividend decreases. The sample consist of all non financial firms that listing in Singapore and Pakistan stock exchange with December fiscal year ends over the 2005-2007 time period, and the data available on OSIRIS database. We find evidence that higher level of accounting conservatism is associated with lower likelihood of future dividend decreases.

Keywords: *conservatism, future bad news, future earnings decreases, future dividend decreases*

1. Introduction

Investors and potential investors in the firm's securities demand information, not only on the firm's past financial performance and its net assets, but also on its expected future performance. (e.g., its future cash flows). However, there are limits to the extent to which management-provided information can be credible. As information becomes less verifiable, it becomes easier for the manager to manipulate and less credible making it less useful to investors. If accounting cannot solve the problem of reducing information asymmetry by providing unverifiable information, how does conservative accounting reduce information asymmetry between equity investors? Two potential mechanisms suggest themselves. First, conservative accounting could well provide the best possible non-stock price "*hard*" summary information on current performance for uninformed investors. Second, that hard information provides a benchmark that makes it possible for alternative "soft" sources to generate credible information on unverifiable gains (LaFond and Watts, 2007).

The conservative principle, defined as the more timely recognition of

unrealized losses vs. gains in annual earnings, has characterized for centuries

the practice of accounting reporting (Basu, 1997). Watts (2003) and others

argue that conservatism helps in corporate governance (specifically in

monitoring firms' investment policies). We hypothesize that if conservatism

reduces managers' ex ante incentives to take on negative NPV projects and

improves the ex post monitoring of investments, firms with more conservative

accounting ought to have higher future profitability and lower likelihood (and

magnitude) of future special items charges. We find that firms with more

conservative accounting have (i) higher future cash flows and gross margins,

and (ii) lower likelihood and magnitude of special items charges than firms with

less conservative accounting. Our results hold after controlling for industry, firm

size, leverage, growth opportunities, prior special items charges, and stock

returns. These findings are (i) consistent with conservatism mitigating agency

problems associated with managers' investment decisions as predicted by Watts

(2003) and Ball and Shivakumar (2005), and (ii) inconsistent with standard

setters' view that conservatism is not a desirable characteristic in financial reporting.

The understanding of the motivations and determinants of conditional conservatism is central to gaining insights in the role of financial reporting in debt contracting, managerial compensation, firm valuation, and institutional settings. Bushman and Piotroski (2006) show that timely loss recognition is affected by the legal environment. A country with a stronger law and order tradition is likely to have more-developed financial markets and more-effective financial reporting practices. Stronger Rule of Law limits firms' ability to exploit debt holders, and hence could be associated with the development and comparative size of debt markets. In addition, higher Rule of Law could result in more enforcement of timely loss recognition standards. On the other hand, higher Rule of Law could reduce the demand for conditional conservatism due to substitution effects, by the protection it provides to creditors. Conservatism is the differential verifiability required for the recognition of accounting gains versus losses that generates an understatement of net assets (Basu, 1997, and

Holthausen and Watts, 2001). The existing empirical evidence is consistent with

listed firms' financial statements being conservative in the U.S. (e.g., Basu, 1997,

and Watts, 2003) and in other Anglo-American law countries (e.g., Ball, Kothari

and Robin, 2000). This conservatism is attributed to the use of financial

statements in debt and/or compensation contracts, litigation, regulatory and

political processes, and taxes (Watts, 2003). However, many important

questions remain unanswered and more empirical issues need to be addressed.

This study investigates the benefits of accounting conservatism to the

share holder. This issue is particularly important in light of the ongoing policy

debate of whether conservatism is a desirable property of accounting earnings

(Watt, 2003). In particular, this study examine whether higher levels of

conservatism are associated with lower levels of future bad news. To address

whether conservatism leads to lower likelihood of future bad news, this study

examine the association of accounting conservatism with 1) likelihood of future

earnings decreases, and 2) likelihood of future dividend decreases. We find

evidence that accounting conservatism is associated with lower likelihood of future dividend decreases.

This study is important for several reasons: (1) the empirical accounting literature provides strong evidence that debt-holders demand higher levels of conservatism in order to reduce potentially negative impact of agency conflicts arise between borrowers and lenders. However, whether greater levels of conservatism have impact on share holder wealth is an open empirical question. Two opposing explanations of the role of conservatism in share holder wealth exist: a) conservatism is beneficial to shareholders, and b) conservatism is potentially harmful to shareholders because it decreases firms' information quality. (2) Conservatism is one of the attributes of accounting quality. Conservatism is also one of the major reasons for international differences in financial reporting, thus this study also examine the comparison of the association accounting conservatism and future earnings bad news in Singapore and Pakistan, where financial reporting environment and accounting legislation is different significantly.

The rest of the paper is structured as follows. Hypothesis development is provided in Section 2. Research design is presented in Section 3. Result is provided in Section 4 and Section 5 Conclusions and limitations of the paper.

2. Hypothesis Development

2.1. Earnings Conservatism Literature

The seminal paper by Basu (1997) started the stream of research on earnings conservatism. Such institutional factors as contracting, shareholder litigation, taxation, and accounting regulation are reported to affect the level of conservatism (Watts, 2003). Ball, Kothari and Robin (2000) examine the effect of institutional factors on accounting earnings and they present evidence that earnings are considerably more timely in common law countries than in code law countries due to greater earnings conservatism.

Pope and Walker (1999) compare timeliness of gain and loss recognition between UK and USA. Raonic *et al.* (2004) examine the effect of institutional and market complexity on timeliness of income recognition by using cross-listed firms. They emphasize the importance of institutional variables in explaining

international differences in properties of earnings. Their results imply that both capital market pressure and regulatory impact lead to more conservative accounting. Bushman and Piotroski (2006) have extended earlier cross-country research by examining the influence of legal and political institutions on accounting conservatism. Their results indicate that after controlling for legal regime, conservatism is significantly related to a variety of other country-level institutions, such as investor protection, securities laws, political economy and tax regime.

Beatty, Weber and Yu (2008) examine the relation between conservatism in firms' financial reports and conservative adjustments made to reported financial numbers used in debt covenants. If financial statement conservatism and conservative adjustments to debt covenants each serve a similar role in resolving agency problems, then the two types of conservatism should be substitutes. That is, firms that choose greater financial statement conservatism should require fewer conservative adjustments in debt covenants. Alternatively, if financial statement conservatism and conservative adjustments to debt

covenants each have relative strengths and weaknesses in resolving agency

problems in debt contracting, then the two types of conservatism may be

positively related. That is, firms that require greater conservatism to resolve

agency problems in their debt contracting relationships may make more

conservative adjustments to both financial statements and debt covenants.

2.2. Conservatism Determinants

Previous literature (La Fond and Watts 2007; Watts 2003; Ball et al.

2005) suggests five alternative explanations for conservatism in financial

reporting. The first explanation is its use as efficient technology employed in firm

governance. A conservative accounting approach is used to deal with the moral

hazard determined by the asymmetric information, limited liability, and

asymmetric payoffs of the different parties involved in the firms, e.g.

management compensation and debt contracts. The second possible

explanation for accounting conservatism is limiting shareholders' litigations.

Overstating a firm's net assets is more likely to increase the litigation costs for

the firm than understating net assets. Thus, with conservatism, the firm reduces

its expected litigation costs. The third possible explanation is taxation; in profitable firms, conservatism reduces the present value of taxes, thus increasing the value of the firm. The fourth possible explanation of conservatism in financial reporting is standard setters' and regulators' incentives. Both standard setters and regulators are exposed to asymmetric loss functions because they would be more criticized if they adopt accounting standards that favor overstatement of net assets instead of understatement of net assets.

Finally, the fifth reason for conservatism in financial accounting is theoretically introduced and empirically tested recently by La Fond and Watts (2007). They argue that conditional conservatism may serve as a corporate governance mechanism to reduce the information asymmetry among the various parties (managers, shareholders, investors, stakeholders in general) involved in firms' contracts, litigation, taxation, and regulation processes. Much of the information asymmetry arises from the firm's investment opportunity sets, but it also occurs because of the way the firm's management, more informed about events and investment opportunities, formally collects and reports information to

stakeholders. The two common denominator factors in the economic explanation

of accounting conditional conservatism are the asymmetry of both the loss

functions and information sets that characterize the different categories of

stakeholders.

2.3. Positives and Negatives View of Conservatism

Positives view of conservatism. Theory and evidence suggests several

informational benefits of conservatism, such as reducing benefits of earnings

management (Chen et al., 2007), improving information quality (Fan and Zhang,

2008), and signaling managerial private information (Bagnoli and Watts, 2003).

The unifying underlying theme of these studies is that conservatism improves

information quality and thus should reduce information asymmetry between

informed and uninformed investors. La Fond and Watts (2008) and Khan and

Watts (2007) examine the associations between conservatism and firm liquidity

levels and provide some evidence consistent with the idea that decreases in firm

liquidity are followed by increases in firm conservatism.

Negatives view of conservatism. Several studies show the association of

higher conservatism levels with lower earnings persistence. It implicate that if

conservatism reflects contemporaneous bad news more fully, then the likelihood

of future bad news is lower. Basu (1997) shows that bad news of earnings

surprises are less persistent than good news earnings surprises. Roychowdhury

and Frankel (2007) show that greater conservatism levels are associated with

less persistent special items. Per se, lower persistence of earnings of more

conservative firms does not suggest that conservatism negatively affects stock

holders because observed lower earnings persistence could be due to more

complete revelation of bad news. Paek et al. (2007) show that firms with more

conservative reported earnings have lower earnings multiples because

conservatism reduces earnings persistence. Their result suggests that

conservatism introduces noise in the earnings process and thus makes earnings

less value-relevant. However, the implications of this result for usefulness of

conservatism are not necessarily clear. More persistent earnings are associated

with lower uncertainty about firms' future performance, and make it easier for

investors to correctly estimate earnings multiples. At the same time, given well documented results that bad news in general is less persistent, lower earnings multiples are expected for bad news firms. The latter implication suggests that conservatism does not necessarily hurt users of financial information.

Hui and Matsunaga (2004) show that more conservative firms issue less management earnings forecasts. One possible consequence of this result is that overall level of firm disclosure of more conservative firms is lower, thus possibly hurting uninformed shareholders. However, this prediction need not hold true. Recent studies in disclosure literature point out that greater levels of firms' voluntary disclosure have a limited positive effect on firms' cost of capital (Francis et al., 2007), and liquidity (Pevzner, 2007).

Kim and Pevzner (2008) address a question of whether accounting conservatism is beneficial to the stock market. They examine 1) whether conservatism is associated with lower likelihood of future bad news, and 2) whether the stock market reaction to firms' earnings surprises varies with firms' conservatism levels. The result: First, we show that higher current conservatism

today is associated with lower probability of future bad news. Second, find

evidence that the stock market reacts stronger (weaker) to good (bad) earnings

news of more conservative firms. Thus, this study provides additional evidence

that conservatism affects stock prices.

The hypothesis is as follows:

Hypothesis 1: Higher conservatism levels are associated with lower likelihood of future bad news.

3. Research Design

3.1. Sample Selection

We restrict our sample to all non financial firm that listing in Singapore and

Pakistan stock exchange with December fiscal year ends over the 2005-2007

time period, and the data available on OSIRIS database.

3.2. Tests of the Hypothesis

The empirical model of the likelihood of future earnings and dividend decreases,

is the following regression model:

(1) Earn Decr$t+1$= $\beta0$+ $\beta1CONSt$+ $\beta2$ ROAt + $\beta3$ EARNt + $\beta4$ MVEt +et

(2) Div Decr$t+1$= $\beta0$+ $\beta1CONSt$+ $\beta2$ ROAt + $\beta3$ EARNt + $\beta4$ MVEt +et

Where:

Earn Decrt+1 : a dummy variable equal 1 if a firm experienced a reduction in

earnings before extraordinary items in year *t+1* as compared to

year *t.*

Div Decrt+1 :   a dummy variable equal 1 if a firm experienced a reduction

in

dividends per share in year *t+1* as compared to year *t.*

CONSt: conservatism that measure according to Ball and Sivakumar

(2005)& Kim and Pevzner (2008):

coefficient $\beta 3$ from the following regression, multiplied by -1.

$OIt = \alpha t + \beta 1\ D + \beta 2\ OIt-1 + \beta 3\ D*OIt-1 + et$

Where:

OIt is change in operating income in year t deflated by beginning

market value of equity.

OIt-1 is change in operating income in year t-1 deflated by

beginning market value of equity

D is 1 if _OIt-1 is negative and 0 otherwise.

Control variables:

ROA_t : year t return on assets.

$EARN_t$: year t change in earnings before extraordinary items, deflated by

prior assets.

MVE_t: year t size

The hypothesis in this study is test using logistic regression.

4. Results

In this study, we use two proxies for future bad news that is the likelihood

of future earnings decrease and the likelihood of future dividend decreases. We

examine the effects of conservatism on avoiding future earnings decrease,

because the stock market looks upon earnings changes as an additional

benchmark of credibility of earnings news (Dopuch et al. (2003)). Thus,

managers have incentives to avoid earnings decreases as well, and

conservatism could serve as an additional device constraining managerial efforts in upward manipulation of earnings changes.

We also examine the effects of conservatism on the likelihood of future dividend decreases because literature shows that market generally reacts very negatively to such events. Moreover, due to negative effects of dividend decreases on firms' stock prices, Daniel et al. (2007) show that firms manage earnings upward to avoid showing dividend decreases. Kothari, Wysocki and Shu (2006) show that market reacts particularly negatively to the news of dividend decreases. They interpret this result as indicating that managers are more likely to withhold bad news releases relating to dividend cuts. Thus, it is interesting to see whether greater conservatism constrains manager's earnings management behavior and forces bad dividend news "out".

To further investigate the relationship between accounting conservatism and future earnings bad news, the formal test of regression model 1 and 2 are employed. The regression of model 1&2 are estimated using logistic regression.

Table 1 summarizes the empirical result of logistic regression test for all

variable used in our analyses.

Table 1 Empirical Result

	Panel A		Panel B	
	Wald	p-value	Wald	p-value
CONS	0.318	0.197	-0.331	0.041*
ROA	-0.58	0.291	0.0.92	0.518
EARN	0.146	0.111	0.100	0.140
MVE	0.068	0.031*	0.004	0.850
-2 Log L (Block = 0)	826.690		753.774	
-2 Log L (Block = 1)	805.299		748.462	
Chi-Square	14.228	0.006	5.637	0.218
Homers and Lemeshow	26.274	0.01	5.001	0.758

* Significance at alpha level of 5%

Panel A of Table 1 summarizes our results of estimation of equation (1)

for the earnings decreases dependent variable. It is not consistent with our

predictions, CONS, EARN, and MVE are all positively associated with the

probability of future earnings decreases. With respect to control variables,

interestingly, ROA is negatively but not significant associated with future

earnings decreases. This is likely due to the fact that firms with higher ROA

have already experienced significant earnings decreases, and are probably in

loss reversal mode.

Panel B of Table 1 summarizes our results of estimation of equation (2)

for the future dividend decreases dependent variable. Consistent with our

predictions, CONS negatively associated with the probability of future dividend

decreases. It shows that Hypothesis 1 is supported when a dummy variable for

future dividend decreases is used as dependent variable. With respect to

control variables, all are negatively (but not significant) associated with future

dividend decreases. Thus, our results generally support the predictions of

hypothesis 1: "higher conservatism levels are associated with lower likelihood of

future bad news."

Further we investigate the effect of accounting conservatism level on

future earnings bad news for each country, by comparing them. Table II

summarizes the empirical result of each country.

Table II. Empirical Result (Pakistan vs. Singapore)

	Singapore		Pakistan	
	Wald	**p-value**	**Wald**	**p-value**
CONS	6.343	0.023*	0.027	0.992
ROA	0.235	0.336	-0.253	0.189
EARN	57.872	0.024*	0.124	0.026*
MVE	8.082	0.031*	0.369	0.005*
-2 Log L (Block = 0)	342.235		811.412	

-2 Log L (Block = 1)	285.388		765.651	
Chi-Square	0.086		70.846	0.023
Homers and Lemeshow	66.36		65.023	0.018

* Significance at alpha level of 5%

Table II shows that accounting conservatism associated (positively) with the

probability of future earnings declines only for Singapore samples. It doesn't

support the hypothesis 1. Further this study cannot make a comparison the

level of accounting conservatism for each country, because the conservatism

variable for Pakistan doesn't significant at 5% level.

5. Conclusions and Limitations

The empirical results of this study indicate that higher conservatism levels

are associated with lower likelihood of future bad news that is future dividend

decreases. We thus provide empirical support for theoretical predictions that

higher levels of accounting conservatism are beneficial to shareholders. We

argue that information asymmetry between firm insiders and outside *equity*

investors generate conservatism in financial statements. Conservatism reduces

the manager's incentives and ability to manipulate accounting numbers and so

reduces information asymmetry and the deadweight losses that information

asymmetry generates. This increases firm and equity values. Further accounting

conservatism is a governance mechanism that reduces the managers' ability to

manipulate and overstate financial performance and increases the firm's cash

flows and value. It indicates that higher levels of accounting conservatism have

impact on share holder wealth.

Accounting conservatism is also one of the major reasons for

international differences in financial reporting, thus this study also examine the

comparison of the association accounting conservatism and future bad news in

Singapore and Pakistan, but this study can not find evidence that the difference

of financial reporting environment and accounting legislation have an impact to

the association of accounting conservatism levels and the likelihood of future

earnings bad news.

This study has several limitation, that is only use non financial firms that

listed in Singapore and Pakistan stock exchange, thus this study can not

generalize for international context in term of differences in financial reporting

environment and accounting legislation. Further this study only use one proxy of

conservatism, that is conservatism that measure according to Ball and

Sivakumar (2005)&Kim and Pevzner (2008), future research can use a new

measure of conditional conservatism (Gotti, 2008) which results from a Least

Absolute Deviation (LAD) piecewise regression and adopts the number of

changes in financial analysts' EPS forecasts as a proxy for good/bad news about

future earnings and extends the analysis to two-year and three-year time

horizons.

BOARD INDEPENDENCE, OWNERSHIP STRUCTURE, AUDIT QUALITY AND INCOME SMOOTHING ACTIVITIES

Ayoib Che Ahmad, Universiti Utara Malaysia
Nooriha Mansor, Universiti Teknologi MARA

ABSTRACT

The 1997 economic crisis faced by many East Asian economies has generated

a substantial amount of debate largely focused on issues such as the roles and

functions of good corporate governance (CG). Lack of transparency has been

singled out as the major culprit of the crisis and it has been alleged to cause

management to indulge themselves in unhealthy activities such as income

smoothing (IS) act. The paper extends Nasuhiyah, Hian, Soh and Wei (1994) by

incorporating contextual variables that proxy for CG, ownership structure and

audit quality. The empirical analysis is conducted on a sample of Bursa

Malaysia listed companies for a period between 1991 to 2000. The main

intention of taking this time span is to observe to what extend has previous

business operations inculcated the feature of CG in the running of their

companies activities despite not being obligatory for them yet to uphold. The results showed that the existence of non-executive directors and the presence of brand name auditors to be significant in hindering the management from indulging in IS. The study opens the way for a richer understanding of the links between CG, ownership structure, audit quality and IS in Malaysia.

1.0 INTRODUCTION

The economic crisis faced by many countries including Malaysia, which occurred in 1997, has generated a substantial amount of debate largely focused on issues such as the roles and functions of good corporate governance. Many believed that the weak corporate governance condition had exacerbated the crisis. The crisis would not have been that severe if there was confidence in the ability of large corporations to maintain financial transparency in corporate dealings. Hong Kong is said to experience the least impact as compared to the other Asian capital markets, and this was probably because

of better corporate governance mechanisms that were already in existence at that

particular time (which include more financial disclosures and transparencies) than the

other capital markets in Asia (Tsui and Gul, 2000).

Lack of transparency has caused management to indulge themselves in earnings

management. According to Healy and Wahlen (1999), earnings management, happens

when managers, who are the agents of the shareholders, use judgment in financial

reporting and in structuring transactions to alter financial reports to either mislead

some stakeholder about the underlying economic performance of the company, or to

influence contractual outcomes that depend on reported accounting numbers. One

aspect of the earnings management debate that has received much attention is the

income smoothing (Albornoz and Alcarria, 2003). Income smoothing is a deliberate

acts by the management to reduce income variation by using certain accounting

devices. Besides the less transparent practices, the smoothing behavior is also caused

by the pressure to signal growth and stability to shareholders (Nagy and Neal, 2001).

This paper examines the effects of certain corporate governance characteristics,

ownership structure and external audit quality on income smoothing activities on a sample of Bursa Malaysia Berhad companies. Previous literature quoted on income smoothing are studies that were carried out mostly in developed countries. With this study, which is based on the Malaysian scenario, it is hoped that it could be a form of contribution to the existing literature on income smoothing

This study is an extension to the study done by Nasuhiyah, Hian, Soh, and Wei (1994) that examined factors affecting income smoothing among the listed companies in Singapore. In their study, Nasuhiyah et. al (1994) used company size (total assets), profitability (the ratio of net income after tax to total assets), industrial sectors (industrial and commercial, hotels and properties and others) and nationality (Singaporean and Malaysian companies) as the explanatory variables. This study extends further by adding seven other contextual variables related to corporate governance, ownership structure and audit quality. They are: proportion of independent non-executive directors, chairmanship duality, directors' remuneration, type of auditor (brand name or non-brand name), Chinese controlled companies, institutional investors

and management ownership. The reason for selecting these seven variables is to

observe their impacts, if any, on the income smoothing activities prevailing among the

Malaysian listed companies. The empirical analysis is conducted on a sample of Bursa

Malaysia listed companies for a period between 1991 to 2000. This time period is

observed in order to find out to what extend has companies inculcated the feature of

corporate governance in the running of their business operations despite not being

obligatory for them to uphold. The results showed that the existence of non-executive

directors and the presence of brand name auditors are of importance in hindering the

management from indulging in income smoothing activities.

This paper is organized as follows. The next section describes and discusses on

literature review and hypothesis development. The third section explains the research

design, and the fourth reports and discusses the analysis and findings. The final section

summarizes and concludes.

2.0 LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

What is actually corporate governance? According to Report on Corporate Governance,

Finance Committee (1999), corporate governance is concerned with the process and

structure used to direct and manage the business prosperity and corporate

accountability with the ultimate objective of realizing long-term shareholder's value,

while taking into account the interests of other stakeholders. In most of today's modern

businesses, shareholders merely provide the capital.

Income smoothing, or deliberate voluntary acts by management, in order to reduce

income variation by using certain accounting devices, has been a topic of interest in the

accounting literature. It is said that income smoothing is a logical and rational practice,

as Beidleman (1973) believed that management smoothes income to create a stable

earnings stream and reduce covariance of returns with the market, so as to avoid public

scrutiny and criticism. Currently, there is ample evidence that managers use a variety

of instruments to smoothen the reported periodic streams because they see advantages

in doing so (Copeland,1968).

With due regard to the financial disasters that have sprouted in the developing

countries, such as Lehman Brothers and Enron, it is only wise that the government too,

take up an active role in ensuring proper corporate governance practices are being

adhered to, especially among the listed companies. Malaysian government and many

other related local parties and institutions are taking steps towards enhancing corporate

governance in Malaysia. For instance, in March 1998, there was an effort to create a

good corporate governance environment for the Malaysian corporate sector. High Level

Finance Committee (HLFC) on Corporate Governance has formed an entity known as

the Malaysian Institute of Corporate Governance (MICG). The Institute was

incorporated on 10 March 1998 as a public company Limited by guarantee. The

principal activity of the Institute is to promote and encourage corporate governance

development, education and training for the benefit of its members and other interested

institutional bodies in Malaysia.

The Institute then came out with Malaysian Code on Corporate Governance in

year 2000 with the aim to encourage adequate disclosure by the firms, so as to

provide sufficient information to investors regarding the firm's board

composition and its structures. Compliance with the MCCG is not mandatory but

effective January 2001, part one of the MCCG was incorporated into Part E,

Chapter 15 of the Bursa Malaysia listing requirements in the effort to further

enhance the governance structures among the public listed companies in

Malaysia. It was then revised in year 2007 after taking into consideration the

2008 budget announced by the Malaysian Prime Minister. The main purpose of

the amendments is to strengthen further the roles and responsibilities of boards

of directors and audit committees. It is done in order to assist the investors to

monitor the running of the companies in which they have entrusted their funds.

Followings are the discussions on the hypotheses development for this study:

2.1 Proportion of Independent Non-executive Directors

The separation of ownership and control of the corporate bodies has definitely

introduced new problems in the effective control of top management activities, which

includes amongst others, the income smoothing act. The existence of non-executive

directors (NEDs) in any organization will, in one way or another, hinder the

management from any intention to smooth the reported earnings. This is because the

NEDs, who are not involved in the day-to-day activities, will ensure that the

management will act in a manner that is expected out of them, that is to increase the

shareholders' value. Lai and Tam (2007) reported that NED are effective in monitoring

managers from involving in income smoothing. Thus, it is hypothesized that the

existence of NEDs will hinder the management from indulging in the income

smoothing activities. Given the above discussion and evidence, we are led to the

following null hypothesis:

H 1 : Income smoothing does not depend on the existence of

non-executive directors on the board.

2.2 Chairman Duality

Fosberg and Nelson (1999) stated that firms that use separate leadership in order to control agency problems would experience a statistically significant improvement in performance as it permits clear-cut leadership for purposes of strategy formulation and implementation. This is supported by Farber (2005) who found fraud firms have higher percentage of duality as duality makes it difficult for insecure directors to be honest when evaluating firm performance which, in turn, would lead to long term organizational drift (Carver, 1990).

In contrast, the proponents of duality argue that non-duality would dilute the CEO's power to provide effective leadership of the company by increasing the probability that actions and expectations of management and the board are at odds with each other (Alexander, Fennel and Halpern, 1993). Accordingly the null hypothesis is as follows:

> *H2: Income smoothing does not depend on the existence of duality chairmanship.*

2.3 Remuneration

Remuneration is allocated with the intention of aligning the interest of the managers with that of the shareholders. However, since managers will suffer reputation effects that could result in management's dismissal if their performance is poor, thus they have an incentive to smooth reported earnings by increasing current earnings at the expense of future earnings (Fudenberg and Tirole, 1995). This is proved by Denis, Hanouna and Sarin (2006) who found that firms with both lawsuits and earnings restatements use executive option remuneration more than the matched firms. Cheng and Warfield (2005) also reported a relation between equity incentives and earnings misstatement. Hence, the null hypothesis is as follows:

H 3 :   Income smoothing does not depend on the existence of remuneration scheme

2.4 Institutional Investors

It has been argued that that institutional investors are interested mainly in making quick profits (i.e. short term gains) (Drucker, 1986). Since the institutional investors would withdraw their investment whenever they see a down turn in the earnings made,

thus it is of no surprise that companies that have a large number of institutional

investors would be more inclined to do income smoothing. However, Chung, Firth and

Kim (2005), found that institutional investors are effective in deterring managers'

opportunistic earnings management. Accordingly the null hypothesis is as follows:

H 4 : Income smoothing does not depend on the existence of

institutional investors

2.5 Management Ownership control

Income smoothing activities is said to be significantly associated with management

ownership (Moses, 1987). As a manager's percentage of ownership increases, the

ownership structure of a firm changes from one which is manager-controlled to one that

is manager/owner-controlled. Thus, as managerial ownership increases, there is a

corresponding increase in the manager's discretionary ability to modify the revenue

generating process through the use of accounting policy choice and this is hazardous to

firm performance (Morck et al., 1988 and Chen and Kao, 2005). In contrast, as

managerial ownership increases there is a concurrent increase in the alignment of

manager and shareholder interests (Jensen and Meckling, 1976). Thus, the null

hypothesis is as follows:

H 5 : Income smoothing does not depend on management's

ownership control

2.6 Chinese-controlled companies.

Next we shall look into the impact of having Chinese directors on the income

smoothing practice. This is because, there exists a unique institutional

characteristic of Malaysian Chinese companies, that is the wide-spread

involvement of the owners as the management executives even after companies

go public (Heng, 1992). CheAhmad and Houghton (2001), and Johnson and

Mitton (2003) document a significant relation between ethnicity and audit fees in

the Malaysian market. They suggest that Chinese business practices may

influence differences in levels of agency conflicts and risks associated with

Chinese-controlled companies. This will lead to lower external audit fees

charged to these companies. Accordingly for the purpose of this study, the null

hypothesis is stated as follows:

H6: Income smoothing act does not depend on the presence of

majority Chinese directors of the board

3.7 Auditor

Ability of brand name auditors[426] to constrain earnings management is perceived to add

credibility to the quality of reported earnings (Chia and Lapsley, 2007). Since various

parties use the financial statements of a company for making investment decisions,

thus, auditors' independence is vital in order for them to discharge their statutory audit

duties with greater objectivity and to issue the right opinion about the underlying

financial status of the company. Auditor independence is considered high, if firms are

---

[426] Brand name auditors can either be Big-5 (which is comprised of PricewaterhouseCoopers (PwC), Andersen Worldwide (AW), KPMG, Ernst & Young and Deloitte Touche Tohmatsu) or Big-4 (Big-5 excluding AW)

being audited by the international brand name audit firms (Datar, Feltham and Huges,

1991). Accordingly, the null hypothesis is:

H7: Income smoothing does not depend on the existence of the

brand name audit firms.

2.8 Other factors

Whilst the main focus of this study is on the effects of corporate governance

characteristics on income smoothing activities, the other determinants of income

smoothing that were found to be important in previous studies need to be controlled in

the model in order to have a meaningful analysis.

2.8.1 Industry

This point is taken into consideration, in order to observe which industry does income

smoothing the most; the reason being, according to Ronen and Sadan (1981), Belkaoui

and Picur (1984), and Albrecht and Richardson (1990), that companies in different

industries smooth their income in varying degrees. It appears that companies in certain

industries face a more restricted opportunity structure and a higher degree of

environmental uncertainty. Nasuhiyah et al. (1994) stated that companies in

hotel/properties and industrial sectors tend to smooth their income more as compared to

other sectors. Such companies have more opportunity and are more predisposed to

smooth their income.

2.8.2 Company's size

Previous studies found that company size had an effect on income smoothing behaviour

(see Moses, 1987). One explanation is that larger companies are likely to be subjected

to public scrutiny than smaller companies. In other words, larger companies are likely

to receive more attentions from analysts and investors, and thus more is known about

them. Consequently, there is little additional value for a smoothed income signal, and

accordingly larger companies have less incentive to smooth income. The foregoing

arguments suggest a negative association between size and income smoothing.

2.8.3 Profitability

Trueman and Titman (1988) stated that firms that are experiencing healthy profitability

will tend to find larger instruments available with which to smooth. In contrast,

according to Archibald (1967) a high proportion of companies would smoothed their

income when their profitability was relatively low. Presumably, fluctuations in income

streams have a more severe impact on low profitability companies; hence, they have a

stronger motivation to smooth income, as compared to firms that have larger

profitability. In another words, larger-profitability firms have lower involvement with

income smoothing.

3.0 RESEARCH DESIGN

3.1 Measurement of variables

Given the seven (7) null hypotheses stated above, the experimental variables for the

study are non-executive directors, duality, remuneration, institutional investors,

ownership control, Chinese controlled companies and audit quality. The other

independent (control) variables are industrial sectors (industrial and commercial; and

hotels and properties, company's size and profitability.

The dependent variable for the study is income smoothing, as measured by an index.

For this purpose, Eckel's (1981) operationalization of income smoothing is used. (A

good description of this index can be found in the appendix to Albrecht and Richardson

(1990)). This measurement relies on the analysis of income and sales variability as follows:

Income smoothing index = (CV $_I$ / CV$_S$)

Where:

I   = one-period change in income

S   = one-period change in sales

CV$_j$ = coefficient of variation for variable j

              (i.e. j's standard deviation divided by it's expected value)

Income smoothing is indicated by an index of less than 1. Eckel's index is developed specifically as a dichotomous measurement of income smoothing. Thus for the purpose of this study, the sample companies are classified as smoothers or non-smoothers, depending on whether the income smoothing index is less than 1 or more than 1, respectively.

Four possible income smoothing objectives are examined in this study. They are

income from operations, income before tax, income after tax and income attributable to

shareholders.

3.2 Sample selection and source of data

The population of interest comprises companies listed, both on the main board and the

second board, of the Bursa Malaysia Berhad (previously known as Kuala Lumpur Stock

Exchange (KLSE)) as of 31st December 1990. The year 1991 was taken as the initial

year as the study has employed a ten-year time series data collection that is from 1991

to 2000. This ten-year time frame was used by Barefield and Comisky (1972), with the

justification to identify the variability and average absolute growth increments for

companies that have opportunity to do income smoothing. This procedure is consistent

with Moses's (1987, pg. 362) suggestion that multi-period studies capture

achievements of smoothing, whereas one- period studies reflect attempts to smooth. A

total of 161 companies have been taken as samples for the purpose of this study (Please

refer to Table 1).

3.3 Statistical Method

Logit analysis is used in a multivariate setting to investigate the factors associated with

income smoothing. The logit model is considered appropriate because the dependent

variable is a dichotomous variable and the independent variables are either intervally or

nominally measured.

The logit model can be expressed as follows:

$$\text{Smooth}_i = \alpha + \beta_1 \text{NED}_i + \beta_2 \text{DUAL}_i + \beta_3 \text{REM}_i + \beta_4 \text{INST}_i + \beta_5 \text{OWN}_i +$$

$$\beta_6 \text{CCC}_i + \beta_7 \text{AUD}_i + \beta_8 \text{IND}_i + \beta_9 \text{PROP}_i + \beta_{10} \text{SIZE}_i + \beta_{11} \text{PROFIT}_i +$$

$$\varepsilon_i$$

where:

Smooth   = income smoothing status of company where 1 is for smoothers and 0

               for non-smoothers

      (Conclusion can be drawn by looking at the significance and numerical sign (+

      /-) of the regression coefficients)

The details on the definitions for the independent variables are as per Table 2.

4.0 ANALYSIS AND FINDINGS

The results of running descriptive statistics, univariate tests and logit analyses are

reported below.

4.1 Descriptive Statistics

The descriptive statistics of the 161 sample companies are presented in Table 3. These

results indicate the existence of income smoothing practices among companies listed on

Bursa Malaysia Berhad.

4.2 Univariate Test Results

Two univariate tests were conducted for this study. One is the Wilcoxon Signed Ranks Test, while the other is T-test. In the former, the results obtained for DUAL, AUD, IND and PROP, are all very significant at the 0.01 significance level, for all income smoothing objectives. This is indicated in Table 4.

Under the T-test, all the variables, except for NED (H1)and REM (H3), do affect the incidence of income smoothing activities among the listed companies on Bursa Malaysia Berhad boards. Though not all of these income smoothing objectives are affected by each of the independent variables that are included in this study, yet their occurrences in one or more of the income smoothing objectives is sufficient to highlight the fact that each of these variables does have an impact on the income smoothing activities that prevail. To investigate the results further in a multivariate context, logit analyses are performed. The following section discusses the results of the multivariate analysis.

4.3 Logit Analyses Results.

The results of logit analyses are summarized in Table 5 for each income-smoothing objective. In particular, the estimated model beta, the associated significance test results and the holdout accuracy rates of the model are reported.

The logit model for Income from Operations and Profit before Tax as income-smoothing objectives are found to be insignificant with a p-value of 0.845 and 0.791. As can be seen from Table 5 Panel A, at significance level above 0.1 (one-tailed test), only the variables for the industry sectors namely IND and PROP are significant (p-values equals 0.095 and 0.081, respectively). The findings suggest the company in the hotel and property industry would tend to smooth their income more than the Industrial/Commercial industry.

When Profit after Tax is the income smoothing objective, as can be seen from Table 5, Panel C, the resulting logit model is significant with p-value of 0.058. At significance level slightly above 0.05 and 0.1, the null hypotheses for H7 (AUD) and H1 (NED) can be rejected at p-value equals to 0.058 and 0.063 (one-tailed test). All these findings are expected under the hypotheses tested in the study. The NED (H1) variable has a negative sign for the coefficient. This indicates that companies with non-executive directors on the board and having one of the brand name auditors as their external auditor would hinder the management from involving in income smoothing activities.

Finally, when Profit Attributable to Shareholders is the income smoothing objective, the resulting logit model is significant at 0.01 significance level, with a p-value of 0.008 (please refer to Table 5, Panel D). At a significance level less than 0.01 with p-value of 0.003 (one-tailed), the null hypothesis for AUD (H7) can be rejected,. This is followed by OWN (H9), with p-value equals to 0.03. At a one tailed-test, the null hypotheses for NED (H1) and CCC (H6) can also be rejected too, as their p-value are 0.09 and 0.083. All these findings are as predicted under the hypotheses tested in the

study. All the coefficients have a negative sign indicating that companies will not

indulge in income smoothing activities if they have the brand name auditors as their

external auditors, having non-executive directors on the board, their BOD is being

dominated by the Chinese directors and when the management is being influence by the

incentive effect (i.e. the manager's interest is maneuvered so that it is in line with that

of other shareholders' interest)

5.0 IMPLICATION, LIMITATION AND CONCLUSION.

The objective of this study is to identify to what extend can good corporate governance

practices, ownership structure and audit quality hinder the companies from indulging in

the income smoothing activities. Analysis of a sample of companies listed on Bursa

Malaysia Berhad indicates that good corporate governance practices, such as having

independent non-executive directors on the board, separation of chairman and chief

executive officer duties, as well as appointment of external auditors, specifically the

brand name audit firms, among others, do have an impact on the income smoothing

activities that prevail in these companies. As for the factors affecting income

smoothing, apart from the company size, profitability and industrial sectors highlighted

by Nasuhiyah et .al (1994), all except for management remuneration, the univariate and

the multivariate tests results obtained largely support the alternative hypotheses that

have been put forward in this study. The study also found that the model that utilized

income attributable to shareholders as the income smoothing objective to be the best fit

model. The could be due to the fact that income smoothing is most likely to be targeted

at the shareholders.

The above findings can have implications for users of financial statements and

regulatory bodies. In particular, financial statement users should be aware of income

smoothing and the factors affecting such behavior when they rely on financial

statements to help them make decisions. Specifically, users should note the influence of

the independent non-executive directors, chairman-duality and the brand name auditors,

on such behavior. Further, since extensive income smoothing may lead to inadequate or

misleading income disclosure, thus regulators should concentrate their efforts where income smoothing is most likely and most extensively to happen.

There are few limitations that exist in this study. It is appropriate to highlight these potential limitations that should be considered when interpreting the results. They are; firstly, the study does not include companies that are not listed on Bursa Malaysia board, and also those companies that are categorized as financial institutions. The authors justify the former shortcoming, by stating that the companies that are listed on Bursa Malaysia contribute a larger scale to the well being of the country's economy, as compared to those that are not listed on the boards; while for the latter, the author justifies it on the basis that they are governed under different accounting regulations. Secondly, while Eckel's (1981) index identifies companies that artificially smooth their income, it may not identify all companies that attempt to do so.

Thirdly, the companies that are taken into consideration are only those companies that have year 2000 annual report in the Bursa Malaysia website, as well as those

companies that have a complete 10 years' income statement data with the www.klse-ris.com, to enable the calculation of the income smoothing index. And finally, the study may lack external validity in the sense that since it is based only on companies listed on Bursa Malaysia, especially those companies whose companies' websites are available on the Bursa Malaysia website, thus the result obtained may not be applicable in other settings or situations. However, the results obtained from this study could be an additional contribution towards the literature on income smoothing.

This study is by no means completed or comprehensive; there are still avenues that can be further researched. For instance, research can be done on the factors that motivate managers to resort to income smoothing acts, such as in an agency setting, or on the use of various income smoothing objectives and instruments by managers. Further, following the limitations mentioned earlier, future study can also try to come up with improved methods in order to measure or even to detect income smoothing, as well as, to investigate it in different contexts (e.g., different time frame or economic cycles).

In conclusion, it is the authors' hope that with the findings compiled from the study

could be of some assistance to the investors, the rule makers, as well as other interested

parties with regards to financial statements issued by the listed companies. These

affected parties are, therefore, able to take up certain precautionary steps so as not to

be misled by the financial statements which might be a mere window dressing act by

the management executives who may want to save themselves from being scrutinized

or from being dismissed. The regulatory bodies thus are able to decide on the extend to

which income smoothing needs to be monitored and controlled. It is also hoped that

this study could contribute to the existing literature on income smoothing.

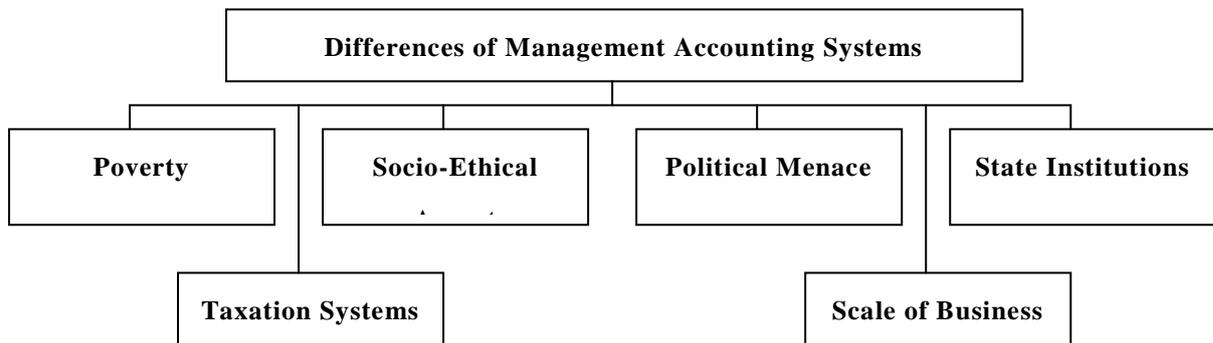
DIFFERENCES AND THE FACTORS OF CONVERGENCE OF MANAGEMENT ACCOUNTING SYSTEMS IN DEVELOPED AND LESS DEVELOPED COUNTRIES

Gohar Saleem Parvaiz, M.A Strategic Financial Management, MBA Finance

Owais Mufti, Qurtaba University of Science and Information Technology

Peshawar

Abstract:

The article focuses on two areas. First part examines the major differences amongst the systems in developed and less developed countries and the rational behind it i.e. inadequate financial resources, weak business structure, poverty, political influence, weak state institutions, difference in taxation and social-economic factors. The second part examines the factors which are motivating and intimidating these two sets of groups to follow the similar management accounting practices i.e. discouraging the system of protection, innovation in IS/IT technologies, normative & mimetic aspect, international strategic alliance and international trade agreements. Organizations operating in LDC's need to understand the pros and cons of each management accounting system considering local as well as international environment before adaptation. There are number of factors which a company needs to confront with like international collaboration, international competition, taxation, socio-ethical issues, technology, political conditions etc. Therefore the companies need to adopt the system which suits the most considering current and future prospects. However the converging factors are seen more active and dominating therefore in coming few years there are more expectation to have similar set of standards of management accounting systems.


Introduction

According to World Bank, the countries, where the gross net income (GNP) of an individual is lower than \$9,266 per annum are classified as less developed countries (LDC's) or underdeveloped countries. Management Accounting

Systems (MAS) in developing countries may operate differently from those in developed countries (Hopper et al. 2003). It is a valid argument in a way that most of the LDC's have adopted the systems from the developed countries but were unable to take the true benefits claimed and associated with them therefore the desired is to probe the critical factors which become the major ingredients for such failure. The paper is divided in two parts. First part examines the major differences among systems in developed and LDC's and the rational behind it. The second part of the paper looks toward factors which are motivating these two set of groups (developed and LDC's) to follow the similar management accounting practices. The significance of the paper is especially from LDC's point of view i.e. to understand their need to adopt management accounting tools and practices considering local and international requirement and the other motivating factors which they need to underlay before switching to any new MAS.

Differences of Management Accounting Systems

Most of the LDC's (India, Pakistan, China, Korea, Malaysia etc) after having independence pursued modernization and the foot steps of modern civilization through following central state planning and governmental control of the large enterprises (Hopper et al. 2003). The reason for such control is obvious for not having enough financial resources and business structures to support individually. The systems which LDC's have adopted were mostly from developed countries, typically based on computer technology to achieve operational excellence (which is the main theme of adopting automated computer technologies). Other than that another main accounting system, which LDC's have adopted is the budgeting system to keep in control the expenses of the private and public sectors (Pakistan and Indian public departments are the live examples of expense based budgeting systems). The following are number of factors influencing organizations in LDC's for management accounting practices:

```
                    ┌─────────────────────────────────────────────────┐
                    │  Differences of Management Accounting Systems   │

  └──────────────┘                      └──────────────────┘
```

Poverty:

The poverty is a major factor towards difference in adoption of management accounting tools and techniques. Most of the companies in LDC's do not have enough resources to safeguard there-selves by having various management accounting tools like insurance against unwanted circumstances (natural disasters, theft), inventory buffers (protection against unexpected business transactions), and improvised information systems (to achieve operational and competitive excellence). This lack of appropriate management accounting tools, leave managers with no other choice to take decisions in a traditional way, without considering the market forecasts and competition. In such environment accounting is seen nothing more than a clerical job, just as book keeping. In developed countries the theme of the management accounting system has been changed enormously, where accountants can be seen as a part of the strategic alliance of the firm, and the managers should understand the strategic role of accounting system (Steadman et al. 1995).

Socio-ethical aspect:

Due to lack of capitalists, normally people in LDC's conduct business based on personal relationships or at family terms, which is a very conservative approach towards outside world. This approach is one of the major barriers towards adoption of new methodologies because the company gets estranged from various personnel traits and new emerging talent. Considering the developed countries, now there is almost a multicultural environment in every small to

large size organization. In developed countries these methods work properly due to harmony under government strict regulations.

The literacy and experience level also matters a lot. It ensures the exposure to think and broaden the vision to evaluate what is best in the interest. We can't exercise any kind of modern MAS or policy till then the effective person would be in a position to properly grasp the main theme behind it. To properly run the modern MAS the organizations needs the right exposure to international environment and excellence in previous accounting tools like Japanese organizations, which most of the companies in LDC's don't have.

Political Menace:

Most of the countries from LDC's have weak political structure and are still trap in the black hole of dirty politics. In LDC's the politicians have much influence on business community due to their unwanted interests in different business sectors. This fact is also supported by Al-Eryani (1987) by stating that even the multinational corporations give special attention for having good relations with ruling government in LDC's. Therefore the relationship of business community with ruling politicians gets more importance than the business relations (Hopper et al. 2003).

State Institutions:

Also their have been noticed a lack of appropriate state institutions and other legislative agencies in LDC's due to which they often have a problem of swings in currency fluctuation, commodity prices and other relative issues. In LDC's often there is an environment of uncertainty and risk, which leads to wrong market forecasts, and the remaining is catalyzed by insufficient information systems, which provides less security to creditors and investors. Often there has been evidence of poor financial reporting and taxation due to which several cases of bank frauds and companies defaulted at repayments and some later on (Hopper et al. 2003).

Taxation System:

According to Blake et al. (2003) the taxation rules have a deep influence on the financial accounting in all countries. We do believe that in a country, the taxation system can have an impact on MAS. The management accountants are free to take their own approach to cost allocation issues considering their tax requirements. For example; in Finland tax law requires the stock valuation on variable cost bases. This has been influential in promoting variable costing in the management accounts. From this we can have a very good idea about the major difference in cost allocation amongst developed and LDC's. Usually in UK the corporate tax rate (31%) is far more than eastern countries, this allows different mode of tax treatment in accounting according to different countries. The Chinese government wants foreign investment enterprises to exercise market based cost to secure the interest of local partner from foreign investors (Chan & Lo. 2004), which leads to different taxation treatment in accounts.

Scale of Business:

Most of the organizations in LDC's are at the stage of value chain, where they are trying to achieve the production and operational excellence through automation and by achieving the optimum level at economies of scale (where the benefits can't be capitalized further). Whereas in developed countries most of the large enterprises have already achieved the optimum level (Toyota, BMW, Ford, SONY, GM) therefore to create the margin beyond, they have to adopt the other methods like Just in Time (JIT) in collaboration with Kaizen and then eventually to other systems like activity based costing (ABC) and target costing (TC). The LDC's still have the same old internal approach that first to develop a product and deliver it with considerable margin (push approach), and not from the customer needs perspective or claimed benefits. In a way this approach of LDC's is right because of poverty, where demands of the claimed benefits (associated with the product) are always higher than the supply side, and also the customers don't have the enough financial resources to avail the respective commodity. So in such a situation enterprises usually work on value chain to remove the duplicate process and redundant the over staff to increase profitability (Low wages to temporary and subcontracted workers who were afforded little protection under industrialized relations law). Other than that with

reference to JIT (production where companies usually have kaizen rule by having the same level of quality), in LDC's companies also compromise on quality of products to reduce the cost as minimum as possible (Schmelze et al, Kato, 1993). Normally the government appears to be the central body of control but because of too much political intervention and cultural pressures it becomes almost impossible for the government bodies to properly regulate the policies regarding material, product pricing and other similar issues.

Other than that there are also some other issues like national legislation, religion, corporate cultures etc which could be the main reason for adoption of different MAS practices in LDC's.

Converging Factors towards Management Accounting Systems

Instead of such a big cultural and ethnic differences between developed and LDC's, also there are several motivating and intimidating factors which are working towards MAS's convergence. This section will discuss the factors of convergence of management accounting in detail.

System of Protection and Globalization:

Amat et al. (1994) see the end of the system of protection that had shielded Spanish industry from international competition till the mid of 1970's as a major force for the development of MAS's in Spain. Recently the deregulation of Chinese and Indian markets catches the eyes of big foreign investors. Also the deregulation of banking and telecom sector in Pakistan has seen enormous development. These markets are now become more attractive for investments. Other than that the competitive pressures of a global economy are cited by Bhimani (1996) to explain growing interest in advance management accounting techniques in both Germany and Italy.

Similarly the concept of globalization infuses the whole new life in the international business. Now the companies' territories are no more restricted to some specific geographical areas. The whole world is now in direct competition with each other and converted into a kind of global village, where everyone is trying to give the best and using the top leading quality tools to get the competitive edge (transfer pricing is too common in case of china and India refer to Chan & Lo (2004), similarly target costing in Japan). In Brazil it has been noticed that the industries had led the way in developing the innovative approaches to costing have been those which do not enjoy government protection (Bhimani, 1996) (like in Pakistan the motorcar, textile, and airline industry is protected by government).

Technological Revolution:

The remaining difference is evolved by the fast moving and innovating IS/IT technologies, which are coming in a form of standard and customizable software's based on the leading management tools and concepts. Here I would like to mention the name of SAP application, which is based on International accounting standards. It is one of the fastest emerging application systems for enterprise resource planning (ERP). Recently most of the companies in the east are thinking to adopt this system to coherent their process and methods to

western leading enterprises (mimetic pressure as identified by Lukka & Grunland (1998)). Therefore around the globe companies are now trying to adopt the leading MAS like JIT, ABC, Target costing etc to reduce the cost and to achieve the competitive edge by adopting different generic strategies (Porters, 1985 this idea is also getting vague due to globalization. Now most of the companies are having a mix of strategies e.g. Boeing, P&G, Toyota etc).

International Trade Agencies:

There are also the involvements of some coercive pressures, which are contributing towards the convergence of MAS's. Due to the recent development in 21's century i.e. WTO and other transnational trade agreement like SAFTA, NAFTA etc enforces all the member countries to follow the same kind of trade laws and procedures. This allowed the companies from different territories to come together and trade according to international set standards. For example the letter of credit (LC) is normally used instrument in international trade. Now the banks usually follow the same set of policies and regulations to avoid the trade agreements conflicts. Agreement terms can be different at national level due to cultural, religious and other ethical reasons but at the international level they usually have the similar kind of terms and regulations for the standardization purpose.

Multinational Culture:

The multinational structure and the culture of the mega organizations like Airbus, Boeing, Proctor & Gamble, Toyota, Honda and Unilever etc also demands for the standardization of systems. Multinational organizations emphasis the need for the use of similar kind of accounting tools to all their subsidiaries, this reduces the problem of information integration and system synchronization. Other than that international financial reporting standard (IFRS) also enforces the listed companies to follow the set standard accounting procedures to stop malfunctioning and frauds at external reporting level and secure the confidence of shareholders and other external stakeholders. Other reason being to generate financial reports in a standardize format (IFRS) is to make them understandable to international investors.

Standardize Education and Professional Networks:

From the normative aspect, the recent trends of professionalization of management accountants (consultants) have included the promotion of the similar ideas of cost management (ABC, Target costing etc) and other financial measures such as balance score card, critical success factor etc (Granlund & Lukka, 1998), which are acting as a major contributing factor towards the convergence and implications of the similar management accounting systems. Most of the companies having foreign investment in LDC's are adopting new management accounting tools to acclimatize with new technologies and processes without understanding the business demands.

DiMaggio & Powell (1983) suggested that the two major sources of convergence are; the professional networks and the university education. In universities the similar books and the case studies leads to the similar kind of new emerging management thinking. Other than that the recent educational revolution in eastern world influenced thousands of students from LDC's to study in western universities, this will have a major contribution towards the convergence of management accounting as they will have a similar education background. According to Blake et al (2003) "in the absence of management accounting professional bodies the role of accountancy used to be filled by four ways i.e. 1) trained public auditors and accountants may move into the management accountants role e.g. Institute of chartered accountants of England and Wales (ICAEW) and French Ordre des experts comptables et comptables Agrees (OECCA), 2) voluntary bodies may emerge to discuss the accounting issues like The Spanish Association of Accounting and Business Administration (AECA), 3) engineers may become involve in management issues like in France where the detailed costing provisions in the accounting plan has emerged, under the influence of engineers, the concept of the 'Tableau de Bord', literally an instrument panel, presenting key physical and financial indicators, 4) universities and consulting firms can be important channel for the circulation of management accounting ideas like Belgium". But now due to the international accounting bodies like IFRS and other major

national institutes like CIMA in the UK, IMA in US and AECA in Spain as mentioned before are working more closely to regulate the international standards at macro level. There are still some major cultural and corporate issues which are not yet resolved at micro or national level, which are one of the major sources for divergence in small and medium size enterprises (SME).

Strategic Alliance:

Last but not the least the emerging issue which is contributing heavily towards the convergence of management accounting system is the international strategic alliance (ISA). This tool is not new but the use of it is more common since the last three decades. We have seen a number of large business giants coming together for the same market stake and to get the competitive advantage over their traditional rivals and new emerging challengers (Lorange & Roos, 1991). For-example Sony-Ericsson, HP-Compaq, Toyota-Frontier, Atlas-Honda, and LG etc. Usually companies exercise this tool, when the market gets too saturated and the pace remains the only key to get the competitive advantage. There are also other reasons and benefits associated with the ISA like synergy; getting access to far reach markets, protectionism, experience, competences etc (refer to case study of American and British Law firms Mellahi et al. 2005). As our discussion is related to management accounting system, I feel the joint ventures and alliances increases the need for having the similar kind of management accounting system so that the entire participants can easily integrate the results and systems with their parent company. In the near future we will come to see the major alliances amongst major giants, which will enhance to increase the need for the use of same accounting systems.

Conclusion:

Examining the differences of management accounting systems amongst the developed and LDC's and their implications according to different socio-economic factors, it can be stated as, these factors would become less important and will be discouraged in the future because of growing international business collaboration, but still, there would be some socio-ethical factors

remains, which would contribute towards the divergence of some of the management accounting treatments and systems. The converging factors like globalization, standardized application softwares like SAP, international trade agencies (WTO, SAFTA, NAFTA etc), and other accounting and operating standards like IFRS, would get more regulated and will have more implications eventually. This will enforce the globally accepted set standards and systems in all countries whether they are developed or not. In coming few years we would expecting to have similar set of standards of management accounting systems which will not only enhance the organization ability to understand international environment but also help them to learn the key strategic tools from developed nations. The conclusive statement for organizations operating in LDC's is that they need to understand the importance of each management accounting tool considering local as well as international environment before adaptation. There are number of factors which a company needs to confront with like international collaboration, international competition, taxation, socio-ethical issues, technology, political conditions etc. Therefore the companies need to adopt the system which suits the most considering current and future requirements.

E-LEARNING MODEL TO OPTIMIZED LEARNING

IN HIGHER EDUCATION

USING DICK AND CAREY DESIGN APPROACH

A.A. Gde Satia Utama & Khusnul Prasetyo

AIRLANGGA UNIVERSITY

ABSTRACT

Nowadays many universities in the world apply technology enhanced learning in order to help learning activities. Due to the potentials that technology enhanced learning offers, recent education using it and universities in particular are trying to apply it. One of the subjects of this research is The Accounting Department of Airlangga University in Surabaya.

Accounting Department as one of many departments in Unair, faces challenges when it comes to implementation of information technology enhanced learning. The idea of this research is to investigate the students about how they deep they know about e-learning system and learning objectives as a first step to conduct e-learning model. The students' answer will be combined with teachers' opinions regarding the implementation of technology information and how they prepare themselves to face e-learning. After the model completed, the next step is to prepare database learning. Entity Relationship Diagram (ERD) can be helped to explain the model.

The purpose of this research was done by using Dick and Carey Design Model. There are nine steps to conduct e-learning model. All steps can be categorized into three steps research: first is the introduction or empirical study, the next step is the design and the last is the feedback after the implementation.

The methodology used in this research is using Qualitative Exploratory, by using questionnaire and interviews as data collection techniques. The questionnaire and interviews were collected from Accounting Students and All professors in Accounting Department.

The analysis of the data shows organization required to need information about e-learning content, user as a learning subject and information technology infrastructures. Before conducting e-learning model, the content must be fullfilled requirement and then must be tested the function of e-learning model and fill the content to complete.

E-learning model as one of the alternative learnings can help users to optimaized learning.

Keywords: E-learning content, E-learning System, Database Learning, Entity Relationship Diagram (ERD), Dick and Carey Design, E-learning model and Optimize learning

CHAPTER 1 — INTRODUCTION

1.1. Background

Information technology (IT) currently plays a critical and strategic role. Application of information technology is omnipresent, such as in economy, business, banking, engineering, social, culture, and so on (Erdani, 2007). Application of technology-based information system is also pervading educational environments, where education principally represents processes of communication and information of educator and the educated. These processes contain educational information with educator as source of information, media as means of presenting idea, educational ideas and materials and educators themselves (Adri, 2008). Educational institutions in Indonesia are currently competing for educational utilization of information and communication technology, construction of hardware infrastructure, the

Internet network development, software procurement, and so on (Arifin, 2007). Educational utilization of information technology is more commonly known as electronic learning or e-learning.

Educational development directed into e-learning is a must (Triono, 2007) and the need for concept of information technology-based teaching and learning is a requisite (Widodo, 2008). It has been believed that improvement of education productivity can be achieved by using information technology (Witanti, 2008). Development of e-learning in Indonesia is only so limited to transfer of e-learning content that communication is only one-way, by which students can download materials of lectures administered by lecturers through web sites of respective universities (Adri, 2008).

Rapid development of information technology supported by sophisticated technology creates opportunities for researchers to find solutions for organization problems. Advances of information system lead to the carrying out of educational researches, such as by Wahid and Suryani in Indonesia and by Kurti in Kosovo.

Research by Wahid (2007) concerned with "Lessons from Implementation of E-learning: Diffusion of Innovation Perspective." The research dealt with analysis of factors influencing adoption and diffusion of Klasiber, a portal of e-learning. Approach employed in this study was diffusion of Innovation Theory developed by Rogers. Those innovations

were *relative advantage*, *compatibility*, *complexity*, *observability*, and *triability*. The purpose of research was to implement e-learning by using *Learning Management Systems (LMS) of Moode open source* subsequently called Klasiber. Object of research was Information Technology Faculty of Universitas Islam Indonesia. Method employed was survey. Results indicated that the above five general characteristics of innovation proved to influence the pace of Klasiber's diffusion and Klasiber, bot by lecturers and students.

Study by Suryani (2007) was more concerned with the development of IT Governance in higher education institutions by referring to standards of COBIT 4.0. Processes of model development started with measurement of maturity of current IT Governance followed by a phase of gap and risk analyses in order to identify IT processes urgent to be implemented. Result was a proposed model of IT Governance sufficiently appropriate to the higher education institution "X" that was the setting of the research. Subsequently, validity test was conducted to the model.

One of recent studies of e-learning was conducted by Kurti (2008) entitled "*Students's experience on eMesimi: an e-learning system in University of Pristhina, Kosovo.*" The research employed Octagonal Model approach as suggested by Khan. The constructed e-learning model was based on three domains: educational, technological, and organizational. The e-learning had been applied in the university of research object, the

researcher being only evaluated its application. Method used was qualitative exploratory method by using questionnaire administered to students and interview to senior and junior lecturers as data collection. Results indicated a difference in viewpoint on e-learning utilization among senior and junior lecturers.

Differences of this study and previous studies can be summarizes as follows:

Table 1				
Similarities and differences of previous studies and present study				
Aspects	**Present study**	**Wahid (2007)**	**Suryani (2007)**	**Kurti (2008)**
Similarity	Equally deal with e-learning as special topic			
	Object of research is higher education institutions			
	Employ qualitative method			
	Use approach of some experts in analysis and construction of model			
Difference	Present study	Wahid	Suryani	Kurti
Purpose	Construct e-learning model	Analysis of e-learning portal	Development of IT Governance model	Evaluation of e-learning model
Process	Dick and Carey Design Model	Diffusion of Innovation Theory by Rogers	Standards of Cobit 4.0	Octagonal Model by Khan
Respondent	Lecturers and students	Students	All element of organization	Students and (senior and junior) lecturers
Result	E-learning model without validity test	Effect of innovation on pace of diffusion	IT Governance model with validity test	Difference in viewpoint of senior lecturers and junior ones on IT utilization

Source: Processed data, 2008

1.2 Problem Statement

Based on the above background, the present research has two statements of the problem, namely:

1. How to construct models of e-learning and database learning?

2. What is e-learning model appropriate to achieve optimal learning in higher education institutions by using Dick and Carey model?

1.3 Motivation of the Study

Abundant opportunities for every education institution to apply e-learning was, in fact, not supported by optimally utilized information technology. Therefore, the faculties need to be prepared to master skills and creativity in developing content of e-learning in order for the learning to be optimal, that is, more interesting, interactive and the content can be absorbed fully by students. In the future, many higher education institutions are expected to be inspired to make e-learning as their excellencies.

1.4 Purpose of the Study

The purpose of the present study is to construct e-learning model appropriate to higher education in order to achieve optimized learning.

1.5 Contribution of the Study

The study contributes to providing an alternative learning model for education where there is no temporal and spatial differences between educator

and the educated. Model of e-learning with Dick and Carey approach can be used in all level of education (elementary, secondary, and higher education).

CHAPTER II — THEORETICAL REVIEW

2.1 Literature Review

There are many terminologies in today's education realm that have nearly the same connotations, namely *web-base learning*, *online learning*, *computer-based learning* and *distance learning* (Effendy, 2005). Electronic learning (e-learning) is a special combination of technology, especially informatics and education (Setiawan, 2005). According to Thompson (2000), "E-learning is instructional content of learning experiences delivered or enabled by electronic technology." He suggested that the most important elements of e-learning are its contents and delivery by using information technology. In addition, Thompson expressed e-learning advantages of capable of providing flexibility, interactivity, speed and visualization through a variety of respective technological advantages. E-learning would be more effectively utilized by using a more extensive computer network of the Internet. E-learning system using the Internet is also called *Internet-enabled learning* (Nurhayati et al. 2008).

Instructional materials are critical factors in developing e-learning materials. Consequently, a basic and clear principle of development is required. In doing so, a principle of Instructional Design can be used

(Setiawan, 2005). Instructional Design is used to design, develop, evaluate, and refine an e-learning for higher education (Siragusa, 2008).

There three (3) criteria for optimal utilization of the Internet technology in delivering learning (Rosenberg, 2001): (1) e-learning is a network with capability of updating, retaining, distributing, and allocating instructional material or information; (2) transmission to end-users through computer by means of standard Internet technology; (3) focus on broadest view on learning behind traditional learning paradigm.

In instructional designs, there are voluminous models that can be used to compose e-learning-based instructional materials (Botturi, et al. 2008; Herridge, 2004). Among those models are (a) Morrison, Ross and Kemp who tend to class orientation, (b) Seels and Glasgow who tend to outcome, and (c) Dick and Carey who do not only orient to class and outcome but also overall system. Additionally, instructional skills in the selected models are required to be applicable to all levels (low, medium, and high). Differences of the three models can be found in **Appendix 1a and 1b**.

In general, model of Dick and Carey underlying this research uses system of outlining overall learning processes in composing smaller parts, starting from determination of instructional purposes to its evaluation (Dick, 1990). Model of Dick and Carey design can be found in **Appendix 2**.

Attitude building in Dick and Carey's model represents learners who are expected to have comprehension before entering e-learning

implementation phase. There are several standard requirements that have to be fulfilled: comprehension, skill, and attitude. Those requirements shall determine their applications of e-learning, from how to plan learning initially, processes, receipt of assignments and examinations, through the final phase of learning evaluation.

Learning objectives are emphasized more on how learning processes are eventually achieved, what forms of those achieved learning objectives, and a variety of conditions such as supported infrastructure, media, learning techniques or methods.

Learning phases are emphasized more on how instructional materials should be delivered by lecturers to students. Student-lecturer interaction plays important role here. Assignment of tasks, quizzes, exams and reception of results take place in learning phases.

The final phase is evaluation performed after the completion of learning processes. Evaluation shall be benchmark of success of learning processes.

2.2 Conceptual Framework

Rationale for the present research followed models of Dick and Carey Design. However, there was a development of the model involving database

as a site of data storage and construction of e-learning model. The Conceptual Framework can be found in **Appendix 3**.

CHAPTER III — METHOD

3.1. Type of Study

The present research used methodology of qualitative approach. Method employed was exploratory research. Research by using qualitative-exploratory approach was extensively carried out to inform an innovation; for example, detailed study of web-based learning environment (Agostinho, 2005).

3.2. Data and Sampling

Data collection in this qualitative-exploratory research used interview and documentation. Detailed technique of data collection can be found in **Appendix 4**. In order to obtain detailed information on what contents of e-learning construction in order for the ideal model to be fulfilled, this research employed lecturers and students of Faculty of Economy of Airlangga University in accordance with criteria of (a) permanent lecturers and structural officials of Accounting Department of Airlangga University, (b) students of Accounting Department of Airlangga University. The use of lecturers and students as respondents for this research was based on a consideration that they were elements in learning processes. They actively

and passively involved in learning processes. The present research employed
purposeful sampling since the purpose of its was to construct an e-learning
model that would eventually be implemented in Accounting Department of
Airlangga University.

3.3. Stages of Research

Based on the abovementioned method and theory, processes of research
aimed at producing an e-learning model could be summarized as follows:

1. Observation stage, important considerations of which were:

    a. What are general learning purposes that would be performed.

    b. Who would be participants of the learning.

    c. What materials that would be delivered to the participants.

    d. What processes that would influence success of learning processes.

2. Model construction stage, consisted of:

    a. Outlining general purposes into smaller learning purposes.

    b. Collecting instructional materials from a various source of experts.

    c. Utilizing Dick and Carey's method in accordance with purposes.

    d. Finding problem samples relevant to materials prepared.

    e. Determining media that would be used in delivery of materials.

    f. Determining who would be involved in learning processes.

    Contents of e-learning collected in the preliminary phase/observation
were then constructed into an e-learning model that would be depicted in the
form of Data Flow Diagram (DFD), a web e-learning mapping. After

construction of e-learning model, the next phase was construction of e-learning database based on contents originated from results of analysis. The database was subsequently assembled by using Entity Relationship Diagram (ERD) and resulted in e-learning database. This database would be a basis in implementing e-learning. The above overall stages could be made into table of input-process-output as can be found in **Appendix 5**.

CHAPTER IV — RESULTS AND DISCUSSION

4.1. Overview of Information System of Accounting Department of Airlangga University

Information system of Airlangga University was interconnected to information systems of respective faculties, one of them was Faculty of Economy of Airlangga University. Information system of Faculty of Economy was employed concomitantly by four departments: Accounting, Economics, Management, and Islamic Economy. Facilities of information system resource of Faculty of Economy, among others, included Internet access terminal, computers for academic activities, bandwidth, and server. Hence, Accounting Department together with other three departments received facilities of information system in order to provide services:

1. SMS for ascertaining academic reports, semester credit units to be programmed, and accumulative number of semester credit units. This

program was available to students by means of cooperation of Faculty of Economy and a cellular phone provider.

2. Hot spot within buildings of Faculty of Economy of Airlangga University capable of being used by all academicians by means of laptop with wi-fi facilities.

3. Inter-computer network available to facilitate process of data collection. The network was equipped with a security system in order to prevent access by other illegal parties.

4. An online study plan programming used by undergraduate students of Accounting in order to program subjects of study.

5. Class lectures using computers or laptops, and LCD where computers in every class had its own server containing instructional materials.

Faculty of Economy as one of faculties with the greatest number of students in Airlangga University certainly needed to contemplate on what strategies that needed to be devised or developed in order to fulfill user demands, including lecturers and students. Indeed, those strategies needed to be initiated from respective units/departments in Faculty of Economy, one of them was Accounting Department.

Rationale for selection of the setting only in Accounting Department was in order to initiate designing e-learning in a smaller scope by utilizing the available university website. Content of e-learning was searched for

completely in order for construction of preliminary formulation when the content was developed in a higher level.

4.2. Data Presentation

Data of the research originated from interviews with lecturers or structural officials in Accounting Department and students of Accounting Department. For the sake of completeness and comprehensiveness of data, questionnaire was administered to permanent lecturers of Accounting Department and students of Accounting Department. Documentation data was also obtained.

4.3. Discussion

The obtained four sources of documentation, namely GBPP, SAP, Syllabus, and Education Manual were closely related to success of learning. For the sake of clarity, discussion was confined to only one subject, Management Information System. Observational results of GBPP, SAP, Syllabus, and Education Manual appropriate to achieving output are summarized in **Appendix 6**. In order for the e-learning to be applied, GBPP, SAP, Syllabus/contract of lectures, and Education Manual needed to be translated into computer language.

In fact, Accounting Department has utilized IT in limited fashion for searching for information and the lecturers possessed their own e-mail addresses for informational exchange with workmates. Results of questionnaire administered to lecturers showed that as much as eight

respondents very frequently used the Internet for searching for information in order to support learning processes. In addition, 91.7% of them possesses e-mail addresses, which was expected to optimize e-learning utilization. Lecturers, administration staff, and students as users were keys to e-learning success. E-learning model was certainly strived for eliminating direct lecturer-student interaction as was in the class. Lecturers were by far used facilities of LCD and laptop to run powerpoint or as aids in delivery of materials. This was based on students' responses of the question of technologies used by their lecturers in the class and their capabilities in operating it.

Infrastructure of Faculty of Economy provided sufficient facilities to students in searching for the needed learning information. Facility of wi-fi in the campus area of Faculty of Economy was extensively used by students to search for lecture materials or other information. Fulfilled requirement of infrastructure resource would facilitate installation to home Web site of Faculty Airlangga University that had already linked to faculties. Web site of Airlangga University has already been used by most students of Accounting Department of Faculty of Economy. About 90.2% respondents have ever visited the Web site and utilized link facilities available in the university Web site. Home Web site of Airlangga University was used by students to browse faculty link, academic link, and departmental link, successively.

Processes of learning currently taking place in Airlangga University were one-way and two-way. One-way process of learning connoted a direct face-to-face interaction of lecturers and students where the lecturers spoke and the students sat down and listened. In two-way process of learning, there was lecturer-student interaction interrupted by discussion. In general, processes of learning were divided into three stages: preliminary planning of the learning, process of material delivery and media involved, and the final stage of evaluation.

Based on analyses of documentation, organizational and user demands, infrastructure and processes of learning, it was known that lecturers and students played important roles in e-learning. In addition, media of delivery and supports of information technology of the Internet complemented the use of e-learning. Stage of designing could be performed after the completion of these analyses.

4.4. Designing of E-learning Model

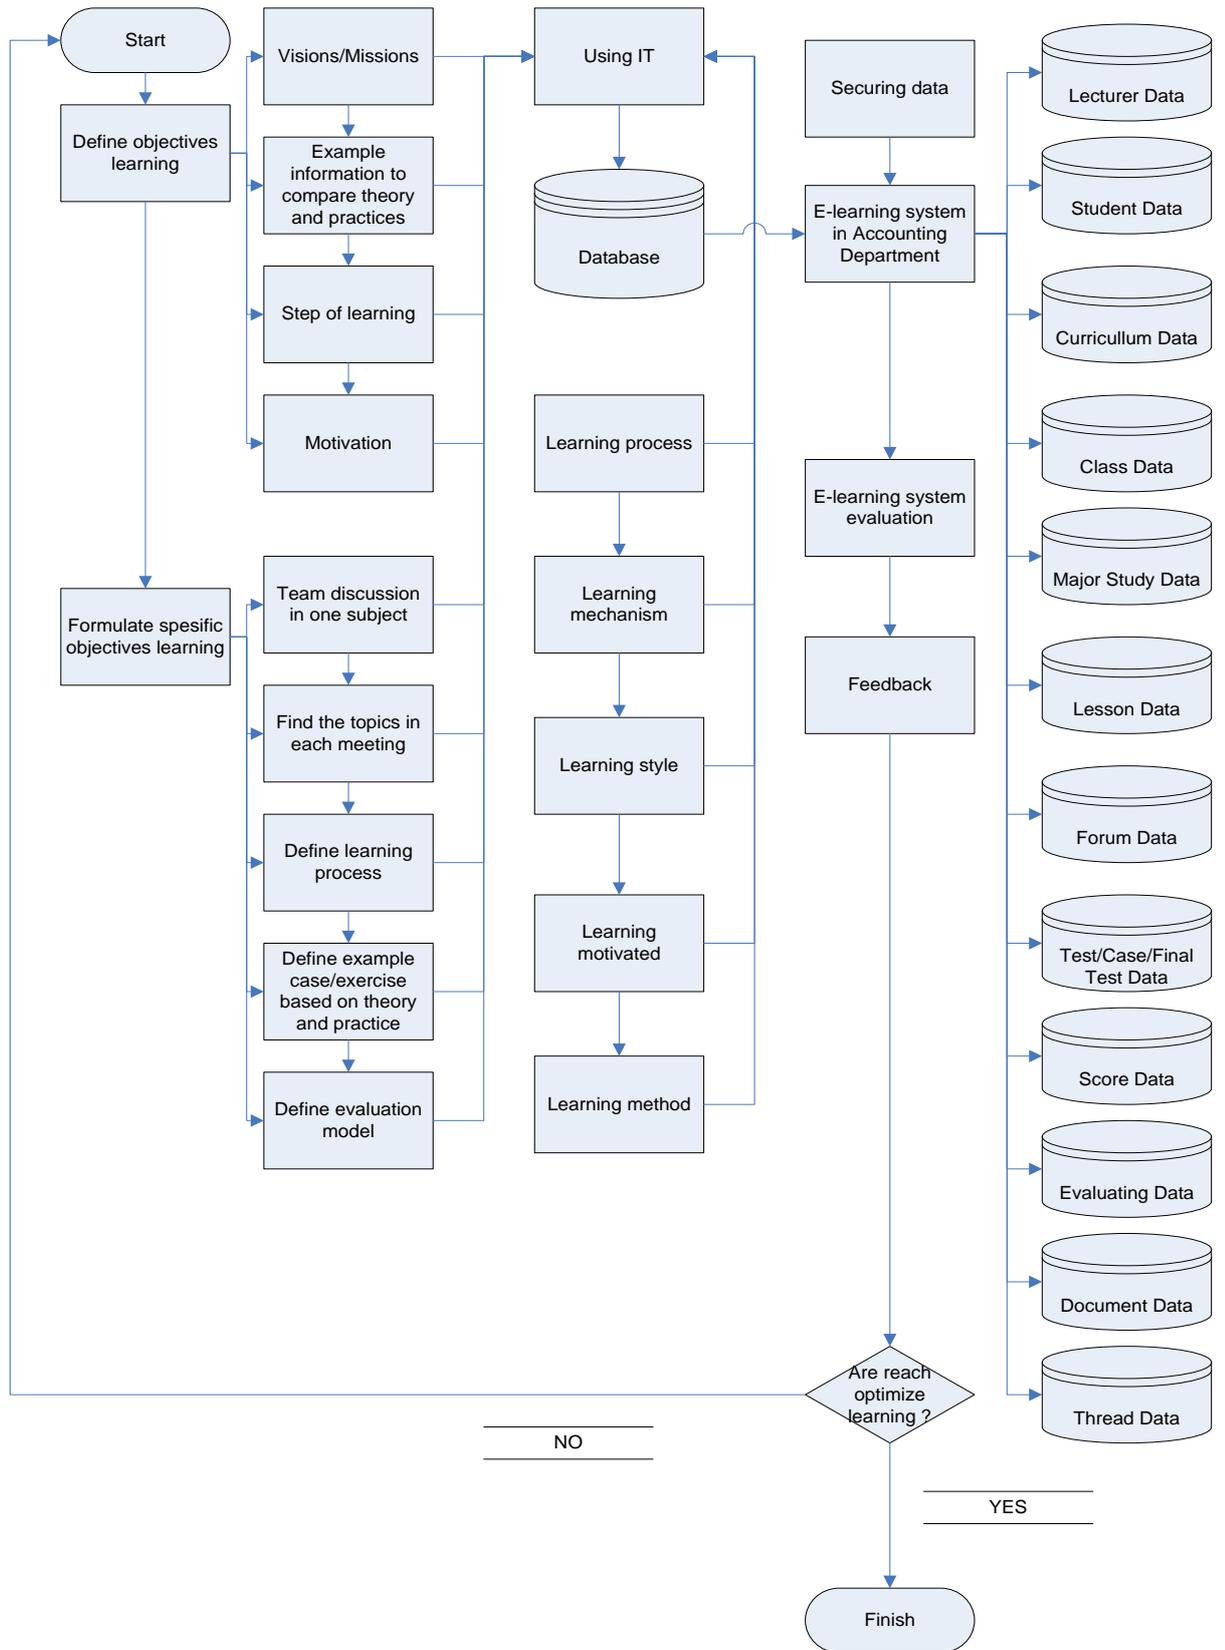
This stage was initiated by determining content of e-learning. These materials would involve lecturers, administration staff, and students. Content of e-learning can be found in **Appendix 7**. Before the construction

of e-learning model, Data Flow Diagram (DFD) was to be made firstly. This diagram can be found in **Appendix 8** and database of learning.

Data Flow Diagram (DFD) of e-learning explicated lecturer-student interaction in the processes of learning. Database of learning was a storage function in e-learning system that would be made when the e-learning would be implemented.

The Data Flow Diagram (DFD) could be started firstly from lecturers or students, or administration staff. There was no standard rule governing this since all of them were interconnected and interrelated flows of data and information. There three parties that would involve in the processes of e-learning: administration staff, lecturers, and students. Administration staff was responsible for arranging and controlling data input from students and lecturers, including for creating preliminary setting of e-learning. Once the e-learning setting created, the lecturers and students were capable of interaction. In e-learning, lecturers uploaded instructional materials and delivered it to students during the on-line class. Lecturers were also capable of changing desired materials or deleting outdated materials. Additionally, lecturers were facilitated to send questions of exams and their answers with scores to students.

In utilizing the Internet facility, students firstly entered login and password and subsequently downloaded the desired e-learning materials. During on-line lectures, discussion facility or forum group could be utilized.

Answers to questions or quizzes administered by lecturers could also be given. Evaluation of learning was also facilitated by online questionnaire on outcome of learning that could be completed directly by students and the results could also be obtained fast in order for ease of follow-up.


4.5. E-learning Model of Accounting Department of Airlangga University

The constructed e-learning model would be better when it was applied. It needed to be tried out to a small class on certain subject in order to determine whether that constructed e-learning was already appropriate, comprehensible to lecturers and students and in order to supplement or update e-learning contents.

This e-learning model could only be applied to Accounting Department due to adjustments to various demands. As it has been known, every higher education institution had its own characteristic and specificity of resource. E-learning model of Accounting Department can be depicted as follows:

Figure 1

E-learning Model Accounting Department Airlangga University

Based on the above model, there were several stages of e-learning:

1. E-learning-based planning of learning, including the following components:

    (1) Content of e-learning

    (2) System of material delivery

    (3) Lecturer-student interaction

    In planning of learning, content contained arrangements related to objects and materials of learning. These arrangements included:

    (1) Stage of learning, starting with delivery of objectives of the learning, stage of material delivery and closing, including session of learning.

    (2) Delivery of materials of learning in the forms of texts, pictures, videos, audios, simulations, or electronic presentation.

    (3) Interactive activities in the forms of forum groups, teleconferences, face-to-face interactions. Use of e-mail was intended to activate students both individually and in-group and provided latitudes for students to search for sources of learning in the Internet, initiate discussion, generate forums, create blogs, and so on.

    (4) Assignments and tests could be in the forms of study tasks, independent tests, quizzes, exams, and so on.

2. Stage of processes of learning. There several cores of processes of learning, the two of which were:

(1) Finding principal materials of learning. There were several aspects to be prepared first in this stage:

   a. All computers had to be connected to the Internet.

   b. Students had their own e-mail addresses.

   c. Students possessed capabilities to download principal materials of learning.

   d. Students possessed capabilities to edit principal materials of learning and then send it to e-mails of lecturers.

   e. Students possessed capabilities to store the re-sent edited materials into CD or flashdisk.

In brief, the stages of finding principal materials of learning were:

a. In the feature of subjects, there should be entered information on objectives of learning both generally and specifically, and contract of lecture was stated fully.

b. Students downloaded principal materials of learning according to objectives of learning.

(2) Execution of exams. Aspects to be prepared before the execution of exams with e-learning, among others, were:

   a. Lecturers prepared banks of questions in a relatively large number but according to the expected objectives of the learning, so that the questions could be randomized in order for students to have different set of questions. These banks of questions should be

equipped with program of randomization for questions, keys to answers, and scores obtained by every participant.

b. Every student possesses his/her own special number, fox example a registration number, as an identity in addition to his/her name by the time of data entry.

c. All networks were well connected, where banks of questions and supporting programs were stored.

During execution of exams with e-learning, several aspects to be considered were:

a. Students opened their own e-mail, opened questions prepared by lecturers, and completed their personal identities.

b. Students answered questions during predetermined time and then sent those answers to be processed.

c. Students were to receive their scores based on their answers.

3. Evaluation of the learning.

Evaluation of learning was an important part of e-learning success. By means of database of evaluations, it could rapidly be known which elements of assessment required improvement and follow-up. Therefore, in the implementation of e-learning, management system needed to be given attention. The management system consisted of arrangements and monitoring of student tracks and lecturer records, time and schedule of

execution, access to both users and administration staff, prevention of plagiarism, ethic code and maintenance of data.

CHAPTER V — CONCLUSION

5.1. Conclusion and Suggestion

Conclusions that can be drawn from the present research, among others, are:

1. Stages in the construction of e-learning model were initiated by identification of organizational needs, users' needs, infrastructure and processes of learning. In those stages, objectives, participants, techniques of material delivery, media and processes of learning were to be identified. Thee next stage was identification of e-learning needs and then designing of the e-learning. This stage was started by determining contents of e-learning.

2. E-learning model for higher education institutions was different according to their respective needs and characteristics. In constructing an e-learning model, one of approaches that could be used was Dick and Carey Design. The constructed e-learning model only reflected the need for information system of Accounting Department of Airlangga University. The e-learning model was initiated by determination of objectives of learning, then instructional activities involving online discussion, material uploading and downloading, online administration of quizzes and exams and evaluation. Those activities were translated

into computer programs and constantly utilized the Internet in its applications.

Suggestion provided in order to obtain adequate outcomes are:

1. Strategies of direction priority and objectives of learning in Accounting Department need to be re-devised and then executed. Training of human resource and an integrated management information system must be priorities.

2. In addition to lecturers and students as users of e-learning, administration staff is highly desirable for the success of e-learning.

3. Lecturers as main sources of learning were obliged and must have e-mail.

4. E-learning server needs to be supplemented in Accounting Department.

5.2 Implication

The constructed e-learning model shall be used as basis for determining an e-learning model in a higher scope (faculty or university). The e-learning model shall be flawless when it is translated into programming language or software.

HARMONIZATION OF ACCOUNTING STANDARDS AND EXTENSION OF EXTENSIBLE BUSINESS REPORTING LANGUAGE (XBRL)

Saeed Jabbarzade Kangar lui
PHD student and member of scientific broad IAU of urmia
Akbar Pourreza soltan ahmadi
Member of scientific broad IAU of Salmas

Abstract:

XBRL is a language based on XML for the electronic communication of business information. It is designed to improve the exchange, aggregation and analysis of corporate data requiring disclosure, through a unique tagging structure that provides interoperability. But the proliferation of a multitude of XBRL taxonomies, based on different accounting principles, can risk the objectives of harmonization, comparability and reusability of the information that is sought with XBRL. It is there fore essential to develop harmonization accounting standards as a unique foundation on which the XBRL taxonomies can be established, so that it becomes possible to compare the financial information originating from various countries. Along these lines, harmonization of accounting standards can be created to establish a common ground for international firms and create a platform that would enhance the benefits of XBRL. This paper investigates the importance of accounting standards harmonization in extension of XBRL.

Key words:

Harmonization – Extensible business reporting language (XBRL) – Extensible markup language (XML) – Standards

Introduction:

XBRL (Extensible business reporting language) is a commercial branded language, based on XML, dvised with the aim of establishing standardized protocols for the transmission of accounting information

through the internet. Currently, it is being promoted by the consortium XBRL international, which groups around 450 companies and organizations committed to extending the use of a standard taxonomy globally. XML is a meta language; in other words, it represents metadata that are essentially data about other data. These metadata play a fundamental role in facilitating the search for information on the internet. On this latter point, Alimohammadi (2003) notes that the internet lacks the necessary structure to allow users to rapidly find the information that they need, and metadata provide a possible solution for better organizing and retrieving digital information. Accordingly, XBRL as an adaptation of XML to the business world should allow financial information to be managed more effectively and efficiently.

The principal components of XBRL are the items and the taxonomies. An item is a fact that makes reference to the entity that issues information by means of XBRL and a" taxonomy" is a set of elements that allows several different items of information to be represented in an XBRL document. These items can be associated with the auditing, elements of the financial statement themselves, and accounting policies. Each of this groups is included in a different taxonomy; some of them are universal in scope, while others are specific to nations or regions and allow the requirements of the accounting regulations in each environment to be represented; that is, they are in accordance with different sets of generally accepted accounting principles. At first sight, these adaptations may seem an advantage, but in reality they represent an impediment for achieving the full, comprehensive expansion and application of the standard. There fore, if the bases on which the XBRL taxonomies rest are different, users will not be able to compare the financial information corresponding to companies from several countries. A possible solution to this problem is the development of a toolset capable of translating the financial statements prepared under a set of accounting principles into another one. Along these lines, the IASC foundation XBRL team is developing theories and mechanisms to compare taxonomies and to signal equivalent concepts. However, this toolset is still under development (Eccles et al.,

2001; Jensen and xiao ,2001), Unless a different approach is adopted, the objectives of harmonization, comparability and reusability of information that XBRL is intended to achieve will be put at risk. It is essential to develop a set of accounting principles and standards of universal character that would make possible the comparison of the financial information originating from many different countries.

The concept of accounting standards harmonization

Accounting harmonization is defined as "a process of increasing the comparability of accounting practices by setting limites on how much they can vary. Harmonized standards and free of logical conflicts, and should improve the comparability of financial information from different countries" (choi, frost & meek, 2001, p291). Accounting harmonization is a process leading to the ultimate goal of increasing comparability of financial information across national borders.

Accounting harmonization is a multi faceted concept, containing at least three components of accounting harmonization (choi et al., 2001): 1) harmonization of accounting standards, which deals with measurement and disclosure; 2) harmonization of disclosures made by publicly traded companies in connection with securities offerings and stock exchange listings; and 3) harmonization of auditing standards. Countries with very similar accounting standards may not be comparable for reasons well beyond the similarity of the respective accounting standards. It is possible to have a situation of only apparent accounting harmonization if the standards are relatively similar, but if either the culture of compliance or the system of enforcement is inadequate.

Development of an operational measure of accounting harmonization is a complex issue. Two sets of accounting standards may be "in harmony" but may apply different sets of rules to the same situation since each national set of accounting standards allows degree of choice of treatment. Scholars (canibano & mora, 2000) note there are two forms of harmonization: de jure and de facto harmonization. De jure, or formal

harmonization, refers to the harmonization of regulations. De facto or informal harmonization, refers to the actual accounting practices of corporations. De facto and de jure harmonization can each be broken down into two components. The degree of disclosure and measurement criter: This results in four forms of accounting harmonization: 1) de jure measurement harmonization, which concerns regulations governing what is disclosed, 2) de jure measurement harmonization, which concerns regulations governing how reported quantities are measured, 3) de facto disclosure harmonization, which concerns what corporations actually disclose; and 4) de facto measurement harmonization, which concerns how corporations actually measure quantities.

The concept of accounting convergence

Recently, the term" accounting harmonization" has at times been by the term "accounting convergence "this term has been defined as:

The process pursued by the international accounting standards board(IASB) of eliminating the present differences between national accounting standards and the avoidance of future differences to achieve international accounting harmonization (Hussey& ong,2005, p.229)

In this sense, accounting convergence is a process that occurs at the standard setting level intended to achieve a state of de jure accounting harmonization. It is possible to measure de jure harmonization by focusing on the range of choices provided by various accounting standards.

If we consider measurement as a system of assigning numbers to qualities of an object, we can consider a set of accounting standards as rules for measuring aspects of the financial condition of an organization. If the two measuring systems are equivalent, they should produce the same set of accounting numbers. For example, if U.S accounting standards and IFRS were equivalent, then net income reported under

U.S accounting standards and net income reported under IFRS should be the same.

If the two sets of accounting numbers are different under each set of accounting standards, then the measuring instruments are not equivalent. If the two sets of accounting standards are becoming harmonized over time, then it is likely that the numbers purporting to measure the same quality (e.g. net income) of an organization would be moving closer over time. This is the meaning of the term convergence.

XBRL and opportunities and challenges

XBRL (Extensible business reporting language) is the XML based solution being developed for business information reporting. XBRL uses XML based data tags to describe financial and other business information to facilitate external and internal reporting by companies. XBRL is an open specification, which means any one can develop applications using it, and is freely licensed in order to encourage wide acceptance.

XBRL is expected to create significant benefits for all participants in the business information supply chain. Examples of the potential uses of XBRL include:

- Internationalization of capital markets and external reporting.

- Important to emerging markets to assess global capital markets.

- Trust and creditability of financial information.

- Important to market transparency and timely reporting.

- XBRL links accounting with non accounting information.

- Preparation of financial statements for statutory and other purposes.

- Analyses of financial information (e.g. equities research, investment management,. . .).

Despite the clear benefits that XBRL provides for the business information supply chain, its current usage is very limited. In order for XBRL to be deployed success fully on a universal basis a number of requirements must still be met, including the following:

- Common specifications need to be developed. Although taxonomies need to be tailored to meet the requirements of particular industries or jurisdictions, all specifications should cue a similar (XML based) framework.

- Software applications that automate tagging of information with XBRL tags need to be developed.

- Style sheets that can produce information in various different reporting formats need to be created.

Accounting standards harmonization and extension XBRL

XBRL is a language based on XML for the electronic communication of business information. It is designed to improve the exchange, aggregation and analyses of corporate data requiring disclosure, through a unique tagging structure that provides interoperability. Nowadays, there are many different XBRL taxonomies, based on different national accounting regulations. At first, these adaptions may seem an advantage but, actually, they represent an impediment for achieving the full, comprehensive expansion and application of the standard. If the bases on which the XBRL taxonomies rest are different, users will not be able to compare the financial information corresponding to companies from different countries.

A possible solution to this problem is the development of toolset expable of translating the financial statements prepared under a set of accounting principles into another one. Along these lines, the IASC foundation XBRL team is developing theories and mechanisms to compare taxonomies and to signal equivalent concepts. However, this toolset has not been developed yet. Therefore, in order to fully exploit the capabilities of XBRL, it seems essential to create a common set of global accounting standards with the objective of facilitating the comparison firms from different countries (Eccles et al., 2001). Only under the presence of such standards could the efficiency of XBRL be brought to exceed the desired levels.

the treatment of certain transactions, as for example the **negative goodwill** *or the* **extraordinary items** *or again* **the minority interest in the income statement.** *The taxonomy is very flexible. It does not require the data to be presented in any specific order. Its only aim is to provide a complete list of the elements and the relationships between them.*

XBRL "tags" individual items of data and in doing so enables them to be recognized and processed by different kinds of software, rather than simply tagging a block of information as is the case with the presently used HTML coding. "Taxonomies" are the dictionaries utilized by XBRL. They define the specific "tags" utilized for the individual elements of data (as for example "net profit"). The various taxonomies differ for the different countries and different business sectors and are generally prepared and managed at the national level. Many countries, in fact, have developed their taxonomies based on their own accounting standards, which are then recognized by XBRL international and made available for consultation on the organization's official site.

The reporting terms used in financial reporting, the relationships between terms and the structure of a report can be expressed using XBRL. In this way XBRL is much more than merely a simple grouping of data and relative tags. In particular, the taxonomies are constituted by a "schema" and various "linkbases".

The schema is substantially the container of the definitions of the various elements. These definitions go to form a tree structure (or taxonomy) that determines and links the various elements in the various reports. The linkbases, in turn, are constituted by a series of "links" that provide further information regarding the individual elements by linking them to one another and to further information sources (labels in various

2505

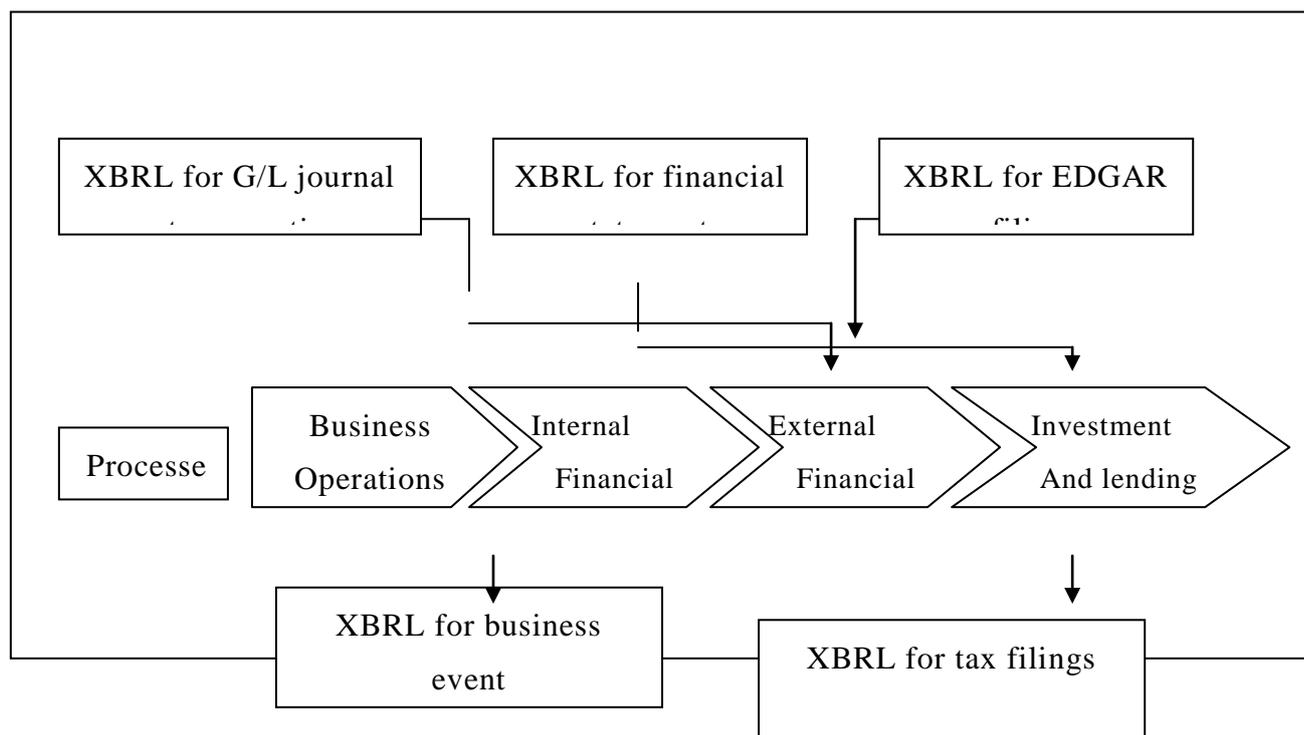
common patterns of financial reporting, elements for "structural completeness" (such a sub total), and elements required specifically for XBRL specification.

Expansion forms of XBRL

1- Expansion of XBRL for different processes:

As Fig.1 illustrates, the XBRL steering committee is expecting to expand the XBRL specification in other related financial domains. The box labeled "XBRL for financial statements" presents the initial XBRL activities.

External financial reporting to external parties is, however, only one aspect of XBRL. The standard also has the potential to be used for tax filings or for other regulatory purposes, such as reports to the regulators of financial institution.



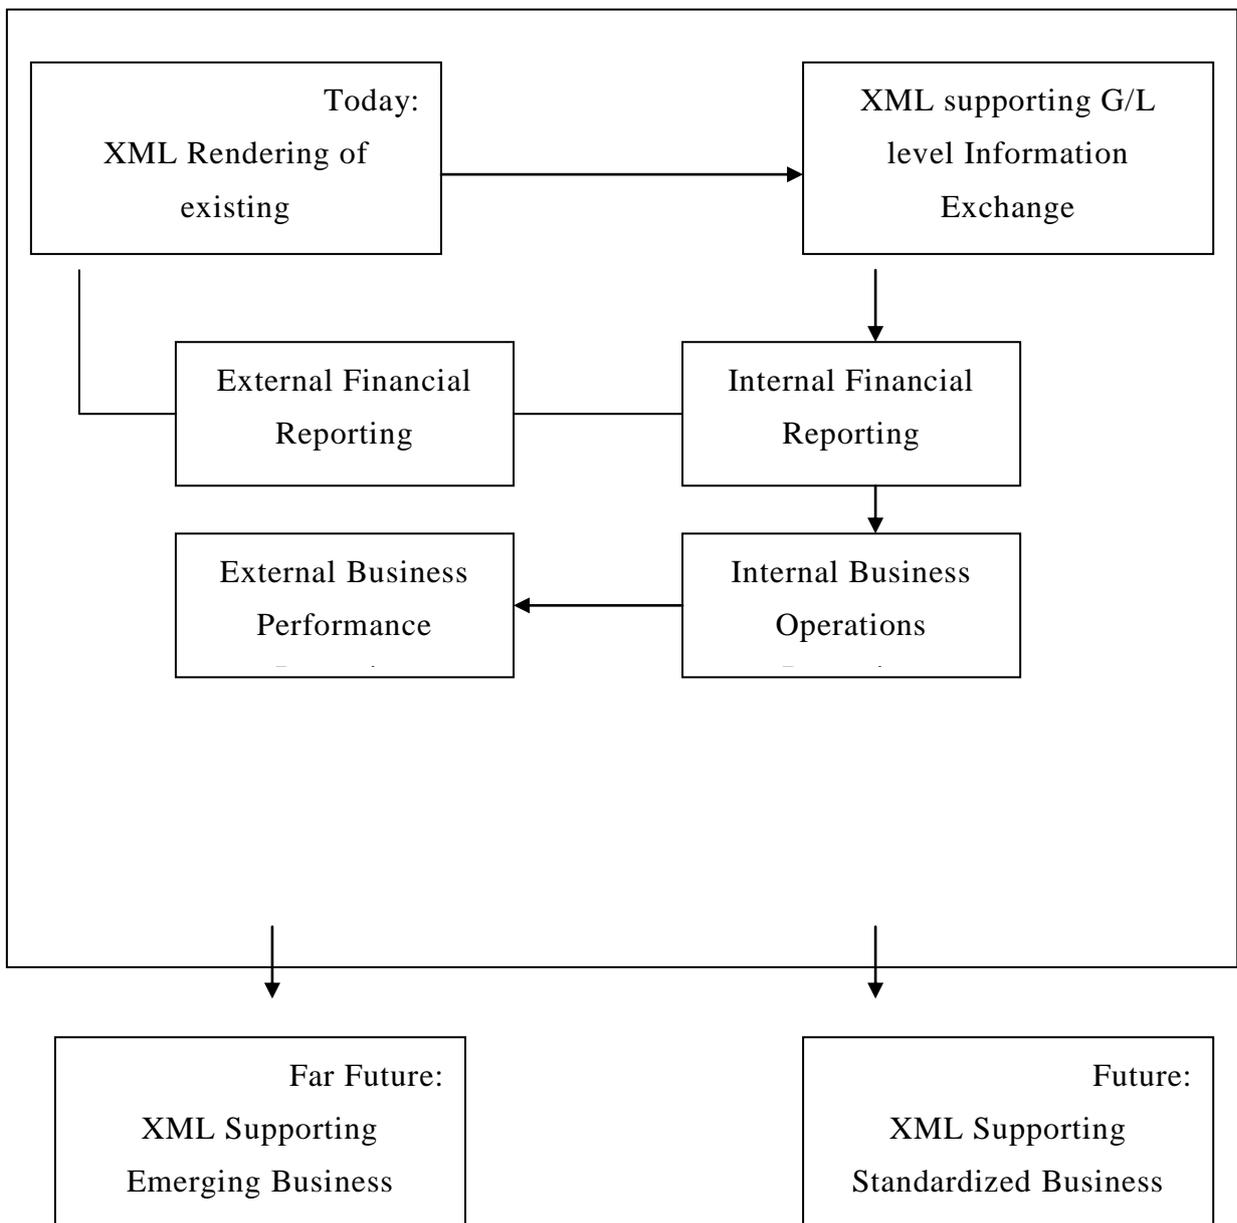


Fig.1. Expansion of XBRL for different process.

Fig.1. Expansion of XBRL for different process.

2- Expansion of XBRL beyond financial reporting:
Fig.2 illustrates expanding beyond financial reporting. The four blocks in the center of Fig.2 can be viewed as four cells in a 2×2 matrix. Vertically, reporting can be divided into external and internal. Horizontally, the contents of the reports could be divided between financial and operational. The larger arrow in the background of Fig.2 illustrates the evolutionary flow of the expanding XBML domain. Initially, XBRL is focused on external financial reporting.

Conclusion:

XBRL (Extensible Business Reporting language) is the XML based solution being developed for business information reporting. It is designed to improve the exchange, aggregation and analysis of corporate data requiring disclosure, through a unique tagging structure that provides interoperability.

Since, the proliferation of a multitude of XBRL taxonomies can risk the objectives of standardization, comparability and reusability of the information that is sought with XBRL, it is essential to develop global accounting standards as a unique foundation on which the XBRL taxonomies can be established. The harmonization of accounting standards with creation of common ground for international firms, can increase the benefits of XBRL.

As a final conclusion, a future scenario is proposed in which the reviews of the IFRS-GP taxonomy need to be continuous, or at least frequent, to be able to detect possible mis fits between the taxonomy and the reporting practices of companies that prepare their financial statements based on IFRS.

ISLAMIC VIEW OF ACCOUNTING AND NEW THEORIES

Yaghoub Aghdam ,
Member of science board of Islamic Azad University (Iran-Sofyan branch)

Abstract:

These years accounting has found more relationship with society, culture, religion, markets and economic. Some researches thought that concentraiztion of accounting and have consensus that can cause to simplifying on interpreting and understanding of themes and increase the authority and reliability of financial statements. There are some common points between some religions in doing trade and some common rules. That guide and help mans and corporate to do fairness transactions. In this way we survey some Islamic views that want people to do them for progressing and developing. In the last section we conclude that Islamic commands on contrasting with boarding and creating of resources inflow have relation with activity based costing (ABC) and just in time producing (JIT)

Key words: International accounting, culture effects, just in time, hoarding

Islamic accounting at theoretical perspectives:

These days there are many discussions in society about the effects of religious aspects of accounting. In some Islamic countries scientists believes that

regarding of Islamic rationalities may have efficiency on accepting and doing of better accounting by Muslims. In these countries Islamic commands have more efficiency on human's lives and government has to establish Quran Sonnat. In this way some accounting scientists differentiate between Islamic and eastern economics.

As mentioned in Islam, man is just trustshiper of god give recourses. But at eastern economy man is the final owner of resources and Muslims responsibility is for gods and people, in this way all Muslims corporations can just do legitimated transactions and are responsible for there transaction results to al; interested on corporation and god so the main instruments for that is known khoms and zakah. In the capitalist societies profit maximizing, personal interests are the base of economical movement but in Islamic view of economy society benefits, fairness, trustiness are main factors whom would be suspected. Some transactions like trading alcoholic, gavel, gambling are prohibited in Islam. There for economical activities would be based on no including   those activities.

So Islamic accounting determined as: systematic process of recording of legitimated transactions, measuring and reporting of financial statements.

As mentioned some Islamic regards the main different between traditional and Islamic accounting is "legitimated" that is esoteric for understanding Islamic accounting and there would be explored   some principles of this view of accounting. In many Islamic countries established some council for surveying

transacting for recording Islamic legitimating on the other hand Islamic society cannot accept and support no legitimated transactions that some corporations do them. Muslims believe that all transactions that are prohibited on canon of Islam ,have losses for people and perfect likelihood society so they would be deposited for society .but accounting has to record and maintain results of both legitimated and non legitimated transactions .

These days we can found some relation between Islamic commands for prohibited activities and benefits of that for society. These days scientists emphasis on losses of alcoholic on human organism.

Zakah

Another definition of Islamic accounting is a process of identifying, measuring and reporting legitimating of financial activities that are used to decision, measuring zakah and actual profit of Islamic investment based on Islam commands. So other goals of

Islamic accounting is measuring Zakah. Zakah are commanded in Islam canon as a permanent factor of developing Islamic societies. So another function of accounting is measuring of Zakah as a regulator of worth among man. Recently zakah has been can centrated in so many Islamic countries. Pursuant of Islamic commands all Muslims that have residual benefits from some activities must pay some amounts as zakah for government, this is like tax that use for adjusting so worth between poor and rich people. Zakah is personal and there is not

requirement for corporation to any Zakah. Main goal of Islamic accounting is usefulness for decision, agency function, and Islamic responsibility.

Usefulness for decision:

Islamic accounting goals for banks is determining propose of banks activity that would be charity loans. In this way all Islamic banks would consistent their activities with Islam commends and they have to achieve permit of shariah. So main purpose of Islamic banking reporting are:

1) Information about sharieh regarding in banks.

2) Information about economical resources and obligations and events.

3) Information required for determining zakah.

4) Information about cash in flow estimation.

5) Information about banks responsibility for resource keeping.

6) Information about social responsibity of banks.

Some researchers believe that Islamic accounting theoretical framework that is prepared by Islamic accounting institutions is common with traditional accounting framework. In tradition view relevant information for users are whom that are related with financial position and performance may be that is one of difference between Islamic and traditional accounting also Islam and Muslim expect companies to have rational profit. Financial accounting proposes is preparing information needs of outside users that are environmental needs. So environmental factors are effective on accounting and if there is international need, accounting have in so many Islamic countries trading and corporation are

like other countries and in many cases are common so Islamic accounting propose would corer all institutions information needs and we can not limit Islamic accounting proposes.

In Islam canon maximizing of profit is not prohibited if that is in framework of Islam legitimating. In practice there is common motivated for Muslims in achieving profit and we can set some standard for special trades of Muslims like Islamic agreements standards.

Some Islamic accounting researcher's limit that just for zakah while that is not true and it would develop trading, taxing and even cost accounting and management like JIT, ABM. Further more Islamic accounting proposes can be used on usefulness for decision making is useful for responsibility. So information that are used for Muslim decision making would used for sharieh responsibility of Muslims. In this way some researchers discuss that word of 'Islam' would be add to accounting and state of Islamic transaction accounting can be true. So some Islamic accounting and auditing institution set some standards for these transaction reordering. Because international accountings standards have not have related standards about Islamic agreements these institutions are active but it seemed there would be common standards included by IASB about Islamic transactions.

Stewardship

Stewardship accounting has theme at historic .in this concept human is stewardship of god for maintained of resources and has to create profitability and efficiency of them as a social responsibility.

In Islamic view stewardship means that all assets which owned by peoples are belong to god and people most do there agency task rightly and would be responsible for. in so many cases god transferred his rights to people and wants them to keep that in right way .on the other hand all resources which owned by people are belonged to all people as gifts from god for all kinds of people in this way worth can be adjusted by Islamic rules as gods commands at Quran and can notice to this that is one of major factors of permanent and sustainable development of economics and societies.

Social accounting and Islamic accounting:

Social contract theory:

Lately there are a lot of variations in environmental and social revealing of companies. Social contracts theory supposes that conscience is the social insight in such an excellent way to who act legitimately and according to contract. Social contracts theory completely contact with environmental contracts assumption. This theory supposes that companies participate in social contrast agreeing with society in forming social, environmental demands to reach their goals and finally surviving of themselves.

Definition of legitimacy theory:

Social contract is done for arranging reciprocal effects of social. This contract was between citizens and actually is formal declaration of condition that is better for all of people and the role of democracy with attention to appealing of people is performed. It is also try to characterize the right of person, social and environmental groups in contravention agreement between social members. The legitimacy theory is appeared in context of reciprocal effects of organization, Society and environment which is state that organizations are trying continually for assuring that their activities are done as social appeals until they assure that there is positive understanding from their activities which have be done out of organization's activity. Organizations as small member of big circumstance in which they have activity are controlled. This days not only the stockers are in contact with social contract but also adherent of environment are benefit from social contracts. However in past, benefit of companies was the only means of measuring the legitimacy of companies, today's institutions remain with legitimacy title to develop their activities in same form and size with goals of environmental and social system. Ignoring social contract means defeat in acting as expect of society and environment which may cause to delete some social contract and lose of activity license from society. This state appears when society knows that environmental expenses of company are more than its benefit for circumstance. Vice versa organizations and institutions which have

successful connection with society and acted according social contract, have more benefit distribution than cost and expenditure for society and circumstance in suitable financial and social situation

Environmental accounting:

Any accounting information which is inform the decision makers and make noticeable perm in reaming the environmental reality, have two important characterizes: first, they are relate to accounting information, secondly, they are reliable. From accounting benefit view, successful institution is which increase production in maximum. While increase in volume of inputs accompany with increase in volume of outputs and financial border remain acceptable among dates and takes in accounting goods.

In real economic situation, all inputs are from environment and all outputs are catches and distributed goods with terminated which are return to environment. From this view successful institution is one which has more destruction and effect in environment. Accounting measures them only where it can estimate this effect as element that can change into money. In other word when it can gain final cost, it can recognize them. Because it seems impossible to estimate any price for most of environment destroying element so they are delete. It seems that in modern accounting system, continually destroying of environment must be fallowed. Now one of discussable topic is environment reporting and

increasingly environment auditing which is characterize other aspects of organizations and their activities.

Lately noticeable increase is happened in accounting research, especially in environmental effect of organizations. Researcher pay most of their attention in environment investment, management of environment and its auditing form, environmental reporting, role of accounting in playing environmental responsibility of organizations, effects of environment accounting in both financial and auditing statement, insurance, bank debt, destruction of cutch and legitimacy.

Conclusion:

At the end we conclude that zakah and khoms are Islamic instruments that are made for adjusting worth and economic between all kind of human and because of Islam commands people have responsibility for good maintenance of all resources that are gifted from god. Also As mentioned above social and environmental accounting completely are related with resources that are trusteeship and gifts from god and emphasized at Islam commands for keeping rights god and people . So we can explode and include them in Islamic accounting too. As Islam keep so many importance for payment of labors fees and emphasized on preservation environment also have emphases on costumer right as mentioned: Woe to those that deal in fraud, Those who, when they have

to receive by measure, from men, exact full measure, But when they have to give by measure or weight to men, give less than due. Do they not think that they will be called to account? On a Mighty Day, A Day when (all) mankind will stand before the Lord of the Worlds? Nay! Surely the Record of the Wicked is (preserved) in Sijjin. And what will explain to thee what Sijjin is? (There is) a Register (fully) inscribed. (Surah Al-Mutaffifin:1-9)at the end we can receive some new theories of accounting base on Islam , like JIT systems that not having saved goods in stores is recommended and necessitated at Islam commands(hoarding) so Muslims can create resources inflow .

ISSUES OF FINANCIAL LITERACY AND SUPERANNUATION

Ms Ide Clinton

Australian Catholic University

ABSTRACT

The purpose of this paper is to provide an exploratory of the financial capabilities of superannuates and the protection offered by Government and the Financial Services Industry in Australia. Interpretivism techniques have been used to examine various reports and websites provided by government authorities. Results indicate that even though financial literacy programs have been introduced and amendments to legislation to improve the protection of superannuation funds have been made, many people are still making incorrect investments regarding superannuation. This paper examines the need to increase financial literacy educational programs in the light of current demographic and economic trends.

Keywords Financial Education, Financial Risk, Superannuation, Financial Service Industry, Fraud. Interpretivism.

INTRODUCTION

In Australia today, superannuants bear more risk in regards to their financial security than their parent's ever did. This has been brought about by government policies such as the deregulation of the banking and financial system and the introduction of self funded retirement in the form of superannuation. The deregulated financial market has brought about economic benefits for some but unfortunately for others it has brought their financial ruin, this is due to the lack of understanding of the financial risks, costs and rewards associated with their financial decision making. Issues of financial literacy are growing with the increase in complexity of the financial markets and regulation.

Australia is confronting the social and economic issues associated with a large and rapidly growing aged population. Demographic trends indicate that by 2047, 42% of the population will be over the age of 65 years (ABS 2005). People are living longer and retiring earlier and spending as much as one third of their life in retirement (ABS 2006). Therefore, planning for retirement is important if superannuants want to maintain a good standard of living in retirement.

Superannuation is compulsory for all working Australians and this puts the government under some obligation to protect these funds and educate consumers. Government policy is that superannuation is a desirable form of saving for retirement. Funds are deposited in entities within the Financial Service Industry (FSI) that in turn invest in the marketplace and charge fees for doing so but the risk associated with investment is born by the superannuant. The role of government and the Financial Service Industry has been poor in regards to the protection and education of consumers.

This paper will focus on an exploratory investigation of the increase in financial risk of individuals with emphasis on superannuation and the role of regulatory bodies in protecting the public interest. A brief overview of the research method will be explained and a discussion on the regulatory bodies will follow. The third section of the paper will focus on some of the recent 'scams' or fraudulent activities that have occurred causing some superannuants to lose their

retirement savings**.** Finally some suggestions on policy changes and conclusions are drawn.

BACKGROUND AND LITERATURE

Over the past twenty years there has been a shift in financial risk from Government and corporations to the individual. In the past corporations would provide pensions on retirement in the form of defined benefit plans for their employees. The onus was on the employer to ensure that the employee would retire with adequate funds. The Government would provide modest pensions for those who did not qualify for a defined benefit plan. Over the past decade the shift of responsibility for retirement funds has been placed on the individual. Now employees have to ensure that they have adequate funds to maintain their lifestyle and health insurance in their retirement. At present there is more than $700 billion in the superannuation pool and that amount is growing by $50 billion a year. The biggest growth is in self-managed or do-it-yourself funds (SMSF). While the idea of managing your own money may be desirable, experts

warn it can be a trap for the unsophisticated superannuant who can lose all monies invested.

In addition to the above circumstances the introduction of Super Choice and changes to Portability Provisions has given the majority of working Australians more control over the management of their superannuation benefits. Super Choice will allow the 9 million Australians' with superannuation to invest in any fund they wish. A loophole in the legislation allows people to gain access to their superannuation on 'compassionate' or 'hardship' grounds before they reached the official preservation age which is between 55 and 67 years of age depending on the individuals date of birth. Compassionate or hardship is defined as the inability to meet living expenses due to terminal illness or long-term unemployment and payments are generally limited to $10,000 per annum.

The lure of control and access to superannuation funds to pay off mortgages and other accumulating debts has led some superannuants into making

detrimental decisions when unaware of the stringent conditions as stated above.

There are 'financial advisors' who encourage people in financial strife to withdrawn their superannuation funds and charge a fee of 20% or more of the funds assets, only to find several months later a tax penalty for the early withdrawal of funds, which can be up 50% on the amount withdrawn.

Also the deregulated innovative financial world has expanded the range of financial products and strategies available to superannuants, providing scope for better financial risk management but also allowing (and encouraging via advertising) greater financial risk taking (Davis, 2007). Unfortunately, many superannuants that were born between 1946 and 1964 purchase products that are not suitable for their needs. Superannuants who are lacking financial literacy skills find it difficult to identify products and services that are appropriate to their needs;

> they are unsure about how best to access and evaluate independent advice; they make inappropriate financial decisions;

and they fall victim to abusive practices and mis-selling (FSA, 2005).

More generally, the persistently high profit rates of financial institutions and the income of financial advisers raises the question of whether, despite competition in financial markets, many superannuants pay too much for the financial products they need (or feel they need) to purchase. The availability of 'easy' income from less than informed superannuants leaves them vulnerable to unscrupulous conduct. 'Superannuants face a wide range of alternative, heterogeneous; complex and can constantly changing financial products' (Davis, 2007).

Financial markets are intertwined with superannuation funds and government policies. The markets are mechanisms for investment of superannuation funds and have been producing healthy returns for investors up until recently. Government policies promote economic development and encourage savings to increase the living standards of the community. In addition some of the funds

have been used to purchase shares in newly privatised state assets. When the market fails or there are unscrupulous financial advisors many superannuants can and have lost their life savings therefore having a significant social and economic cost. As a consequence the Government imposes more regulation which in some instances complicates policy and superannuants understanding.

In the past few years there has been an increase in mortgage debt and consumer credit with some concerns raised over the lack of financial knowledge which has lead to some superannuants who are seeking to reduce their debt succumbing to immoral behaviour as mentioned above. In the current financial climate low levels of savings and increasing high interest rates are being experienced which have placed many Australians in an adverse financial position.

Concept of Legitimacy

Corporations and governments are artefacts of society that are enabled through legalisation and it has been argued by many authorities (Shocker and Sethi 1973, Reich, 1998) that their existence depends on the willingness of society to continue to allow them to operate and as long as they hold a moral obligation to act in a in the responsible manner. The moral obligation forms a part of the social contract between business, government and society. This social contract forms the basis of many theories, eg. Legitimacy theory (Dowling and Pfeffer, 1975, Guthrie and Parker, 1989, Matthews 1993), political economy theory (Guthrie and Parker, 1990) accountability theory (Gray et. al. 1995) and stakeholder theory (Roberts, 1992). These theories have common characteristics but it is evident that the common theme is the relationship between stakeholders and the enabled bodies.

Legitimacy theory is derived from the notion that corporations and governments will strive to legitimise their actions in society and has been defined by Dowling and Pfeffer as:

A condition or status which exists when an entity's value system
is congruent with a value system of the larger social system of
which the entity is a part. When a disparity, actual or potential,
exists between the two value systems, there is a threat to the
entity's legitimacy (1975:122)

Legitimacy theory posits that the legitimacy of a corporation and government to

operate in society depends on an implicit social contract between the entities

and society. These bodies lose their license to operate in society by breaching

society's norms and expectations (Kent and Monem, 2007:7). Therefore, if a

company or government perceives that its legitimacy is at threat it will alter its

operations to conform to society's current values and norms.

Organizations seek to establish congruence between the social
values associated with or implied by their activities and the
norms of acceptable behaviour in the larger social system of
which they are a part. Insofar as these two values systems are
congruent we can speak of organizational legitimacy. When an
actual or potential disparity exists between the two value
systems, there will exist a threat to organizational legitimacy.
(Dowling and Pfeffer, 1997:122)

This allows society to achieve a whole rang of social objectives that it otherwise could not do. Many organisations have taken actives roles in improving their communication channels in order to comply with societies expectations as Dowling and Pfeffer in their seminal paper on legitimacy theory make the following point;

> … since legitimacy is a constraint on behaviour, organizations in which values, output, or methods of operation are currently at variance with social norms and values will tend to alter these values, or methods of operations to conform to social values (1975:131).

Suchman (1995) refers to a 'generalised perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions' (p. 574). Organisations will continually seek to ensure that they are perceived to be operating within the social values and norms of society. Unfortunately for organisations, these values and norms are not fixed but change over time, therefore requiring organisations to be responsive. 'Legitimacy' is consider to

be a resource on which an organisation is dependent for survival (Dowling and Pfeffer, 1975; O'Donovan, 2002) therefore it is an attribute that is desirable for organisations to operate in society successfully. It could be said then that legitimacy theory is really based on management's perceptions on how society views the organisation. If society views the organisation in a negative manner then management will do everything in its power to be perceived as conforming to society's values and norms.

However, the majority of research examines legitimacy on an organisation level and rarely at the level of an individual decision-maker. Devos et al. (2002) research about the degree of people's trust in institutions found that;

> .. trust in institutions was linked positively to values such as security, conformity, and tradition, but negatively to values such as self-direction. This supports the view that seeking security and conformity relates to stronger attachment to collectivities, while reliance on own judgment and individuality is compatible with a sceptical attitude towards institutions. (p.481)

Devos et al research is insightful in that if government and organisations are not seen to be looking after society in relation to social and economic benefits then these bodies will risk disapproval. Society's values are constantly changing and organisations need to be reactive to these changes as Lindblom (1994) states

> Legitimacy is dynamic in that the relevant publics continuously evaluate corporate output, methods, and goals against an ever evolving expectation. The legitimacy gap will fluctuate without any changes in action on the part of corporation. Indeed, as expectations of the relevant publics change the corporations must make changes or the legitimacy gap will grow as the level of conflict increases and the levels of positive and passive support decreases (p:3)

MAINTAINING LEGITIMACY

Lindblom (1994) identified four strategies for maintaining legitimacy.

1. educate and inform (in response to the recognition that a legitimacy gap may exist)
2. change the perception but not actually change behaviour (misconceptions in the market place
3. deflecting attention from the issue and adapt a positive strategy to override any negative performance
4. change expectations (unrealistic or incorrect expectations of the companies responsibility)

In order for the government to legitimise its changing role it has combined several government agencies to regulate and enforce legal requirements in the protection of $1.4 trillion dollars invested in superannuation assets (APRA 2008) and also to protect the superannuants themselves.

There are three major agencies that are involved in the regulating and protection of superannuation assets, The Australian Securities and Investment Commission (ASIC) which is responsible for market integrity and is the enforcer of regulations. The Australian Prudential Regulation Authority (APRA) is concerned with the quality of a financial institution's systems for managing the various risks in its business. The third body, the Australian Taxation Office (ATO) acts as a compliance overview on self-managed superannuation funds, employee superannuation contributions and tax rules in regards to early withdrawal of funds.

By deregulating the financial industry, the government has made an implied statement that consumers will act in their own best interest based on disclosure supplied by the industry participants. The amount of government intervention over recent years has made superannuation and taxation regulations very complex. Unfortunately, it appears that many Australians lack the knowledge, experience and judgement to make informed decisions on financial matters. In the 2008 a survey of Adult Financial Literacy found that 20% of people surveyed where 'unsure' of the type of superannuation fund they contributed to (ANZ, 2008:69).

In recent years there has been considerable attention paid by the FSI and the Government to the delivery of programs that enhance financial capability in the community. To this end the Government has established the Financial Literacy Foundation and various companies within the FSI have introduced programs such as the ANZ Money Minded. Money Minded consists of adult financial

education programs that are developed to help people build their financial skills, knowledge and confidence in relation financial planning for now and the future.

There are many reasons for these initiatives but in particular the ongoing changes and complex rules and regulations of superannuation are clearly affecting superannuation understanding. The Commonwealth Bank in one of its latest newspaper advertisements states' Retirement planning made simple, because most of us aren't fluent in gobbledygook' is a reflection on how one of Australian's major banks understands the difficulties that face superannuants in making financial decisions.

A survey conducted by the Financial Literacy Foundation in 2005 found that 67% of respondents said they understood the principle of compound interest when asked to make a calculation only 28% were rated with a 'good level' of comprehension. In 2007 a further study was conducted by the same body and it revealed 88% of the respondents were highly confident in their ability to protect their money and were able to recognise a scam or an investment scheme that

seemed 'too good to be true'. But the same survey found that many participants

were not confident in their ability to understand financial language which could

indicate a higher degree of vulnerability to scams (FLF, 2007).

Superannuation is a complex issue and it is important to understand the

financial capabilities of superannuants in order for the FSI and Government to

delivery appropriate programs. It is also necessary to understand the role the

FSI and Government play in the inclusion and exclusion of information and how

they conduct their activities for the benefit of the community.

The shortfall is between the FSI and Government expectations of

Superannuants' financial capabilities and the ability of Superannuants to

increase their own personal wealth for retirement. On the other hand

Superannuants rely on Government and the FSI to act in their best interests.

Even educated and well informed consumers cannot predict fraudulent

behaviour.

Figure 1 Gap of Confutation

Figure 1 above illustrates the confutation gap that exists between the government, FSI and Superannuants. This is due to the increased responsibility on superannuants to provide financially for retirement, the rising number complex financial products available, the increase in risk and changes in legalisation including taxation law has lead to a confutation gap.

Australians' ability to manage financial risk would also be helped by better government policy on financial education for consumers and control of products.

There has been an increase in the options and complexity of financial products

which can cause confusion by the sheer volume of information. Without education and expert independent advice, the range of choice available to investors may actually compound the problem (Smith, 2008)

RESEARCH METHOD

To demonstrate the confutation gap an exploratory study utilising a 'natural setting' which has been defined by Vogt, 1993 (in Collis and Hussey, 2009, p153) as a research environment that would have existed had researchers never studied it. The environment for this study is the relevant government agencies websites.

This study undertakes a interpretivism focus 'that explores the complexity of social phenomena with a view to gaining interpretive understanding. The research involves an inductive process with a view to providing interpretive understanding of social phenomena within a particular context. (Collis and Hussy, 2009:57). Therefore this research method will lead to a board conclusion and hopefully lead to further research.

EXPLORATORY OUTCOMES

One of the major activities that Government and the FSI must perform is the protection of superannuants' funds. Whilst most of the information delivered to consumers is on the performance of their funds, not much information is made available to the community on the superannuation 'scams'.

On the ASIC website some of the recent 'scams' and prosecutions are;

- Australians have lost at least $400 million to telephone investment fraud or cold calling scams over the last decade.

- Advertising flyer promoting access to superannuation for a fee of $2,000.

- Unlicensed financial advisors advising clients to withdrawn superannuation to pay off mortgage and other accumulated debt.

- Convincing superannuants to switch from their industry super fund to a retail super fund

The above three cases are recent convictions, but unfortunately these practices have been in existence and known to some of the above authorities for nearly 10 years as presented on various government websites. Even though laws prohibiting the withdrawal of funds and financial literacy initiatives have been introduced clearly these strategies are not working as can be seen from some events of 16 years ago.

- An accountant was convicted and sentenced to 3½ years imprisonment with a non-parole period of 27 months for fraudulently obtaining the payment of $2.5 million in superannuation benefits on behalf of 114 clients between August 1996 and October 1999.

- A Financial adviser was convicted of fraudulently inducing the payment of $62,000 in superannuation benefits on behalf of three of his clients and for theft of part of these payments in November and December 1999. He received a three month suspended sentence and ordered to pay $38,000 in compensation to the clients.

- An insurance agent was convicted of fraudulently inducing the payment and theft of five clients' superannuation benefits totalling $34,000. These offences, which occurred between August 1996 and February 1997, resulted in him receiving a four-month suspended sentence and order to pay compensation to the clients.

In the early 1990's the Government set about establishing 'tough' new regulations to control such scams and introduced financial regulation, including arrangements for market integrity, consumer protection, stability and competition.

In response to the financial problems which occurred in the late 1980s and the expansion of superannuation, prudential regulation was upgraded through tougher capital requirements and structurally reformed through the consolidation, refocusing and better coordination of regulatory agencies. The greater range and complexity of products and, in some areas, concerns about more aggressive selling practices, have led to an increased focus on consumer protection. This has resulted in new consumer credit regulation and new rules for disclosure, codes of conduct and dispute resolution (Australian Treasury, 1997)

But it would appear that these 'tougher capital requirements structural reforms' have not had the desired effect. For Government who has made superannuation compulsory and FSI who members are responsible for investing these funds they need to be more in tune with society's expectations, failure of superannuation funds could wipe out entire savings of some superannuants therefore having a social consequence.

The Australian Tax Office (2009) (ATO) website warns 'beware of illegal schemes to withdraw your superannuation early' and that;

Both promoters and participants of these schemes are breaking the law and will face heavy penalties and potentially prosecution, even if the participant was unaware that their actions were against the law.

Unfortunately the judicial system is lenient on such promoters and the 'heavy penalties' do not compensate the victims. It is evident from the above that the Confutation Gap between Government, FSI and Superannuates is a serious social issue.

SUMMARY AND CONCLUSIONS

Unfortunately, these changes have not had the desired effect as can be seen from the first three cases on superannuation 'scams' which occurred in 2007. As stated above the role of Government is changing from a facilitator of goods and services to that of a protector of the community. There appears to be great hope and expectations placed on the outcomes of financial literacy programs provided by the FSI and the FLF but unfortunately the findings from the survey conducted by the FLF suggest that fewer Australians are confident in their ability to understand financial language, yet their confidence in related areas,

e.g. recognising a scam and dealing with financial service provider, is comparatively high (FLF, 2007) which exploratory evidence presented suggests is not the case.

The Association of Superannuation Funds of Australia (ASFA) is critical of the consumer protection structure and cited recently that 'poorly designed and complex information disclosure processes have long been the bane of effective decision making by consumers, (Vamos, 2007). With billions of dollars tied up in superannuation it is evident from the above that government and the FSI need to be more proactive in consumer protection and education.

This paper is based on anecdotal evidence collected from various government bodies and regulatory authorities. However, it is indicative of an underlying problem that needs a more objective test for hardship and compassion and a federal agency body should be established to administer the early release of

superannuation funds. More research is needed in this area so that strategies can be put in place to aid and protect superannuants.

There appears to be a disjointed match between government legislation and the superannuation industry. The regulations have not improved the protection of funds and people are still being disadvantaged by the miss-appropriation of funds. What the government's intent and what is actually happening appears to be increasing the confutation gap of all parties involved.

Areas of further research

Challenges exist in trying to address financial literacy, particularly in light of changing knowledge demands in the twenty-first century. There needs to be mechanisms in place that allow superannuants to obtain independent advice and this advice needs to be in a format that is understandable and affordable to the individual. More research needs to be undertaken to ascertain the best

method of delivering and information. Reliance on the internet as the major tool of communication appears not to be working.

In relation to crime and superannuation this is an under-researched area which involves some difficult conceptual and methodological issues due whether the perpetrator is caught, charged and incarcerated. This will depend on the resources available to police superannuation funds and financial advisors and affects the availability of data.

LEASING IN TRANSITIONAL COUNTRIES – CASE OF B&H

Maja Letica, bsc.

Mirela Mabic, bsc

Jelena Brkić, bsc.

Abstract

Lease is defined as "an agreement whereby the lessor conveys to the lessee, in return for a payment or series of payments, the right to use an asset for an agreed period of time".

Leasing is used to finance a vast range of assets and leases can be tailored to meet the needs of clients, implying that almost any kind of good can in principle be leased.

Among many reasons why to lease there are finacial reasons, efficiencies and advantages, quick application process, flexibility etc.

Two major types of leasing are financial and operative leasing.

Accounting treatment of the financial leasing stipulates that legal entity – the lessee shows vehicle, machine or equipment acquired through leasing arrangement as capital asset and as obligation to the leasing company. Monthly installment is booked separately on principal and interest. Interest with tax

enters the cost, and principal decreases liabilities to the leasing company. The lessee calculates depreciation on the leased asset, as capital asset, in accordance with valid depreciation rates.

On European leasing market, Bosnia and Herzegovina belongs to CESEE countries group (Central Eeastern and South Eastern Europe), where currently, according to the statistics, is the biggest increase of leasing business. The value of the concluded leasing contracts in 2004 was 106.361 million Euros, while in 2005 the value was 185.025 million Euros, which is 74% more than in 2004. This fact proves that leasing business in Bosnia and Herzegovina is in increase.

Key words: lease, leasing, financial lease, operating lease, IAS 17

What is leasing

The simple term lease covers a myriad of different contact types, the common feature of which is that the lessor retains the ownership of the leased asset throughout the life of the contract.

With a multitude of definitions existing in local GAAP, fiscal legislations and in some cases within specific local legislative frameworks for leasing, the only common definition of a lease that can be given on the European level is that provided by IAS17, the international accounting standard for leases, where a lease is defined as "**an agreement whereby the lessor conveys to the lessee, in return for a payment or series of payments, the right to use an asset for an agreed period of time**".

Leasing is used to finance a vast range of assets and leases can be tailored to meet the needs of clients, implying that almost any kind of good can in principle be leased.

Why to lease

Financial reasons - not every company or individual is in position to buy equipment necessary for start, expansion or modernization of its business. Not every company has adequate collateral to offer as security for bank loans. Leasing represents the answer to such problems enabling lessees to acquire necessary equipment.

Efficiencies and advantages - users of leased asset pay leasing installments out of the profit acquired via utilization of the leased asset. Very often, leasing secures 100% of the project financing.

Leasing is in most cases offered without additional security means - one of the major advantages of leasing is that the lessor offers financing without requests for additional security (since the lessor is the legal owner of the leased asset). In countries in transition, additional security is often requested, but in that case the security is significantly smaller than with traditional bank loans.

Quick application processing - since in most cases the additional security is not needed, leasing can be concluded in simpler and quicker way than classic

bank loans (ideally, for just one day). In most cases the decision is made on the basis of the capability of the potential lessee to fulfill monthly obligations stipulated by the contract on leasing.

Flexibility - leasing offers possibility to start or to develop business with minimum initial deposit (down payment). Leasing installment plan can be modified to meet the specific needs of the lessee. Additional services such as more favorable maintenance of machines and equipment can be obtained via lessor's assistance, which cannot be expected with bank loans.

Leasing categories

Lease can be defined as written contract between two parties: lease company (lessor) and beneficiary of lease subject (lessee).

In this transaction the lessor acquires the equipment from the supplier and gives it to the lessee for use for certain period of time, while the lessee is obliged to make periodic payment to the lessor under conditions specified in the contract, in return. Lessee is choosing its own supplier of the subject and

making its own price and delivery arrangements. After that, lessee is turning to the lessor with the offer of buying the subject on his behalf.

The main principle of leasing business is:

The lessor retains legal ownership over the leased asset, while the lessee acquires economic ownership.

Two major types of leasing are:

- Financial leasing

- Operative leasing

Financial leasing

The lessor, upon the agreement concluded with the lessee, purchases the leased asset from the supplier and gives it to the lessee to use. The lessee uses the leased asset for business and thus acquires profit which allows the lessee to pay agreed fees to the lessor. During the payment period, the leased

asset is legally owned by the lessor and the leased asset is booked and written

off in the lessee's books. Usually (but not obligatory), leasing contract stipulates

that with payment of the last installment, the lessee automatically becomes the

legal owner of the leased asset. Financial leasing is often defined as alternative

way of financing new investments of enterprises. In comparison to the bank

credits, financial leasing has many advantages for the lessor as well as for the

lessee: quick and efficient application processing, flexibility, economical quality

etc. Summarizing:

- Ownership over the leased asset is usually automatically transfered to

  the lessee upon the expiration of the contract on leasing

- Time period of the contract on leasing is comparable to the assessed

  economic shelf life of the equipment.

Operative leasing

It is primarily intended for utilization of the leased asset with downpayment and

future value. Operative leasing allows the lessee to return the leased asset or to

renew the contract for the new, more modern leased asset upon the expiration

of the contract. With operative leasing, installments are booked as cost and the

leased asset is booked and written off in the lessor's books. Summarizing:

- The lessor retains ownership over equipment even after the expiration of

    the contract on leasing

- Time period of the contract is considerably shorter than the assessed

    economic shelf life of the equipment.

Besides this basic classification of the types of leasing, there are other

classifications based on characteristics of objects of leasing, duration period,

the number of the engaged parties etc.

Benefits of leasing

Generally speaking, the economic importance of leasing derives from the fact it

provides capital which is used for investment purposes. This in turn translates

into a healthy economy, generates employment, and promotes innovation.

The benefits of using lease finance include:

- The possibility to finance 100% of the purchase price of an asset without having to offer any supplementary guarantees which would otherwise be an additional burden for the company seeking finance;

- Allowing companies to manage their working capital by spreading payments over the life of the asset;

- Making budgeting exercises easier as lease payments are regular and usually for a fixed amount;

- Giving firms the opportunity to renew their equipment, making sure that they benefit from the latest available technologies;

- Providing other sources of finance, independent from bank loans or credit lines, thereby conveying more freedom to the lessee;

- Ensuring the lessee has a stable and certain source of funds that cannot be withdrawn as long as payments are made;

- The ability for the lessee to use equipment or other assets without having to worry about considerations linked to being an owner such as the disposal of the asset when it is no longer used;

- Providing customers will a full package - a lease can also accompanied by an array of services, including the insurance and maintenance of the asset. A wide range of services can be combined with different types of leases;

- Taking advantage of local fiscal treatment which implies that leasing can also be beneficial from a tax point of view;

- Being the only available source of funds. In certain cases, particularly for smaller companies who have high growth potential, leasing may be the only way to finance their development;

- Generally speaking, providing finance in circumstances when traditional bank facilities would not be granted as lessors have greater security due to the ownership of the asset. This also implies that leasing may be offered on better terms than other forms of finance.

Leasing and accounting (IAS 17)

Accounting treatment of the financial leasing stipulates that legal entity – the lessee shows vehicle, machine or equipment acquired through leasing arrangement as capital asset and as obligation to the leasing company. Monthly installment is booked separately on principal and interest. Interest with tax enters the cost, and principal decreases liabilities to the leasing company. The lessee calculates depreciation on the leased asset, as capital asset, in accordance with valid depreciation rates.

IAS 17 represented through picture 1:

FINANCIAL AND OPERATING LEASE IN THE LESSEE'S FINANCIAL REPORTS			
FINANCIAL LEASE		**OPERATING LEASE**	
DEFAULT	EXCEPTIONAL	DEFAULT	EXCEPTIONAL

FINANCIAL LEASE — DEFAULT

1. All ownership related risks and rewards are transferred
2. The ownership is transferred to the lessee by the end of the lease term
3. Recorded as an asset by the lessee
4. Recorded as an asset at the lower:
   a) fair value of the asset (practically by the purchase price without interest, increased by initial expences)
   b) present value of the minimum lease payments
5. Depreciation policy is conducted by lessees according to IAS 16 and IAS 38
6. Land and building elements are classified separately

FINANCIAL LEASE — EXCEPTIONAL

Everything else is the same except:

1. The ownership is not transffered to the lessee
2. The land and building elements are classified as one unit if the land price is negligible

OPERATING LEASE — DEFAULT

1. Operating lease is the one that is not financial
2. All risk and rewards are not transferred to the lessee
3. The ownership is not transferred to the lessee
4. It's not recorded as an asset in the lessee's balance sheet
5. The lease payments are recognised as an expense
6. The lessee is not depreciating the lease as an asset, the lessor is in charge of that

OPERATING LEASE — EXCEPTIONAL

1. Operating lease is treated as a financial lease if it's the case of investment into real estate according to IAS 40
2. It is recognised in the balance sheet of the lessee by present value of the maximum lease payment
3. The use of fair value model is mandatory (IAS 40-34)

Over 100 members of the asset finance industry and businesses from across

Europe met in London 22 May this year, to debate the preliminary views on

lease accounting that were published recently by the International Accounting

Standards Board (IASB) and the Financial Accounting Standards Board (FASB)

– so called *right of use model*. They were joined by representatives of the IASB

and European standard setters, together with leaders of the U.S. Equipment

Leasing and Finance Association and the Australian Equipment Lessors

Association.

The European Forum, "Putting Leasing on the Line", considered the standard

setters' long-awaited discussion paper that focuses on putting all types of leases

on firms' balance sheets. This would involve the several million businesses

across Europe who lease or rent making significant changes to the way they

account for leases of all types of assets, including cars, commercial vehicles,

machinery, PCs and photocopiers.

The European leasing industry is concerned that the standard setters are

considering an excessively burdensome approach for accounting for leases.

Leasing provides vital economic benefits for many businesses, and the Forum heard that there is a risk that these benefits could be undermined by unnecessary complexity.

The main opinion of business people is that the focus for lease accounting should be on improvement and simplification, but complex new methods proposed by IASB board may make this vital form of business finance more difficult to use and more opaque for users of accounts.

Leasing in B&H

It can be sad that leasing is relatively new business form in Bosnia and Herzegovina.The first leasing company on B&H market was Volksbank Leasing, established at the beginning of 2001. Hypo-Alpe-Adria Leasing was established the same year in August. Another two leasing companies were established in 2003 – Euroleasing in March and Raiffeisen Leasing in November. In September 2005 CBS-NLB Leasing entered B&H leasing market and HVB Leasing was established in January 2006. Majority of leasing companies are

seated in Sarajevo except Euroleasing which is seated in Mostar. With their

organizational units and branch offices these leasing companies are present in

all bigger towns in B&H: Banja Luka, Mostar, Tuzla, Bihać, Zenica, etc.

On European leasing market, Bosnia and Herzegovina belongs to CESEE

countries group (Central Eeastern and South Eastern Europe), where currently,

according to the statistics, is the biggest increase of leasing business. The

value of the concluded leasing contracts in 2004 was 106.361 million Euros,

while in 2005 the value was 185.025 million Euros, which is 74% more than in

2004. This fact proves that leasing business in Bosnia and Herzegovina is in

increase.

For lack of legislation on leasing matters and in order to improve and develop

leasing business and to achieve their common goals, three currently leading

leasing companies in B&H – Hypo-Alpe-Adria Leasing, Raiffeisen Leasing and

Volksbank Leasing – established Association of Leasing Companies in Bosnia

and Herzegovina in February 2005. The Association officially started to work in

April 2005. In January 2006, Euroleasing from Mostar and CBS-NLB Leasing

joined the Association, and it is expected that HVB Leasing will also join the
Association in the following period. In accordance with their goals, the
Association of leasing companies in BiH is engaged on international plan as
well. In June 2005 the Association joined Leaseurope as associate member.

Leaseurope (Federation of European leasing associations from 30 countries)
was founded in 1972 and it is seated in Brussels.Today, Leaseurope presents
92% of leasing industry throughout the whole Europe and as an umbrella
organization of European leasing market, Leaseurope unites around 1,200
leasing companies.As of 1 March 2006, the Association is a member of
Chamber of Economy of Sarajevo Canton.

Leasing in Bosnia and Herzegovina and in region

Market share of the leading leasing companies in Bosnia and Herzegovina,
Serbia and Montenegro and Croatia in, as well as the value of concluded
leasing contracts in 2005 (considered as crucial year for Bosnia and
Herzegovina leasing market) is shown in the following table:

Company	Bosnia and Herzegovina	Serbia and Montenegro	Republic Croatia
	Market share in 2005.	Market share in 2005.	Market share in 2005.
Hypo Leasing	63 %	29,72 %	38,3 %
Raiffeisen Leasing	22 %	21,52 %	8,9 %
Volksbank Leasing	13 %	6,47 %	9 %
LB Leasing (CBS)	1 %	8,87 %	-
HVB Leasing	-	6,07 %	11 %
Euroleasing	1%	-	-
Other	-	27,35 %	32,8 %
Value of concluded contracts in 2005 in mil €	**185,025**	**401,050**	

From annul reports we can see following:

	jan - jun 2008	2007	2006	2005
	mil €	mil €	mil €	mil €
Vehicles	73,1	134,02	87,923	81,645
Equipment	45,4	89,466	58,258	78,214
Real estate	69,5	157,063	90,79	23,08
Other	1,4	6,556	2,004	2,08
UKUPNO/TOTAL	189,4	387,105	238,975	185,025

EU leasing trends

The relative importance of leasing and its contribution to the economy can be expressed in terms of what is referred to as a "penetration rate". This is calculated by taking new European leasing business as a proportion of European investment to calculate the share of investment financed by leasing.

Over past years, the European leasing penetration rate has risen steadily, reaching 19% at the end of 2006 (compared to just under 12% at the end of 2000). This uninterrupted growth is proof that leasing is continuing to gain in popularity as a method of finance in Europe and Leaseurope expects this to continue in the future.

Equipment lease finance in particular is an important source of funding, with leasing financing on average approximately 28% of equipment investment in Europe during 2006.

Preliminary results for European leasing show that leasing remained a key source of finance for businesses' investment needs in 2008.

Preliminary market data from Leaseurope reveals that the portfolio of leased assets in Europe at the end of the 2008 is estimated to be in the region of €780 billion, a 4.5% increase compared to the previous year.

Conclusion

In Bosnia and Herzegovina, a transitional country, lease is still being developed. The great leap has been done by establishing the Association whose effort contributed to developing appropriate legislative on both entities level and recently, on a national level.

Since IFRS/IAS were introduced in 2006, while period prior to this was covered by national standards, great effort was invested by professionals in charge so that every legal and accounting aspect of lease was introduced to public as clear and explicit as possible. New lease regulations by IASB are not considered so much positive here, and observed from the accountants and all of those who are trying to keep up with the trends through the data from financial reports point of view, certain changes would be very welcome.

Recession, whose profound consequences are just starting to surface in the world economy, has led to light decrease in number of lease business so it is expected that the total number of lease jobs will be less than expected for year 2008 and 2009.

However, it is indisputable that lease activities have major significance in business development in a transitional country as Bosnia and Herzegovina, where the enterprises are often blocked by lack of investment capital for equipment and further development. Having this fact in mind, all EU and world lease related changes should be carefully monitored and appropriately applied in Bosnia and Herzegovina economy.

MATERIALITY DISCLOSURE THRESHOLDS AND DECISION-MAKING FOR ENVIRONMENTAL EVENTS

Jeffrey Faux, Victoria University

Abstract

The accounting profession has been encouraged to develop standards and revise the notion of materiality with regard to environmental accounting (Victoria Parliament, Public Accounts and Estimates Committee, 1999, p. 85). With this in mind it would be useful to determine a materiality disclosure threshold that affects decision-making for environmental events. To determine an appropriate threshold 1882 participants were surveyed and valid responses were received from 876 (46.5%) respondents. A vignette describing an environmental event facing a company was provided to participants who were asked whether the event was deemed to be material and, secondly, would the event initiate an action or no action decision. Results indicate that user groups consider the environmental event to be material at a threshold of 6%. The determination of the event as material results in a 'no action' decision that suggests isolated events of this size

may not result in 'action' decisions. The experimental research approach is

limited by, the ability to generalize the findings and, the specific contextual

nature of the event. Determining the threshold for disclosing an

environmental event enables the establishment of regulated thresholds that

are indicative of the needs of users. The use of an experimental approach

reveals results regarding the decision-making process of users rather than

respondents stating preferences and as a consequence this study adds

constructively to the literature.

Introduction

The effect of environmental event materiality on the decision-making

process of users has received minor attention from researchers and

would be the logical investigative realm (Dierkes and Antal, 1985). The

differentiation between economic and environmental events has been

described as significant rather than material (Environmental

Accounting Taskforce, 1998). Notwithstanding the semantic difference

the benchmark criteria for disclosure of economic events is described

as; above 10% material to decisions; below 5% immaterial to decisions; and, between 5% and 10% preparer discretion is to be exercised (AASB 1031, 2004). This discretion may cause problems from the perspective of user decision-making in so much as several alternatives may result in less than satisfactory disclosure of events.

In this paper the decision process of users is examined by considering event significance (materiality) in the context of an 'action' or 'no action' decision outcome. A decision outcome may take into account a succession or string of events that affect an entity or if an event is considered significant an isolated event may result in an 'action' outcome. An in-isolation environmental clean-up event representing 6% of total revenue was provided to three user groups including shareholders, shareholder/environmentalists and environmentalists. The experimental research model employed evaluates the effect of a single or in-isolation event on the decision-making of users which has

implications for not only entity preparers but also regulators. The effect on the decision process is in terms of deeming the event significant in an environmental and economic context.

The paper is structured in the following manner. The literature review discusses decision usefulness, the decision process and event significance. The research method includes a description of the surveyed groups, experimental model and the material discretion matrix used to evaluate the decision and significance of preparer discretion. Results are discussed in terms of the effect on economic and environmental decisions. The conclusion describes the limitations, implications for users, preparers and regulators, and further research opportunities in the area.

Literature Review

Whilst it may be presumed that the objective of financial reporting is the provision of information to interested parties, the theoretical underpinning does not provide insights into users, their decisions or the presentation of information. Theories considered to be offering the social accounting and reporting researcher some insight have been drawn from social and political theory and include stakeholder theory, legitimacy theory and political economy theory. These theories are not seen as competing but rather as complementary (Gray et al. 1995). However, from the perspective of users, the theories, whilst providing some justification for the provision of accounting information to groups other than groups whose interest is predominantly economic, offer little in respect of what, why and how information is used for decision purposes. Rather, the theories are predominantly about the interaction of power between society, management and users.

Descriptions of the term 'decision usefulness' are embedded in accounting conceptual frameworks (AARF, SAC 2, 1990) that narrowly depict information useful for decisions as being only economic information as being decision useful. The concept of accountability through the antecedent term, stewardship, also has connotations of economic utility. The relationship between decision usefulness, accountability and stewardship is expressed by Stanton (1997, p. 684) and reflects the narrow perspective held of the purpose of reporting and accountability.

Decision usefulness is the primary objective for financial reporting, having consumed the objective of accountability (stewardship), so long held to be the justification for accounting. As an objective, decision usefulness reflects the utilitarian philosophy underlying most conceptual frameworks: concern is for the efficient allocation of resources which is in the interest of society as a whole. Accountability, on the other hand, reflects concern for some individual interest.

Accountability has been identified with a broader social as well as economic purpose that may well be the case with the notion of decision usefulness reflecting changing ideological attitudes and philosophies (Goldberg, 1965). The reflection by Stanton that accountability is 'concern for some individual interest' does not preclude that 'interest' being decision-making. It is contended that issues of accountability shape future thinking through retention of 'memories' and, therefore, affect the individual decision process (Chambers, 1966). Asking users what is useful for their decision-making seems to be a productive process that Dierkes and Antal (1985) identified.

In their seminal research into developing a model for environmental reporting Dierkes and Antal (1985) acknowledge this situation stating "that it is difficult for most people to envisage the potential usefulness and uses of a concept until it has been developed to a certain extent". Later in the paper it is stated that:

In practice, key individuals in business and academics in particular have postulated

information needs and determined how to meet them, with almost no attempts to obtain

*inputs and feedback from the potential target groups (*op cit*., p29).*

However, the decision-useful approach has its detractors. Gray *et al.*

(1996, p. 75) make the following statement:

Decision usefulness purports to describe the central characteristics of accounting in

general and financial statements in particular. To describe accounting as useful for

decisions is no more illuminating than describing a screwdriver as being useful for

digging a hole – it is better than nothing, and therefore useful, but hardly what one

might ideally like for such a task.

The subsequent issues arise from the above statement:

- That decision usefulness determines the characteristics and who shall participate in the use of financial statements.

- The usefulness of accounting for decision-making is deteriorating.

- Asking users to determine the usefulness of information is not a satisfactory research option.

The last issue, whilst not directly mentioned in the above statement, underpins prior discussion in Gray *et al.* (1996). Alternative terms to decision usefulness such as 'user utility' (Guthrie and Parker, 1990) and 'usefulness and use' (Dierkes and Antal, 1985) broaden the applicability of decision usefulness or user utility theory to include accounting for social and economic performance. This indicates that significant changes need to be made in areas such as accounting regulation and education. The changing demands on financial reporting, brought about by users interested not only in the economic performance of companies but also in the social performance, may present some interesting extensions to user utility theory.

The plurality of purpose presently in financial reporting between decision usefulness and accountability is a dilemma that regulators and the profession need to sort out. A decision usefulness approach that allows for alternative decisions other than financial is considered a possible extension to user utility theory.

An aspect of the decision process that is often disregarded is that the lack of action as a result of an event is a decision (no action decision). It could also be construed that an action may be in response to a single disclosure of an event or a succession of events. This may not necessarily result in action but merely form part of the memories of the users that, in the future, may combine with other signals to create an outcome (action decision). Making decisions regarding an entity is often a complex process and rather than use one source of information users may avail themselves of a range of information from diverse sources. These 'inputs' could be from external sources such as the state of world economies or from individual ideological

belief structures. The notion of decision useful often implies some immediate decision outcome or action. In many instances, useful information may not result in an immediate outcome but form part of a future decision process. Users are individuals and may consider information differently, one individual may consider that an event warrants some form of negative action, another may consider the event positively and still another may consider the same event to be irrelevant. Accountants can merely disclose events as accurately as possible, within the constraints mentioned above, without bias and allow users to make their own judgements (Chambers, 1966; Sterling, 1967; Houghton, 1989).

A key facet of an event being decision useful is its significance or materiality. The Environmental Accounting Taskforce (ICAA, 1998) chose the term 'significant' as an alternative concept to 'material' for environmental impacts of an entity. In conceptual framework projects a more legalistic description of materiality (AARF, SAC 3, 1990) that connects disclosure with a

consequence has been adopted as the following summation by Spacek

(1969, p. 447) sets out:

A material fact is a fact to which an average, reasonably prudent person would attach

importance in determining a course of conduct to be taken or followed upon learning

the fact, such as in deciding whether or not to buy or sell stock, or to lend or refuse to

lend money, or to cancel a loan.

The identified outcomes of 'determining a course of action' are identified as,

for example, buying or selling stock. Whilst supporting legalistic description

of materiality no accommodation is made for the decision that does not have

an outcome. Deciding whether to buy or sell shares involves a third

possibility which is to hold or to take no action. This particular decision,

while it involves no action and has no immediate consequences is, from the

user's point of view, the result of conscious and deliberate choice.

2584

Materiality guidelines (AASB 1031, 2004) describe an event that is less than 5% of the base amount as not material, whilst an event greater than 10% of the base amount would be considered material. An event or item falling between 5% and 10% of the base amount is material and the preparer, considering the nature of the event, would exercise judgement as to whether disclosure of the event is necessary. However, the preparer, following the guidelines, may consider that the nature of an event would not materially affect the decisions of users when, in fact, users in exercising their judgement may believe the information to be material. Unfortunately, if preparers make the decision not to disclose an event, then the utility of the information to users cannot be determined. The importance of research in this area to determine event significance (materiality) and thresholds, from a user perspective, would be valuable not only for users but also for preparers in determining disclosure of events in the range 5% to 10%.

The importance of the nature and size of an event has been acknowledged in the Australian Accounting Standards (AASB 1031, 2004). The type of event that should be disclosed is one that would materially affect the decisions of users. To assist in determining whether an event may affect the decisions of user threshold guidelines, as described above, are provided for preparers. The approach to materiality described above is reasonable in a legal context and practical from an accounting perspective because it provides clear threshold rules. Whilst providing regulators and accountants with workable arrangements the interests of users have received minimal attention. Materiality judgements are crucial in decision-making and failing to take account of user perspectives may render disclosures ineffectual for decision purposes. Conceptually, a broader description of materiality that includes the 'no immediate action alternative' would be desirable and can only improve disclosure of material events.

Deegan and Rankin (1997) asked shareholders, stockbrokers, analysts, academics, financial institutions and review organizations "whether environmental issues are material to their decisions concerning a company". The results indicate that a rather high percentage of the user groups surveyed would use environmental information (66.7%). The range between the economic-type decision groups (43.8%) and the non-economic-type decision groups (83.0%) is quite large. A study conducted by Faux (2002) asked users to indicate the threshold range for disclosure of environmental events. Five categories were provided: 0 – 3%; 4 – 6%; 7 – 9%; greater than 10%; and, should not be disclosed. 73.4% of users surveyed indicated that they would like disclosures to be made in the first two categories that is 0 – 6%. The difference between economic and non-economic user groups is blurred as a result of a mixed category but the economic user group indicated a preference for disclosure in the first two categories of 60.9%. Both the above studies suffer from respondents stating their preferences rather

than revealing results through a case scenario requiring respondents to make a decision. Deegan and Rankin (1997) requested that respondents indicate 'real needs' rather than a 'wish list' but never the less results are still stated.

Studying the relationship between the regulated determination of the deeming of a material event and users' determination as to the usefulness in their decision-making of the deeming would extend the literature. In the light of the above studies (Deegan and Rankin 1997, Faux 2002) and the recommendations of the Interim Report of the Inquiry into Environmental Accounting and Reporting (Public Accounts and Estimates Committee of the Parliament of Victoria 1999) this area of study would be particularly useful. The conceptual confusion over decision usefulness and accountability functions of entity disclosures only serves to make it more difficult to establish practical disclosure requirements that meet the needs of users, preparers and regulators.

The discussion of the disclosure of an event, from the preparer's perspective, provides three possible situations.

- **The event is greater than 10%, is significant and material, and therefore will have an action decision outcome.**

- **The event is in the 5-10% category and could be:**

  o **Not significant and not material with a no-action decision outcome.**

  o **Not significant and not material with an action decision outcome.**

  o **Significant and material with a no-action decision outcome.**

  o **Significant and material with an action decision outcome.**

- **The event is less than 5% is not significant or material and therefore will have no decision outcome.**

The preparer's decision in the first and third possibilities is prescribed

in the guidance provided in the commentary to AASB 1031 (2004) and,

therefore, quite clear. The second situation has several alternatives

that may result in less than satisfactory disclosure of events from a

user's perspective. The preparer's choice in deciding whether to

disclose the event results in certain outcomes for users that have been

described above. In Figure 1 the choices available to preparers are

presented in matrix form to enable visual identification of the

relationships that exist between event significance (materiality) and

users' decisions.

Take in Figure 1

The 'type 1' event occurrence is the non-disclosure of an event by

preparers and is unlikely to have an effect on users' decision-making.

The non-disclosure would therefore be justified. The 'nature' of the

event in terms of a 'type 2' situation is more relevant than the amount

being disclosed.   The significance (materiality) may not relate to the

magnitude of the event as AASB 1031 (2004, Para 4.1.3) states.

In deciding whether an item or an aggregate of items is material, the nature and amount

of the items usually need to be evaluated together. In particular circumstances, either

the nature or the amount of an item or an aggregate of items could be the determining

factor.

'Type 3' and 'type 4' events present preparers with a dilemma because

users have deemed the event to be significant. If preparers disclose

the event there is no problem. However, if the disclosure is not made

then an event that affects decision-making is not disclosed.

The issue becomes one of determining whether an environmental event

in the 5-10% category would be considered by users to be materially

significant and would the determination of significance cause an action

or no action decision.

Research Method

The use of an experimental model has the benefit of revealing user

intentions in a decision context whereas the studies of Deegan and

Rankin (1997) and Faux (2002) suffer from respondents stating their

preferences. However, generalizing the findings is constrained by the

lack of external validity when using an experimental model. Providing

participants with a clean-up environmental event is also problematic in

that there are numerous possibilities for describing an environmental

event. Considering the decision context as an isolated event rather

than a sequence or string of events may also weaken the findings.

However, the experimental model employed does explore the

relationship between event size and decision usefulness.

Two groups of users were surveyed in the experiment; shareholders

and environmentalists. Shareholder participants were randomly drawn

from the registries of three public companies, also selected at random,

from the top 50 companies listed on the Australian Stock Exchange.

The membership of a professional association of environmentalists

served as the database of environmentalists and all members were

surveyed. The survey was posted to 1882 participants and valid

responses were received from 876 (46.5%) respondents. Through a

filter in the survey a further group who exhibited characteristics of

both groups (shareholder/environmentalists) was established.

Shareholder responses were 253, shareholder/ environmentalists

amounted to 240 and responses from environmentalists were 383.

A description of an in-isolation environmental situation facing a

company was provided to participants in the form of a vignette and

they were asked whether the event was thought to be significant and

whether the event would initiate an action or no action response. The

vignette concerned a company facing a 'clean-up' event. The

description of the event was approximately 20 lines in length which

Milne and Chan (1999) describe as being the average length of an

environmental disclosure.

The detail of the vignette described an Australian retail petroleum

company that was listed on the Australian Stock Exchange and

confronted with a situation whereby a significant number of its city

petrol stations showed signs of deterioration. The vignette continued

with an explanation of the assessment and grading of contaminated

petrol stations that saw low and medium polluted sites sold at a loss

and clean-up of high polluted sites undertaken. The threshold for the

event was 6% and the nature of the event can be easily identified as

environmental allowing for the interpretation of the vignette and the

making of environmental and economic decisions. The questions

accompanying the vignette were as follows and allowed action and no

action decisions to be made:

- **Is the event described considered significant? (event significance)**

- **If no shares were held in the vignette company would you take an action on the basis of the environmental report? (environmental decision)**

- **If shares were held in the vignette company would you take an action on the basis of the environmental report? (economic decision)**

Results

The notion of expanding the user utility to include decisions other than financial was used in the possible response alternatives to the environmental and economic decisions. The environmental action decision provided a number of alternatives and the opportunity for respondents to

specify an action decision they may take. The action alternatives were all

coded one while the no action response was coded zero. The economic

action decision was to either reduce or increase the holding and either

response was coded one. The no action response was coded zero. The

relationship between event significance and the dichotomised response to

the environmental and economic decisions are described in Figure 1. The

analysis draws on the contentious discretionary disclosure of events in the

5% - 10% region discussed earlier.

To establish how many respondents were in each of the above categories a

cross-tabulation was constructed based on Figure 1 to take account of the

user group, whether the event was significant, and the decision outcome.

The results for the environmental decision of this analysis appear in Table I.

The cross-tabulation shows a rather high number of missing cases (176 or

20.01%). There were 35 or 13.8% missing shareholders, 50 or 20.8%

shareholder/environmentalists and 91 or 23.8% environmentalists.

Determining the significance (materiality) of the event and making both an environmental and economic decision with the same information acknowledges the flexibility of decision-making.

Take in Table I

The Type 1 situation is where users believe the event to be neither

materially significant to their decisions nor would they take any action. A

total of 13.6% of respondents identified a Type 1 occurrence. The largest

group within this category was shareholders (17.0%), followed by

shareholder/environmentalists (15.2%) and finally environmentalists (9.9%).

This perhaps reflects the greater concern of environmentalists.

Respondents supporting a Type 1 situation would support the company if it

chose not to disclose the event. This situation does not present a problem

for preparers; if they disclose the event there is no effect and if they do not

disclose the event there is no effect.

In the Type 2 scenario respondents deem the event not to be materially

significant but would take an action decision. The Type 2 situation would be

a concern in a decision context that is not in-isolation where the collective

effect of a succession of events, whilst not on their own significant, would,

at some stage, trigger a decision. However, this is not the case as the

situation is in-isolation and, therefore, it is difficult to interpret this result

even though it is quite low (2.9%).

The Type 3 situation, a materially significant event but no action

decision deemed necessary, is the choice of 52.1% of respondents and,

interestingly, the percentage of shareholders is 54.1%,

shareholder/environmentalists 53.7% and environmentalists 49.7%. The

vignette is an in-isolation event and it is difficult to determine the

reason why, having identified the event as significant, a no action

decision is taken. Perhaps the event is deemed important and will form

part of the 'memories' as Chambers (1966) suggests for a future

decision.

The Type 4 event is more easily interpreted, the event is significant and

an action decision is made. The Type 4 situation has been selected by

31.4% of respondents, 24.8% of shareholders, 29.5% of

shareholder/environmentalists and 37.7% of environmentalists. The trends in the Type 3 and 4 events support the interest of shareholder/environmentalists and environmentalists in an environmental decision. The intriguing result is the high percentage of shareholders (78.9%) that identify the environmental event as significant.

With regard to event significance and the environmental decision the cross-tabulation reveals that 83.5% (Type 3 + Type 4 total) of users believe the event is significant. This is an important finding given that the significance of the event is 6% and that the nature of the event is environmental and would support suggestions from the Inquiry (Victoria Parliament, Public Accounts and Estimates Committee, 1999) that environmental disclosures should be quantified at lower levels than those for financial reporting (AASB 1031, 2004). Even though a very high number of respondents identified the event as significant (material), 65.7% (Type 1 + Type 3 total) would take a

no action decision. This could mean that whilst respondents feel the event

is significant to decision-making they would like to wait and see what the

company does with similar events or perhaps they feel that the company's

actions are positive.

The results from the event significance and the economic decision appear in

Table II. The cross-tabulation has resulted in a much lower number of

missing cases than the environmental decision (92 or 10.5%). There were

19   or   7.5%   missing   shareholders,   33   or   13.8%

shareholder/environmentalists   and   40   or   4.6%   environmentalists.

Interestingly, there is very little difference between the totals for the

economic decision and those for the environmental decision.

Take in Table II

In the Type 1 situation 16.2% of shareholders, 10.6% of shareholder/environmentalists and 9.9% of environmentalists consider to be of little concern for the reasons previously mentioned as the event is deemed not materially significant and no action would be taken. As with the environmental decision, the Type 2 occurrence for the economic decision is difficult to interpret but it is very low across all groups.

The Type 3 situation identifies 54.7% of shareholders, 52.2% of shareholder/environmentalists and 46.9% of environmentalists as deeming the event significant but taking no action. The reason for the no action decision in this circumstance is once again difficult to interpret but perhaps the event size and nature does not warrant an immediate action. The Type 4 event is not a confusing outcome and results indicate that 24.4% of shareholders, 33.3% of shareholder/environmentalists and 41.5% of environmentalists chose this option.

The significance of the event with regard to the economic decision (86.4% = 50.6% + 34.2%) differs from the environmental decision (83.5% = 52.1% + 31.4%) only in the number of additional cases that have been included in Table II. The number of respondents that would take a no action decision was 62.6% (Type 1 + Type 2 total) opposed to 37.4% (Type 2 + Type 4 total) that would take an action decision. The majority of respondents once again chose a wait-and-see attitude.

A summary of the findings determining the environmental event material significance and decision outcome are as follows:

- Environmental decision; event significance (Type 3 + Type 4) 83.5% of users.

- Environmental decision; no action outcome (Type 1 + Type 3) 65.7% of users.

- **Economic decision; event significance (Type 3 + Type 4)**

  84.8% of users.

- **Economic decision; no action outcome (Type 1 + Type 3)**

  62.6% of users.

The results for the event described are conclusive and suggest that further consideration be given by preparers and regulators to environmental disclosures in the 5% - 10% range. The no action decision outcome reflects the need for more research on the decision process of users. Whilst statistical significance testing of the results may provide a level of certainty that descriptive statistics do not offer it is felt that the overwhelming results render further testing unnecessary.

Conclusion

Dierkes and Antal (1985) have suggested that whilst there is confusion regarding the best approach for deciding what and how to describe

environmental events, asking users of reports is considered as the most likely method to result in outcomes in terms of decision-making. The intention in this study was to investigate the relationship between event significance (materiality) and a decision context. Regulations require certain levels of disclosure for economic events, and a suggestion from an Inquiry (Victoria Parliament, Public Accounts and Estimates Committee, 1999) is that the accounting profession consider lower threshold levels for disclosing environmental events. Studies have considered the issue of material significance but have emphasised user preference rather than an experimental model which would indicate the relationships between decision-making and the material significance of events disclosed. The limitations of the experimental research approach have been discussed along with the ability of the findings to be generalised, the specific contextual nature of the vignette and that the event described in the vignette is in-isolation.

An interesting outcome from the analysis of the findings is that the differences between the results in Table 1 and Table 2 are relatively minor. The Type 1 situation difference between user groups, and the economic and environmental decisions, is mainly shareholder/environmentalists with a 4.6% variation. The Type 2 situation results are too small to be significant. The Type 3 occurrences main difference exists between environmentalists but once again is quite low at 2.8%. Differences exist between shareholder/environmentalists (3.8%) and environmentalists (3.8%) for the Type 4 situation but as with the other groups these results are relatively minor. This indicates that environmental information can be used for either environmental or economic decisions. The environmental event at 6% will affect both environmental and economic decisions in similar ways.

The findings indicate the importance of identifying no action as a decision response. Events between 5% and 10%, regardless of whether they are environmental or economic, need to be disclosed because they are deemed significant by the user groups investigated as affecting decision-making. The results indicate that an in-isolation environmental clean-up event with a 6% threshold will affect the decisions of users in terms of the event significance and taking a course of action. This is an interesting finding for regulators as it confirms the suggestion stemming from the Inquiry (Victoria Parliament, Public Accounts and Estimates Committee, 1999). Reporting entities should also be interested in the findings as it suggests they should be disclosing environmental events with much lower thresholds than 10%. The above points must be considered in the light of the study limitations. Further studies could consider, given the take no action decision, a sequence of various environmental events with a range of thresholds.

MATHEMATICS IN ACCOUNTING AS A BIG UNANSWERED QUESTION

Sony Warsono

Arif Darmawan

Muhammad Arsyadi Ridha

ABSTRACT

Mathematics has been employed in accounting for centuries. It was included in the double entry system in the Luca Pacioli's mathematics book but has not, so far, received appropriate attention in the development of modern accounting. The expanded accounting equation employed nowadays is considered a black-box, and there have been no significant improvements to the equation. This paper outlines the importance of the accounting equation in identifying the limitations of current accounting standards, particularly the definition of the elements of financial statements. Furthermore, this paper argues that the approach employed in the definitions of the elements of financial statements should be on the basis of information-base, instead of the use either the balance sheet or the income statement approach. Finally, the paper suggests that the application of mathematics in accounting be dealt with so that accounting will make a significant contribution to the academic world.

INTRODUCTION

The following question and statements in *Accounting Horizons* have

inspired this paper.

"What is the most important accounting issue where we either think
we understand it but in fact do not or have failed to consider the issue
in anywhere near the depth it deserves?" (*Panel on Big Unanswered
Questions in Accounting—Genesis*, Basu 2008, 426).

 "Rules are fundamental to financial reporting, tax regulation, and
auditing processes, and therefore the limitations of rule-based
structures are of primary interest to accountants." (*Rules and
Accounting:Vagueness in Conceptual Frameworks,* Penno 2008, 339)

"... (I)nnovation is essential.... (I)f it comes it will be from a small
number of scholars who are willing to thumb their noses at the status
quo."(*Is Accounting an Academic Discipline?,* Demski 2007, 156)

"We could, if we wanted, use the double entry system to illustrate
(and access) important theorems in mathematics ..." (*Is Accounting an
Academic Discipline?,* Fellingham 2007, 161)

This paper employs the mathematical perspective (especially the

expanded accounting equation) to reveal the incompleteness of current

accounting standards in the elements of financial statements. Next, this paper

states that efforts to develop accounting with a focus on the pillar of

mathematics have not been taken far enough and this remains a big

unanswered question.

This paper is presented in the following order. Firstly, it discusses the

current employment of mathematics in accounting. Secondly, it presents recent

developments in the construction of standards in the elements of financial

statements as undertaken by the Joint Project of International Accounting

Standards Board and Financial Accounting Standards Board (hereafter the Joint

Project IASB/FASB). Thirdly, it points out several examples of incompleteness

of standards in the elements of financial statements which are liable to make

the financial information incapable of reflecting the real business condition.

Fourthly, it proposes the use of an information-base (hereafter "infobase")

approach (another word for "database") to define the elements of financial

statements. Fifthly, it uses a mathematical perspective, especially the expanded

accounting equation, to meet two of some ideal objectives set up by the Joint

Project IASB/FASB. Finally, this paper claims that the disinterest in the central role of mathematics in accounting requires an immediate response.

THE USE OF MATHEMATICS IN ACCOUNTING

In *Summa de Arithmetica, Geometria, Proportioni et Proportionalita*, Luca Pacioli codified the double-entry systems which are based on the basic accounting equation Assets = Liabilities + Equity (Peters and Emery 1978). This basic accounting equation (BAE) maintains that the assets on the left side of the equation reflect resources, whereas the liabilities and equity on the right side of the equation reflect financing sources. The firm's resources should always be equal to its financing sources. Furthermore, revenues increase equity, while expenses decrease it. On the basis of these rationalities, modern accounting textbooks present an expanded accounting equation (EAE) as follows.

Assets = Liabilities + Equity + (Revenues – Expenses) ……. EAE Conventional

The authors argue that the rationality employed to explain BAE is

inconsistent with those employed to explain EAE, because expenses on the

right side of the equation are not financing sources. Instead, expenses should

represent the use of funds. Furthermore, the EAE can be presented as follows.

Assets + Expenses = Liabilities + Equity + Revenues ……. EAE Mathematics

We call this equation EAE Mathematics because "Pacioli, like other

mathematicians of his time, did his utmost to avoid even the use of a symbol for

minus, let alone a negative number." (Peters and Emery 1978, 426). Although

mathematically both are correct, so far we do not find accounting textbooks

which present the EAE Mathematics. The absence of accounting textbooks

which employ EAE Mathematics reflects accounting teaching methods which

simply emphasize rules.

The authors argue that it would be more fitting to employ EAE

Mathematics in the teaching of accounting. The use of EAE Mathematics may

explain the rules about debits and credits so logically and easily that the need

to memorize the rules is irrelevant. Furthermore, students may more easily

understand why assets and expenses have the same rules in debits and credits;

both elements represent the uses of funds. More importantly, the rationale

employed to explain EAE Mathematics is consistent with those employed to

explain BEA; the left side of the equation reflects the uses of funds, while the

right side reflects the sources of funds (Subramanyam and Wild 2009; Anthony

et al. 2007). Unfortunately, current accounting practices give more emphasis to

the development of rules rather than the development of mathematics, to the

effect that EAE Conventional is in greater use.

On the basis of EAE Mathematics, the teaching of accounting might

simulate various transactions made by the firm. For example, an increase in

expenses in the accounting equation followed by an increase in revenues may

occur if there is a transaction of service exchange (barter) between two service

firms. Likewise, an increase in expenses followed by an increase in equity may

occur if the firm issues shares paid in the form of the buyer's services. These

types of transactions cannot easily be found in accounting textbooks currently

available. In short, it can be inferred that accounting is actually based on

mathematics but accounting research and teaching nowadays do not fully or

adequately explain the central role of mathematics.

The accounting standards employ mathematics in defining the elements

of financial statements. Equity is defined as net assets, namely "the arithmetic

difference between assets and liabilities …" (Alfredson et al. 2007, 76).

Furthermore, revenues are conventionally defined as asset increases or liability

decreases (or a combination of both). Such a definition of revenues is based

purely on the accounting equation; increases in revenues (recognition of the

occurrence of revenues) on the right side of the accounting equation should be

followed by asset increases on the left side of the equation or followed by

liability decreases on the right side of the equation (or a combination of both) so

that a balance in the accounting equation would be maintained. Unfortunately,

the elements of financial statements, especially for revenues and expenses, are

not adequately defined to the effect that accounting runs the risk of providing

financial information which does not correctly represent the reality of business.

The limitation of accounting standards in defining the elements of financial

statements will be further discussed later in this paper.

STANDARDS IN THE ELEMENTS OF FINANCIAL STATEMENTS

The International Accounting Standards Committee (IASC) issued the

conceptual framework in 1989. It was based on FASB, which adopted the

balance sheet model of financial reporting (Camfferman and Zeff 2007). More

specifically, the definition of the elements of financial statements was based on

the perspective of assets (Alfredson et al. 2007). This happened because the

standards considered economic resources or assets as "central to the existence

and operations of an individual entity" (FASB 1985, par.11) and "the lifeblood of

a business enterprise" (FASB 1985, par.15). Furthermore, the IASC was

replaced by the International Accounting Standards Board (IASB) in 2001.

Currently the Joint Project IASB/FASB is redefining the elements of

financial statements. The Joint Project IASB/FASB tentatively adopted the

following working definitions of asset and liability as follows.

"An *asset* of an entity is a present economic resource to which the entity has a right or other access that others do not have." (IASB – FASB 2008, Asset Definition)

"A *liability* of an entity is a present economic obligation for which the entity is the obligor." (IASB – FASB 2008, Liability Definition)

Essentially the redefinition of the elements of asset and liability by the Joint Project IASB/FASB was still based on the same perspective, namely the balance sheet orientation (Dichev 2008).

So far the work of the Joint Project IASB/FASB is still continuing. The tentative definition of the elements of equity has not been issued. Several differences in the definition of other elements relating to equity will be discussed further as stated:

"The FASB Concepts Statements presently identify more elements than does the IASB Framework, and the two frameworks define differently those elements that are common. The Boards' approach will focus initially on converging and defining only those key elements that are defined today in the IASB and FASB Frameworks. As well, the Boards will need to consider the extent to which, and if so how, to define elements that are not defined today, such as comprehensive income." (IASB – FASB 2008, Next Steps – Other Elements)

Taking a close look at the definition of assets and liabilities made by the

Joint Project IASB/FASB, it is predicted that the Joint Project IASB/FASB's

efforts to define equity and other elements, including revenues – the IASB

refers to them as income – and expenses, would still be based on the

perspective of assets, unless the Boards "expand their effort to a more thorough

reassessment of their conceptual framework" (Dichev 2008, 454). In this case, it

is very likely that equity will be defined as net assets, and revenues and

expenses would be parts of the equity.

LIMITATIONS OF STANDARDS IN THE ELEMENTS OF FINANCIAL

STATEMENTS

The use of the asset perspective to define the other elements of financial

statements may result in an incomplete definition. In turn, accounting may

provide financial information which does not faithfully represent the company's

real condition. Many experts have revealed the inadequacy of accounting to

represent the reality of business (Ball 2008; Cheney 2009). Before pointing out

the limitations of defining the revenues and expenses, we would like to present

the definitions of revenues and expenses according to the FASB and IASC as

follows.

> "Revenues are inflows or other enhancements of assets of an entity or
> settlements of its liabilities (or a combination of both) from delivering
> or producing goods, rendering services, or other activities that
> constitute the entity's ongoing major or central operations." (FASB
> 1985, Par 78)

> "Income is increases in economic benefits during the accounting
> period in the form of inflows or enhancements of assets or decreases
> of liabilities that result in increases in equity, other than those relating
> to contributions from equity participants." (in Mirza et al. 2008)

> "Expenses are outflows or other using up of assets or incurrences of
> liabilities (or a combination of both) from delivering or producing
> goods, rendering services, or carrying out other activities that
> constitute the entity's ongoing major or central operations." (FASB
> 1985, Par 80)

> "Expenses are decreases in economic benefits during the accounting
> period in the form of outflows or depletions of assets or the incurrence
> of liabilities that result in decreases in equity, other than those
> relating to distributions to equity participants." (in Mirza et al. 2008)

The above definitions are substantially similar, namely that the recognition of revenues and expenses should be followed by changes in assets and/or liabilities. Such a definition disregards revenue/expense transactions that do not produce directly any change in assets/liabilities.

Below are two cases which reveal limitations in the standards of the elements of financial statements, especially related to the definitions of revenues and expenses.

Case I

Business event A: Merchandising firm Q, which is in the business of selling computers, and merchandising firm R, which is in the business of selling furniture, barter their merchandises. According to the standards, both merchandising firms Q and R recognize this business event as a revenue transaction, as in this event there is an increase of assets into each firm.

Business event B: Service firm S, which is in the information technology consultation business, and service firm T, which is in the accounting consultation business, barter their main services. According to the standards, both firms S and T should not recognize this business event as a revenue transaction because there is no increase of assets or decrease of liabilities in each of these firms. Accordingly this business event cannot be classified as a revenue transaction by either firm.

Business event C: Service firm S, which is in the accounting consultation business, is conducting barter with merchandising firm Q, which is in the business of selling computers. According to the standards, firm S should recognize this business event as a revenue transaction because there is an increase in assets in the form of computers. Firm Q, however, should not recognize this business event as a revenue transaction because there is neither an increase in assets nor decrease in liabilities even though firm Q delivers its services. This business event, therefore, is recognized as a transaction by firm S but cannot be recognized as such by firm Q.

Case 2

Business event D: Service firm V, which is in the business of advertisement, purchases a number of firm W's shares (with the intention to own them). The payment is made directly and fully in the form of advertising services delivered by firm V. Firm V should recognize this business event as a revenue transaction because there is an increase in assets in the form of share investment. According to the standards, however, firm W should not recognize this business event as an expense transaction because there is neither a decrease in assets nor an increase in liabilities as a result of this business event; what results is an increase in equity.

Business event E: Service firm X, which is in the business of TV advertising, distributes revenue dividends in the form of services to firm Y, which owns more than 20 percent of the company shares. On the announcement date, firm Y immediately utilizes the revenue dividends. According to the standards, firm X should not recognize this business event as a revenue transaction because there is neither an increase in assets nor a decrease in liabilities; what results

is an increase in dividends distribution. On the other hand, firm Y should

recognize this business event as an expense transaction because the firm

receives advertising services and there is a decrease in assets in the form of

share investment (equity method). Therefore this business event should be

recognized as an expense transaction by firm Y but should not be recognized

as a transaction by firm X.

The illustrative cases above are simulations of transactions that may

happen in business on the basis of the expanded accounting equation. In short,

the recognition of revenues can be balanced not only by increases in assets or

decreases in liabilities, but also by increases in expenses or decreases in

equity. Likewise, the recognition of expenses can be balanced by decreases in

assets, increases in liabilities, increases in equity, or increases in revenues.

Therefore, the current definitions of the elements of revenues (income) and

expenses are incomplete. This occurs because the standards argue that

revenues and expenses should make a direct impact on the assets and/or

liabilities. The inadequacy of the definitions of revenues and expenses is also

due to the placement of revenues and expenses under the category of equity.

An extended effect of the limitation of standards is the lack of accounting

textbooks that reveal the above transactions. This demonstrates that the

inadequacy of the standards is likely to result in a serious risk to teaching

because accounting rules "provide an alternative way to organize and frame the

teaching of accounting" (Fellingham 2007, 160).

REDEFINING THE ELEMENTS OF FINANCIAL STATEMENTS

One of the topics which is currently discussed in earnest by accounting

experts is the approach that should be adopted in constructing financial

statements (Haka 2009). Current standards have opted for the balance sheet

approach, while some others suggest the use of income statement approach

(see Dichev 2008; AAA FASC 2007). First and foremost, financial accounting

should provide financial information, not just the balance sheet and income

statement. Therefore, standards determined by the use of one perspective are

likely to underestimate the importance of other perspectives. As demonstrated

above, the use of the balance sheet perspective has rendered as un-coverable

a large number of business events significantly related to revenues and

expenses. Likewise, the use of the income statement approach is likely to

underestimate the importance of business events related to assets, liabilities,

and equity.

To solve the problems related to the use of appropriate approaches in

the definition of the elements of financial statements, we can take a lesson from

the approach employed in data management. Early in the development of the

computer, data management employed a file-oriented approach, which tied the

data to the application that produced them. As a consequence, in order to

access particular data with other applications the data must be converted first.

The conversion process may cause changes to the original data. This file-

oriented system was considered inefficient, highly susceptible to errors,

redundant, etc (Wilkinson et al. 2000). Modern data management uses a

database approach, which separates data from the application that produced

them. This approach makes it possible to produce data which are standardized,

consistent, and integrated (Romney and Steinhart 2009). An analogy can be

made between the use of the balance sheet or income statement approach and

the file-oriented approach.

Mathematically, the expanded accounting equation shows that the

elements of assets, expenses, liabilities, equity, and revenues are on the same

level. The placement of one element above another element is inconsistent with

the accounting equation. Therefore, we argue that the approach employed in

the definitions of the elements of financial statements should be on the basis of

an "infobase" (another word for "database," which is already common in the

literature of information systems), instead of the use either the balance sheet or

the income statement approach. With this "infobase" approach, the elements of

financial statements are not tied to the financial information which has been

produced. It is only at the end of the accounting period that these elements are

designed to produce financial statements.

The equation of Assets + Expenses = Liabilities + Equity + Revenues

indicates that the left side of the equation reflects the uses of funds, while the

right side of the equation reflects the sources of funds. Compared with the

rationale currently employed in EAE, the authors argue that the above rationale

is more consistent and acceptable. That rationale should, therefore, be

employed in defining each element of financial statements. Besides, the current

definition of the elements of financial statements is mechanistic rather than

substantive, especially for the definitions of the elements of equity, revenues

(income) and expenses. The mechanistic definition is not flexible enough for

future development, and is incapable of providing any information about the

subject to be defined.

Using the "infobase" approach, below are the definitions of the elements

of financial statement are:

a. Assets are uses of funds in the form of resources whose economic value

can still be utilized in the future

b. Expenses are uses of funds in the form of resources whose economic

value has been utilized for the firm's activities within a particular period

c. Liabilities are sources of funds from third parties acting as creditors

d. Equity is sources of funds from the company's owner, retained earnings

(accumulated profits), and sources other than creditors

e. Revenues are sources of funds from the firm's activities within a

particular period

This definition of elements of financial statements is more abstract, and covers

many more business events than the current mechanistic definition allows for.

MATHEMATICS AS A BIG UNANSWERED QUESTION

Written documents show that accounting was included in Luca Pacioli's

mathematic book (Sangster et al. 2007). In its historical progress, however,

accounting has developed a focus on rules (Penno 2008). A large number of

rules have been issued to the effect that accounting was well-known as a

regulatory enterprise (AAA FASC 2007). Nevertheless, the development of rules

cannot completely protect the users of accounting information (Scott 2009).

Beside the focus on the development of rules, accounting has also developed

an emphasis on vocational skills. The teaching of accounting, as a result, has

focused largely on vocational skills (Demski 2007), with little contribution to the

academic world (Fellingham 2007).

"Financial reporting is not an end in itself. It is a means of

communicating to the users of financial reports information that is useful in

making choices among alternative uses of scarce resources" (FASB 2006, OB6)

and "the objective of general purpose financial reporting is to provide financial

information . . ." (FASB 2008, OB2). Thus, financial accounting is a tool to be

used to provide financial information. As a tool, accounting should be of the

same nature as computing, aircraft technology, etc. All these technologies

require established knowledge in order to function effectively; to give the best

possible contribution to humanity, and to allow for continuous development. The

authors argue that three major pillars should be developed in a balanced

manner to enable accounting to be an academic discipline, namely mathematics,

rules, and vocational skills. The Joint Project IASB/FASB has been developing

the Conceptual Framework for Financial Reporting that underlies financial

reporting. Several topics are still debated up to the present. These debated

topics usually come to tore when choosing among two extreme points which

appear utterly irreconcilable but which eventually must be accommodated in

order to serve the interests of all parties involved. For example, the Joint

Project IASB/FASB originally stated in the Preliminary Views of the Conceptual

Framework for Financial Reporting that the potential users of financial reports

include equity investors, creditors, suppliers, employees, customers,

governments and their agencies and regulatory bodies, and members of the

public (FASB 2006, OB6). Later, the Joint Project IASB/FASB revised the

objective of external financial reporting is to provide information that is useful

for capital providers including equity investors, lenders, and other creditors

(FASB 2008, OB6).

Through development of the accounting equation, several objectives of

the Joint Project may be achieved. Below are two of the Joint Project

IASB/FASB's objectives as mentioned in the Preliminary Reviews of the

Conceptual Framework (FASB 2006).

Objective A: The objective of external financial reporting is directed to the

needs of a wide range of users. As long as all sources of funds other than

liabilities are contained in one element, namely the equity, it will be difficult for

financial reporting to provide information which is useful to users other than

equity investors and creditors. As the equity contains various sources of funds

then the quality of information coming from the element may decrease. For

example, current financial reporting is unable to provide a representative picture

of the long-term contribution of the management to the company because their

performance is periodically moved into the equity. We argue that this could be

the reason for the emergence of conflicts between principals and agents.

Likewise, current financial reporting is unable to provide information which is

specific about governmental subsidies, donations or facilities received by the

firm, as the information about governmental support is mixed up with

information about other sources of funds in one big basket called "equity". In

this information era firms need information that is more detailed and

comprehensive in order to make informed decisions.

Had the accounting equation consisted of elements that represented

specific types of users, then information that is useful to a wide range of users

might have been produced. The accounting equation could be developed along

the line of, for instance, Asset + Expenses = Liabilities + Owner's Capital +

Revenues + Management Contribution (accumulated profits) + Governmental

Fund + Residual Sources.

Objective B: The qualitative characteristics of financial reporting information

should be relevance, faithful representation, comparability, and

understandability. As long as the elements of accounting equation consist of

financial information employing various measurements, then it will be difficult to

fulfill these qualitative requirements. For example, when assets cover several

accounts that employ some measures then the assets are unable to fully meet

both the characteristics of relevance and faithful representation. Likewise, the

use of various measurements in one element may weaken the comparability

and understandability of the financial reporting. This applies also to other

elements in the accounting equation, both in the element of balance sheet and

in that of income statements.

Had the accounting equation consisted of various elements containing

information measured with the same (homogenous) measuring tool, the

accounting information produced may acquire the long-awaited characteristics

of relevance, faithful representation, comparability, and understandability. For

instance, the elements of assets are divided into two, namely value-based

assets and historical-cost assets, and the elements of expenses are divided into

two, namely accrual-based expenses and cash-based expenses. Elements of

the value-based assets reflect the provision of information which is relevant for

decision-making, while the elements of historical-cost assets reflect information

which is relevant for faithful representation.

CONCLUSION AND EXPECTATION

The same thing, perceived differently, may produce different results. Unfortunately, this happens in accounting. The development of financial accounting with an overemphasis on rules has limited accounting simply to the "rules of the game", especially in the stock market. The use of a mathematical perspective, especially the accounting equation, reveals the limitations of the current standards in defining elements of financial statements. This paper also briefly discusses the use of the mathematical perspective to achieve the ideal objectives expected by the Joint Project IASB/FASB.

Accounting should use widely applied mathematical theorems. As a preliminary step, we should identify and discuss several persistent questions and problems, including standards, by using the mathematics perspective. Subsequently, the development of accounting along the line of the three major pillars, namely mathematics, rules, and vocational skills, should be undertaken in a balanced manner. In turn, as in computer technology, accounting should be

able not only to function as a supporting tool to portray the reality of business,

but also to function as an enabler and transformer.

More than 80 years ago Henry Rand Hatfield (1924) believed that double

entry accounting –which is an application of mathematical theorems –

constituted a significant intellectual contribution to the world (in Fellingham

2007). Now it has become our duty to develop the accounting equation in such

a way as to enable accounting to make a significant contribution to the

development of the academic world.

REVISIONS OF MANAGEMENT FORECASTS AND EARNINGS MANAGEMENT
UNDER THE TOYOTA PRODUCTION SYSTEM IN THE JAPANESE AUTOMOBILE INDUSTRY

Michio KUNIMURA*※ & Mitsuru KUBO

Meijo University

June 14.2009

Abstract

The Toyota Production System (TPS) has been widely used in the Japanese automobile industry. The TPS has a check mechanism for restraining earnings management. Does use of the TPS prevent earnings management? We examine the income smoothing behavior based on inventory and the revision behavior of management forecast in the Japanese automobile industry. Based on eight years of recent financial data, we clearly identify possible income smoothing behavior under the potential handling of discretionary day's inventory (= inventory÷sales×365) and find possible pessimistic(optimistic) revision behavior of management forecast with large increase(decrease) of discretionary accruals. Although we found such two behaviors in most of the groups studied, we could not identify above two behaviors in the Toyota group. The TPS may prevent earnings management based on inventory and accruals only in Toyota Group under the order-driven Toyota Production System.

Keywords : revision of management forecasts, earnings management, discretionary day's inventory, Toyota Production System

1. Skewed distribution of net income

   Yoshida and Kunimura (2008) examined the cross-sectional distribution of net income of listed firms in the Tokyo Securities Exchange and showed four cross-sectional distributions of net income scaled by beginning total assets, as seen in Figure 1. In Japan, a so-called "accounting big bang" occurred in 1999. At that time, the main financial statements changed from parent company financial statements to consolidated financial statements. Panels a and c of Figure 1 show the large change of distribution from the period before the accounting big bang from 1991 to 1998 to the period after the accounting big bang from 1999 to 2006. The low frequency of net income in the left-hand side of zero net income in Panel c and the high frequency of net income in the right-hand side shows the loss avoidance behavior after the accounting big bang in the consolidated financial statements. The change shows the strong impact of the accounting big bang in Japan. Both Panels b and d of parent company financial statements show a large skew and do not show a change from the distribution in the period before the accounting big bang to the distribution in the period after the accounting big bang. The old statements remain important.

   The data in Figure 1 imply that the firm with potential losses in the bottom line of their income statement is apt to manipulate the bottom line from losses to small profit. Skewed distribution is the evidence of management behavior designed to avoid losses.

   Skewed net income may be a result of management earnings. However, we want to identify the cause of earnings management designed to find and improve the real activity in question. In this paper we examine earnings management through real activities manipulation of inventory in consolidated financial statements.

   <figure 1>

2. Inventory manipulation

In this paper we examine earnings management through real activities of inventory. An increase of inventory does not necessarily lead to an increase in net income. Therefore, we must first show the case of an income increase that occurs when inventory increases. Overproduction sometimes intentionally results in lower cost of goods sold than usual and increases profit (Roychowdhury, 2006) through lower fixed overhead costs per unit. For example, top management hesitates to stop production lines under a lower level of realized sales than budgetary planned sales and artificially keeps the production level constant with unwelcome overproduction, that is, with a large amount of unnecessary inventory. In this case, a lower allocation rate of fixed overhead costs than necessary to meet expected demand results in higher inventory costs and higher net income. For instance, if the cost of goods sold is 9,000 units, inventory is 1,000 units (finished goods base), and fixed overhead cost is 1,200 million yen, then the allocation amount of the fixed overhead cost to inventory is 120 million yen ($1,000 \div (9,000+1,000) \times 1,200 = 120$). If overproduction leads to 3,000 units, the allocation amount is 300 million yen ($3,000 \div (9,000 + 3,000) \times 1,200 = 300$). *Ceteris paribus*, the cost of inventory increases 180 million yen. The net income also increases by the same amount. We can exhibit many traditional manipulations on inventory which are not illegal but are highly strategic or intentional, such as the manipulation of the quality standard of a product, changing the accounting valuation procedure from FIFO to LIFO under an inflation period of time, and so on.

Managers can also decrease their profit from adverse manipulations, such as from slim production, applying strict quality standards, changing from LIFO to FIFO, and so on. We find such relationships between earnings and inventory that an inventory increase usually leads to an earnings increase and, usually, an inventory decrease results in an earnings decrease. It is assumed that inventory change may be utilized as a typical component of income smoothing.

On the other hand, the Just-In-Time system that is part of the Toyota Production System requires "order-driven-production" Then, the JIT system has a check mechanism for restraining income smoothing by inventory change.

Do managers have an incentive to use this relationship for income smoothing even under the Just-In-Time system in the Japanese automobile industry? The purpose of my research is to answer this question.

3. Discretionary models and the income smoothing hypotheses

3.1 Discretionary accruals : the Modified DJ model

Healy (1985) defined accruals as the difference between net income and cash flow from operations, as follows:

$$
\text{Total Accruals } (TA) = \text{Net Income } (NI)
$$
$$
- \text{ Cash Flow from Operation } (CFO) \cdot \cdot \cdot \cdot \cdot \cdot \cdot (1)
$$

Discretionary accruals as total accruals minus non-discretionary accruals that are a normal part of accruals reflecting working capital circulation, as follows:

$$
\text{Discretionary Accruals } (DA) = \text{Total Accruals } (TA) - \text{Non-discretionary Accruals}
$$
$$
(NDA) \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot (2)
$$

However, what is called the normal part of accruals is not clear. Healy applied the average value of five years of accruals, while DeAngelo (1986) used accruals from the last year. Jones (1991) regressed accruals on sales. In this study we use the new data of cash flow from operations only applicable for eight years. we have to avoid data loss from estimating the normal discretionary part and we choose to adopt DeAngelo's assumption. Next, we assume that accruals change proportionally to sales. This assumption is a simple application of Jones (1991), and thus we call my discretionary accruals model the Modified DJ model.

Discretionary accruals: the Modified DJ model

$$DA_t \quad /S_t = TA_t \quad /S_t \quad - \quad TA_{t\text{-}1}/S_{t\text{-}1} \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot (3)$$

3.2 Discretionary day's inventory

This paper focuses on the day's inventory (= inventory÷sales×365) when examining the relationships between the introduction of the JIT System and income smoothing behavior by managers. Changes in the discretionary day's inventory ($\varDelta\varDelta INV_t /S_t$) may be a main component of discretionary accruals. The day's inventory change ($\varDelta INV_t /S_t$) is a negative component of cash flow from operations in cash flow statements, and cash flow from operation is a negative component of accruals (equation(1)). In this case the relationship between accruals and the day's inventory change is positive. The positive relationship may introduce a change in the discretionary day's inventory in equation (4) from the discretionary accruals of equation (3), as follows:

Discretionary day's inventory change: the Modified DJ・S model
$$D\varDelta INV_t /S_t = \varDelta INV_t /S_t - \varDelta INV_{t\text{-}1}/S_{t\text{-}1} \quad \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot (4)$$

Strictly speaking, a more exact relationship exists between the day's inventory and the cost of goods sold. We also define the discretionary day's inventory (= inventory÷cost of goods sold×365) as a main component of accruals, as follows:

Discretionary day's inventory change: the Modified DJ・C model
$$D\varDelta INV_t /C_t = \varDelta INV_t /C_t - \varDelta INV_{t\text{-}1}/C_{t\text{-}1} \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot \cdot (5)$$

We cannot identify prior earnings before earnings management, and it is difficult to classify a firm-year an income increasing firm-year or an income decreasing firm-year by using post earnings after earnings management. We focus on the cash flow from operations, which is sometimes called hard profit. We introduce the following assumptions and hypotheses.

3.3 Partition assumptions and the income smoothing hypotheses

partition assumptions

A firm-year with an earnings increase before potential earnings management is assumed to have positive ⊿CFO.

A firm-year with an earnings decrease before potential earnings management is assumed to have negative ⊿CFO.

Hypothesis 1: Discretionary Accruals (DA/S)

A firm-year makes income smooth by using discretionary accruals.

Type a: conservative accounting

Positive ⊿CFO leads to negative discretionary accruals (DA/S).

Type b: window dressing

Negative ⊿CFO leads to positive discretionary accruals (DA/S).

Null Hypothesis 1

H1. There is no difference in mean values of discretionary accruals (DA/S) between the positive ⊿CFO Group and negative ⊿CFO Group。

Hypothesis 2: Discretionary Day's Inventory Change (D⊿INV/S or D⊿INV/C).

A firm-year makes income smooth by using the discretionary day's inventory change.

Type A: conservative accounting

Positive ⊿CFO leads to a negative discretionary day's inventory change (D⊿INV/S or D⊿INV/C).

Type B: window dressing

Negative ⊿CFO leads to a positive discretionary day's inventory change (D⊿INV/S or D⊿INV/C).

Null Hypothesis 2

H2S. There is no difference in mean values of the discretionary day's inventory change (D⊿INV/S) between the positive ⊿CFO Group and negative ⊿CFO Group。

H2C. There is no difference in mean values of the discretionary day's inventory change (D⊿INV/C) between the positive ⊿CFO Group and negative ⊿CFO Group。

We divide the firm-years sample into two groups for testing my two hypotheses. We call the positive firm-year group with a positive increment of cash flow from operations the positive ⊿CFO Group and the negative firm-year group with a negative increment of cash flow from operations the negative ⊿CFO Group.

The above null hypothesis does not directly test the income smoothing hypothesis, but it does test a symptom of the income smoothing by using the discretionary day's inventory change. Here we dismiss the problem of errors in variables on cash flow from operations by using sales (or cost of goods sold) deflating CFO as the explanatory variables for testing the null hypotheses.

4. Data and day's inventory

4.1 Data

We sample all 57 firms of the Japanese automobile industry listed on the first section of the Tokyo Stock Exchange from fiscal year March 2000 to fiscal year March 2008 in the Nikkei Needs Database. We classify these 57 firms into 26 firms of the Toyota group and 31 firms of other groups based on both capital-holdings and sales-production relationships. We can use only eight fiscal years' data after the accounting big bang in 1999, since we can use cash flow from operations in the cash flow statements. We have samples of 456 firm-years (57 firms×8 years), because the first-year data of cash flow from operations is utilized for the difference calculation.

4.2　Day's inventory : descriptive statistics

Table 1 shows the day's inventory (inventory/sales×365) of 456 firm-years in the Japanese automobile industry from fiscal year 2000 to fiscal year 2007. In this period of time the industry enjoyed aggressive direct investment in foreign countries with the gradual growth of overseas sales and profit.

The average value of a day's inventory in the parent company is 16.247 days, and the median is 13.640 days. These days nearly correspond to the period of time from the customer order to delivery to the customer in domestic sales. The average value of a day's inventory in consolidated financial statements is 26.569 days, and the median is 25.426 days. These periods of time may approximately correspond to above two weeks and another 10 days which may be necessary for shipping finished cars and their parts by balloon ships or other cargo ships. In particular, the average days of a day's finished goods and a day's raw materials are high and show, respectively, 11.136 days and 7.968 days in consolidated financial statements, mainly because of the shipping period.

< Table 1 Day's Inventory >

4.3   The discretionary day's inventory change: spread sheet

The main variable to be analyzed is the discretionary day's inventory change (D⊿INV/S). We will examine the relationships between profitability, which is surrogated by cash flow from operations change (⊿CFO) and the discretionary day's inventory change (D⊿INV/S). Table 2 is a sample spreadsheet of Nissan Motor for testing hypotheses. If ⊿CFO is positive, discretionary accruals (DA/S) and discretionary day's inventory change (D⊿INV/S) can be expected to be negative under possible conservative accounting by managers. We call these conditions "Type a" for DA/S and "Type A" for D⊿INV/S. For example, the entry for the fiscal year of March 2007 in Table 2 shows negative 11.93 days of DA/S, which corresponds to a positive ⊿CFO(1,043-758). If ⊿CFO is negative, discretionary accruals (DA/S) and the discretionary day's inventory change (D⊿INV/S) will be assumed to be positive under potential window dressing or under plausible gain trading for increasing income. We call these conditions "Type b" and "Type B". For example, the entry for the fiscal year of March 2005 in Table 2 shows positive 18.58 days of DA/S, which corresponds to a negative ⊿CFO(369-797). The above four relationships can be identified for all firm-years except for DA/S in fiscal year 2008 and for INV/S in 2004.

We can clearly identify "a big bath" by the huge negative 57.94 days of DA/S in fiscal year of March 2000 when the new COE Mr. Ghosn started his reform of Nissan Motor. In the following year, Table 2 shows a "V character recovery" of net income of 331 billion yen with a big positive 73.98 days of DA/S. However, the discretionary day's inventory change (D⊿INV/S) modestly exhibits positive 0.35 days, which is a much smaller number of days than the 73.98 days of discretionary accruals (DA/S) in 2001. This discretionary accruals behavior may explain the true story of "the Nissan's miracle recovery".

< Table 2 Nissan >

5. Income smoothing results

5.1 Comparison of the positive ⊿CFO Group with the negative ⊿CFO Group in the discretionary accruals

  We will examine the following null hypothesis in this section:
H1. There is no difference in mean values of discretionary accruals (DA/S) between the positive ⊿CFO Group and negative ⊿CFO Group。

  Table 3 exhibits a clear difference of the positive ⊿CFO Group with the negative ⊿CFO Group in mean values of discretionary accruals (DA/S) on the total sample, Toyota group, and other groups. Positive ⊿CFO may lead to negative discretionary accruals (DA/S) under conservative accounting. Negative ⊿CFO may lead to positive discretionary accruals (DA/S) under window dressing accounting. In the case of the total sample, Table 3 shows the negative 3.850 days in positive ⊿CFO and positive 8.934days in negative ⊿CFO. The high t value more than two and the low p value less than one percent in Table 3 tell us that H1 is rejected at the one percent significance level. In that case it is assumed that discretionary accruals may make use of possible income smoothing.

  Positive ⊿CFO results in negative 3.829 days of discretionary accruals (DA/S) and negative ⊿CFO results in positive 9.757 days of discretionary accruals (DA/S) in the Toyota group. Positive ⊿CFO results in negative 3.869 days of discretionary accruals (DA/S) and negative ⊿CFO results in positive 8.314 days of discretionary

accruals (DA/S) on other groups. We find no clear difference between the Toyota group and other groups. Why.

< Table 3 >

The concept of discretionary accruals has a strong power for detecting earnings management, but it is artificial for improving the business cycle. Next we apply this concept to the day's inventory.

5.2   Comparison of the positive ⊿CFO Group with the negative ⊿CFO Group in the discretionary day's inventory change based on sales

In this section we will test the following null hypothesis:

H2S. There is no difference in mean values of the discretionary day's inventory change (D⊿INV/S) between the positive ⊿CFO Group and negative ⊿CFO Group.

Table 4 shows the difference of positive ⊿CFO Group with negative ⊿CFO Group in mean values of the discretionary day's inventory change (D⊿INV/S) on the total sample and other groups. In the case of the total sample, Table 4 shows the negative 0.242 days in positive ⊿CFO and positive 1.16 days in negative ⊿CFO. The t value more than two and the low p value less than one percent in Table 4 tell us that the H2S is rejected at the one percent significance level. In this case it is assumed that discretionary accruals may make use of possible income smoothing.

Positive ⊿CFO results in positive (not negative) 0.046 days of the discretionary day's inventory change (D⊿INV/S) and negative ⊿CFO results in positive 0.528 days of the discretionary day's inventory change (D⊿INV/S) in the Toyota group. Positive ⊿CFO results in negative 0.500 days of discretionary accruals (DA/S) and negative ⊿CFO results in positive 1.635 days of the discretionary day's inventory change (D⊿INV/S) on other groups. The comparison of the Toyota group with other groups shows a different sign of discretionary day's inventory change (D⊿INV/S). The Toyota group in positive ⊿CFO is not negative but is positive 0.046 days. Positive ⊿CFO does not lead to a negative discretionary day's inventory change (D⊿INV/S) in the Toyota group. The t value of 1,055 and the p

value of 0.146 in Table 4 tell us that the H2S is rejected at the ten percent significance level. In this case the discretionary day's inventory change (D⊿INV/S) might be used for possible income smoothing. I find a clear difference between the Toyota group and other groups.

Additionally we will test the following null hypothesis:

H2S1. (H2S2, H2S3) There is no difference in mean values of the discretionary day's finished goods （or work in process or raw materials）change between the positive ⊿CFO Group and the negative ⊿CFO Group。

The above difference is clearer in the case of the components of inventory, that is, finished goods, work in process, and raw materials. Table 4 rejects these null hypotheses at the ten percent significance level for finished goods (t value is positive), work in process (p value is 0.088), and raw materials (p value is 0.442) in the Toyota group, and they show clear evidence of income smoothing by finished goods, work in process, and raw materials on other groups.

＜　Table 4　＞

5.3 Comparison of a positive　⊿CFO Group　with a negative　⊿CFO Group in the discretionary day's inventory change based on cost of goods sold

This section will show the result of testing the following null hypothesis:

H2C. There is no difference in mean values of the discretionary day's inventory change (D⊿INV/C) between the positive　⊿CFO Group and negative　⊿CFO Group。

In the case of the total sample, Table 5 shows the negative 0.124 days in the positive ⊿CFO and positive 1.211 days in the negative ⊿CFO. The t value more than two and the low p value less than one percent in Table 5 tell us that the H2C is rejected at the one percent significance level.

Positive ⊿CFO results in positive (not negative) 0.152 days of the discretionary day's inventory change (D⊿INV/S) and negative ⊿CFO results in positive 0.476 days of the discretionary day's inventory change (D⊿INV/S) in the Toyota group. Positive ⊿CFO results in negative 0.370 days of discretionary accruals (DA/S) and negative ⊿CFO results in positive 1.763 days of the discretionary day's inventory change (D⊿INV/C) in other groups. The t value of 0.561 and the p value of 0.288

in Table 5 tell us that the H2C is not rejected at the ten percent significance level. Additionally, we will test the following null hypothesis:

   H2C1 (H2C2, HC3) There is no difference in mean values of the discretionary day's finished goods（or work in process or raw materials）change between the positive ⊿CFO Group and negative ⊿CFO Group components of inventory, that is, finished goods, work in process, and raw materials.

   Table 6 does not reject the null hypotheses at the ten percent significance level for finished goods (t value is positive), work in process (p value is 0.175), and raw materials (p value is 0.465) in the Toyota group. On the contrary, the table shows clear evidence of income smoothing by finished goods, work in process, and raw materials in other groups.

＜ Table 5 ＞

6. Limitation

   We identify positive ⊿CFO results in negative days of discretionary accruals (DA/S) and negative ⊿CFO results in positive days of discretionary accruals (DA/S) in the Toyota group. Positive ⊿CFO results in negative days of discretionary accruals (DA/S) and negative ⊿CFO results in positive days of discretionary accruals (DA/S) on other groups. We find no clear difference between the Toyota group and other groups. Why. The concept of discretionary accruals has a strong power for detecting earnings management, but it is artificial for improving the business cycle and the relationship between ⊿CFO and DA is self-evidently negative by definition of accruals equation (1).

   Then we apply this concept to the day's inventory. We identify the symptom of income smoothing behavior by possible handling of the day's inventory in the Japanese automobile industry, excluding the Toyota group. The discretionary day's inventory is explained by income smoothing behavior of managers in groups other than the Toyota group. However, generally speaking, in the less profitable period of time with negative ⊿CFO, the day's inventory (inventory/sales) may

increase because of the inventory increase and sales decrease, and in contrast, in the more profitable period of time with positive ⊿CFO, the day's inventory may decrease because of the inventory decrease and sales increase. This relationship can be said as the self-evident automatic earnings stabilizing system under the over-production hypothesis. We find an interesting fact that the TPS including JIT System of the Toyota group under order-driven TPS is more powerful than the stabilizing system. Under the following sections, we want to answer the question of why the Toyota group shows stronger prevailing power against income smoothing than other groups introducing the revision information of management forecast.

7, Discretionary accruals and the revision of management forecast

7.1 Partition by management forecasts

We usually find management earnings forecasts at three times in May, November and next March for the fiscal year end by March 31 by firm's summary management letter at the news-paper-crab in the Tokyo Securities Exchange.

   We define three partitions for revision of management forecasts as follows.
Partition for November revision = earnings forecasts at May – earnings forecast at September (b Panel of Table 6)
Partition for March revision = earnings forecasts at May – earnings forecast at March (c Panel of Table 6)
Partition for May announcement = earnings forecasts at May – actual financial statements earnings at May(a Panel of Table 6)

   These partitions will divide optimistic firms which announce larger forecasts of net income at May than following revision to pessimistic firms which announce smaller forecast of net income at May than following revisions.

   Kato, Skinner and Kunimura(2009 September, *Accounting Review*) finds that managers of firms with the worst profitability set the most optimistic forecasts for the next year. They find that managers who release initial earnings forecasts that are overly optimistic in one year are also likely to release overly optimistic forecasts the next year. They find difference from US data that in Japan, where

litigation is not a factor, managers can "walk down" forecasts more explicitly. We introduce new hypotheses on management forecasts.

7.2 Hypothesis 5: Discretionary Accruals (DA/S)

A pessimistic (optimistic) firm-year increases (decreases) income by increasing (decreasing) discretionary accruals.

Null Hypothesis 6. There is no difference in mean values of discretionary accruals (DA/S) between the pessimistic Group and optimistic Group.

7.3 Results

We compare pessimistic Group with optimistic Group in the discretionary accruals. Then, we will test the following null hypothesis:

H2S. There is no difference in mean values of the discretionary accruals between pessimistic Group and optimistic Group。

<Table 6>

Table 6 shows three revision results. We identify the large difference between pessimistic Group and optimistic Group in mean values of the discretionary accruals (DA) on the total sample and other groups. In the case of the other groups, Table 6 shows the negative 2.882, 5.862 and 3.800 days in optimistic Group and positive 2.681, 2.71096 and 1.986 days in pessimistic Groups. The t value of around two and the low p value less than 10 percent in Table 6 tell us that the H2S is rejected at the one percent significance level. In this case it is assumed that discretionary accruals may make use of possible income changes.

However, in Toyota group, two revisions, a and b, show adverse relation. The comparison of the Toyota group with other groups shows a different sign of discretionary accruals (DA). The optimistic group of Toyota group is not negative in two revisions. Optimistic group does not lead to negative discretionary accruals in the Toyota group. The low t value of three revisions and the high p value in Table 6 tell us that the H2S is not rejected at the ten percent significance level. In this case the discretionary accruals might be used for possible income smoothing. We find a clear difference between the Toyota group and other groups.

8. Conclusion

Does TPS prevent earnings management?　We examine earnings management　behavior on inventory and the revision behavior of management forecast in the Japanese automobile industry. we clearly identify income smoothing behavior under the potential handling of discretionary day's inventory (= inventory÷sales×365) and find pessimistic(optimistic) revision behavior of management forecasts with large increase(decrease) of discretionary accruals. Although we found such two behaviors in most of the groups studied, we could not identify above two behaviors in the Toyota group.　The TPS may prevent earnings management based on inventory and accruals only in Toyota Group under the order-driven Toyota Production System.

Abstract

Intellectual Capital (IC), a value creator of today's economy, is of critical importance to a company's long-term sustainability, profitability and growth. Though the value of companies has been shifting from tangible to the intangibles, many studies indicate that IC (or IC components) is not fully measured by the traditional financial statements due to its intangible nature (see for example Guthrie & Petty, 2000; Williams, 2001). As IC enables higher corporate value which results in better financial performance, it is essential to measure or value IC via a more creative tool such as IC Index (Bontis, 2004) or Rating (Edvinsson, 2002). An IC Index/Rating provides management with a basis for optimising competitiveness of its companies by focussing on the potential value of IC. It also functions as a foundation to measure IC and its components maximising profits for companies. It should also help various groups in comparing the potential IC values of companies.

The research will study the effect of intellectual capital on companies' performance in the Malaysian (business) environment. Components of IC are introduced and linked to the companies' competitiveness and/or performance. The intent is to provide an exploratory foundation for the development of systems and processes useful for meaningful management of intellectual assets. Finally, the study shall make recommendation based on empirical findings for external reporting of intellectual capital.

Keywords: Intellectual Capital, Malaysia

CHAPTER 1: INTRODUCTION

1.1   Introduction

Intellectual Capital (IC), a value creator of today's economy, is of critical importance to a company's long-term sustainability, profitability and growth. Though the value of companies has been shifting from tangible to the intangibles, many studies indicate that IC (or IC components) is not fully measured by the traditional financial statements due to its intangible nature (see for example Guthrie & Petty, 2000; Williams, 2001). As IC enables higher corporate value which results in better financial performance, it is essential to measure or value IC via a more creative tool such as IC Index (Bontis, 2004) or Rating (Edvinsson, 2002). An IC Index/Rating provides management with a basis for optimising competitiveness of its companies by focussing on the potential value of IC. It also functions as a foundation for modern business control system supplying clear and measureable goals to measure IC and its components maximising profits for companies. It should also help various groups in comparing the potential IC values of companies. Thus, the old axiom that "something gets measured, gets managed" holds valid.

Review on intellectual capital literature which has focus on performance measurement, shows that most of the studies concerning performance measurement have examined mature listed companies and had market value as one key indicator (see e.g. Bontis et al. 2000; Hurwitz et al. 2002; Chen et al., 2005). Many of the studies support the hypothesis that intellectual capital has a positive impact on firm's financial performance and market value. There are of course contradictory results as well suggesting that more investment in intellectual capital is not always better (Huang and Liu, 2005) and that not all elements of intellectual capital have positive impact on firm's financial performance (Wang and Chang, 2005; Firer and Williams, 2003). Contradictory results may stem from the facts that the analyzed firms are from different regions, they are not in the same field of business or firms may undergo divergent growth stage.

The critical competitive importance of intellectual capital in today's economy inidicates a need for high performance systems to manage them. Recent advances associated with total quality management, reengineering, learning organizations, and other initiatives have accomplished much. However, review from literature indicates that the management of intellectual capital is, at best,

ad hoc in most organizations. One reason is that traditional accounting systems are not well equipped to measure or monitor most elements of intellectual capital. Anoher reason is that the management of intellectual capital is considered by many as synonymous with workforce management. However, intellectual capital encompasses more than people and, therefore, requires a more comprehensive approach.

1.2   The Proposed Study

The research will study the effect of intellectual capital on companies' performance in the Malaysian (business) environment. Components and elements of intellectual capital are introduced in detail and linked to the issues raised in the analysis of competitiveness and/or performance. In addition, methods of measuring intellectual capital at both the components and organization levels shall be presented/developed. The intent is to provide an exploratory foundation for the development of systems and processes useful for meaningful management of intellectual assets. Finally, the study shall make recommendation based on empirical findings for external reporting of intellectual capital. The core of the thesis is to develop an intellectual index or rating for Malaysian companies.

1.3   Significance of the Study

The results of this research should supplement interest groups in investing decisions and company valuations. The result which links IC value to performance and market value of companies will be used for prediction. The findings of this research will aid the profession in a more systematic external reporting of IC like disclosing IC Index in the annual reports in the future.

1.4   Summary

This research hopes to develop an IC Index/Rating for Malaysian companies. The result of this research should help interest groups in investing decisions and company valuations as well as make comparison among them. The result will also link IC value to performance and market value of companies.

This research also intents to make recommendations to the Accounting profession for external reporting of IC in the annual reports of Malaysian companies indicating their IC index or rating.

On the next section, a short review on relevant literature is given. After this, the research framework is considered.

CHAPTER II: LITERATURE REVIEW

2.1   Introduction

Recent changes in the global economy which charaterized by complex and dynamic competitive environment have led to the importance of knowledge-based resources as the true source in sustaining competitive advantage of the firm. With this growing need to support knowledge-based economy, the way business is carried out has to be reshaped as firm's core asset are now the intellectual capitals (IC) that generally made up of the combined knowledge of human, structural, and relational resources (Abdul Latif & Fauziah, 2007).

Following this new development, Malaysia has also embarked on a mision to develop a knowledge-based society by launching a Knowlwdge-Based Economy Mater Plan in 2002 which outlines various strategies to accelerate the transformation of Malaysia to a knowledge-based economy (Economic Planning Unit, 2002). It aims to achieve a sustainable economic growth where Malaysia can no longer rely on investment in capital or physical assets but rather growth must be driven by productivity and innovation supported by effective managment of both tangible and intangible resources particularly the IC.

It is expected that the number of knowledge workers and new knowledge-based opportunities will increase in the near future of Malaysia and this new phenomenon will force firms to further develop and manage their IC. However, other than the concern on IC management, what is equally important is that the accounting discipline reflected in financial reporting as currently conceived can no longer provide what is being demanded by information users and investors.

The study/research is trying to propose here is the need for a much more broadly conceived concept of firm value reporting in Malaysia based on the dual requirements of financial and operational reporting, and within this context, IC reporting. In Malaysia, as presently, not much is known as to the extent to which firms in Malaysia have adopted IC management and subsequently IC reporting. Thus, it is the purpose of this research to analyse the initiatives developed in Malaysia in relation to IC reporting practices and then propose a policy framework specifically in the development of Malaysia own IC reporting index for a consistent and comparable IC reporting among Malaysian firms that would allow for more meaningful decision making. The practical implication would be for enforcement bodies like Securities Exchange (SE), Bank Negara Malaysia (Central Bank of Malaysia), and Companies Commission of Malaysia to use this propose IC reporting index as a guideline in setting legal requirement for mandatory operational and IC reporting. This research will also become a reference framework in assessing information quality that is, inter alia, based on consistency, comparability, and comprehensiveness of reported information.

2.2   Intellectual Capital - Definition

A review on literature indicates that there is a lack of a homogenous view on how to define, classify and value intangible assets or intellectual capital. It can

be argued that definitions and classifications of intangible assets are made with respect to the specific purpose of each study (see e.g. Kaplan and Norton 2004; Bontis and Fitz-enz 2002; Hurwitz, Lines, Montgomery and Schmidt 2002). The literature concerning intangible assets is widely encountered in the field of (business) research. One remarkable research project concerning intangible assets was the MERITUM-project – a project funded by European Union. The project's final report "Guidelines for managing and reporting on intangibles" (2001) presents intellectual capital as a combination of three groups where intangible assets can be further derived from.

In MERITUM-project's guideline *intellectual capital* refers to the combination of the human, structural and relational capital. A concept of *intangible asset (intangible)* refers to a factor (asset) arising either from human, structural or relational capital, which is used to create value. Human capital focuses on skills, experience, competence and innovation ability of personnel; structural capital consists of organizational processes and systems, software and databases, business processes and brands; relational capital includes customer reference lists, information on customer revenue potential and customer closeness. Though these elements are presented separately, they are bound with each other (Guidelines for managing… 2001; Rodov and Leliaert 2002).

From management's perspective, intangibles are directly linked to internal strategic decision-making, whereas the importance of intangibles for investors is emphasized in investment decision-making process. Arvidsson (2003) studied extensively strategic management and measurement/accounting literature and found intangible assets classifications being developed either for the internal or external usage. The strategic management literature relates intangibles to the process of creating sustainable competitive advantage and corporate value, whereas measurement/accounting literature focuses on how intangibles can be structured and measured in the financial accounting and reporting context. This definition is of course not an exclusive one, leaving room for other definitions too. Figure 1 represents the classification structure for intangibles suggested by Arvidsson (2003).

Figure 1. Classifications for Intangible Assets

Listing-approach, comprehensive-approach and BSC-approach represent the classifications developed for internal usage – their origin lie in the strategic management literature. Management team and other employees involved in the strategic decision-making processes use listing-approach to propose sub-groups and then to sort intangibles into these sub-groups. In comprehensive approach intangibles importance in the value-creation process is emphasized and intangibles classifications are put forward as schemes, models or frameworks developed and designed to assist in the internal strategic decision-making process. Neither listing-approach nor comprehensive-approach has a

measurability dimension that BSC-approach has. BSCapproach does not, however, try to value the intangible assets in currency units. It is distinguished from other approaches by the fact that it does not have an explicit focus on intangibles. Nevertheless, its customer, internal-business processes, and learning and growth perspectives have had substantial influence on the classifications of intangibles (Arvidsson 2003).

Three approaches described above refer to the strategic management literature and represent the classifications of intangible assets developed for the internal usage. In a similar manner, a threefold division-approach represents a classification developed for the external usage. Measurement/accounting literature has provided a base for this classification structure, where the dimensions of human capital, structural capital, and relational capital are emphasized. This categorization helps firms to communicate the presence and the importance of their intangible assets. Investors on the capital markets can utilize this structure to evaluate the firm's intangible assets and to better capture a value of the firm. Though the threefold division-approach has external usage status, its exploitation for internal use cannot be excluded (Arvidsson 2003).

Intellectual capital and intangible assets are often used as synonyms to describe the non-tangible factors of production that the firms make use of. However, when accounting is considered, a definition for both terms can be drawn. The International Accounting Standards Board defines an intangible asset as an identifiable non-monetary asset without physical substance held for use in the production or supply of goods or services, for rental to others, or for administrative purposes. In addition, FRIS 38 prescribes that intangible asset is a resource controlled by an enterprise as a result of past events and from which future economic benefits are expected to flow to the enterprise. These definitions draw a distinction between intellectual capital and intangible assets. The former includes all elements of non-tangible assets that the firm can utilize in its operations; in the latter elements that the firm does not control (own) are excluded, i.e. some elements of human capital.

2.3   Theoretical Background to the Study
The investigation of IC reporting could probably best drawn from social and political theory most particularly the stakeholder theory and legitimacy theory. Stakeholder theory talks about how the organization owes accountability to all its stakeholders to provide information on how the organization's activities affect them (Deegan, 2000). These should encourage voluntarily disclosures of IC as indicators of which stakeholders matter most to the firms and thus, those which firms may be seeking to influence. Legitimacy theory argues that firms can only continue to exist if the society in which they are based perceived the firms to be operating to a value system which is commensurate with the society's own value system. Thus, Guthries et al (2004) argue that firms with high levels of IC will be more inclined to disclose their IC as they cannot

legitimize their status through the traditional symbols of corporate success, the tangible assets. Instead, they need to communicate how the firm uses its IC to generate value.

2.4   Measuring and Reporting Intellectual Capital Practices

Efforts to reconstruct firms annual reporting to include IC indicators were spearheaded in the early 1990s by a small number of firms which took a particular interest in thsi issue (Guthrie and Petty, 2000). Annual Report is an ideal location for applying the IC model because they provide a good proxy with which to measure the comparative positions and trends of IC between firms, industries, and countries (Abeysekera, 2001).

This has been one reason why much of the published research on measuring and reporting of IC practices has used annual reports as a source documents to ascertain the status of the IC of firms, both within countries and between countries. Among IC reporting researches published in the last few years are located in Australia (Gutrie & Petty, 2000), Sri Langka (Abeysekera & Gutrie, 2000), and United Kingdom (Williams, 2001). Most of these researches used framework developed by Sveiby (1997) i.e. the Intangibles Assets Monitor model in undertaking their research. One of the researches conducted by Gutrie and Petty (2000) in Australia revealed that key components of IC are poorly understood, inadequately identified, inefficiently managed and inconsistently reported. In fact, even the Australian best practice firm is in need of a comprehension management framework, especially for reporting IC information. There were also researches conducted in the area of human resource (HR) reporting, a subset of IC, in which has seen an increasing importance in Nordic countries in the 1990s, especially Sweeden (see Sveiby, 1989) where companies took a lead in this respect by publishing statements about their HRs in their annual reports as an addition to the conventional financial statements.

In Malaysia, as presently, not much is known as to the extent to which firms in Malaysia have adopted IC reporting but there are high possibility Malaysian firms that produce the Corporate Social Responsibility (CSR) reports to provide information on HR (See Kamaluddin and Abdul Rahman, 2007). However, that does not mean there is no research being conducted in Malaysia on IC as most of the exixting research has put more focus on the IC management instead of IC reporting (see Abdul Latif & Fauziah, 2007). Recent study on IC is focus on the impact of the IC disclosures in the prospectus of the firms offering IPOs. Therefore, what this research trying to propose here is the need to create a better management of IC and better quality of financial reporting among the Malaysian companies by analyzing the initiatives developed in Malaysia in relation to IC reporting practices and propose a policy framework (index) specifically in the development of Malaysia own IC reporting Index for a consistent and comparable IC reporting among Malaysian firms that would allow for a more meaningful decision making.

2.5 Development of Intellectual Capital Reporting

Measuring and assessing IC by firms have become more important with the adoption of International Financial Reporting Standards (IFRSs) by many countries including Malaysia. The prudent approach taken by IFRS especially in recognizing assets (such as applying impairment test on assets and writing off intangibles which cannot be objectively verified in reference to an active market) has altered the reporting value of firms rather than the fair value of the firm (Abeysekera, 2007). This approach has also increased the "unexplained" gap between the fair price and the reported value (net book value) of the firm. Since investors are not fully aware of the gap between fair value and the reported value, this information gap creates two broad classes on investors: those that have access to information relating to the "unexplained gap" (perhaps shared at private meeting) and those that don't (Mary et al, 2003). As investors have access to information that explicates the "unexplained gap" can make better economic decisions as compared to those without the information, the need for better reporting has increased which lead to the development of external reporting that include IC Reporting. This new development could possibly create a competitive advantage to those firms that are able to produce such report.

Firms have always used tools to assess their assets and with the increasing demand for IC reporting, a demand for a new managing and measuring tools for a special type of intangible resources, such as organizational knowledge, has existed. Among tools being introduced for managing firm's IC is the Skandia Navigator, the Intellect Model, and the Intangible Assets Monitor.

Skandia Navigator model proposed by Edvinson and Malone (1997) exposes five scopes: financial, client, human, processes, and renewal and development as elements of the IC system, proposing for every one scope, a set of indicators. The model uses indicators of absolute measurement and efficiency indexes of IC. The main contribution of this model is its integrity, looking at the financial and non-financial perspectives of the organization that allows the estimation of market value of the firms (Bontis, 2001). The Intellect Model (1998) developed in Spain in the workgroup of European Institute proposed three areas of IC: human, structural, and relational. Each area tries to give a preliminary order in elements which are then concreted in measurement indicators. The Intangible Assets Monitor (Sveiby, 1997) commonly described as consisting of three capital categories: internal, external, and employee competence (human capital). In an IC research conducted by Abeysekera (2007) on developed and developing countries, this IC model has been further divided into sub-categories. For instance, human capital was clustered into seven sub-categories i.e. training and development, entrepreneur skills, equity issues, employee safety, employee relations, employee welfare, and employee-related measurements. The training and development sub-category normally comprises know-how, vocational qualifications, career development and training programs while the equity issues can be traced down to issues relating to race, gender, religion, and disability. The employee relation covers union activity, employees being

thanked, employees being featured and employee involvement in the community whereas the employee welfare sub-category consists of employee compensation plan, employee benefits, and employee share and option ownership plan. Lastly, the employee-related measurements sub-category comprises value-added by employees and executives, employee numbers, professional experience, eductaion levels, expert seniority, and age of employees (Subbarao and Zeghal, 1997).

The next section shall illustrate the research methodologies that will be carried out throughout the study.

CHAPTER III: RESEARCH DESIGN AND METHODOLOGY

3.1 The purpose of the study, research questions and hypothesis
The main objective of this project/research is to develop an IC Index/Rating for Malaysian companies. With the development of Malaysia into a 'knowledge-based economy', companies have begun to recognise the importance of managing IC and it is appropriate to develop an IC Index for these companies. Other sub-objectives are to derive IC value using such Index and relate to performance and market value of these companies. Spesifically, the study embarks on the following objectives:

1. To identify the components and elements of IC of companies;

2. To develop a structured measurement tool for management of IC;

3. To assess the IC value of companies;

4. To relate IC value with performance, market value, etc.

5. To make recommendation based on empirical findings for external reporting of IC.

3.2 Research Hypotheses
The research aims to test the following hyphotheses:

1. The higher the value of IC, the higher the company's performance (e.g. profitability, ROA)

2. The higher the value of IC, the higher the company's market to book ratio (MTBR) or market value

3. There is a significant difference between the value of IC among different types of companies in Malaysia.

Further hypothesis shall be developed later.

3.3 Research Methods
The research will use a mixed method of investigation:

1. A list of IC elements/components will be developed from literature;

2. An empirical research via questionnaire on managers (companies listed on the main board of Bursa Malaysia) regarding IC elements/components and their measures used in practice;

3. A check list and score board will be developed and employed to measure companies' IC;

4. Some financial data such as MTBR, profit, etc will be obtained from DataStream.

5. Content analysis of companies' annual reports will also be carried out to gauge/analyse the level of IC repoting;

The research will also be conducted via interviews and postal survey with the aid of questionnaires.

3.4 Sampling Procedure and Data Collection

This research will use simple random sampling as the research is attempting to value IC of Malaysian public listed companies (main board). Various methods of investigation such as self-administered and/or postal survey and interviews will be employed. Interviews will be conducted on selected companies after preliminary survey. Other financial data such as market to book ratio (MTBR), profit, etc will be obtained from DataStream.

Strategic management and measurement/accounting literature both provide huge amounts of intellectual capital related information, which will be used to create an instrument (IC-index) for the measurement purpose. Studies among these areas and especially in the area of capital market research contain disclosure indexes, where items of intellectual capital exist. Although these indexes contain most often other elements as intellectual capital as well, they can be used to help the structural formation of the planned index. At this point of process it seems that there will be three main categories in this index – human, structural and relational capital – which all contain items of intellectual capital. A pilot study will verify that the questionnaire is properly designed and the items are understood in a proper manner. The pilot study also allows to add items of intellectual capital to the index that the respondents feel absent. Managers of financial (and personnel) administration should probably be stressed, when executing the survey. A 1-to-5 or 1-to-7 Disagree-Agree type scale (Likert scale) will be used to score firms' intellectual capital.

3.5 Data Analysis

Besides descriptive statistics, quantitative analysis such as factor analysis and regression analysis will be conducted. Regression model for example can be used to test the importance of intellectual capital for companies' financial performance. Factors such as size, industry, ownership, etc can be used to split the data in more detail. Furthermore, each element of the IC Index can be tested separately to find out their importance for companies' financial performance. In addition, qualitative analysis will be conducted on the findings of interviews.

3.6 Potential Results of the Study

First of all, this study aims to construe a deeper understanding of the role of intellectual capital in firm's business processes and financial performance. Some models of economics are used to describe the core functions and operational environment of firms, whereas models explaining firms'

competitiveness are used to analyze the role and importance of organizational capabilities and resources in business processes. Elements and separate items of intellectual capital will be linked to the issues that have emerged from the competitiveness analysis. This is the conceptual contribution of the study. Secondly, the results of the survey could hint what kind of intellectual capital elements are vital for the companies that are engaged in business activities. As the survey covers companies in different size and industry, some information about the elements that trigger the performance may unfold as well. In addition, the survey is of course to find out, whether the intellectual capital affects firms' financial performance or not. The main objective of the study is to come up with the IC Index for Malaysian companies. This may interest firms, as intangibles are difficult to measure and control, and by that way lead to further research subjects. The Index may provide some consistency for the measurement and reporting of intellectual capital for companies.

THE EFFECT OF FINANCIAL CRISIS AT KOREAN STOCK MARKET

Jang Hee Lee, Dongseo University

Abstract

In this study's analysis pre and post the Financial Crisis, the value correlations of the accounting information and the additional explanation ability of the fundamental variables were found to be very high after the Financial Crisis. The significant fundamental variables varied pre and post the crisis. Inventory (SALINV) was found to be significant before the Financial Crisis but was found insignificant after. On the other hand, Accounts Receivable (ΔSALAR) and Personnel Expenses (ΔASLR) were not significant before the Financial Crisis but significant after the crisis, and the signs also changed from negative (-) to positive (+). Meanwhile, Gross Profits (ΔGMSAL) showed negative (-) coefficients before the crisis, but showed positive (+) coefficients after.

Also, the results from conducting regression analysis using POST, which is the dummy variable representing the periods pre and post the Financial Crisis, show that Gross Profits (POST*ΔGMSAL), Sales (POST*ΔSALA), Cost of Sales (POST*ΔCGSA), Accounts Receivable (POST*ΔSALAR) and Personnel Expenses (POST*ΔASLR) showed positive (+) signs, but Equipment Investment (POST*ΔCAPEX) and Assets (POST*ΔASA) showed negative (-) signs.

1. Introduction

The Korean economy has been undergoing many changes since the 1997 Financial Crisis. Such radical changes in the capital market include expansion in foreign stock investments in stocks, full-scale advance of foreign financial institutions into the Korean market, selling off domestic enterprises overseas, and the expansion of foreign ownership rate in domestic enterprises. Owing to such rapid changes after the Financial Crisis, investment methods in the Korean stock market have also changed. As is the case with other countries, investment analysts of securities companies in Korea evaluate the intrinsic value of the enterprises through fundamental analysis using financial statements and the current investment opinions on applicable enterprises and industries. Generally after the crisis, investments in stocks are advised based on the opinions of these securities analysts.

Particularly after the crisis, the country's securities companies made full-scale investments in establishing research centers competitively based on favorable business results following the stock market boom in 1998. Backed by the extensive investments in the business analysis sector, investment analysts have been greatly growing both qualitatively and quantitatively. (Analysts utilizing fundamental analysis are considered the best analysts by media organizations.) Based on such growths, research centers of securities

companies have been able to conduct more systematic and logical corporate analyses. Accordingly, the use of corporate analysis reports has become generalized and the influence of investment analysts continues to expand. The investment analysts of securities companies utilized the fundamental analysis in order to find and analyze the stocks that deviate from intrinsic values as being overestimated or underestimated in the efficient market. The investment strategy that utilizes fundamental analysis suggests to buy underestimated stocks and to sell overestimated stocks.

Meanwhile, focusing on profit information, researches have been made on the effect of information that began to support the utility of financial statements information in the study of accounting. Such research works were based on the assumption that the sum of the present value of future cash flows is the corporate value and that the profit information can be used as the replacing value of cash flows. In the actual capital market, however, the ability to explain the fluctuations of stock prices is found to be minimal. This is primarily due to the fact that profit information is only one part of a company's economic value as contained in the financial statements but the stock prices reflect all information factors contained in the statements. In other words, profit data on the financial statements are important information with regard to the evaluation of corporate values but are only a part of various accounting information. Accordingly, in order to evaluate the utility of financial statements, all the pieces of information reflected in the financial statements should be used, and not only the ones on profit.

From the viewpoint of fundamental analysis, this study observed that one can predict future profits by using the collection of information besides the information on stock prices alone on the assumption that stock prices do not sufficiently represent all the necessary information. This thesis therefore attempts to verify how much the Financial Crisis has influenced the effects of financial statements information in the country's capital market by utilizing the variables of fundamental analyses that have been generalized through the Financial Crisis.

This thesis consists of the following. Chapter 1 explains research objectives and purposes; Chapter 2 explains the conceptual framework of performing the research and describes the research designs; Chapter 3 proves the analysis and presents the results of analysis; and Chapter 4 discusses the results of the research.

II. Research Design

1. Setting Up Hypotheses

Starting from the Financial Crisis that greatly changed the Korean economy, this research will verify whether there are any differences before and after the financial crisis in the use of the financial statements information that utilizes fundamental analysis variables. The reasons for verifying this are twofold. First, due to the Financial Crisis, the accounting transparency of domestic companies was emphasized, expectations for the local companies' accounting

information were raised and the responsibility for inappropriate accounting was reinforced. Second, the domestic financial market environment has rapidly changed due to full-scale foreign investments. And, as investment analysts of securities companies have been engaged in full-fledged activities, fundamental analyses utilizing the financial statements have been very active. Actually, due to substantial business analysis investments since 1999, the business analysis sector of the domestic securities companies has been experiencing rapid quantitative expansion and qualitative growth. Also, the competitions among the investment analysts of securities companies have intensified due to several special events sponsored by news media such as the selection of the best analyst and other prize awards, which have caused general investors to recognize fundamental analysis. Based on this, additional and more diverse fundamental analysis data have been produced and transmitted through diverse channels to investors. So, Hypothesis 1 was set up since it was expected that there would be differences in the use of financial statements that utilize fundamental analysis variables before and after the Financial Crisis.

Hypothesis 1: There are no differences in the use of financial statements that utilizes fundamental analysis variables before and after the Financial Crisis.

Before the crisis, the local companies focused mainly on sales growth rather than on profitability in business management. Such expansion-oriented management led to over borrowing, which was one of the causes of the Financial Crisis. During the crisis however, the local enterprises lowered their debt ratio and focused on profit-oriented management rather than on sales growth. Investors also evaluated the companies and decided to make investments based on profitability rather than on sales or on the asset size of the companies concerned. Due to this, along with the utility of fundamental analysis variables, the variables representing profitability, Gross Profits (ΔGMSAL), Cost of Sales (ΔCGSA), and Personnel Expenses (ΔASLR) are expected to be more significant during after the crisis. So, in addition to the above hypothesis, Hypothesis 2 was set up since it was expected that there would be differences in value correlations of Gross Profits (ΔGMSAL), Cost of Sales (ΔCGSA) and Personnel Expenses (ΔASLR).

Hypothesis 2: Of the fundamental analysis variables, there are no differences in the value correlations of the fundamental analysis variables representing profitability, Gross Profits (ΔGMSAL), Cost of Sales (ΔCGSA) and Personnel Expenses (ΔASLR) before and after the crisis.

On the other hand, during crisis, the local companies lowered their debt ratios, sold off non-business properties and pushed forward restructuring, which are factors that favored the stock market. Variables representing an enterprise's external growth such as equipment investment (ΔCAPEXA) or assets (ΔASA) are expected to have negative (-) impact on the earning rates after the Financial Crisis. In addition therefore, Hypothesis 3 was set up since it was expected that there would be differences in the value correlations of

2680

Equipment Investment (ΔCAPEXA) or Assets (ΔASA) representing the external growth of a company before and after the Financial Crisis.

Hypothesis 3: Of the fundamental analysis variables, there are no differences in the value correlations of the fundamental analysis variables representing an enterprise's external growth, Equipment Investment (ΔCAPEXA) or Assets (ΔASA).

2. Selection of Variables

This research attempts to verify the utility of the financial statements by using a total of 16 fundamental analysis variables, which are made up of eight fundamental analysis variables that can be applied to the Korean market, 12 fundamental analysis variables are based on the expertise of American securities analysts presented in the dissertation of Lev and Thiagarajan (1993), and eight fundamental analysis variables that do not overlap with the other eight fundamental analysis variables of American securities analysts.

In general, the distinction between good signal and bad signal is clear in the accounting profit information but unclear in the non-profit accounting information. Investment analysts of securities companies generally interpret accounting information that is based on fundamental analysis. For example, the imbalanced increase in inventory is interpreted as bad signal. Of course, such imbalance can be due to the managers' expected increase in sales. Although such interpretation is not always right, this research makes the necessary judgment regarding the signal of non-profit accounting information in accordance with the criteria that the securities analysts use to distinguish between good signal and bad signal when conducting fundamental analysis. In general, a sharp increase in inventory more than net sales means the company is experiencing sales difficulties. Moreover, such imbalanced increase in inventory will force management to attempt to maintain the level of inventory, which will reduce profit. Besides, an increase in inventory will lower future profit due not only to the opportunity cost of inventory purchase, inventory storage costs, inventory diminution and loss but also to the reserve of overhead costs allotted to inventory. Accordingly, in general, the increase in inventory is regarded as a bad signal and the decrease in inventory is a good signal.

In this research, the rate of increase in sales less the rate of increase in inventory is denoted as ΔSALINV.

Accordingly, as mentioned above, the value of the variable resulting from the increase in inventory is expected to be negative (-) or as a bad signal, and the value of the variable resulting from the decrease in inventory is expected to be positive (+) or as a good signal. It is expected to have the same effect on the fluctuation of stock prices.

The rate of increase in inventory is calculated by dividing the change in the inventory amount at the end of the current year (t) compared with the inventory amount at the end of the immediate previous year by the inventory amount at the end of the immediate previous year. This can be expressed as:

$\Delta SALINV_t = (\text{Inventory}_t - \text{Inventory}_{t-1})/\text{Inventory}_{t-1}$

This equation shall be used to determine the rate of increase in sales and all the other fundamental analysis variables that are discussed below. Table 1 below summarizes the investment analysts of securities companies that are used in this research.

Table 1: Definition of Fundamental Analysis Variables

Fundamental Analysis Variables	Measurement of Variables
1. Inventory	The increase rate of sales – the increase rate of inventory
2. Accounts Receivable	The increase rate of sales – the increase rate of accounts receivable
3. Equipment Investment	The increase rate of equipment investment – the increase rate of equipment investment of the same industry
4. Gross Profits	The increase rate of gross profits – the increase rate of sales
5. Selling and Administrative Expenses	The increase rate of sales – the increase rate of selling/administrative expenses
6. Bad Loan Reserves	The increase rate of bad loan reserves – the increase rate of accounts receivable
7. Effective Corporate Tax Rates	(Before tax net profit per share/stock price of the immediate prior year)
8. Labor and Personnel	The increase rate of sales compared with immediate prior year per employee
9. Sales	The increase rate of sales – the increase rate of sales of the same industry
10. Accounts payable	The increase rate of sales – the increase rate of accounts payable
11. Cash Flow	The increase rate of cash flow compared with the immediate prior year per share
12 Liquidity	The increase rate of current assets – the increase rate of current liabilities
13. Debt	The increase rate of liabilities – the increase rate of current liabilities
14. Cost of Sales	The increase rate of cot of sales of the same industry – the increase rate of cost of sales
15. Personnel Expenses	The increase rate of personnel expenses of the same industry– the increase rate of personnel expenses
16. Assets	The increase rate of assets – the increase rate of assets of the same industry

* Variables 1to 8 are the variables used by Lev and Thiagarajan, and variables, 9 to 16 are used by Korean investment analysts that do not overlap with 1 to 8.

3. The Enterprises Analyzed

Among the enterprises listed on the Korea Stock Exchange from January 1, 1992 to December 31, 2001, the sample enterprises include the companies settling accounts in December and whose stock prices and financial statements data are included in the database of the enterprises information warehouse TS2000 of the Korea Listed Companies Association, excluding the following companies:

(1) Banks, investment finance companies, securities companies and insurance companies. (Financial industries and similar services

industries widely differ from the other industries in business activities, asset structures and accounting policies.)

(2) Stocks that are classified as controlled. (Their trade was sluggish or even discontinued, incurring problems in data continuity.) This research may have certain biases in the sampling as it included only the relatively sound enterprises.

(3) Company stocks that were merged from January 1993 to December 2001 (due to the same reason of the problems of data continuity).

The period applicable begins in 1992 in consideration to the fact that in 1993 the country's capital market opened and investment organizations including securities companies began to adopt the fundamental analysis.

4. Descriptive Statistics

As the summary of descriptive statistics of the variables used in this research, Table 2 shows mean, median, and the percentage value of the parts within 1% and 5% at both ends of the distribution of the variables. The distribution of the value of ΔEARN poses a serious problem in extreme value in that it ranges from the minimum of -38.62 to the maximum of 80.79. So, the extreme value in ΔEARN was treated through "winsorize" at the values of ±1 at both ends of the distribution.

Table 2: Descriptive Statistical Measures of the Sample

2299 Enterprises/Year, 1993-2001

Variables	Mean	Standard Deviation	Minimum	1% Value	Median	99% Value	Maxmum
Rt	0.072	0.704	-0.940	-0.853	-0.031	2.040	14.000

When the correlations among the independent variables are high, the core model of this research can cause the problem of Multicolinearity at the time of multiple regression analysis. In this research, however, the problem of Multicolinearity is not considered a serious threat in view of the figures of VIF and condition index in the later multiple regression analysis.

5. Research Methodology

In order to verify the hypotheses, this research examines the utility of the information of fundamental analysis variables before and after the Financial Crisis. The basic regression model used to prove the research hypotheses is as follows:

$$R_{t,i} = a_0 + a_1 \Delta EARN_{t,i} + V_{t,i} \quad \text{.. (1)}$$

$R_{t,i}$ = Stock earning rates from April, Year t to March, Year t+1

$\Delta EARN_{t,i}$ = Change in EPS of i enterprises in the Year t divided by the stock prices of Year t-1

In this research, each fundamental signal is defined such that the more positive value it has by logical inference, the more positive effects they have on the excess earning rates. Accordingly, the purpose of this research is to verify whether or not bj, which is coefficient of each Sj, has positive value when the fundamental analysis variables are used as additional independent variables. If bj has positive value it can be interpreted as having positive influence on the future earning rates.

Each of partial F values are examined in order to determine the adaptability of the model. In the regression model, Rt is the buy-and-hold stock prices earning rates for the period t from April to March of the succeeding year, and $\Delta EARNt$ is the change in EPS for the period t divided by the stock prices of the previous year, and a and b are coefficients of the regression model. When fundamental analysis variables are not useful at all, the slope coefficient b should be 0, and when fundamental analysis variables are useful, b should be greater than 0 (b>0). So, partial F value is the value used to verify the regression coefficient for the fundamental signal in its entirety, as well as to prove the hypothesis that the regression coefficients of the fundamental signals are all 0. If partial F value is high, then the hypothesis that the regression coefficients are all 0 can be rejected.

In order to verify whether or not there are differences in the utility of non-profit financial statements information before and after the Financial Crisis which greatly impacted the Korean economy, this research repeated the regression analysis three years (1994 to 1996) before the crisis and three years (1999 to 2001) after. This study also verifies whether the regression coefficient Bj of the fundamental analysis variables differ before and after the said crisis.

$$R_{t,i}=a_0+a_1\Delta EARN_{t,i}+b_{1t}\Delta SALINV_{t,i}+ b_{2t}\Delta SALAR_{t,i} + b_{3t}\Delta CAPEXA_{t,i} + b_{4t}\Delta GMSAL_{t,i}$$
$$+ b_{5t}\Delta SALSA_{t,i} + b_{6t}\Delta BDAR_{t,i} + b_{7t}\Delta ETR_{t,i} + b_{8t}\Delta SALPP_{t,i}+ b_{9t}\Delta SALA_{t,i} +$$
$$b_{10t}\Delta SALAP_{t,i} + b_{11t}\Delta CFPS_{t,i} + b_{12t}\Delta ASDB_{t,i} + b_{13t}\Delta DEBT_{t,i} + b_{14t}\Delta ACGS_{t,i} +$$
$$b_{15t}\Delta ASLR_{t,i} + b_{16t}\Delta ASA_{t,i} +V_{t,i} \cdots\cdots\cdots\cdots\cdots\cdots (2)$$

The period before and after the Financial Crisis are divided into two periods, 1994-1996 and 1999-2001, because 1997 was the year of the crisis and 1998, the following year, was excluded. In 1999, the Accounting Institute aimed to enhance the transparency of accounting was established. Furthermore, in order to verify whether there were changes in the fundamental analysis variables which investors consider important in making decisions on investment, the regression analysis is conducted on the Regression Model (3) in which the dummy variable, Post, representing the period before and after the crisis was added into the regression expression.

$$R_{t,i}=a_0+a_1\Delta EARN_{t,i}+b_{1t}\Delta SALINV_{t,i}+ b_{2t}\Delta SALAR_{t,i} + b_{3t}\Delta CAPEXA_{t,i} + b_{4t}\Delta GMSAL_{t,i} +$$
$$b_{5t}\Delta SALSA_{t,i} + b_{6t}\Delta BDAR_{t,i} + b_{7t}\Delta ETR_{t,i} + b_{8t}\Delta SALPP_{t,i}+ b_{9t}\Delta SALA_{t,i} +$$
$$b_{10t}\Delta SALAP_{t,i} + b_{11t}\Delta CFPS_{t,i} + b_{12t}\Delta ASDB_{t,i} + b_{13t}\Delta DEBT_{t,i} + b_{14t}\Delta ACGS_{t,i} +$$
$$b_{15t}\Delta ASLR_{t,i} + b_{16t}\Delta ASA_{t,i} + c_{1t}POST*\Delta SALINV_{t,I} + c_{2t}POST*\Delta SALAR_{t,i} +$$

$$c_{3t}POST^*\Delta CAPEXA_{t,i} + c_{4t}POST^*\Delta GMSAL_{t,i} + c_{5t}POST^*\Delta SALSA_{t,i} +$$
$$c_{6t}POST^*\Delta BDAR_{t,i} + c_{7t}POST^*\Delta ETR_{t,i} + c_{8t}POST^*\Delta SALPP_{t,i} + c_{9t}POST^*\Delta SALA_{t,i}$$
$$+ c_{10t}POST^*\Delta SALAP_{t,i} + c_{11t}POST^*\Delta CFPS_{t,i} + c_{12t}POST^*\Delta ASDB_{t,I} +$$
$$c_{13t}POST^*\Delta DEBT_{t,i} + c_{14t}POST^*\Delta ACGS_{t,i} + c_{15t}POST^*\Delta ASLR_{t,i} +$$
$$c_{16t}POST^*\Delta ASA_{t,i} + V_{t,i}.\cdots\cdots\cdots (3)$$

Provided POST= 1 if after the Financial Crisis, otherwise, POST= 0

III. Results

Table 4: shows the results of the regression analysis on each of the two period-groups before and after the crisis, into which the sample was divided based on the criteria set up previously. The explanation ability of the fundamental analysis variables before and after the crisis was compared. The R^2 of the period after the Financial Crisis was 0.172, higher than 0.102 of the period before the Financial Crisis. This means the explanation ability of the fundamental analysis variables after the Financial Crisis was found to be higher. Also, when only accounting profits were used as an independent variable, the R^2 for the period after the Financial Crisis was 0.050, which is higher than 0.026 for the period before the Financial Crisis. This now means that the explanation ability of accounting profits was found to be higher. With regard to the increase in the additional explanation ability of the fundamental analysis variables, the R^2 increase before the crisis was 0.076 whereas the R^2 increase after the crisis was 0.122, which means the additional explanation ability of the fundamental analysis variables after the Financial Crisis was found to be higher.

The results of the regression analysis by group showed that before the Financial Crisis, Gross Profits (ΔGMSAL), Sales (ΔSALA), and Cost of Sales (ΔCGSA) were found to be statistically significant at the level of 1%; Liquidity (ΔASDB) and Debt (ΔDEBT) were found to be significant at the level of 5%; and Inventory (ΔSALINV) was found to be significant at the level of 10%. After the Financial Crisis, Accounts Receivable (ΔSALAR), Sales (ΔSALA), Cost of Sales (ΔCGSA) and Personnel Expenses (ΔASLR) were found to be statistically significant at the level of 1%; Gross Profits (ΔGMSAL) were found to be significant at the level of 5%; and Liquidity (ΔASDB) and Debt (ΔDEBT) were found to be significant at the level of 10%. Thus, there were differences in significant fundamental analysis variables among the period-groups before and after the crisis.

Inventory (ΔSALINV) was found to be significant before the Financial Crisis but found insignificant after. Before the crisis, Inventory responded significantly in the positive (+) direction when the increase rate of sales is greater than that of Inventory, which means that in the period after the crisis it did not respond significantly. This means that before the crisis, Inventory showed significant results when the increase rate of Sales is higher than that of Inventory. After the crisis however, the mere fact that the increase rate of Sales is higher than that of Inventory was not received as good signal in the stock market.

As opposed to this, Accounts Receivable (ΔSALAR) and Personnel Expenses (ΔASLR) were not significant before the Financial Crisis but were

found to be significant after, with the negative (-) sign changing into positive (+). This means that, with regard to Accounts Receivable (ΔSALAR), the increasing rate of Accounts Receivable exceeding that of Sales was received as negative (-) signal in the stock market during the Financial Crisis. In other words, the stock market responded negatively to the softening of payment terms or increasing Accounts Receivable during the crisis, all of which are commonly used to expand the external growth through sales growth. This is thought to be attributable to the fact that the increase in sales by the softening of payment terms deteriorates profitability. Also regarding Personnel Expenses, it is thought to be attributable to the fact that the increase in personnel expenses exceeding the industry average was received negatively (-) in the stock market since personnel expenses became a burden to a company's profitability as enterprises experienced the rapid rise in personnel expenses after the crisis.

Meanwhile, Gross Profits (ΔGMSAL) showed negative (-) coefficients before the Financial Crisis but positive (+) coefficients after. This means that before the crisis, growth was considered more important in the stock market than profitability. After the crisis however, profitability was considered more important. Such changes mean that investors saw profitability in their stock market investments as more important since companies that continued to focus on gross sales-oriented growth had difficulties during the crisis. This is attributable to the fact that after the Financial Crisis, the investment analysts of securities companies placed the greatest weight on profitability in their fundamental analysis.

*/**/*** represent statistical significance at the level of 10%, 5% and 1%, respectively.

Table 5 shows the results of the regression analysis by using POST, which is the dummy variable additionally representing the periods before and after the Financial Crisis in order to analyze the differences in the use of the fundamental analysis variables before and after the crisis. The results of the regression analysis showed that the R2, which represents the explanation amount of the regression model, was 0.143, representing an increase from the R2 of 0.117 shown before POST was taken. The F value of significant verification for the adaptability of the regression model was 11.403 and p value was 0.000, which was statistically significant at the level of 1%.

The dummy variables of equipment investment, POST*ΔCAPEX, of Gross Profits, POST*ΔGMSAL, of Sales, POST*ΔSALA and of Cost of Sales POST*ΔCGSA were significant at the level of 1%. Also, the dummy variables of Accounts Receivable POST*ΔSALAR, of Personnel Expenses, POST*ΔASLR and of Assets, POST*ΔASA were significant at the level of 5%.

With regard to the signs of beta value of the standardized coefficients of each value, the dummy variables of Gross Profits, POST*ΔGMSAL, of Sales, POST*ΔSALA, of Cost of Sales, POST*ΔCGSA, of Accounts Receivable POST*ΔSALAR, and of Personnel Expenses, POST*ΔASLR showed a positive sign (+), while the dummy variables of Equipment Investment, POST*ΔCAPEX, and of Assets, POST*ΔASA showed a negative (-) sign. This means that the fundamental analysis variables representing profitability such as Gross Profits (ΔGMSAL), Cost of Sales (ΔCGSA), Personnel Expenses (ΔASLR) and Sales (ΔSALA), and Accounts Receivable (ΔSALAR) became more significant in the stock market after the crisis. Such changes mean that investors consider profitability and stability in their stock market investments as more important since enterprises that continued to focus on gross sales-oriented growth had difficulties during the crisis. Also, Equipment Investment (ΔCAPEXA) and Assets (ΔASA), all of which represent the growth of the scale of enterprises, were found to have negative (-) effects during the crisis.

This agrees with the fact that company restructuring after the crisis was received as a good sign in the stock market.

Accordingly, the three hypotheses, Hypothesis 1 (which says there are no differences in the utility of the financial statements information utilizing the fundamental analysis variables before and after the crisis), Hypothesis 2 (which says there are no differences in the value correlations of the fundamental analysis variables representing profitability such as Gross Profits (ΔGMSAL), Cost of Sales (ΔCGSA), and Personnel Expenses (ΔASLR) before and after the crisis) and Hypothesis 3 (which says there are no differences in the value correlations of the fundamental analysis variables representing gross sales growth such as Equipment Investment (ΔCAPEXA) and Assets (ΔASA) before and after the crisis) were rejected.

In conclusion, there were differences in the value correlations of the fundamental analysis variables in the periods before and after the Financial Crisis, and the explanation ability of the fundamental analysis variables and profits was enhanced after the crisis. After the crisis, the value correlations of Gross Profits (ΔGMSAL), Cost of Sales (ΔCGSA) and Personnel Expenses (ΔASLR) of the fundamental analysis variables representing profitability were increased. On the other hand however, Equipment Investment (ΔCAPEXA) and Assets (ΔASA) of the fundamental analysis variables representing gross sales growth were found to have negative (-) effects.

Table 5: The Regression Analysis Result of the Regression Model (3)

$R_{t,i}=a_0+a_1\Delta EARN_{t,i}+ b_{1t}\Delta SALINV_{t,i}+ b_{2t}\Delta SALAR_{t,i} + b_{3t}\Delta CAPEXA_{t,i} + b_{4t}\Delta GMSAL_{t,i} + b_{5t} \Delta SALSA_{t,i} + b_{6t}\Delta BDAR_{t,i} + b_{7t}\Delta ETR_{t,i} + b_{8t}\Delta SALPP_{t,i}+ b_{9t}\Delta SALA_{t,i} + b_{10t}\Delta SALAP_{t,i} + b_{11t} \Delta CFPS_{t,i} + b_{12t}\Delta ASDB_{t,i} + b_{13t}\Delta DEBT_{t,i} + b_{14t}\Delta ACGS_{t,i} + b_{15t}\Delta ASLR_{t,i} + b_{16t}\Delta ASA_{t,i} + c_{1t}POST*\Delta SALINV_{t,i} + c_{2t}POST*\Delta SALAR_{t,i} + c_{3t}POST*\Delta CAPEXA_{t,i} + c_{4t}POST*\Delta GMSAL_{t,i} + c_{5t}POST*\Delta SALSA_{t,i} + c_{6t}POST*\Delta BDAR_{t,i}+ c_{7t}POST*\Delta ETR_{t,i} + c_{8t}POST*\Delta SALPP_{t,I} + c_{9t}POST*\Delta SALA_{t,i}+ c_{10t}POST*\Delta SALAP_{t,i} + c_{11t}POST*\Delta CFPS_{t,i} + c_{12t}POST*\Delta ASDB_{t,i} + c_{13t}POST*\Delta DEBT_{t,i} + c_{14t}POST*\Delta ACGS_{t,i} + c_{15t}POST*\Delta ASLR_{t,i} + c_{16t}POST*\Delta ASA_{t,i} + V_{t,i}$

IV. Conclusion and Suggestions

In this study's analysis before and after the Financial Crisis, the value correlations of the accounting information and the additional explanation ability of the fundamental variables were found to be very high after the crisis. The significant fundamental variables varied before and after the crisis. Inventory (SALINV) was found to be significant before the Financial Crisis but was found insignificant after. This means that the increase rate of Sales exceeding that of Inventory, responded in the positive (+) direction before the Financial Crisis, but did not respond significantly after. This means that during the crisis, the mere fact that the increase rate of Sales is greater than that of Inventory was not received as good signal in the stock market. On the other hand, Accounts Receivable (ΔSALAR) and Personnel Expenses (ΔASLR) were not significant before the Financial Crisis but significant after the crisis, and the signs also changed from negative (-) to positive (+). This means that during the crisis, the increase rate of Accounts Receivable exceeding that of Sales was received as a negative (-) sign in the stock market. In other words, during the crisis, the stock market responded negatively to the easing of payment terms that is commonly used for the gross sales growth through expanding sales of the enterprises or the increasing of Accounts Receivable through sales on credit.

Regarding Personnel Expenses (ΔASLR), rapid increase in personnel expenses after the crisis became a burden on a company's profitability, so the increase in Personnel Expenses was received as a negative (-) signal in the stock market. Meanwhile, Gross Profits (ΔGMSAL) showed negative (-) coefficients before the crisis, but showed positive (+) coefficients after. This means that before the crisis, the stock market considered growth more important than profitability, but after the crisis, profitability became more important. Such changes mean that while undergoing the crisis, companies that continued to focus on gross sales-oriented growth underwent many difficulties, so that investors gave greater weight on profitability when investing in the stock market.

Also, the results from conducting regression analysis using POST, which is the dummy variable representing the periods before and after the Financial Crisis, show that Gross Profits (POST*ΔGMSAL), Sales (POST*ΔSALA), Cost of Sales (POST*ΔCGSA), Accounts Receivable (POST*ΔSALAR) and Personnel Expenses (POST*ΔASLR) showed positive (+) signs, but Equipment Investment (POST*ΔCAPEX) and Assets (POST*ΔASA) showed negative (-) signs. This means that Gross Profits (ΔGMSAL), Cost of sales (ΔCGSA) and Personnel Expenses (ΔASLR), all of which are the fundamental analysis variables representing profitability, became more significant in the stock market after the crisis. Such changes mean that during crisis, companies that continued to focus on gross sales-oriented growth underwent many difficulties, so that investors gave greater weight on profitability and stability when investing in the stock market. Equipment Investment (ΔCAPEXA) and Assets (ΔASA), both of which represent the growth of the scale of the enterprise, were found to have negative (-) effects during the crisis. This agrees with the fact that company restructuring was received as a good signal in the stock market after the crisis.

This research contributes to the existing research works as follows:

First, the utility of the fundamental analysis generally used for evaluating stocks in Korea has been verified on an actual proof basis, and as opposed to existing works, the fundamental analysis variables used by securities analysts in Korea have been additionally utilized for verification. Second, this research has presented the change that took place sometime in 1997 during the Financial Crisis, in which participants in the stock market, when establishing their investment strategy, emphasize more on profitability than on the gross sales or size of enterprises. Third, this study has presented that there are differences before and after the Financial Crisis in the fundamental analysis variables which securities analysts after the crisis consider significant.

Notwithstanding this contribution, there may be limitations in generalizing the results of this research since only the listed manufacturing enterprises were analyzed. The influence of the industry was not removed. In future research, research works on the enterprises that are included not only in the manufacturing industry but also in the service and financial industries are considered meaningful. Additional research works that shall utilize the unique fundamental analysis variables that are used by securities analysts on an industry basis are necessary.

THE PREDICTIVE ABILITY OF ACCRUAL MODELS WITH RESPECT TO FUTURE CASH FLOWS

Yasushi Yoshida[+], Chiba University of Commerce
June 15, 2009

Abstract
Many prior studies advocate the variant predictive power of the accrual models with respect to future cash flows. This paper investigates the sobering predictive power of the accrual models. Results indicate that theoretical accrual models such as Barth, Cram, and Nelson (2001) are highly correlated with future cash flows, but they do not have the predictive ability of the future cash flows in a precise sense.
.

Keywords: *Accruals, Cash flow, Earnings, Cash flow prediction, Panel data analysis*

I. Introduction

Barth, Cram, and Nelson (2001), hereafter BCN, investigates the role of accruals in predicting future cash flows by comparing the explanatory power of equations (1) and (2).

$$CF_{i,t+1} = \phi + \sum_{\tau=0}^{k} \phi_{t-\tau} EARN_{i,t+1} + u_{i,t} \quad (1)$$

$$CF_{i,t+1} = \phi + \phi_{CF} CF_{i,t} + \phi_{AR} \Delta AR_{i,t} + \phi_I \Delta INV_{i,t} + \phi_{AP} \Delta AP_{i,t} \\ + \phi_D DEPR_{i,t} + \phi_{AM} AMORT_{i,t} + \phi_O OTHER_{i,t} + u_{i,t} \quad (2)$$

BCN extended analysis of the Dechow, Kothari, and Watts (1998), hereafter DKW, reveals that the various accrual components of earnings capture different information about expected future cash flows. BCN suggests that disaggregated current earnings has significantly more predictive ability than current and up to six years lagged aggregate earnings. But the equation (2) is not exact conclusion of their assumption.
The specification of equation (1) comes from reduced-form equation (3).

$$E_t[CF_{t+1}] = (1 - \gamma_1(1-\pi)\pi^{-1}[\beta + \gamma_2(1-\beta) - \beta\gamma_2])EARN_t$$
$$+ \gamma_1(1-\pi)\pi^{-1}[\beta + \gamma_2(1-\beta) - 2\beta\gamma_2]EARN_{t-1} \quad (3)$$
$$+ \gamma_1(1-\pi)\pi^{-1}\beta\gamma_2 EARN_{t-2} + u_{i,t}$$

Where,

   CF: cash flow,

   $EARN$: earnings.

And the specification of equation (2) comes from reduced-form equation (4).

$$E_t[CF_{t+1}] = CF_t + (1 - (1-\beta)\gamma_1\gamma_2(1-\pi)\alpha^{-1})\Delta AR_t + (1-\beta)\Delta INV_t - \Delta AP_t + u_t \quad (4)$$

Where,

   $deltaAR$: one period change of accounts receivable,

   $deltaINV$: one period change of inventory,

   $deltaAP$: one period change of accounts payable.

That is, the following condition should be tested.

$$\phi_{CF} = 1, \phi_{AP} = -1$$

However, only signs are given as the prediction for the parameters. Indeed, the former coefficient is about 0.59, t-statistic of it is 61.34, the later coefficient is -0.56 and t-statistics is -28.58. Thus means the conditions are not satisfied. So, most of prior research which estimate equation (4) does not compare predicting ability of derived model.

The remainder of the paper is organized as follows. Section II describes the sample and presents the findings. Section III summarizes and concludes.

II. Data and Empirical Results

Data are from the 2008 Nikkei Needs files. Our sample is 104 firms of the Japanese automobile industry listed on Japanese stock exchange from fiscal year 1969 to fiscal year 2007. The sample is unbalanced panel of 33years and 104 firms.

Panel A of table 1 and Panel B of table 2 are the same specification but we use panel data analysis, and the results are almost same. However, Panel C of table 3 is the restricted form of coefficients. It follows insignificant coefficients.

III. Conclusions

This paper investigates the sobering predictive power of the accrual models with panel data from Japanese automobile industries. Our results indicate that theoretical accrual models such as Barth, Cram, and Nelson (2001) are highly correlated with future cash flows, but they do not have the predictive ability of the future cash flows in a precise sense. The coefficient of lagged cash flow and disaggregating cash flow are significantly lower than predicted by the model.

TRANSPARENCY REPORTS AND THE PERCEPTION THEY CREATE ON THE AUDIT PROFESSION – CASE OF THE REPUBLIC OF MACEDONIA

Zorica Bozinovska Lazarevska Ph.D., University Ss Cyril and Methodius
Stolevska Maja, State Audit Office

Abstract

The term transparency was introduced for the first time in the audit practice in the Republic of Macedonia with the Audit Law in September 2005. Article 26 of the Audit Law stipulates the requirement for an audit firm or a statutory auditor – sole proprietor to publish in at least one mass media or on their websites, within three months of the end of each financial year, the annual transparency report. In the spirit of integration of the Republic of Macedonia in the EU, minimum information requirements than need to be included in the transparency report fully correspond to Article 38 of the Revised Eighth Company Law Directive. Taking into account the fact that audit firms presented the first transparency reports in 2007 and 2008, this paper will, through detailed and comparative analysis of their key segments, make an attempt to give a clear picture of the developments in the audit profession in the Republic of Macedonia. The paper comprises three segments. The first segment gives brief review of the developments in the audit profession in the Republic of Macedonia prior to the introduction of the transparent reporting requirement for the audit firms. The second one places the focus on analyzing and comparing the information presented in the transparency reports in 2008. The third segment, on the basis of previously carried out comparative analysis, shows the trends on the audit services market in 2008 in the Republic of Macedonia. At the same time, we would also like to point out to the potential benefits the information in transparency reports provide for the audit firms on one hand, and for the users of audit services on the other.

Key words: transparency report.

Introduction

In the period 1945-1991, Republic of Macedonia, as an integral part of SFRY, was building plan economy. At that time, like in the other former socialist countries, the audit profession was not developed in the Republic of Macedonia. Following the breakdown of SFRY in 1991, transition period in the Republic of Macedonia was marked with privatization of socially-owned enterprises. Carrying out just privatization was conditioned, among other things, by true and fair presentation of the financial statements. Unfortunately, despite the emphasized need for credibility in the presented financial statements, in the period 1991-1997 audit profession was in the margins of the transition process. First steps towards creating the necessary climate for establishing the audit profession were undertaken in the post-privatization period by adopting the Audit Law in December 1997. Signing the Stabilization and Association Agreement (SAA) with the European Union and its Member States on 9 April 2001 confirmed the decisiveness of the Republic of Macedonia to integrate in the European family. Not even the audit profession was resistant to the requirements for harmonization with the *Acquis Communautaire*. On the contrary, in a relatively short period of time, in September 2005, new Audit Law was adopted, fully harmonized with the Revised Eighth Company Law Directive. New Audit Law introduced essential changes in the audit profession, which were assessed as a step forward in the EU integration processes. The obligation to present transparency report, by precisely defining the information necessary to be disclosed therein pursuant to the Law, reached the most sensitive and the most mysterious part of the operations of the audit firms in

the Republic of Macedonia. With one-year delay, first transparency reports were presented in the course of 2008, covering the operations of the audit firms in 2007. Segments below describe, in more details, the trends in the audit profession in the Republic of Macedonia through thorough analysis of information presented in certain segments in the transparency reports.

Developments of audit profession in the Republic of Macedonia prior to introducing the requirement to present transparency report

Under the Audit Law dated 1997, conditions for creating the audit profession, with attributes immanent for the developed market economies, were established for the first time in the Republic of Macedonia. The Law defined, for the first time, the requirements for registration of audit firms as primary holders of audit activities. At the same time, the Law precisely stated the preliminary criteria to be met by individuals that wanted to become part of the audit profession. What was immanent for the environment in which the Law was adopted was the absence of strong professional association of accountants and auditors, that could be the generator of changes. Association of Accountants, Financial Workers and Auditors, having tradition longer than half a century, remained passive at the time the foundations of the profession were laid down. Taking such trends in the accounting profession into account, delicate mission related to the creation of the professional regulation in the audit profession with the Law was entrusted to the Ministry of Finance. Having in mind the fact that the Law expressed the commitment to accept and

implement the international regulation as a substitute for the national one, in 1998 Ministry of Finance translated IFAC's IAS. One year later, Ministry of Finance translated the IFAC's Code of Ethics for Professional Accountants, which was accepted in the national profession in its original form and contents.

In 2001, Minister of Finance adopted the training program for the potential candidates to pass the exam for acquiring the title of statutory auditor. Ministry of Finance also adopted the Rulebook on the Manner of Passing the Exam for Acquiring the Title of Certified Auditor by precisely stating the exam criteria under the program. Logical continuation of the undertaken activities was for the Minister of Finance to be assigned the toughest task to appoint the Exam Commission. The first exam for acquiring the professional title was held in December 2001, organized by the Ministry of Finance. By having two exam cycles annually (in May and December), nine exam cycles were carried out as of December 2005 inclusive, and the initial audit core, comprising 147 statutory auditors, was established. However, despite the generally created climate for introduction of the audit profession in the accounting infrastructure, the Law did not cover all aspects that were crucial for this profession. Part concerning the professional development of the auditors after acquiring the title of statutory auditor remained fully unregulated. Basically, the Law left series of opened issues, the resolution of which became an imperative in the next several years. Resolving these issues initiated radical changes in the existing Audit Law, which, after full 7 years, was substituted with a new one.

In the meantime, on 9 April 2001, Republic of Macedonia became the first country in the region to sign the Stabilization and Association Agreement

(SAA) with the European Union and its Member States. Parliament ratified the SAA on 13 April 2001, thus confirming the strategic interest of the Republic of Macedonia and the political commitment for integration in the European structures. Article 68 of SAA clearly includes the obligations for harmonizing the national legislation with the *Acquis Communautaire*, creating own experience and guidelines in this process. On 9 November 2005, the country was delivered positive *Avis* for the status of a candidate country, with detailed standards to be met.

The *Avis* clearly pointed out the need for the candidate country to meet the EU criteria, among which was the acceptance of 31 Chapters of the *Acquis Communautaire*. Adoption and implementation of the relevant components in Chapter 5 (Company Law) of the *Acquis Communautaire* pertaining to accounting and audit is the key part of all the activities envisaged in the *Country Action Plan adopted in June 2005 by the Steering Committee appointed by the Government*. In line with the commenced EU integration processes, enforcement of the new Audit Law should provide for a significant improvement of audit quality, as well as commencing the process of approximation of the audit profession in the Republic of Macedonia to the European family.

Having in mind the fact that in the past period the term "self-regulation" was unknown to the members of this profession, primary task of the new Audit Law was commencement of the process of deregulation of the audit profession. Deregulation should contribute to transfer of the competences in the field of creating the professional regulation and certifying the statutory

auditors by the Ministry of Finance in the Institute for Certified Auditors established under this Law. More specifically, the Law envisages establishment of a professional association of statutory auditors with a wide range of obligations and responsibilities, having all statutory auditors and audit firms as its members. Assembly for the incorporation of the Institute for Certified Auditors of the Republic of Macedonia (hereinafter: ICARM) was held on 23 May 2006.

Establishment of ICARM caused avalanche of changes in the audit profession, in particular in the field of profession public oversight, assessment of the quality of work of the statutory auditors and the audit firms, changes in the exam program for acquiring the title of statutory auditor, introduction of continuous professional development of statutory auditors, defining the obligation for the audit firms to present transparency report on annual basis, etc. Part of these activities has already commenced, while part of them will start in the period to come.

Process of professional training and certification of statutory auditors by ICARM commenced in the course of 2009. In addition, training within the continuous professional development of statutory auditors was carried out for the first time in 2009, and preparations are made for introduction of quality control over the operations of audit firms and statutory auditors.

Transparency reports and perception they create on the audit profession in the Republic of Macedonia

Establishment of ICARM led to creation of the key pre-conditions for development of a modern audit profession with all attributes immanent for the EU Member States. Absence of strong professional association of statutory auditors in the past period not only slowed down the development of the profession itself, but also completely blocked the integration of the national auditors in IFAC and FEE. Establishment of ICARM has opened new horizons for the statutory auditors in the Republic of Macedonia.

During the past eight years by the time the first Audit Law was adopted, audit firms operated in conditions of unfair competition on the audit market on which, unfortunately, quality was not the key criterion for attracting clients, but it was rather the price of the service offered. Most often offered price for carrying out audit by the local audit firms did not correspond to the time and the complexity of the engagement and the competence of the auditors. Unscrupulous race for profit and clients evidently led to significant deviations from the enforcement of the professional regulation, in particular in the methodological approach of certain audit firm and the behavior of the statutory auditors. Despite the legal limitation for the audit firm to carry out audit and render audit services at the same client, it has never been proven that this legal requirement de fact functions in the national audit practice. In conditions of absence of installed mechanism to observe the rules of the game and adequate quality control, statutory auditors and audit firms observing the professional regulation were discontented by the unprofessional behavior of their colleagues.

Such trends initiated the need to introduce, as a novelty to the existing Audit Law, the obligation for the audit firm or the statutory auditor – sole proprietor to publish in at least one mass media or on their websites, within three months of the end of each financial year, the annual transparency report. Transparency report should provide for a permanent insight in monitoring the rules of the game in the competition on the market by the members of this profession. The report should include a wide range of information providing clear picture of the type and the volume of activities carried out by the audit firm during the year and the turnover thus realized. More precisely, pursuant to Article 26 of the Audit Law, annual transparency report should include the following information: (1) description of the legal structure and ownership; (2) description of the professional network and the legal and structural arrangements in the network they belong to; (3) description of the governance structure of the audit firm or the statutory auditor – sole proprietor; (4) description of the internal quality control system of the audit firm or the statutory auditor – sole proprietor and a statement by the administrative or the management body on the effectiveness of its functioning; (5) list of entities being audited during the preceding year; (6) statement on the policy followed by the audit firm or the statutory auditor – sole proprietor concerning the continuing education of the statutory auditors and (7) financial information on the total turnover realized on the basis of audit and on the basis of other fees, broken down by four categories of audit services, additional services for quality assurance, tax advisory service and other non-audit services. (Audit Law, Official gazette of the RM, no. 79. p. 99, 21 September 2005)

Transparency reports should be signed by the authorized person at the audit firm, i.e. the statutory auditor – sole proprietor, as the case may be.

If Article 26 Transparency Report in the Law is compared with Article 40 Transparency report in the Revised Eighth Company Law Directive, one can conclude that there is high level of harmonization regarding the issue on compulsory information to be presented in the transparency report. However, regarding the information requirements to be part of the transparency report, Revised Eighth Company Law Directive is more rigorous, in particular the following points: (e) an indication of when the last quality assurance review referred to in Article 29 took place, (g) a statement concerning the audit firm's independence practices which also confirms that an internal review of independence compliance has been conducted and (j) information concerning the basis for the partners remuneration. (Directive 2006/43/EC of the European Parliament and of the Council of 17 may 2006 on statutory audit of annual accounts and consolidated accounts)

New Audit Law entered into force in the course of 2005, imposing the obligation for the audit firms to submit the annual transparency report in 2007 covering their operations in 2006. Unfortunately, during 2007, most of the audit firms did not submit annual transparency reports. Having in mind the fact that in 2007 ICARM was engaged in building its architecture and it worked on constitutive acts, while the Council for Advancement and Oversight of the Audit put efforts to assist ICARM in commencing the functioning, not adhering to Article 26 of the Law remained suppressed, and the offenders were unsanctioned.

First transparency reports were published in the course of 2008, and they covered the operations of audit firms in 2007. Number of submitted reports can lead to the conclusion that situation evidently improved in 2008 and, 17 out of 24 audit firms published their annual transparency reports, while the remaining 7 audit firms did not adhere to this legal requirement. In parallel to adhering to the legal requirements, in 2009, transparency reports are published, covering the operations in 2008. In 2009, 21 out of the total of 24 audit firms published the transparency report within the deadline stipulated by law. Submitted transparency reports will be observed in more details in this paper.

Initial reading of the transparency reports imposed the impression of lack of experience of the audit firms in preparing and presenting such type of reports. Certain audit firms, especially the local ones, briefly focused in the reports on several key information (such as, the legal structure and ownership, description of the governance structure and part of the financial information), without covering the other segments of the report (such as, the internal control, continuous professional development, presentation of list of clients and realized turnover by categories of services defined in the Law). Unlike them, other audit firms, especially the Big Four, presented more detailed information on the internal system on internal quality control of the firm, attached list of entities, however, they did not make precise distinction of the realized turnover pursuant to the requirements in the Law. Such approach is logical if one takes into account that the Big Four operate according to the globally accepted audit methodology. It means a developed, detailed and rigorous internal control

2707

system. What is immanent for the Big Four is carrying out control through every-day controlling of the operations on the basis of hierarchy-pyramidal system, from the lowest to the highest management level. In addition, there are periodic internal controls according to specially designed methodology of the audit firm. Offices of the Big Four in the Republic of Macedonia are subjected to detailed review once a year, carried out by another firm member of the European audit firm, according to specially designed control methodology and sophisticated and specially designed control software.

Such inconsistent approach regarding the form and the contents of the transparency reports burdens the comparison of data presented in certain segments and the carrying out of more detailed research. However, despite such limitations, presented transparency reports provide realistic picture on the developments in the audit profession in the Republic of Macedonia.

The paper analyses the data presented in the following segments in the annual transparency reports: (1) description of the legal structure and ownership; (2) description of the professional network and the legal and structural arrangements in the network they belong to; (3) description of the internal quality control system of the audit firm or the statutory auditor – sole proprietor and a statement by the administrative or the management body on the effectiveness of its functioning; (4) list of entities being audited during the preceding year; (5) statement on the policy followed by the audit firm or the statutory auditor – sole proprietor concerning the continuing education of the statutory auditors and (6) financial information on the total turnover realized on the basis of audit and on the basis of other fees, broken down by four

categories of audit services, additional services for quality assurance, tax advisory service and other non-audit services. (Audit Law, Official gazette of the RM, no. 79. p. 99, 21 September 2005)

Table 1 gives a review on the legal structure and ownership of all audit firms, ICARM members, which submitted transparency reports in 2008. Pursuant to Article 17 of the Audit Law, audit, as a service, can be performed by an audit firm established as company and statutory auditor – sole proprietor, having obtained working license therefore. Audit firm is issued working license to perform audit operations if it fulfils the following requirements:

1) having employed at least two statutory auditors and

2) majority voting shares in the audit firm owned by the statutory auditors.

On the basis of the presented legal structure and ownership in the transparency reports, one can conclude that all audit firms meet the legal requirement to obtain working license in the field of auditing.

Table 1 Legal Structure and Ownership of Audit Firms

	Name of audit firm	Legal structure and ownership of audit firms
1.	Ernst&Young Statutory Auditors, Skopje	Limited liability company, 49% owned by Ernst&Young Southeast Europe Limited, headquartered in Nicosia, Republic of Cyprus, and 51% owned by local statutory auditors.
2.	PricewaterhouseCoopers DOOEL Skopje	Limited liability company established by two physical persons – statutory auditors, owning 51%, and PricewaterhouseCoopers DOOEL Skopje, owning 49% of the firm.
3.	KPMG MACEDONIA DOO Skopje	Limited liability company, fully owned by three physical persons – statutory auditors.
4.	Deloitte DOOEL Skopje	Limited liability company owned by Deloitte Central Europe Holdings Limited, headquartered in Nicosia, Republic of Cyprus.
5.	Grant Thornton DOO Skopje	Limited liability company established by two physical persons – statutory auditors, owning 75%, and one legal entity in private ownership, owning 25% of the firm.
6.	Macedonian Audit Center, Skopje	Limited liability company, fully owned by three persons – statutory auditors.
7.	Dimitrov Audit, Skopje	Limited liability company, fully owned by two physical persons – statutory auditors.
8.	B&Lj, Boro and Ljupco, DOO Skopje	Limited liability company, fully owned by two physical persons – statutory auditors.
9.	Trio-Consulting DOO Gevgelija	Limited liability company, fully owned by two physical persons – statutory auditors.
10.	Rafajlovski Audit DOO Skopje	Limited liability company owned by one physical person - statutory auditor and Rafajlovski Consulting DOO consulting company.
11.	Censum DOOEL Skopje	Limited liability company, owned by one physical person – statutory auditors.
12.	Pelagoniska Audit Firm DOOEL Prilep	Limited liability company, owned by one physical person – statutory auditors.
13.	Kojzakliev-Pavleska AD Skopje	Limited liability company, fully owned by two physical persons – statutory auditors.
14.	Kni-Prokom Prilep	Limited liability company, owned by one physical person – statutory auditor.
15.	Baker Tilly Macedonia DOO Skopje	Limited liability company, fully owned by two physical persons – statutory auditors.
16.	Primeko Audit DOOEL Skopje	Limited liability company, owned by one physical person – statutory auditor.
17.	Revizions DOO Skopje	Limited liability company, fully owned by two physical persons – statutory auditors.
18.	Audit IAS Skopje	Limited liability company, fully owned by two physical persons – statutory auditors.
19.	Efect Plus A udit Firm, Skopje	Limited liability company, fully owned by three physical persons – statutory auditors.
20.	Audit and Consulting firm - ERC - Skopje	Limited liability company, owned by one physical person and one legal entity.
21.	ProAudit Audit Firm, Kumanovo	Limited liability company, fully owned by two physical persons – statutory auditors.

Table 2 shows which professional network the audit firm belongs to

and the legal and the structural arrangements therefrom.

Table 2 Description of the professional network which the audit firm belongs to

	Name of audit firm	Description of the professional network which the audit firm belongs to
1.	Ernst&Young Statutory Auditors, Skopje	The firm is part of Ernst&Young Southeast Europe Limited network, headquartered in Nicosia, Republic of Cyprus.
2.	PricewaterhouseCoopers DOOEL Skopje	The firm is member of PricewaterhouseCoopers.
3.	KPMG MACEDONIA DOO Skopje	KPMG Macedonia DOO Skopje is competent and respectively licenced firm, member of the international network of KPMG companies.
4.	Deloitte DOOEL Skopje	The firm is part of Deloitte Central Europe Group and, in its operations, it utilizes the available human and know-how resources from all countries in the region.
5.	Grant Thornton DOO Skopje	The firm is member of Grant Thornton International. In its operations, it acts independently and in cooperation with other firms – members of Grant Thornton International. It has offices in Skopje, Republic of Macedonia, and in Pristina, Kosovo.
6.	Macedonian Audit Center, Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia, and does not belong to any professional network.
7.	Dimitrov Audit, Skopje	The firm acts as local audit firm and is correspondent member of the international group of independent audit firms DFK International from London.
8.	B&Lj, Boro and Ljupco, DOO Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia, and does not belong to any international professional network.
9.	Trio-Consulting DOO Gevgelija	The firm acts as local audit firm on the territory of the R. of Macedonia, and does not belong to any broader local, regional or global professional network.
10.	Rafajlovski Audit DOO Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia, and does not belong to any professional network.
11.	Censum DOOEL Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia.
12.	Pelagoniska Audit Firm DOOEL Prilep	The firm acts as local audit firm on the territory of the Republic of Macedonia.
13.	Kojzakliev-Pavleska AD Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia.
14.	Kni-Prokom Prilep	The firm acts as local audit firm on the territory of the R. of Macedonia.
15.	Baker Tilly Macedonia DOO Skopje	The firm is member of Baker Tilly International from London, England.
16.	Primeko Audit DOOEL Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia.
17.	Revizions DOO Skopje	The firm acts as local audit firm on the territory of the R. of Macedonia.
18.	Audit IAS Skopje	The firm acts as local audit firm on the territory of the R. of Macedonia.
19.	Efect Plus Audit Firm, Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia.
20.	Audit and Consulting firm - ERC - Skopje	The firm acts as local audit firm on the territory of the Republic of Macedonia.
21	ProAudit Audit Firm, Kumanovo	The firm acts as local audit firm on the territory of the Republic of Macedonia.

Source: Transparency reports of the auditing firms, 2008

There are differences in the extent of the information given about the network arrangements, with in some cases very little information on the structure of central Boards or committees and their functions. As shown in Table 2, the segment explaining the professional network which the audit firms belong to and the legal and the structural arrangement therefrom, the Big Four provide more detailed explanations, while the local audit firms just stress the fact that they act locally on the territory of the Republic of Macedonia. To the end of transparent reporting, it would be advisable for audit firms to pay more attention in future to the reporting on their organizational setup and the arrangements arising therefrom. In general we consider that the reports would be more transparent were there a fuller statement of the obligations and undertakings of the firm under the agreement for membership of the network.

Table 3 gives review of the internal quality control system of the audit firm or the statutory auditor – sole proprietor and a statement by the administrative or the management body on the effectiveness of its functioning.

Table 3. Description of the internal quality control system of the audit firm

	Name of audit firm	Description of the internal quality control system of the audit firm
1.	Ernst&Young Statutory Auditors, Skopje	Global audit methodology of Ernst&Young Skopje (ES/GAM) provides for effective and efficient delivery of high-quality and acknowledged services to clients worldwide. Ernst&Young Skopje applies efficient and effective internal control system, which fully meets international quality standards.
2.	PricewaterhouseCoopers DOOEL Skopje	On the basis of the quality control carried out by the network, it can be concluded that stipulated operating procedures were implemented.
3.	KPMG MACEDONIA DOO Skopje	The firm has developed, detailed and rigorous internal control system. Control is performed through everyday controlling of the operations on the basis of hierarchy-pyramidal system. There are periodic internal controls according to specially designed KMPG methodology. The firm is subjected to detailed control once a year, carried out by team of professionals – auditors, comprising other firms – members of KPMG, according to specially designed control methodology and sophisticated and specially designed control software.
4.	Deloitte DOOEL Skopje	Appointed professionals from Deloitte Central Europe visit different offices each year so as to perform internal control over the audits carried out. The firm has efficient and effective internal control system, which fully meets international quality control standards.
5.	Grant Thornton DOO Skopje	The firm supervises and evaluates its quality control system on ongoing basis, and it also includes internal control over selected completed arrangements. Quality control process also includes redular controls by Grant Thornton International.
6.	Macedonian Audit Center, Skopje	The firm has adopted policies and procedures pertaining to quality control over the operations pursuant to the Audit Law and ISA.
7.	Dimitrov Audit, Skopje	The firm has adopted policies and procedures pertaining to quality control system pursuant to the Audit Law and ISA.
8.	B&Lj, Boro and Ljupco, DOO Skopje	ISA 220 provisions are implemented for the establishment of quality control system.
9.	Trio-Consulting DOO Gevgelija	The firm has adopted policies and procedures pertaining to quality control over the operations pursuant to the Audit Law and ISA 220 and ISQC 1.
10.	Rafajlovski Audit DOO Skopje	The firm has adopted policies and procedures pertaining to quality control over the operations pursuant to the Audit Law and ISA 220.
11.	Censum DOOEL Skopje	The firm has developed internal software for auditing services, on the basis of which audits are planned, and it provides for quality control over the operations of the audit teams.
12.	Pelagoniska Audit Firm DOOEL Prilep	The firm has adopted policies and procedures pertaining to quality control system.
13.	Kojzakliev-Pavleska AD Skopje	Internal control system of the firm comprises of adhering to the stipulated procedures.
14.	Kni-Prokom Prilep	The firm has internal control system. Control is performed by the chief auditor by controlling and maintaining high level of integrity, professional standards and quality services by the auditor.
15.	Baker Tilly Macedonia DOO Skopje	The firm has adopted Rulebook on the Procedures for Audit Quality Control, prepared on the basis of guidelines on quality control policies adopted by Baker Tilly International.
16.	Primeko Audit DOOEL Skopje	Quality control system is established in accordance with ISQC 1.
17.	Revizions DOO Skopje	Provisions from the Audit Law and ISA 220 provisions are implemented for the establishment of quality control system.
18.	Audit IAS Skopje	ISA 220 provisions are implemented for the establishment of quality control system.
19.	Efect Plus Audit Firm, Skopje	The firm adheres to ISA 220 and ISQC 1 requirements regarding the quality control system.
20.	Audit and Consulting firm - ERC - Skopje	Internal quality control system is established through vertical control performed by statutory auditors as assistance in line with ISA.
21.	ProAudit Audit Firm, Kumanovo	ISQC 1 provisions are implemented for the establishment of quality control system.

Source: Transparency reports of the auditing firms, 2008

This is a key element within the reports. Comparison of information

from the segment pertaining to transparency reports, focused on internal quality control system of the audit firm, and the statement by the administrative or the management body on the effectiveness of its functioning, point out to a heterogenous approach in reporting. The Big Four, as well as the audit firms that are part of the international networks, describe in more details the internal quality control system by orderly positioning the key players in the established control system. Unlike them, there is clear perception at part of the local audit firms of what the internal control system is, but due to their lower personnel potential, it is more simplified. Therefore, the reports state that established and adopted policies and procedures on quality control system are fully harmonized with the international standards on auditing. Unfortunately there are audit firms that are not familiar with the concept of setting and functioning of internal quality control system. Such impression is acquired from reading the explanations on the manner of acting and functioning of the quality control system. However, despite such trends, these audit firms have concluded, at the end of the report, presenting this segment, that the system is well established and functioning efficiently. Such developments may be accepted as logical ones, should one take into account the fact that ICARM is in the initial stage of introducing the system of quality control in audit firms and statutory auditors. Certain aspects from the introduction of excellent quality control system are in promotion stage yet, so the expectations that transparency reports will contain more quality information in this segment are realistic. Again we consider that the fuller presentation provides the better model. Whilst the minimalist approach arguably meets the legal requirement, in our view it falls well short of meeting the spirit of transparency reporting.

Another quite important segment in the transparency report is the list of auditees at which audit firms performed audit arrangements. Due to the heterogenous composition of auditees (part of them are large-, and the other part are medium-sized enterprises), Table 4 presents the number of auditees in 2008 at which the audit firm performed an audit.

Table 4 Number of auditees in the preceding year

	Name of audit firm	Number of auditees in the preceding year
1.	Ernst&Young Statutory Auditors, Skopje	25
2.	PricewaterhouseCoopers DOOEL Skopje	28
3.	KPMG MACEDONIA DOO Skopje	43
4.	Deloitte DOOEL Skopje	33
5.	Grant Thornton DOO Skopje	30
6.	Macedonian Audit Center, Skopje	57
7.	Dimitrov Audit, Skopje	33
8.	B&Lj, Boro and Ljupco, DOO Skopje	41
9.	Trio-Consulting DOO Gevgelija	50 companies, 1 association of citizens and 5 projects at non-profitable organizations
10.	Rafajlovski Audit DOO Skopje	2 construction companies, 30 companies engaged in production, trading and services and 1 brokerage house
11.	Censum DOOEL Skopje	no data in the report
12.	Pelagoniska Audit Firm DOOEL Prilep	41
13.	Kojzakliev-Pavleska AD Skopje	6
14.	Kni-Prokom Prilep	15 companies, 5 public enterprises and 2 projects
15.	Baker Tilly Macedonia DOO Skopje	24 companies and 25 projects financed by financial institution and foreign donors
16.	Primeko Audit DOOEL Skopje	30 companies and non-profitable organizations
17.	Revizions DOO Skopje	10
18.	Audit IAS Skopje	12
19.	Efect Plus Audit Firm, Skopje	12
20.	Audit and Consulting firm - ERC - Skopje	29
21.	ProAudit Audit Firm, Kumanovo	31

Source: Transparency reports of the auditing firms, 2008

Audit firms apply different approach when demystifying the clients at which audit arrangements were implemented. Most of them provide detailed list of all auditees. Small portion of the audit firms use descriptive approach to indicate the auditees by summarizing them in certain categories (companies, non-profitable organizations, etc.). Only one audit firm has presented no list of auditees in the report. However, despite such approach, this segment in the report points out to a positive trend in disclosing information related to client's identity, which was considered as business secret in the past and were not subject to public debate. Regardless of the fact that reports on performed audit were subject to publishing pursuant to the first Audit Law from 1998, it is exceptionally difficult to relate the audit firms with the specific clients. Hence, how small audit firms, having limited personnel resources, manage to perform audits at large number of clients has always been an open issue. Finally, numerous users of audit reports can learn from this segment of the transparency report about the distribution of potential clients to be audited (pursuant to the Company Law, they are the large- and the medium-sized enterprises) between the audit firms and how much one participates in the division of the pie. These information are also a good signal for ICARM to activate its control mechanisms, should it detect discrepancy between the available personnel potential and the volume of realized arrangements at certain audit firms.

Table 5 presents the statements on the policy followed by the audit firm or the statutory auditor – sole proprietor concerning the continuing education of the statutory auditors.

Table 5 Policy followed by the audit firm concerning the continuing education of statutory auditors

	Name of audit firm	Policy followed by the audit firm concerning the continuing education of statutory auditors
1.	Ernst&Young Statutory Auditors, Skopje	Ernst&Young Skopje follows the global policy of Ernst&Young on continuing education of statutory auditors through their participation in trainings, permanent monitoring of the learning though Ernst&Young Intranet, as well as provision of financial asupport for educational purposes (taking professional exams – local and international, post-graduate studies, etc.)
2.	PricewaterhouseCoopers DOOEL Skopje	Employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM.
3.	KPMG MACEDONIA DOO Skopje	The firm carries out constant and mandatory education of statutory auditors and of other personnel employed with the firm through attending specially organized educational workshops in the country and mainly abroad – minimum 5 business days (most often, more than 5 business days), various advancement courses on the basis of latest methodology and standards.
4.	Deloitte DOOEL Skopje	Deloitte DOOEL Skopje follows the global policy of Deloitte on continuing education of statutory auditors through their participation in trainings, permanent monitoring of the learning though Deloitte Intranet, as well as provision of financial asupport for educational purposes (taking professional exams, post-graduate studies, etc.)
5.	Grant Thornton DOO Skopje	Employees are obliged to participate in all trainings organized by Grant Thornton International. In addition, employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM.
6.	Macedonian Audit Center, Skopje	Employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM.
7.	Dimitrov Audit, Skopje	Employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM.
8.	B&Lj, Boro and Ljupco, DOO Skopje	Employees attend training at least 40 hours a year, organized by ICARM.
9.	Trio-Consulting DOO Gevgelija	Employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM.
10.	Rafajlovski Audit DOO Skopje	Employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM.
11.	Censum DOOEL Skopje	The firm pays attention to following the current trends in the accounting and auditing, however, they have not indicated in the report which forms of continuing professional advancement they apply.
12.	Pelagoniska Audit Firm DOOEL Prilep	Employees attend training at least 40 hours a year within the continuing professional advancement, organized by ICARM, as well as seminars and trainings in the field of accounting and auditing.
13.	Kojzakliev-Pavleska AD Skopje	Employees attend training at least 40 hours a year, organized by ICARM.
14.	Kni-Prokom Prilep	The firm carries out continuing education of statutory auditors and of the other employees through attending professional educational lectures, trainings, workshops, etc.
15.	Baker Tilly Macedonia DOO Skopje	Employees attend training at least 40 hours a year, organized by ICARM, as well as seminars organized by Baker Tilly International from London.
16.	Primeko Audit DOOEL Skopje	Employees attend training at least 40 hours a year, organized by ICARM.
17.	Revizions DOO Skopje	Employees attend any type of education trainings (seminars, post-graduate studies, etc.) for the purpose of successful advancement in the field of accounting and auditing.
18.	Audit IAS Skopje	Employees attend training at least 40 hours a year, organized by ICARM.
19.	Efect Plus Audit Firm, Skopje	The firm has organized internal continuing education of the employees, while amendments to the legal regulations, standards on financial reporting and standards on auditing are observed through publications of the Official Gazette, IFAC and IASB.
20.	Audit and Consulting firm - ERC - Skopje	The firm carries out policy on education of auditors.
21.	ProAudit Audit Firm, Kumanovo	The firms carries out continuing education of staturoty auditors and of the other employees through attending seminars and courses in the field of accounting and auditing, as well as mandatory attending of all seminars, courses and trainings held as prior training so as to take the professional exam.

Source: Transparency reports of the auditing firms, 2008

Analysis of the presented information related to the continuing professional development of statutory auditors in the Republic of Macedonia

leads to the conclusion that, if compared to the other segments in the report, they are the least consistent. As pointed out above, the requirement for continuing professional development was introduced for the first time in the Republic of Macedonia with the Audit Law in 2005. In particular, pursuant to Article 21 of the Law, each statutory auditor is obliged to attend at least 40-hour training annually within the continuing professional advancement so as to upgrade the knowledge in the field of accounting and auditing, organized by ICARM.

Taking into account the fact that ICARM commenced realizing the program on continuing professional development in March 2009, information presented in the transparency report at most of the audit firms regarding the monitoring of training of statutory auditors within ICARM in the course of 2008 can be taken with a pinch of salt. Part of the audit firms, such as the Big Four, referred to education that is implemented at the level of the network which they belong to. Similarly, part of the local audit firms indicated that they organized training for their employees, and they strived to update their knowledge by involving the employees in seminars and post-graduate studies in the field of accounting and auditing. This information was not subject to verification by ICARM or the Council for Advancement and Oversight of the Audit.

Keeping in view the fact that paragraph 2, Article 21 of the Law envisages revoking of the statutory auditor certificate from statutory auditors who would not attend training for 40 hours annually, it is realistic to expect that ICARM and the Council would soon react in terms of permanent monitoring of

2718

the fulfillment of the requirement for continuing professional development by the ones engaged in this field.

Table 6 gives summary of all audit firms, ICARM members, which submitted transparency reports in 2009, specifying in more details the financial information on total turnover realized from audit and from other fees, divided into four categories of audit services, additional services for quality assurance, tax advisory services and other non-audit services in the course of 2008.

	Audit firm	Audit-related turnover	Quality assurance services	Tax advisory services	Other non-audit services	Total

More detailed analysis of the data in the Table points out to the fact that, out of the total realized turnover from the wide range of services offered to the clients during 2008, the Big Four, together with Grant Thornton, accounted for 70.85%, while the other 16 local audit firms accounted for 29.15%. With respect to the turnover realized on the basis of the offered services, transparency reports show that turnover realized on the basis of carrying out

audit services was dominant at almost all audit firms. Individual share of audit firms in the total offered audit services and the turnover thus realized are shown in Table 7 below.

Table 7 Structural share of audit firms in other turnover realized on the basis of audit services

	Audit firm	Audit-related turnover	Percentage
1	Ernst&Young Statutory Auditors, Skopje	508,175.74	10.39%
2	PricewaterhouseCoopers DOOEL Skopje	669,426.05	13.68%
3	KPMG MACEDONIA DOO Skopje	1,025,069.38	20.95%
4	Deloitte DOOEL Skopje	927,078.57	18.95%

Source: Transparency reports of the auditing firms, 2008

Data from transparency reports speak of dominant share of the Big Four, together with Grant Thornton, of 70,07% in the total turnover in the Republic of Macedonia realized on the basis of audit. Share of KPMG MACEDONIA in the structure of realized turnover is evident, accounting for 20,95% compared to the other firms in the group of the Big Four. Such trend is partially a result of the requirement in the Banking Law as of June 2007 for

rotation of audit firms each five years. More specifically, Banking Law does not allow for the same audit firm to carry out audit at the same client, i.e. bank, continuously longer than five years. Due to this, arrangements of the Big Four in the financial sector were changed, resulting in losing large clients at part of these firms, and as a result, their turnover dropped on this basis.

Audit Law requires turnover the audit firm realized from quality assurance services to be separately presented in the transparency report. Taking into account the fact that audit market is still not developed in the Republic of Macedonia, as is the case in the EU Member States, small number of clients request quality assurance services, and when they request such services, the audit firms treat them as another type of services. Data in the transparency reports speak of such trends, and it was only Ernst&Young Statutory Auditors, Skopje that showed turnover on the basis of quality assurance services, while the other audit firms, including the rest of the Big Four, presented no turnover.

Another category of turnover from the transparency reports includes the turnover realized on the basis of tax advisory services. Data on the participation of the audit firms in the total turnover realized on this basis are presented in Table 8.

Table 8 Structural share of audit firms in other turnover realized on the basis of tax advisory services

	Audit firm	Tax advisory services	Percentage
1	*Ernst&Young Statutory Auditors, Skopje*	0	0.00%
2	*PricewaterhouseCoopers DOOEL Skopje*	0.00	0.00%
3	*KPMG MACEDONIA DOO Skopje*	31,828.20	14.48%
4	*Deloitte DOOEL Skopje*	24,625.30	11.20%
5	*Grant Thornton DOO Skopje*	0.00	0.00%
6	*Macedonian Audit Center, Skopje*	0.00	0.00%
7	*Dimitrov Audit, Skopje*	131,435.77	59.80%
8	*B&Lj, Boro and Ljupco, DOO Skopje*	0.00	0.00%

	Total	**219,795.66**	**100.00%**

Source: Transparency reports of the auditing firms, 2008

Unlike audit services, where the Big Four had the dominant share in the structure of the turnover realized on the basis of audit services, their share in tax advisory services was 25.68%, out of which *KPMG MACEDONIA DOO Skopje* participated with 14,48% and *Deloitte DOOEL Skopje* with 11.20%. What is surprising is the leader position of Dimitrov Audit local audit firm, which accounted for 59.80% in the turnover realized on the basis of tax advisory services. Remaining 14.52% are distributed among the other 4 local audit firms.

Last category of turnover covers the other non-audit services and, according to the explanations in the transparency reports of the audit firms in the Republic of Macedonia, this category incorporates the turnover from accounting services and assessments. Review of structural share of audit firms in the Republic of Macedonia in the total turnover realized on the basis of other non-audit services is given in Table 9.

Table 9 Structural share of audit firms in other turnover realized on the basis of non-audit services

	Audit firm	Other non-audit services	Percentage
1	Ernst&Young Statutory Auditors, Skopje	82,082.68	10.38%
2	PricewaterhouseCoopers DOOEL Skopje	0.00	0.00%
3	KPMG MACEDONIA DOO Skopje	334,035.92	42.24%
4	Deloitte DOOEL Skopje	193,324.34	24.45%

	Total	**790,742.98**	**100.00%**

Source: Transparency reports of the auditing firms, 2008

Information on the participation of certain audit firms in the total realized turnover from non-audit services, obtained from the data in the transparency reports, is slightly different from the previously analyzed services. Despite the indisputably high share of the Big Four, together with Grant Thornton, of 79,59% in the total realized turnover from non-audit services and the significantly low share of the local audit firms of 20,41%, dispersion of turnover between the Big Four points out to the leader position of KPMG Macedonia, with dominant 42,24% in the total realized turnover. What is interesting is the information that PriceWaterhouseCoopers showed no turnover from non-audit services, while Deloitte DOOEL Skopje showed relatively high share of 24,45%.

Researching the data in the transparency reports is a challenge, however it also imposes certain limitations. Due to the absence of an established practice to regularly publish the transparency reports in at least one mass media or on audit firms' websites, we were compelled to ask for some of the reports directly from ICARM. Processing the inconsistently presented data also imposed serious limitations. At part of the audit firms, selecting the realized turnover on the basis of realized service in the transparency report did not correspond to the requirements in the Audit Law. This certainly required, when processing the data, additional grouping so as to realistically include all the turnover the audit firms in the Republic of Macedonia realized on the basis of the four types of services. Finally, the absence of comparative indicators from the reports from the previous years limited the research and made it poorer in terms of monitoring the dynamics of the

development of certain audit firms and their participation in the audit market in the Republic of Macedonia.

Finally, relatively short history of presenting the transparency reports, which commenced in 2008, limits the research and makes it poorer in terms of monitoring the dynamics of the development of certain audit firms and their participation in the audit services market in the Republic of Macedonia.

Benefits the transparency reports offer to the users of audit firms' services

We believe that transparency reports are an important mechanism for auditors of public interest entities to communicate to interested parties information about themselves, particularly their approach to audit quality.

However, regardless of the numerous limitations we faced when obtaining the transparency reports from the audit firms and analyzing the presented data, observations we made gave us the real picture of the trends on the audit market in the Republic of Macedonia. After almost a decade from the adoption of the first Audit Law and after 3 years of the adoption of the new Audit Law, which promoted the building of the audit profession with attributes immanent for the developed economies, the Big Four have played the dominant role in creating the climate for development of the profession. They were, are and, we expect, they will be generators of changes in the audit profession in the Republic of Macedonia. In parallel to them, several local audit

firms (Macedonian Audit Center, Dimitrov Audit, B&Lj, Boro and Ljupco, Trio-Consulting etc.), by showing high professionalism in their operations, gained their position on the audit market. Such trends for participation of the audit firms in the audit market could be foreseen even prior to obtaining the initial information from the presented transparency reports. However, as said at the beginning, in conditions of absence of strong professional association of chartered auditors, establishment of the audit profession in the accounting infrastructure, establishment of audit firms and their struggle to win the market and the clients was accompanied with a certain amount of mystery. Issue of which audit firm works at which client and the fee for the offered service was speculated. Such atmosphere protected the audit firms and made them untouchable. Adjusting the new Audit Law to the revised Eighth Company Law Directive opened the issue of transparency in the operations of the audit firms and touched the most sensitive information. Resistance to such requirement was shown by refraining from presenting the 2007 transparency reports by most of the audit firms in the Republic of Macedonia.

Different perception of the requirement to present sensitive information from the operations of the audit firms in the transparency report is partially overcome, following their first presentation for 2007. Legal requirement for the audit firms to offer, through the report, transparent information on themselves provides for (1) their better presentation in front of the potential users of their services; (2) better insight for those purchasing the service in the quality of the products offered through the statements for the internal control system of the audit firm, meeting the obligation for continuous professional development of

the employees, respecting the requirement for independence in realizing the arrangement, etc. All in all, presenting data from the transparency report should provide for a positive input of the audit quality and it can help in promoting sounder competition on the audit market.

Presenting the transparency report might, for part of the smaller audit firms, be legal obligation that is time consuming, that incurs costs which in a given situation of clients can be hardly valorized through winning new clients and winning better position on the audit market.

After almost a two years of presenting the first transparency reports, it is extremely difficult to measure the benefits arising from the legal requirement to publicly present the data for themselves and their policies and processes. However, it is quite certain that by developing the audit market in the Republic of Macedonia in the coming years, audit firms will start feeling the benefits form their transparent presentation in front of the clients.

Conclusion

Strategic commitment of all Governments of the Republic of Macedonia since its independence till today is approximation and integration in the EU. Audit profession was, still is and, it is quite certain, will be part of the strategies for faster integration in the EU. New Audit Law was adopted in the spirit of such commitments. Audit profession was waiting for this Law for eight years. It was not just a mere coincidence that, during its preparation, then proposed Eighth Company Law Directive was consulted. Striving for approximating the national audit profession to the global professional elite, new Audit Law is harmonized with the said Directive in all key segments. To that end,

requirement for presenting the annual transparency report by the audit firms in Macedonia was introduced in 2007 for the operations carried out in 2006. However, despite such defined legal requirement, public in the Republic of Macedonia saw the first transparency reports in 2008. Information presented in the reports aroused huge interest at us and stimulated us to carry out initial research so as to give a picture of the trends on the audit market in the Republic of Macedonia in 2007. On the basis of comparison of data from the transparency reports of the audit firms we came to a conclusion that the Big Four, together with Grant Thornton, still held the dominant share on the audit market in the Republic of Macedonia. Local audit firms had just a small portion of the audit market to win. However, this should not discourage the local audit firms. On the contrary, they should use the presentation of transparency report as a possibility to promote the wide range of services to the potential clients.

By presenting the 2007 and 2008 transparency reports, the first barrier is surmounted, and time will tell whether transparent disclosure of most sensitive information from the operations of the audit firms will bring more benefits to them or just more obligations and costs to meet the legal requirements.

TRIPLE ENTRY ACCOUNTING AND ITS METAPHORS REVISITED

G D Donleavy, University of Western Sydney

Abstract

This paper develops Yuji Ijiri's model of triple entry accounting, and exemplifies it by means of hypothetical accounting statements of wealth, momentum and force. It argues such a framework holds the promise of reconciling accounting valuations with stock market ones, thereby resolving several of the most persistent and intractable issues in financial accounting. .

Introduction

Differential triple entry accounting was formulated in 3 papers (Ijiri 1982, 1986 and 1987). The purpose of triple entry accounting is to deepen the explanation of performance provided by accounts. In particular, the new third level of account, the "trebit", seeks to explain the income and cost changes in a period by bringing in their underlying economic and managerial causes and naming them "forces".

There were two metaphors at the heart of Ijiri's proposals, one methodological, the other substantive. The methodological one was calculus, and the methods of triple entry were to be seen as the elements of a 'calculus of accounting' (Ijiri 1982 p. 31 and 1987 p. 33). The substantive metaphor was Newtonian mechanics in which a particle's position in space is a result of its position at the start of a time period and its velocity. The velocity in its turn is a result of the acceleration/deceleration which is imparted by some force. Given an algebraic expression of a particle's position, the derivative of that expression gives its velocity and the second derivative thereof gives its

acceleration. Position in mechanics is mapped to wealth in accounting, velocity to income and acceleration to what Ijiri terms income momentum. Income momentum is expressed as a rate of income per period, such as $8 per month ($8/mo for short) attributable to, say, a bank deposit account. (Ijiri 1982).

Just as income statements account for inter-temporal changes in wealth, so 'action' statements would account for changes in income. Momentum statements are explained in, and analyzed by, impulse statements which attribute sources to the momenta. The derivative of impulse expressions are force expressions, and their integrals are action expressions. Action statements explain income statements, so that a month's income is divided in the action statement between its various historical causes such as owners' contributions, production management, sales management, etc. The period of an action statement is expressed as 'current month *over* previous month', to highlight momentum changes occurring in the current month. (Ijiri 1987).

The momentum statement is presented *'as of* the current month and expresses the current income types such as rent, interest or sales: so many $/mo, dollars per month. The impulse statement is presented 'for the current month' and divides momenta in just the same way: the action statement divides Income, by attribution to historical source. The impulse statement, however, counts in $/mo whereas the action statement counts in $, since actions explain incomes whereas impules explain momenta. Momenta do not of themselves *explain* income, but simply *measure* the rate of change of income. (Ijiri 1987).

Summarising the above in a calculus framework, the fundamental

expression is the position statement. The first derivative is the momentum statement. The second derivative is the force statement. The anti-derivative of the force statement is the impulse statement, itself the derivative of the income statement (and its own anti-derivative is the action statement). (Ijiri 1986)

Momentum, like acceleration in mechanics, is rarely constant, but is subject to an internally sourced decay rate and an externally soured friction rate. The present value of a force (source) of income creating an 'acceleration' or income of X per year per year subject to a decay rate of r is $X/[(r+u)(r-v)]$. For example, a force accelerating income by $2 a year every year' in perpetuity subject to an annual decay of 40, annual friction of 30%, and discounted at 10%. per year has a present value of $2/[(.1+.3)(.1+.4)]=$10$. Were there no decay or friction, the force would have a PV of its PE^2xX, namely $2xlOxl0=$200 assuming $1/PE$ to equal discount rate. Acceleration of income, however, does not equate to Ijiri's income momentum, but rather to his measure of 'force'. Momentum is measured in dollars per period, acceleration, in dollars per period squared. *Momentum is thus measured as if it were comparable to velocity.* Thus, the momentum statement and the income statement both relate directly to the wealth position statement, the former being the explanation or account of position, the latter being the instantaneous rate of change of position. The relation between the six statements is clarified in the diagram (from page 749 of Ijiri 1986) which is reproduced below.

Level of Accounting	Debit	Credit	Trebit
Force-single entry in $/mo^2$			Force
Momentum-double entry in $/mo		Momentum	Impulse
Wealth-triple entry in $	Wealth	Income	Action

Statement Type	*Wealth*	*Momentum*	*Force*

Key to relationship between statements

Derivative - higher being rate of change of lower

Integral or anti-derivative relationship – the reverse of the above

Explicatory - right explains left

Triple entry occurs at the wealth level, accounted for in ordinary $, Euros, RMB etc. such that every entry in the ledgers affects not only wealth (assets and external liabilities) and/or income (any fund flow affecting proprietors' funds), but also can affect 'action' whose individual components are particular 'forces' exemplified by Ijiri (1986) by new product costs and by margin, volume and efficiency variances attributable to existing products. To conventional debit and credit, triple entry adds 'trebit' to an action ledger comprising force accounts expressed in the same currency as conventional ledgers. Triple entry can stop here and not involve the new superstructure.

However, momentum and force accounting create a kind of internal control superstructure on the wealth, income and action level of accounting. Momentum accounting is done by double entry in $ per month ($/Mo) or per any more appropriate period, and is done across momentum ledgers (income or costs per month) and impulse ledgers (forces such as volume variance). Force accounting is done by single entry in $ per month per month ($/mo^2). The two higher levels control the wealth-income.-action level by a kind of calculus reconciliation, the higher being derivatives of appropriate ledgers of the lower.

The statements in Ijiri (1986) are reproduced below by way of clarification.

Wealth Statement

Cash	108
Receivables	200
Inventory	345
Less Payables	(120)
Net Wealth	**533**

Momentum Statement

MOMENTUM		INCOME	
(ending balance)		(impact on wealth)	
	$ / mo		$
Sales	150		290
Cost of Sales	(78)		(150)
Operating Expense	(36)		(74)
Tax	(18)		(33)
Net Momentum	**18**	Net Income	33
		Opening Wealth	500
		Closing Wealth	**533**

Force Statement

FORCE	IMPLUSE	ACTION
	(impact on momentum)	(impact on wealth)

	$ / mo^2	$ /mo		$
New Product	2	6		10
Margin Variance	(3)	(2)		(1)
Volume Variance	2	3		4
Efficiency Variance	2	1		--
Net Force	3	Net Impulse 8	Net Action	13
		Op'g Mmtm 10	Momentum	20
		Cl'g Mmtm 18	Net Income	33
			Op'g Wealth	500
			Cl'g wealth	533

Since the above are for a two month period, the action figures can be found by doubling the impulse figures and subtracting therefrom the force figures on each row.

Ijiri erected a formidable system of accountability in his triple entry model. When first published in 1982, his model attracted only a brief and not very resonant public response. This may be partly due to the novelty of the terms 'force', 'impulse', 'momentum' and 'action'. In the next section the uses of these terms in mechanics are examined to see if they represent the most appropriate borrowings to achieve the explicatory power and systemic logic that Ijiri intended, Ijiri (1986) sounds two cautions about such an exercise. On the one hand (Ijiri 1986, p, 748, footnote 10), 'Concepts and relationships among them in an original field must of course fit in nicely in the applied field; but it is also nice if the concepts and relationships are not inconsistent with their common sense interpretations', On the other hand (loc cit, footnote 11, 'The analogy with Newtonian mechanics should, however, be pursued only to obtain

valuable insights into how the triple entry book-keeping framework should be developed. A wholesale translation without regard to its applicability to accounting is dangerous, since, after all, physics and accounting are two different field of endeavor', The first quotation supports the concepts of force and momentum, the second quotation defends the concepts of impulse against future pedantic criticism.

A Review of Mechanics

Using the book used by Ijiri (French 1971) and two other standard texts (Hannah and Stephens 1984 and Ryder and Bennett 1975), the terms borrowed by Ijiri were investigated to see if the borrowings from Newtonian mechanics were optimal on the criteria cited by Ijiri in footnote 10 of his 1986 article.

First, it was noted that in mechanics the distinction between scalars (which have magnitude but not direction) and vectors (which have both magnitude and direction) is fundamental to the science. Scalars can be manipulated algebraically whereas vectors require geometrical analysis. Time, mass, speed and energy exemplify scalars whereas force, velocity and acceleration are vectors. Since momentum is a function of mass times velocity and impulse is the gain in momentum over a period, it can be seen that Ijiri's key concepts are vectors not scalars. Vectors can be resolved into *X* and *Y,* two dimensional, or *X Y* and Z, three dimensional, co-ordinates of position. In other words, if vectors are to be imported into accounting, an equivalent of length, breadth and possibly height/depth must be found. If, however, direction is not viewed as important in accounting, then scalars will be the appropriate values to import from mechanics. However, direction appears to be

fundamental to mechanics, not surprisingly in a science concerned with how engines move burdens from one position to another.

Force is that which tends to change the state of rest or uniform motion of a body. Newton's second law of motion holds that when a force acts on a body, the body accelerates at a rate proportional to the force AND in the same direction as the force. F=kma where *F* is force, *k a* proportional constant, *m* mass and *a* acceleration. Force is measured in newtons, one newton being the force needed to accelerate 1 kilogram by 1 meter per second per second. (N = I kg. m/s^2). Thus, to quantify force, we need to measure mass and acceleration, but to measure acceleration we need to measure rate of change of displacement, displacement involving both distance and direction. In mechanics, a special case of force is gravity. Just as F=kma, so W=mg where *W* is weight, *m* mass and *g* gravity. Accounting has no equivalent of weight, because, inter alia, it has no equivalent of the gravitational constant. If value of wealth is taken as the accounting equivalent of *mass* rather than of position, it is evident that constant purchasing power of money would be the equivalent of earth gravity. Unfortunately no such constancy is observed, so that even if value (mass) is in some theoretical sense constant, its recorded measurement (weight) varies with the purchasing power of money (gravity). Accounting value (mass) is like the mass of a comet or asteroid whose weight varies with every planet or planetoid it passes. It can be seen that absence of an accounting equivalent of the gravitational constant makes for instability, unreliability and lack of objectivity in accounting valuation. *It is the very constancy of historical cost that keeps it in place despite its generally agreed lack of relationship over time to any meaningful construct of value. However, as will be argued below, value is*

not well represented by mass.

Forces, momenta and accelerations, being derived measures concerned with rates of change, are true only for an infinitesimal instant of time. Force only needs to be applied once and sharply to cause acceleration. To measure effects of forces over a finite but extended time period, mechanics requires the additional concepts of work and of energy. Although impulse is defined as force times duration, impulse is not necessarily the most suitable concept of the prolonged effect of force to import into accounting.

Impulse concerns the continuing action of a force *F* over time *t* so that *FI=mat (t* for time, *m* for mass, *a* for acceleration) and this means that impulse also equals mass times the change in velocity over a given period. that is, change in momentum. In mechanics, mass is constant, velocity varies. In the Ijiri model, income momentum is measured in the same kind of terms ($ per month) as velocity (kilometers per hour) and lacks any equivalent of mechanics' inertial mass. The term momentum critically involves mass, the term income momentum does not. Given wealth as position, income as one dimensional 'displacement' of position, the more natural and more readily understood term for dollars per month would be 'income velocity.' This enables nonscientific accountants more easily to appreciate the import of the construct Ijiri has called momentum.

Momentum is conserved in mechanics when two bodies collide, so that the sum of their velocities of approach equals the sum of their velocities of separation-mass, of course, remaining constant through. Ijiri (1987) proposes the accounting equivalent of conservation through transactions, so that it is to be assumed that when an item is replaced or exchanged, the momentum of

the item leaving the firm is preserved in the item joining the firm and any extra income from the new item represents new, incremental momentum. The last part, however, could not occur if 'momentum' (really 'velocity') were preserved. Business transactions are only exceptionally comparable to physical collisions, so the momentum construct seems inappropriate to transactions. In mechanics, the principle of the conservation of momentum leads directly to the famous third law of motion which holds every mechanical action to give rise to an equal and opposite reaction. Double entry book-keeping could be held to echo this law, but triple entry book-keeping cannot do so. One cannot appreciate mechanical momentum without envisaging collision of bodies possessing mass. 'Income momentum' needs no such equivalent in the Ijiri model, and 'velocity' would have been sufficient to express the meaning desired. Impulse is associated with the change in momentum over time arising from the operation of a force over time. Again mass is 'involved as much as position - and the Ijiri model lacks a construct of mass. However, we are precluded from using 'acceleration' to explain velocity because in the Ijiri model, velocity (momentum in his view) has to be in the same units, $/mo, as the derivative of displacement (impulse as the derivative of income and explicator of momentum). Moreover, acceleration is measured in the same kind of units (Km per sec^2) as Ijiri's force ($/m02) but we cannot replace force with acceleration without destroying the explanatory power inherent in the concept of force. Force, in any case, affects acceleration, so force is the root explicator, while acceleration is merely a way of measuring its effect.

Force is measured in mechanics in newtons and a newton is 1 kg meter/ sec^2. So in order to get the most of the force concept we still need an

accounting equivalent of mass. Force in $\$/mo^2$, exemplified by various economic causes and expressed as variances, does not have such an equivalent unless cost/price/value are regarded as having both position and mass in the way that momentum and impulse do. That something necessarily needs an accounting equivalent of mass. We are accounting for changes in wealth and in income as the effects of explicit forces. Given that accounting wealth is a good match for mechanical position and that accounting income is a good match for mechanical displacement in one dimension, then to relate force to displacement we require something that does not bring in mass in the way that momentum and impulse do. That something also needs to have a meaning similar to its everyday meaning to fit the 'nicety' criteria of Ijiri's footnote 10. In mechanics, for there to be displacement in position, there has to be not impulse (force over time) but work. Work in mechanics is to displacement as impulse is to time. Thus work is force times distance just as impulse is force times time. Since our income displacement in $\$$ and income velocity in $\$/mo$, are direction insensitive (being one dimensional), it is relevant that work in mechanics is considered a scalar whereas impulse is a vector. As has been argued above, we should prefer scalars over vector when we borrow terms unless and until we can find meaningful accounting equivalents of length, breadth and height. Work is a scalar anti-derivative of force with respect to distance, and is a word more readily appreciated by non scientists than 'impulse'. It is recommended as the replacement construct for impulse in the Ijiri model, not only because of its familiarity and its direct relation to both force and distance (income) but also because of its fertility with regard to its associated mechanical concepts of energy and power. In the revised Ijiri model

proposed, work rate is measured in S/mo, despite its mechanical measurement in kg *mS/sec2* (=newton meters -joules = 1. 07 ergs).

Energy is the 'capacity' for doing work, mechanical energy being the capacity to do work which alters position and/or velocity and/or shape. Potential energy arises from position (as a result, usually, of gravity), kinetic energy from velocity and strain energy from deformity of a plastic or springy material. When work is done on a physical system like winding up a mechanical clock, the work can be stored as in a spring, and it is this stored work which is termed energy. However when energy is released some of the work escapes as heat or other loss; thus the first law of thermodynamics: work done equals gain of energy plus heat lost to surroundings. Energy is measured in joules, or kilowatt-hours or calories

With a clock spring, the work is put into the system quite rapidly relative to the rate of discharge, as the hands move round the clock face. With a bow and arrow the work is put in slowly, relative to the fast rate of discharge on firing. In both cases, work in equals work out plus system losses, but the rate of doing work is very different. The work rate in mechanics is power. Power is measured in watts, being the energy gain in newton meters per second (i.e. joules per second). A force of N newtons moving at V meters per second is NV watts. In French's words, (French 1971 p. 373), 'Power is a concept and a quantity of great practical importance, because the time it takes to perform a given amount of work may be a vital consideration'.

Before we try and house 'energy' and 'power' in accounting, we may usefully consider the concept of 'force'. Force in mechanics is an abstraction to name what imparts motion to bodies. This abstraction has three very concrete

2741

real world forms of existence: gravitational force (that causes weight), electromagnetic force (that underlies biological and chemical processes) and nuclear force (that holds atomic nuclei together). These forces are very sensitive to distance such that their strength is inversely proportional to the square of the distance between the two bodies affected, this being the inverse square law. Moreover, gravity principally governs the macrocosm of massive objects like stars and planets separated by vast distances; electromagnetism largely governs the 'mesocosm' of observable everyday phenomena and the nuclear forces govern the microcosm of subatomic particulate reactions. Gravity always attracts, electromagnetism attracts like to unlike charge and repels like from like charge while the nuclear force is attractive/cohesive down to 0.4 X 10-13 centimeters and repulsive at distances below that.

Now it is possible to go forward to the renaming of some of the Ijiri concepts. First, his 'income momentum' is really only a rate of income flow, comparable to velocity. 'Velocity' is not much clearer than 'momentum' to encapsulate the concept. It is proposed to use the word 'rate' to replace 'momentum'. Thus we will have 'rate accounting' a 'rate statement" and speak of an income rate, expense rate, etc. The word 'rate' carries no extraneous meaning to confuse the reader, unlike 'velocity' or 'momentum'.

Second, it is proposed to replace 'impulse' and 'action' with 'power' and 'work' respectively. Power is the rate of doing work and work is the effect on wealth, of force. The 'action' statement becomes the 'work' statement, the 'impulse' statement becomes the 'power' statement. Power accounts for rate; work accounts for income. These replacement terms are familiar to accounts readers and carry a meaning similar to their use both in physics and in

everyday life. Given that income has its mechanical equivalent in displacement or distance, it is appropriate to use work as the word that describes the ultimate effect of force on income.

Let us now attack the question of 'mass'. Everything that has mass has volume and it is proposed to suggest an accounting equivalent of volume. We already have income as one dimension of displacement - let us call it the equivalent of length. Income is of course measured in monetary units. Money has three principal functions: a metric for exchange value, a medium of exchange and a store of value. Length corresponds to the first quality, expressed in $ costs or revenues. Breadth corresponds to the second quality which incorporates notions both of liquidity and of foreign currency translation ease - we will call this dimension convertibility. Depth corresponds to the third quality, the store of value which is eroded by inflation-we will call this dimension stability. We now have x, y and z co-ordinates with which to pinpoint the value of a wealth position or income/cost transaction. Volume then approximates to 'real' value. Value arises from human responses and interactions and it is the human element that our discussion has so far lacked. If we treat a working person as our basic equivalent of mass, we can interlink volume and mass through the act of evaluation itself.

Headcount becomes one gauge of corporate mass. The three forces of physics are all associated with mass. For small masses the nuclear force predominates and we may associate this with that which binds together small teams of people. Borrowings again from physics, let us call this 'charm' in its weak form and 'charisma' in its strong form and let it signify small group cohesiveness and goal congruence. Gravity governs large mass interactions.

2743

A sufficiently massive star deflects light itself. A sufficiently massive corporation deflects credit, for it is a truism that credit flows towards larger firms and away from smaller ones. If firms are seen as planets, then a stock exchange quotation is comparable to graduation from asteroid to planetary status. Indeed we can use the dividing line between quoted and unquoted firms and the dividing line between firms with measurable financial 'gravity' and those without. Finance itself can be viewed as approximating gravity.

Finally, we need an accounting equivalent of electromagnetism-something that repels like from like and attracts like to unlike. That something will explain product, portfolio and personnel diversification, and also shed light on the 'chemistry' of business transactions. The concept 'risk' achieves the former and goes some way toward the latter if risk is seen as including risk of failing to maintain a required rate of return. Indeed, risk has so many manifestations that the risk spectrum is analogous to the electromagnetic spectrum. Every person has his/her own 'charge' or risk attitude. Every personality type has a given 'atomic mass', some are like hydrogen; others, in managerial positions, like gold or lead, and others at the centre of vast conglomerates are like uranium, in their effects on others. Each group has the character of its dominant elemental types, each firm has its own corporate culture.

Now, at last we can return to momentum and impulse and relate them to business matters, having translated mass into personality or at any rate personhood. Angular momentum is displayed by a body orbiting around a central body. It is a result of the interplay of centripetal (centre seeking) and centrifugal (centre fleeing) forces. This can be paralleled by a central headquarters seeking to control (exercise centripetal force) its subsidiaries and

branches who in turn seek to exercise their own initiative (centrifugal force). Angular momentum corresponds with the synergy resulting from the interplay.

If mass units are individuals, then momentum units are productivity units measured income/profit/value added etc. per period per head. Impulse correspondingly explains productivity changes by relation upwards to forces, explanation across-of productivity changes and realization downwards in work.

Energy as the capacity to do work relates to capacity to generate cash flow; potential energy being reflected in such external economies as location, kinetic energy in the present value of current investments and strain energy in receivables.

What has been proposed above is a complete conceptual framework centered on labor (mass), position (wealth) and force (finance, risk and charm). What is to be exemplified in the remainder of the paper, however, is confined to Ijiri's original model as renamed above. The rest of the paper seeks to explore the practical insights obtainable from applying the concepts of force, rate, power and work to the real world. .

Let us begin by considering the investment decision made by a private investor. There is a shortlist of 3 quoted companies all in the same industry, all with the same payout ratio and share price. Other data are shown in the tabulations below:

		Firm		
		Angular Inc	*Breadth Inc*	*Charm Inc*
1.	Earnings over net tangible assets %	5	10	IS
2.	Price earnings ratio	7	17	25
3.	Debt equity percentage (market values)	nil	35	15
4.	Standard deviation of earnings over 5 years as a percentage of current earnings	15	30	30
5.	Number of uncorrelated products	20	10	15
6.	Earnings rate of main product at year end	$ I5 k/mo	$ 10 k/mo	$ 20 k/mo
7.	Instantaneous interest rate at year end	Not applicable	9.3	12.2
8.	Share beta for current year (world market)	0.8	1.3	1.8
9.	Share beta for current month (world market)	0.76	1.24	1.85
10.	Monthly beta rate as at year end	+0.04/mo	-0.06/mo	+0.0 5/mo

11. Cash flow from operations			
In year	$ 3.2 m	$ 6.8 m	$ 9.1 m
12. Cash flow rate at year end	$ 270 k/mo $ 530k/mo		$ 815 k/mo
13. Change in cash flow rate year end to year end	+ $ 18 k/mo	- $ 54 k/mo	+$ 82 k/mo
14. Earnings enabled by borrowings {net)	nil	$ 3.8 m	$ 3.4 m
15. Instantaneous borrowing rate of return at year end	5.7%	8.7%	16.3%
16. Rate of return attributable to finance	0.3%	4.5%	82%
17. Rate of return attributable to risk	2.4%	2.0%	6.1%
18. Rate of return attributable to personality	3.0%	2.2%	2.0%
19. Earnings rate attributable to . personality	$ 26 k/mo	$ 32 k/mo	$ 45 k/mo
20. Increase in net worth in the year (% of last year end)	4.5%	12.2%	17.3%
21. Increase in net worth			

attributable finance	0.2%	6.9%	9.2%
22. Fixed asset weighted average depreciation rate per year	13.0%	11.0%	15.0%
23. Fixed asset replacement and addition rate per year	6.0%	3.0%	9.0%
24. Fixed asset rate of revaluation per year	5.0%	8.0%	12.0%
25. Working capital turnover rate at year end	5.4 p.a.	3.2 p.a.	8.2 p.a.

Conventional accounting will be able to product items 1, 3, 4, 11, 20 and 25. Stock market analysis is necessary for items 2, 8, 9. Item 5 is a note in the power statement as partial explanation of item 4. Item 6 is from that part of the power statement that analyses earnings rates segmentally. Item 7 is from the rate statement, as is item 15, both as notes. Item 12 is from the funds flow rate statement, item 13 from the funds flow power statement. Items 16, 17 and 18 are from percentage columns of the power statement, as are items 22, 23 and 24. Item 10 could be a note in the rate statement if the income statement itself has a note of item 8 or 9.

Essentially the incremental information content of the figures from the new statements is two fold. The rate statement information enables the investor to judge whether earnings are increasing or decreasing. The power and work statements attribute to rate and income data explanations in terms of forces. Applying the data to an investment judgment by way of fundamental analysis to the 3 hypothetical firms, we will look for symptoms of relative risk,

relative returns for risk and financial energy-the capacity to generate sustained cash flow.

Charm has the best ROCE (item I), has its earnings most highly valued in the market (item 2), partially at least reflecting its aggressive betas (items 8 and 9), its instability (item 4) and its financial leverage (items 3 and 7). The absolute value of its operations funds flow is greatest (item 11) as its flow rate (item 12) and flow rate of growth (item 13). Item 16 tells us that its rate of return from financial forces and sources exceeds its rate of return from risk (item 17). On the other hand its beta is increasing (item 10), its instantaneous year end interest rate on borrowings (item 7) is large enough relative to its instantaneous year end rate of return (item 15) to give Angular an advantage in this respect. However, Angular's avoidance of leverage is coupled with low contributions from financial forces (items 16 and 21) and high contributions from personality forces (item 18) which may correlate with high alpha. Angular and Breadth are making scarcely any net investment in the future (items 23 and 24 relative to item 22) compared to Charm. Charm's working capital is the most active (item 25), its product portfolio moderately spread (item 5) and its main product absolute earnings rate is the highest (item 6). All in all it seems Charm is the biggest firm and has the greatest financial gravity in consequence, but makes energetic use of it. It clearly has scope for greater product diversification and other actions that might reduce its world market beta. Also, its PE ratio is quite high and it may already be fully valued. Conversely, Angular's PE is very low and it may be undervalued. Angular seems right for the risk averse investor for the short to medium term, Charm for the longer term. Breadth is unsatisfactory as regards both business risk and financial risk

and at 17 its PE appears overvalued relative to those of the other two firms. All of this assumes market efficiency no better than semi strong form and sufficient imperfection for significant alpha to exist. Given these assumptions, the beta figures have only limited utility although they may well have significant announcement effects. The difficulties of accurate assessment of the separable contributions of the various forces is apparent but, to quote a maxim attributed to Keynes, 'It is better to be approximately right than to be precisely wrong'.

The rate and power statements would closely resemble the momentum and impulse statements (in Ijiri 1986) save the forces would be classified differently. The force statement, however, would be different both as a result of the difference in the view taken of what the basic forces are and because the present writer is not certain that accounts readers can easily handle $/moll as an accounting unit. Just as mechanics uses newtons (kg/mil) to measure force, it is proposed to honor the system founder in this case by naming force units ijiris (I) such that one ijiri is set equal to a thousand US$ per month. Accounts denominated in other currencies could either translate forces into ijiris as defined, or suitably define deutschmark ijiris, yen ijiris in ways their accounting bodies select. The force statement for Charm Inc. as at the year end is shown below : --

Charm Inc

Statement of Forces as at 31 December 1989

FINANCIAL FORCES-attributable to--

Equity issued up to 31 December 1988	7,512

FORCES OF PERSONALITY

Charisma--acceleration in emolument rate of

      parent company board 361

   --acceleration (deceleration) in investment

    in public relations rate 1,256

Charm --acceleration in emoluments of line

    management rate 4,953

   --acceleration in welfare and social

    expenditure rate 2,470

      _____

Gross Personality Forces 8,740

      _____

(Less)--Acceleration in cost rate of labor disputes (4,512)

  --Acceleration in cost rate arising from labor turnover (336)

   --Acceleration in teambuilding cost rate arising from increase

    in total time in meetings (9,512)

Total Personality Friction Force (14,360)

        Net Personality Force (5,620)

Total All Forces **57,440**

The force statement (not to be reconciled with the extracts earlier in the paper) tells us a great deal about. the corporate culture and strategy of Charm Inc. We can see that its major force is risk management as might seem natural for a large conglomerate but its investment risk management force far exceeds even the gross financial force, so we may wonder if it is concentrating too much on finance and facing diminishing returns in consequence. (The financial forces would be those earnings rates not directly attributable to diversification and stabilization policies.) The personality forces end up as a drag on the business, cost acceleration exceeding goodwill and synergy as measured by cost rates of proxies for direct measurement right down the line.

Summarizing the information provided by the new statements, we can compare corporate growth rates, the growth rates of any item of revenue, expense or funding, the growth rate changes in any item, the reasons for changes both in income and income/cost rates by reference to the forces responsible and we can identify the strength of the erosive forces faced by the firm. All of these enable the accounts user to analyze the firm dynamically and sensitizes all concerned to the timing of income/cost flows as well as to their magnitude. PE valuations will take account of income rates, expense rates and accelerations thereof, so that eventually the price rate ratio may be published in the financial press along with conventional PEs. The price rate ratio would be a power ratio, indicating the earnings rate per month, or per stock exchange account period, associated with the security. Derived betas would be possible matching excess security rate of return with market portfolio rate of return. Such a beta would render obsolete the one period restriction in applying the capital asset pricing model. The derivation and measurement of forces affecting wealth, earnings and rates would eventually enable the arbitrage pricing model to be applied with appropriate coefficients for Bn for a firm, where n is the various individually identifiable forces having regression significance in wealth, earnings and rate equations. Thus might a calculus of accounting be built.

Accounting is not only a micro exercise. Nations, as well as firms, keep accounts to assess such aggregates as national income, gross domestic product, money supply, fixed capital formation, balance of payments and inflation indices. There is already a rudimentary triple entry in national accounting through the identity i national income= national product=national expenditure, given appropriate definition of the terms involved. Yanovsky (1969 p. 16) terms the balance of payments accounts 'the oldest and first social accounting system, National accounting. is done on an accruals and not on cash flow basis. Again quoting Yanovsky (1969 p. 40), 'Since national accounts are planned to show the real production and actual sales of goods and services, the accepted principle is. therefore. to record transactions on a receivable-payable basis which makes production invariant to financial arrangements'.

Applying the triple entry model to national accounting yields equivalent statements to corporate accounting shown below :

Corporate Scheme	Debit	Credit	Trebit
Single entry			Force
Double entry		Rate	Power
Triple entry	Wealth	Income	Work

Rates of flow   Sectoral power

Debt/reserve   National Income   Input/Output

Balance of Payments

It is evident that a simple translation of the corporate scheme to the national one is not attempted. The corporate position statement is possible because auditing the existence and cost of corporate wealth is possible. It is only possible, or at any rate practical, on a national scale in a census fuller than the decennial exercises common in the advanced economies. Finding market replacement values of all households' fixed assets would require an investment in time

and effort unlikely to be acceptable, especially since the results may well be out of date before publication. Moreover, auditing the existence of assets owned overseas by domestic citizens is something even the Internal Revenue Services of the United States have not achieved. A full wealth statement is thus not a realistic proposition. However all countries account for their national working capital and for their national debt. A country's economy has a partial proxy for a company's share price through the conversion value of its currency, with the futures premium or discount being a partial indicator of confidence internationally. A partial wealth statement is thus feasible.

National income schedules correspond to the corporate income statement. Balance of payments accounts correspond, in certain aspects, to funds flow statements. (There are national funds flow statements in some countries but they adopt a sectoral approach.) The current account is analogous to corporate funds flow from operations, the capital account is comparable to long term sources and applications and the movement of reserves resembles the corporate change in the size and structure of working capital.

The national rate statement would have the same entries as the national income and balance of payments accounts but be produced monthly and disclose rates of monthly flow at the previous month end. Many countries, including most industrialized economies, already produce monthly digests of statistics slowing the flows through the economy for the previous month. These are already crude rate statements, and it is doubtful whether it is possible or significantly useful to ascertain instantaneous rates of macro-economic flows, subject as they are to repeated and differing acceleration and deceleration.

The force statement for an economy could not be drawn up along the lines suggested for companies. It would be impossible to discriminate and trace even approximately the different types of force; financial, risk management and personality. What might be more useful is to produce inter-sectoral flows in some detail to enable coefficients of productive transfer between sectors to be identified. Such an input-output statement is already produced in France as the

Tableau Economique. The power statement, in $/mo, would be a representation of monthly flows inter-sectorally. The force statement, in megaijiris, *MI* would be a schedule of the monthly accelerations of intersectoral flows, designed to show early signs of overheating or capacity underutilisation. A second form of analysis for the force, power and input-output statements could be by nationality of asset ownership, showing balance of payments effects. The purpose of this would be to raise the level *01* international debate over trade surpluses and protectionism. Currently that debate is based on traditional macroeconomic flows. The proposed analysis might well reveal a situation that although country A is in systematic deficit with country *J, A* owned firms in *J* ate massive net importers aad *J* owned firms in *A* are massive net exporters:-perhaps to a degree that offsets the macroeconomic deficit itself.

This paper has been an attempt to clarify the concepts of the Ijiri triple entry framework and to give some preliminary indications of potentially productive fields for its application Very considerable elaboration remains to be done. There is the effect of Fair Value Accounting at level One to consider. There is the practical objection that professional CPAs and corporate SFOs have expressed no wish to complicate their already complex accounting work still further. There is empirical work to be done exploring the usefulness of the new accounting with real user groups. There is the deeper theoretical question of whether a stable theory of accounting can be built independently of a stable theory of financial economics. There is not however, the So What question any longer. The Great Recession and the accompanying attack on the conceptual framework of accounting as currently practiced shows that the desire for a reliable general theory of accounting, robust against political pressures to suspend or distort the rules, remains as insistent as ever. Triple entry concepts have been shown to be relevant and helpful in moving accounting towards a general theory.

VOLUNTARY DISCLOSURE ON R&D PROJECTS

Carsten Winkler, Heinrich-Heine-Universität Düsseldorf,
Daniela Hochstein, Heinrich-Heine-Universität Düsseldorf,
Torsten Mindermann, Heinrich-Heine-Universität Düsseldorf

Abstract

In an information-based, fast-changing and technology intensive economy, research and development (R&D) are found to be an important contributor to firm's income and capital market value, particularly those operating in pharmaceutical or biotechnological industry. Due to the fact that financial accounting emphasises the aspect of information reliability and objectivity, financial accounting excludes the lion's share of R&D expenses from recognition. Therefore the users of financial statements will not be informed about the R&D activities in the balance sheet and the accounting information about a firm's R&D activity is generally of limited usefulness. As a consequence, a voluntary reporting model is needed which provides additional information on R&D outside the balance sheet. This paper shows how a R&D based innovation calculation in the notes could help to provide users of financial statements with information about firms' R&D activities.

Introduction

In an information-based, fast-changing and technology intensive economy, research and development (R&D) are becoming central to the competitive advantage of large number of firms, particularly those operating in pharmaceutical or biotechnological industry (Cañibano et al., 2000; Nixon, 1997). As a result, the discussion around the opportunity to capitalize intangible assets has always been very vigorous in the accounting literature (Lev and Sougiannis, 1996; Lev and Zarowin, 1999; Høegh-Krohn and Knivsflå, 2000; Litan and Wallison, 2000; Healy, Myers and Howe, 2002; Kothari, Laguerre and Leone, 2002). Even prominent accounting standard setters disagree about how to record internal R&D expenditures.[427]

---

[427] For example in Japan, the accounting profession permits capitalisation of R&D expenditures, in United Kingdom the Auditing Standards Board insists on expensing of research but permits development expenditures and in the United States the Financial Accounting Standards Board mandates generally the full expensing of R&D expenditures.

However, International Accounting Standards deal with accounting for R&D in IAS 38. Its purpose is to prescribe the recognition and measurement criteria for intangible assets. IAS 38.54 requires research costs to be expensed as incurred because a firm can never demonstrate that expected future benefits from such outlays are probable. In contrast to the research phase, the development stage is further advanced. At this more advanced stage of the innovation process, an enterprise is more likely to identify an intangible asset and to present its probable future economic benefits. Therefore, only those development costs that meet certain prudence-driven criteria (IAS 38.57) shall be recognised as an intangible asset.

Given the fact that intangibles resources are difficult to verify, and that the firm's management could use them to manage or manipulate reported earnings, IAS 38.71 permits only to capitalise the expenditure incurred from the date when the R&D project first meets the prudent-driven recognition criteria. Due to the fact that financial accounting emphasises the aspect of information reliability and objectivity, financial accounting excludes the lion's share of R&D expenses from recognition (Keitz, 1997; Høegh-Krohn and Knivsflå, 2000; Fülbier, Honold, and Klar, 2000; Healy, Myers and Howe, 2002; Schreiber, 2005; Lutz-Ingold, 2005). Therefore the users of financial statements will not be informed about the R&D activities in the balance sheet and the accounting information about a firm's R&D activity is generally of limited usefulness. As a consequence, a voluntary reporting model is needed which provides additional information on R&D outside the balance sheet.

This paper shows how a R&D based innovation calculation in the notes could help to provide users of financial statements with information about firms' R&D activities. Therefore, a short overview of the R&D process is given in chapter two. Chapter three explains the structure of the innovation calculation and afterwards chapter four considers whether the information of the innovation calculation meets the principles of decision usefulness. The paper ends with a short conclusion.

The research and development process

The innovation calculation is explained by examples of R&D-projects in the pharmaceutical industry. There are many reasons for choosing the pharmaceutical industry as an example for displaying the innovation calculation. The most important one is that in the pharmaceutical industry extended R&D-activities precede every new product launch (Fülbier/Honold/Klar, 2000). Therefore, in the pharmaceutical industry R&D is found to be an important participant to firms` productivity and capital market value (Lev, 2001).

In the pharmaceutical industry R&D-projects pass through different predetermined phases (Schäfer/Schässburger, 2001). At first the cause-effect relationships of a certain illness are generated by basic research. Directly connected to this is the search for a substance ("lead compound") which influences a clearly predefined illness-causing „target" in the desired way. In this pre-clinical stage the substance is firstly analysed outside of human organisms in animal models or with the help of other methods. Only when the results are promising in the terms of effectiveness and toxic side effects, projects will be taken to the next clinical phase after respective permissions. The clinical studies can be divided in three phases. In the first phase the substance is tested on humans. The substance's security and pharmacokinetics is determined by tests on 10 to 100 healthy persons. In the second phase, the dose optimum and the substance's effectiveness are identified with a group of 50 to 200 test persons. In the third phase the statistical identification of the substance's effectiveness and security as well as an examination of interdependencies with other medicaments takes place with a test group of 100 to 1000 patients. After the clinical studies are finalized, the official admission procedure starts in which the test results are assessed by an expert-commission.

Example of a R&D based Innovation calculation

Due to the fact that the balance sheet excludes the lion's share of R&D expenditures an enterprise should initially disclose in its notes when R&D activities were started. By doing so, the enterprise signals users of financial statements that a possible intangible asset might be created in subsequent periods, but at this early stage the uncertainty of the future economic benefits prohibits capitalisation.

Usually an intangible asset arises from internal R&D projects. With help of an innovation calculation firstly the arising of an intangible asset from R&D projects becomes transparent, and secondly the project-oriented view during the creation of these assets subsequently leads to an asset-oriented view of the balance sheet (Dawo, 2003). During the changeover from a project-oriented view to an asset-oriented view of the innovation calculation three different ways of accounting for project-related expenses have to be considered.

- If no asset has been created, no expenses have to be capitalised.
- If the research project creates an asset, its related expenses have to be capitalised. The amount to be capitalised is the sum of expenditure incurred from the date when the R&D project first meets the recognition criteria (IAS 38.71).
- Furthermore it is possible that during a research project newly extracted realisations can be advanced in another project (or in a different company). This is why the innovation calculation has to consider these transfers of those realisations by a further elimination of the related expenses. So each asset can be associated with its expenses during capitalisation. This requires respective rebookings between the single projects. Because of high costs, increasing risks and the temporary limited monopoly granted by patent protection, especially firms in the pharmaceutical industry are forced to complete there own R&D-projects by acquisition or licensing of foreign technologies and experiences.

In the following innovation calculation (Table 1) three of the companies' R&D-projects, divided into segments, are exemplarily listed.

Innovation calculation of R&D-projects	Segment analgesics		Segment remedies	Totals
	A	B	C	
Frames of the projects				
(1) Projects start	7/05	1/96	11/99	
(2) Project phase	**preclinical**	preclinical	preclinical	
	clinical phase 1	clinical phase 1	clinical phase 1	
	clinical phase 2	clinical phase 2	**clinical phase 2**	
	clinical phase 3	**clinical phase 3**	clinical phase 3	
	admission procedure	admission procedure	admission procedure	
(3) Expected project end	4/18	4/07	2/13	
(4) Planned overall costs of the R&D-project	12.400.000	42.000.000	36.000.000	
Development since project start				
(5) Accumulated expenses since project start	850.000 (760.000)	38.575.000 (35.575.000)	28.931.250 (26.681.250)	68.356.250
(6) + Accumulated addition from other projects	80.000 (65.000)	11.500.000 (11.500.000)	8.625.000 (8.475.000)	20.205.000
- from company-owned R&D-projects	57.000 (48.000)	7.000.000 (7.000.000)	5.250.000 (5.190.000)	12.307.000
- from external R&D- projects	23.000 (17.000)	4.500.000 (4.500.000)	3.375.000 (3.285.000)	7.898.000
(7) ./. Accumulated divestitures to other projects	30.000 (23.000)	6.000.000 (5.985.000)	4.500.000 (4.488.750)	10.530.000
- to company-owned R&D-projects	21.000 (16.000)	3.500.000 (3.491.000)	2.625.000 (2.618.250)	6.146.000
- to external R&D-projects	9.000 (7.000)	2.500.000 (2.494.000)	1.875.000 (1.870.500)	4.384.000
(8) ./. Accumulated capitalised assets	75.000 (72.000)	2.000.000 (1.915.000)	1.500.000 (1.436.250)	3.575.000
(9) = Sum of the project-related expenses since project start	**825.000 (730.000)**	**42.075.000 (39.175.000)**	**31.556.250 (29.381.250)**	**74.456.250**
Development in the regarded period				
(10) Expenses in that period	90.000 (120.000)	3.000.000 (5.700.000)	2.250.000 (4.200.000)	5.340.000
(11) + Additions from other projects in that period	15.000 (22.000)	0 (500.000)	150.000 (600.000)	165.000
- from company-owned R&D-projects	9.000 (12.000)	0 (420.000)	60.000 (380.000)	69.000
- from external R&D- projects	6.000 (10.000)	0 (80.000)	90.000 (220.000)	96.000
(12) ./. Divestitures to other projects in that period	7.000 (9.000)	15.000 (4.550.000)	11.250 (2.500.000)	33.250
- to company-owned R&D-projects	5.000 (5.000)	9.000 (2.575.000)	6.750 (1.575.000)	20.750
- to external R&D-projects	2.000 (4.000)	6.000 (1.975.000)	4.500 (925.000)	12.500
(13) ./. Capitalised assets in that period	3.000 (25.000)	85.000 (250.000)	63.750 (180.000)	151.750
(14) = Project-related expenses in that period	**95.000 (108.000)**	**2.900.000 (1.400.000)**	**2.175.000 (2.120.000)**	**5.170.000**

Table 1: Example of an Innovation Calculation of R&D-project

At first the frames of the respective R&D-projects are presented in the rows (1)-(4). In row (1) the start of the R&D-work is displayed and row (2) informs about the project's phase. The expected project end is shown in row (3). These frames are completed by the estimated overall project costs. As the total time of a pharmaceutical product development takes normally eight to twelve years (Koch, 2001) these frames represent first evidence of the project's prospect of success. For example if a project is still in the preclinical phase for many years and a big portion of the planned total costs have already been incurred a regular successful project completion becomes unlikely.

The project's frames are followed by an overall view which informs about the progress of a particular project since its start. Therefore, the actual innovation calculation starts in row (5) with the disclosure of the accumulated expenses which have been incurred since the projects start. In addition and for a better understanding, last year's values should be listed in brackets. Then the amount of all accumulated expenses for the addition of realisations from other projects is added in row (6). In return the project results which benefit from other projects or are depended on them should be considered. So the amount of all accumulated expenses for the reduction of realisations to other projects has to be subtracted in row (7). It should be stated whether these additions and reductions of knowledge transfer arose from company-owned or external projects. That is because as in case of external knowledge transfer there is already a sales effectivity of those expenditures. Furthermore the expenses from row (8), which already led to capitalised assets, also have to be subtracted. To increase the transparency of the intangible assets creation, the capitalised amounts have to be related to the financial categories of intangible assets. So the report's receiver gets to know in which scale the respective project contributed to the creation of the different categories of intangible assets. As a result, the sum of the project-oriented expenses since the project's start appears in row (9). Row (9) is the initial point for further project-related evaluations. Combined with row (2), a first evaluation of the R&D project's productivity is indicated. In combination with row (4) the reader gets to know how much of the total planned costs are yet expended. Compared with the already elapsed time, a first target-performance-comparison can be deduced. Efficiency is declared by a comparison of row (8) and (9).

Following the overall view, the rows (10) to (14) provide information about the actual progress in the reporting period which shows the difference between actual and last year's values. The current expenses of the respective project also have to be corrected in line with the total period calculation. This focuses on the amounts for realisations from other projects and knowledge transfers to other projects respectively as well as all the amounts that lead from a particular project to an intangible asset in the period under consideration.

Assessment of decision usefulness

Finally, it has to be checked whether the innovation calculation really provides financial information that is useful for decision making. To be useful, information must be relevant, understandable, reliable and comparable. Therefore the requirements of relevance, reliability, understandability and comparability have to be examined.

Relevance

The information is designated as **relevant** when it affects the economic decisions of users by helping them to evaluate past, present or future events, as well as confirming or correcting their past evaluations (IFRS F.26). Usually R&D is immediately expensed in financial statements when it is incurred and an enterprise does not have to disclose when research and development activities were started in its notes (Baetge and Keitz, 2002; Küting and Dawo, 2003; Schreiber 2005; Hepers, 2005). Consequently, the users of financial statements can derive little or no information about a firm's R&D activity. The innovation calculation informs users of financial statements about the expensed R&D costs. With the help of the innovation calculation users of financial statements obtain information about productivity and value of a firm's R&D. Given the fact that R&D activities have an important impact on business profits, the information of the innovation calculation has the potential to affect a user's belief. Consequently, the information of the innovation calculation must be apparently relevant.

Understandability

Information must be **understandable** to enable users, who have a reasonable knowledge of business and economic activities and accounting, and who study the information with reasonable diligence, to comprehend

the real meaning of the information. In general the requirements of understandability appear uncontroversial because relevant information should not be excluded because it is too complex or difficult for certain users to understand (IFRS F.25). However, information is more understandable by aggregating, classifying and presenting it clearly. The innovation calculation shows clearly arranged all R&D projects, in which the firm has invested, and the amounts that were spent on these projects. Therefore the requirements of understandability are met.

Reliability

Reliability is given if the information is free from material error and bias and can be depended upon by users to represent faithfully that which it either purports to represent or could reasonably be expected to represent. The idea of an innovation calculation is that an enterprise should disclose in its notes when R&D activities were started. Then the innovation calculation contains all R&D expenses of the firm. Thus the innovation calculation gives a faithful picture of what has occurred and nothing material has been left out of this picture (Mindermann, 2009). Third parties are able to verify whether the information are true and in accordance with actuality because the innovation calculation is based on the actually expensed costs (Dawo, 2003). Hence the requirements of **reliability** are doubtlessly met.

Comparability

In order to assess a company's performance investors must be able to **compare** the financial statements of a company through time and to compare financial statements between firms, i.e. the investors need information which is consistent across firms and over time. It is the nature of R&D projects that they are unique to the firm and therefore projects are not suitable for comparisons between firms (Lev, 2001; Dawo, 2003). Thus the comparison between firms provides no or only little additional information. But the innovation calculation enables users to **compare** the financial statements of a company through time. Users are able to identify trends in the R&D activities and are therefore able to assess the value and productivity changes of R&D over time (Mindermann, 2009). For that reason the requirements of comparability are also met.

Conclusion

R&D expenses for the creation of new products have certainly been rising for the last years. As shown above, the innovation calculation provides useful information about R&D activities for outside investors. Otherwise this information couldn't be found in financial statements. Therefore IAS 38 should commit enterprises to state an innovation calculation of the type described above in the notes.

THE EVALUATION OF BANK NETWORK
ROLE IN ECONOMIC GROWTH
(CASE STUDY OF GOLESTAN PROVINCE IN IRAN)

Parviz Saidi & Seyyed Hassan Seyyed Rezaie
Islamic Azad University, Aliabad Katool Branch

Abstract

The main Purpose of this article is to evaluate bank Network in Economic growth and development Golestan Province the role of in Iran.

The type of this research method is applied and of two Procedures descripative-Survey and based on multiple Regression Analysis and Panel Data model Were used for data analysis.

The Statistical Subject of this investigation is all active banks during 1998- 2005 including 11 Commercial and Specialized banks.

To gather information the Survey of documents Consolidated Financial Statements of Commercial and Specialized Banking Were extracted and used.

Findings of the research showed that bank Facilities as Completed Capital Producer Can have Significant role investment and Production growth in the Province and model Cofficient Shows that Laination %1 Can increase at Banking Province Facilitics Value Can bring up (economy growth) Province up to % 0/27.

Key Words: bank Network-Financial Institutions-Economic Growth-Economic Development.

Introduction

Scientific and theorical development specially in financial systems and montery and financial organizations, in recent years established a great change. and became the origin of changes in thought toward economic environment and related organizations. Financial system is the main element of each economy. Financial system includes a network of financial markets, organizations, commercial companies, families and government, that participate in system and set system operation. financial and montery organizations as the mediators in this cycle provide services for people, campanies and governmental and non-govenmental orgaizations.

Literature Review

Economist have diffrent aproaches about the role of financial system in economic growth and development in a country. For example HICKS believes that financial system through providing nessessary investment for significant activities, played a vital role in industrilizing, England, Schumpter (1912)also construes that bank favorite funcrion motivates thechnologic inventions and in turn ecnomic development and growth. because banks with determining inventive plans which have more chance to be successful and providing for them financially leads to creation of new goods and new production prossess in economy and also more economic growth . ROBINSON (1952) belived that it is the production part which guides financial flaws and provides request economic develpment for different kinds of financial needs. Be believes that financial system is the follower of the true and real part of economy. I means when ever the real part developes then financial part also developes. most principle aproaches emphesize a positive relation between financial development and economic growth. LEVINE (1962) and GER SCHENKRON (1997) also believe that financial development is nessessary for economic growth. because private commercial banks are the vital tools for transferring savins to industry in many industrilized countries especially Germany inthe second half of the 19 century. also it seems that economists have different aproaches about the role of financial system in economic development and growth in a country, recent studies indicates that financial development leads to long-time

economic development .RAJAN AND ZINGALES (1998) provide evidence that indicates financial growth with decreasing financial costs for economic institues causes an increase in development and access to economic develoopment. also they Show that financial development is nessessary for establishing new institues in naional economy DEMIRGUC-KUNT and MAKSIMOVIC (1998) also show that financial organizations have a vital role in the development and growth in institues and diffrent industries. Zervos and LEVINE1998 also provide evidance that shows the importance of the efficiency of bank system for gaining economic development and it is vital role in it. More over many other studies show the positive effect of financial development and efficiancy of financial system on economic growth in general information accessing cost and interchang cost are the most important motivations for establishing financial institues in fact organization and financial markets are created to decrease the probelems related to information shortage and transaction cost. Levin (1997) defines five basic functions for financial systaem in economy including facilate inter chang covering, verifieing and pooling risks, allocation of superviser resourses on managers, and controlling componies. saving movings to facilate the interchane of goods and services the concept of financial development can be understood on the bases of these five functions it means that favirable and efficiant function of the financial system inestablishing mentioned function is equal to the development of financial system in a country. These two basic channels indicate the effect of financial market on economic growth these channals are: capital accumulations, thechnological innovetions related to the first channal it is important that financial organizatons such as banks cause a change in the rate of saving or with reallocation of saving among diffrent capital thechnologies causes capital accumulaton. LEVIN (1997) andMAYER (2002) also thechnological innovations for having aproper effect on the economic growth and development could affect the production of good and services and change their production prossess so nessessary investment for applying these innovation should be provided and financial organization can do it properly in this way financial system can enter technological innovations in production prossess and affect economic growth in genereal financial and montery mediaters can enhance the prossess of economic development and growth.

The empirical evidence in Support of the benefits of bank relationships is not overwhelming, however. Although Johnson (2003) finds that the use of Short term

bank debt can reduce the negative effects of underinvestment Problems on leverage, he also observes that Short term debt usage increases liquidity risk. Cable (1985) observes a Positive impact of German bank interactions on firm Performance but Edwards and Fischer (1994) question Cable's methodology and argue that the evidence is rather weak. Gorton and Schmid (1996) observe that a bank relationship improves firm accounting Performance in 1974 but does not have the Same Positive effect on firm accounting Performance in (1985). However, Gorton and Schmid (2000) find a Positive relation between close bank relationship and the market to book value of equity. Franks and Mayer (1996) report that concentrations of bank equity holding do not improve corporate control mechanism. Kaplan (1994) also observes no relation between board turnover, Performance, and bank equity ownership in Germany.

Research goals

The main purpose of this research is determining the role of bank network in province development beside the main purpose altenative goals are

1. determin commercial bank facilities in economic growth
2. determin specialized bank facilities in economic growth
3. determin TACLIF and NTACLIF facilties of commercial banks in economic growth
4. determin TACLIF and NTACLIF facilitties of specialized banks in economic growth

5.determin TACLIF and NTACLIF facilities on employment.

The aproaches of research:

1. bank facilities is effective on econimic growth in golestan

1-1 commercial bank facilities is effective on economic growth

1-2 facilities provided by specialized banks are effective on economic growth

1-3 TACLIF andNTACLIF facilities of comercial banks are effective on economic growth.

1-4 TACLIF andNTACLIF facilities of specialized

2. banks are effective on economic growth it seems that the effect of TACLIF and NTACLIF facilities are diffrent on province employment.

Research method

This reseach is analysed on the base of a kind of functional research a discriptive method and through data regression. this research is a Survey study. A Survey study is non-emperical surveys which goals are detecting the relation between variables in order to anallys the information for research aproaches data panell model is used. This model is a combination of time series data cross section data. In this model more statistical points are available for researcher and freedom degee increases and decreases the problemof similarity between discriptive variables. This prossees as a result increases the assessment efficincy of economic evaluation. Also useing information provie the possibilibty of analysing a great number of economic question.

Aproach methodology:

Model assessment

In order to show the role of Golsetan bank system in economic growth. Production function is used as follow:

$$y = f(L, C)$$

in this function variable (Y) stands for domestic grass production variable (L) stands for employment in province and variable (C) stands for bank facilities which is a substitude for investment variable in province production funtion.

$$\log(y) = \alpha + \beta_1 \log(C) + \beta_2 \log(L)$$

This function assess logaritmic and linear formula because of the absence of time series information and data in economic main parts. agriculture industry and mine abode and building and service the model of combination of time series and cross section data panell is used. in this model four parts: agruculture, industry and mining , abode and building and service are considered as cross variables and surveyed time is 1998-2005 the meaning fullness level of all tests are analyzed on at least %90 certainity. So in order to assess mentioned model information related to increase value variable separately for four part at are needed also other effective vaiable on increased value separately of four parts at 1998-2005 is needed according to data description variables increased value employment and facilities are collected separately for four parts in 1998-2005. on order to test the first aproach and separate the role of TACLIF and NTACLIF facilities in commercial and specialized banks several models are provided.

There are 12 panell data model as follow:

1. the role of bank facilities in economic growth in Golestan province.

In this model dependent variable of logaritm increased added-value and independent variables of Longaritm are employment bank facilities (the series of all bank facilities) separately for four department agriculture, industry and mineing , abode and building and service:

$$\log(y_{it}) = \alpha_{it} + \beta_{1it}\log(L_{it}) + \beta_{2it}\log(C_{it})$$

variable (Y) is added-value (L) is employment and (C) is bank facilities. (i) is the number of parts under investigate including four parts: agriculture, industry and mineing abode and building and service. And (t) is time period (1998-2005).

$$\log(y_{it}) = -2.7 + 1.15\log(L_{it}) + 0.27\log(C_{it})$$
$$(-3.11)\ (11.2) \qquad (3.75)$$
$$\overline{R}^2 = \%97 \qquad\qquad D.W = 1.47$$

So employment growth and encouraging employees toward employment and employment politics is both the cause and effect of economic growth in province and of courseit is so becase more employement leads to more production but another variable which is the subject of this paper and bank facilities have the meaningful coefficient of (sig= 0/0038). As it is expected according to theory the coefficient is positive. Since bank facilities as producer capital complementizer can play a major and important role in invesment and production growth in province. And this model also shows that %1 incrase in bank facilities can increase increased added-value (economic growth) up to %27 in province. It should be mentioned that because of applying variables as logarithm gained coefficient is an indicator of flexibility and sensibility of the dependent variable on each independent variable and we see that production flexibility or added-value is very sensitive to work for and employment and production flexibility is less sensitive to bank facilities.

2. the role of bank facilities in the growth of economic development

if we want to examine the role of bank facilities or in other words the role of bank system in economic growth of the parts divided into agriculture, industry and mining

abode and building and service we need to assess data panell with cross section specific coefficients.

$$LOG(y_{it}) = \alpha_{it} + \beta_{1it} \log(L_{it}) + \beta_{2it} \log(C)$$

This method differs from the previous on in β_{2it} coefficient. In the previous one the coefficient was constant but here it equals to the number of econmic parts or four here is the model.

$$\log(y_{it}) = 4.7 + 0.48 \log(L_{it}) + 0.31 \log(CA) + 0.26 \log(CI) + 0.24 \log(CC)$$
$$(0.8)\quad(0.84)\qquad\qquad(2.05)\qquad\qquad(1.99)\qquad\qquad(1.61)$$
$$+0.34 \log(CS)$$
$$(2.19)$$
$$\overline{R}^2 = \%97 \qquad\qquad D.W = 1.82$$

The model shows that the coefficien of facilities in agriculture(CA) has a positive effect on production the coefficient is %31 and meaningful the coefficients of facilities in industry (CI) and service(CS) are also positive and meaningful but coeffient of facilities in abode and building (CC) does not have a meaningful effect on production in province. So facilities provided for agriculture industry and service parts have had major role in economic growth and these three parts have equal effects because the coefficients in all of them is nearly the same.

3. the role of commercial banks facilities in economic growth in Golestan.

The role of bank duties is of prominent importance so the role of commercial and specialized banks is considered here separately in this part the role of commercial banks through providing facilities and credits in economic development.

$$\log(y_{it}) = \alpha + \beta_{1it} \log(L_{it}) + \beta_{2it} \log(CT_{it})$$

Here CT it the facilities provided by commercial banks. And (I) is the number of the four parts and (T) is time period from 1998_2005. to show the role of facilities

provided by commercial banks for agriculture industry abode and building and service parts and their effects on economic growth the coefficient of CT (commercial bank facilities) divided into four parts was calculated through data panell model.

$$\log(y_{it}) = \textit{Fixed effects} + 0.78\log(L_{it}) + 0.26\log(CTA) + 0.75\log(CTI)$$
$$(2.63) \qquad (1.57) \qquad (7.7)$$
$$- 0.006\log(CTC) + 0.06\log(CTS)$$
$$(-0.026) \qquad (0.64)$$
$$\overline{R}^2 = \%98 \qquad D.W = 1.65$$

here it is clear that facilities provided by commercial banks have affected economic growth only in industy . and other facilities provided by commercial bank in other economic parts are not meaningful of course it does not mean that commercial banks facilities and credits do not affect other parts but we can only state that: facilities provided tor industry has a more important rol in production growth and economic development.

4. the role of facilities provided by specialized bank in economic growth ini Golestan.

Accordin g to assessment model specialized banks through providing facilities and credits have a more important role in economic growth and creating increased value than commercial banks. According to assessment model for showing the role of specialized banks through providing facilities and credits for different economic parts. Three of these 4 parts have had positive and meaningful role in increased valued inprovince.

$$\log(y_{it}) = 4.5 + 0.61\log(L_{it}) + 0.2\ \log(CPA) + 0.21\log(CPI) + 0.14\log(CPC)$$
$$\qquad (0.79)\ (1.17) \qquad (2.25) \qquad\quad (2.09) \qquad\quad (1.38)$$
$$\qquad + 0.28\log(CPS)$$
$$\qquad (2.47)$$
$$\overline{R}^2 = \%97 \qquad\qquad D.W = 1.61$$

In the above model it is observed that providing facilities by specialized banks for service industry and agriculture parts can have a positive and meaningful effect in increased value in province. Coefficient of provided facilities for agricultural part (CPA) equals to %2 and coefficient of provided facilities for industrial part (CPI) equals to %21 and coefficient of service part (cps) equals to 0/28. but coefficient of provided facilities for abode and building (cpc) equals to 0/14 positive and it is meaningless. So by comparing the coefficients of commercial and specialized banks it can be asserted that the role of specialized banks through providing facilities and credits is much more important than the role of commercial banks in economic growth on the other hand considering the model and coefficients it becomes clear that the role of facilities for service part by specialized banks has been much more important then providing facilities for agriculture and industry it was also true about the genereal model of the effect of bank facilities on increased value in province.

5. the role TACLIF and NTACLIF facilities in economic growth

below there are 2 assessment models that are indicators of the role of TACLIF and NTACLIF facilities of commercial bank on economic growth in province.

Role of tAclif Facilities:

$$\log(y_{it}) = Fixed\ effects + 0.94\log(L_{it}) + 0.099\ \log(CTTA) + 0.69\log(CTTI)$$
$$\qquad\qquad\qquad (4) \qquad\qquad (1.91) \qquad\qquad (3.4)$$
$$\qquad + 0.03\log(CTTC) + 0.013\log(CTTS)$$
$$\qquad (0.23) \qquad\qquad (0.29)$$
$$\overline{R}^2 = \%95 \qquad\qquad D.W = 1.2$$

Role of NtAclif Facilities:

$$\log(y_{it}) = Fixed\ effects\ + 0.65 \log(L_{it}) + 0.26 \log(CTNA) + 0.75 \log(CTNI)$$
$$\qquad\qquad (3) \qquad\qquad (1.82) \qquad\qquad (8.64)$$
$$+ 0.39 \log(CTNC) + 0.065 \log(CTNS)$$
$$\qquad (2.37) \qquad\qquad (0.79)$$
$$\overline{R}^2 = \%97 \qquad\qquad D.W = 1.73$$

It is understood from the above models that coefficients of TACLIF facilities provided for agriculture part (CTTA) industry part (CTTI) abode and building part (CTTC) and service part (CTTS)is in the order that coefficients of agriculture part which is 0/099 and industry which is 0/69 are meaningful and positive and coefficients of abode and service parts are statistically meaningless so TACLIF facilities of commercial banks could affect economic growth in province only in agriculture and industry although in the next model it is seen that the role of NTACLIF facilities has been much more because it is clear in the model that coefficients of NTACLIF facilities provided for agriculture (CTNA) industry (CTNI) and abode and building (CTNC) are 0/26 0/75 and 0/39 respectively which are positive and meaningful and only coefficient of service part (CTNS) is statistically meaningless in both models it is observed that provided facilities for industry part has a more important role in province. Of course it was indicated before that provided facilitied for industry part in gerenral model could have a positive effection on economic growth in province.

6- the role of TACLIF and NTACLIF facilities of industrialized banks in economnic growth.

In the previous part it was observed that the role of NTACLIF facilities of commercial bank on economic growth has been more important than the role of TACLIF facilities.

Role of tAclif Facilities:

$$\log(y_{it}) = 14.7 - 0.12\log(L_{it}) + 0.08\,\log(CPTA) - 0.09\log(CPTI)$$
$$\quad (4.8)\quad (-0.43)\qquad\quad (1.25)\qquad\qquad (-0.88)$$
$$\qquad -0.135\log(CPTC)$$
$$\qquad\quad (-2.0)$$
$$\overline{R}^{2} = \%98 \qquad\qquad D.W = 2$$

Role of NtAclif Facilities:

$$\log(y_{it}) = Fixed\ effects\ +0.69\log(L_{it}) + 0.11\,\log(CPNA) + 0.25\log(CPNI)$$
$$\qquad\qquad\qquad\quad (2.4)\qquad\quad (2.3)\qquad\qquad (14.2)$$
$$\qquad +0.08\log(CPNC) + 0.09\log(CPNS)$$
$$\qquad\quad (3.4)\qquad\qquad (1.16)$$
$$\overline{R}^{2} = \%98 \qquad\qquad D.W = 1.5$$

The two assessments models show that the role of NTACLIF facilities of specialized banks on economic growth is relatively more thatn TACLIF facilities of these banks. Thereis no meaningful and positive coefficient in the model. And even the model shows that providing TACLIF facilities of commercial banks for abode and building part has a negative effection increased Added-value in province (coefficient of %13 related to CPTC)(of course because of paucity of evidence and abservation we should accept it cautiously and it is seen lack of evicence in this model causes the deletion of facilities of service part). But in the second model most of the coeficient s are meaningful and positive as it is expected from the theory. The role of NTACLIF facilities provided for agriculture part (CPNA) has a co efficient of %11 . for industry (CPNI) 0/25 for abode and building (CPNC) 0/84 and all are meaningful upto 0/99. the important pointis that the role of facilities of industry part is much more than other parts and the role of NTACLIF facilities of specialized bank for service part (CPNS) has no effect on economic growth . of course this case also observed in TACLIF facilities. means that facilities provided by specialized banks for service part cannot have any effect on economic growth.

Second aproach methodology

To examin the second hypothesis of the research TACLIF and NTACLIF facilities are used.

7. the role of TACLIF and NTACLIF facilities in employment.

NTACLIF facilities and credits have diffrent roles in employment. Every year for creating new employment opportunities and decreasing unemployment government obligates banks to provide facilities to creat new employments. This case has had a decreasing direction in the 3rd development program. Because the banks are not motivated to provide TACLIF facilities through government. On the whole this research is aimed at showing the effects of TACLIF and NTACLIF facilities on employment in province. For gaining this purpose data panell model useing employment data (L) increased value (Y) and and TACLIF facilities (TACLIF) and NTACLIF facilities (NTACLIF) is considered for the period from 1998-2005 by dividing four parts: agruculture industry abode and building and service. For this purpose 3 models are assessed.

$$\log(L_{it}) = Fixed\ effects + 0.022\log(TAKLIF) + 0.099\log(NTAKLIF)$$
$$(1.07) \qquad\qquad (2.5)$$
$$\overline{R}^2 = \%98 \qquad\qquad D.W = 2.4$$

In the first model the constant effects of the role of TACLIF and NTACLIF facilities on employment have been shown separately the model shows that TACLIF variable (TACLIF facilities has a positive but meaningless coefficient (0/022). So TACLIF facilities have had no effect on employment. But co effecient of NTACLIF (NTACLIF facilities) is positive and meaningful(0/099). So NTACLIF facilities can have a positive effect on employment in province. In next models the role of TACLIF facilities of economic parts jon employment is shown.

$$\log(L_{it}) = 5.7 + 0.38\log(y_{it}) + 0.05\ \log(TAKLIFA) + 0.004\log(TAKLIFI)$$
$$(3.4)\ (3.5) \qquad (0.6) \qquad\qquad (0.04)$$
$$+ 0.01\log(TAKLIFC) + 0.06\log(TAKLIFS)$$
$$(0.1) \qquad\qquad (0.6)$$
$$\overline{R}^2 = \%96 \qquad\qquad D.W = 1.85$$

This model shows that only production (Y) as an independent variable can effect employment. And TACLIF facilities in agriculture industry abode and building and service has no meaningful co efficient in employment. Now in another model the role of NTACLIF facilities on employment is shown.

$$\log(L_{it}) = 11.52 - 0.127\log(y_{it}) + 0.18\log(NTAKLIFA) + 0.09\log(NTAKLIFI)$$
$$(9.75) \quad (-1.2) \qquad\qquad (4.6) \qquad\qquad\qquad (2.75)$$
$$+ 0.087\log(NTAKLIFC) + 0.193\log(NTAKLIFS)$$
$$(2.12) \qquad\qquad (4.49)$$
$$\overline{R}^2 = \%97 \qquad\qquad D.W = 1.8$$

The model shows that the role of NTACLIF facilities in creating employment is completely diffrent from the role of TACLIF facilities as it is observed TACLIF facilitied of agriculture NTACLIF co efficient=0/18 industry (NTACLIF =0/009) abode and building (NTACLIF =0/008)and service (NTACLIF = 0/019) all have positive and meaningful coefficient.

Conclusion:

By analyzing the relationship between facilities employment and increased added-value by using data panell model following results were obtained:

1. there is a positive and meaningful relation between added-value and work force factor also there is positive relationship between facilities and added-valued but added-value of province is more sensitive to variations in work force factor rather than bank facilities.

2. when we examine the role of bank facilities on added-value independently for each part. The result indicate that except for abode facilities part thereis a meaningful relationship beween coefficients and and added-value in other parts in province.

3. in assessing the role of commercial bank facilities separately on added-value in province. The model showed that facilities in industry has a meaningful effect on in added-value. More over the work force employment had a meaningful relation. But facilities provided by commercial banks in

agriculture abode and building and service has no meaningful effect on added-value in province.

4. in assessing the role of facilities provided by specialized banks on economic growth by separating partsthe model showed that except for facilities provided for abode there was a meaninful relation between coefficients provided and added-valued in province.

5. in assessing the role NTACLIF facilities provided by commercial banks on increased value it was shown through the model that facilities in agriculture industry and abode had a meaningful effect on added-value but they had no meaningful effect on service.

6. in assessing the role of TACLIF facilities provided by specialized banks on added-value the model showed that except for facilities for abode part other parts have no meaningful effects on added-value in province.

7. in assessing the role of NTACLIF facilities provided by specialized banks on added-value it was shown that facilities in agriculture industry and abode had a meaningful relationship with added-value but there is no meaningful relationship with service part.

8. in assessing the role of facilities both TACLIF and NTACLIF added-value it was shown that NTACLIF facility has a meaningful relationship with added-value in province.

9. in assessing the role of TACLIF facilities on employment model it was shown that the TACLIF facilities provided for the four parts of (agriculture, industry, abode, service) had meaningful effect on employment. the model indicates that only added-value of province as an independent variable has a meaningful effect on employment as a dependent variable.

10. in assessing the role of NTACLIF facilities on employment the model indicated that all NTACLIF facilities provided for the four parts of agriculture abode and building industry and service have had a meaningful effect on employment in province.

IDENTIFYING PRODUCTION CAPACITY OF
FOOD INDUSTRIES AIMING AT FINDING OUT THEIR MISSING LINK

Ahmad Sarani[428]
Zahra Nejad Akbari[429]

Abstract- The existence of economic organizations and the very growing number of such organizations are witnesses to human civilization. Lack of the dependent industries of one product in one area is a key factor to increase the product cost. The main aim of this survey is to study and recognize the production capacity of food industries aiming at identifying the missing link of such an industry in Golestan province, Iran.

This research is a descriptive one 165 members in dairy product companies in Golestan province were selected as a sample of study. The data were first collected by the distributed questionnaire among the above mentioned sample. Such a study was done on the basis of the 6th hypothesis. The obtained results of the 5 first hypotheses have shown that dairy product companies faced some limitation and restriction regarding supplying the raw materials. And also the results obtained on the last hypothesis showed that dairy products, oil, spaghetti, animal food and non-alcoholic drink companies had the ability to form an industrial cluster to supply the raw materials for their wrapping – up.

 Key word: food industries, the missing link, production capacity, cluster

1 Introduction

In spite of the feet that the most production units in Iran, have been grouped into small and medium nutrition industries, lack of a development strategy based on the existing industrial structures in one hand and local autonomy of small production units on the other, have made these companies not being able to attract a remarkable percentage on GNP and thus, they suffer from such intensive[i].short coming as shortage of information about production level required amount of primary materials unavailability of materials act.

Theoretical support of phenomenon of clustering or integration, for the first time, was introduced by Alfred Marshal in the context of economical profits of integration [ii].

In the suggested frame, despite of their natural competition small companies are member of an independent network.

Integration's effects are of such an extent that the completion profits would be only understood in its frame concept by its newness and inadequate theoretical support, concept of industrial cluster still experiences ambiguities in both definition and application[iii]. Although Porter was first to start the idea of industrial cluster, but, a variety of definition were appeared since.

Industrial clusters are usually defined as a group of commercial companies and non commercial companies and commercial organization which, the key factor of the members is their competitive behavior. They are related through the role of supplier and porches and sellers of the others needs, using the same technologies, dealing with the same customers distribution channels, counseling and preserving public work forces. Competitive firms create the competitive clusters and economical attractions finally, make the clusters to converge[iv]. Even though some researchers have put emphasis on the role of social capital in the mutual cooperation's between companies contained within a cluster, it is yet possible for some members to not benefit from their membership[v]. The extent of space and time are the most prominent measures of clustering policies, affecting the decisions, related to the clustering plans. On the other hand, the data and materials used possibly delimit the clusters[vi]. Nevertheless when defying the clusters. There might be no need to consider all these limitations.

According to pro & Hirshman, the new emerging perspective discussed in the industrial and regional development is more perfect[vii]. In the industrial and regional development is more perfect. In this respect, regions, based on their natural, organizational, constitutional and humanity's advantage, should pay a serious attention to the development of a number of clusters and facilitate their different organizational facet if so, they would succeed in the national and international markets, control the more important parts of the supply chain, and improve and reconstruct the present structures against the universal fluctuations[viii].

In the context of progression and creation of industrial clusters in Golestan province, any changes should take on board the political, cultural, social and economical realities of the society. Ignoring these would lead to problems for industrial and mineral institutions with regard to quality production and cost [ix].

In this study, it is intended to evaluate the industrial clustering potential of the province, as perfectly as possible. It is worth noting that, until now, there has been no attempt for determining the missing link of

nutrition industrial of the province. Also, increasing umber of nutrition production units has made the related research to be of low practical usage.

This study has been tried with the purpose of analysis and recognition of the production capacities in order to determine missing link of nutrition industries of the Golestan province.

2 Materials and methodology

The present study is a descriptive one. Data collection was practiced through a library research as well as a pilot study; the library research was done for theoretical subjects and the pilot study was done to collect data and input. In this study the capacity of products was examined to find the lost links of nutrition industrial in Golestan province.

Subjects are real or theoretical and the results of this study include it because it was impossible to include all subjects [^{x}], the subjects of this study were just factory managers, dairy industries, and nutrition products in Golestan province. In this research sum 165 people who are managers as well as industry owners of Golestan province participate. A questionnaire was sent to all active industries. In this questionnaire it was emphasized that the collected data will be kept secret. The questionnaire was made up of two parts:

1) part 1 : general questions including 6 general questions considering managers
2) part 2: specialized questions consisting of 12 specialized questions

Because the sample subjects were not homogenous and it was probable to experience reduction of reliability and validity of means measurement.

To avoid this problem, classified sampling method was practiced and in order to examine the significance of answers, different tests were given. In other words, by the use of SPSS software, normal distribution curve, histograms and pie charts as well as a ratio in a population was practiced.

3 Results

During the study from among 140 presented questionnaires, 20 had received no answers, and 30 industrials were closed; these 50 questionnaires were excluded from the analysis and 90 questionnaires were analyzed.

On the basis of the collected data, 64% of manufacturing units of this province produce less then their nominal capacity 29% produce equal to their nominal capacity, 5% produce more then their nominal capacity and 2% of the managers didn't answer the questions.

The distribution of the nutrition product units in Golestan province is as follows:

1) West of Golestan: Gorgan, Agh Gahala, Bandar turkman, Kordkooy, Bandargaz, Nokande and Khajenafas.
2) Este of Golestan: including Aliabad, Gonbad, Azadshar, minoodasht, Kalaleh, Galikesh and Maravetapeh.

The collected data indicates that 63% of nutrition producing units locate in west of Golestan and 37% of such industries in east of Golestan.

Data shows that 56% of producing units in Golestan, present their products to other units. Meanwhile 44% of other units present their products directly to customers.

Table 1: distribution of percentage of producing units in Golestan province with regard to competing products

Competing or alternative products	Frequency	Comparative Frequency	Cumulative Frequency
Competing products exist	85%	94%	94%
No competing products	5	6%	6%
total	90	1	100%

Table 1 shows that 94% products in Golestan province have competitors while 6% of such units are unique and have no competitors in Golestan.

4 Discussions

Accepting hypotheses 1, 2,3,4,5 we came to the conclusion that dairy companies such as cream, cheese and milk deal with different limitations to provide their raw materials.

1) Dairy companies in Golestan provide 31% of their need from other provinces in Iran.

2) Dairy companies in Golestan provide25% of their need from abroad.

-Cheese yeast is imported from Denmark.

-Rulpery is imported from other province.

- All tin 16, 8, 4 are not produced in Golestan so dairy companies face 5% shortage.

On the basis of this data:

1. It is suggested to establishing an industrial unit with the latest technology
2. It is necessary to found Rulperyback producing company in order to supply what other dairy companies provinces need as extra products can be exported to other provinces as well as other Asian countries.
3. A producing company is needed to make plastic as well as tin in different sizes for dairy companies.
4. Craft three layer powder packets are imported from Tehran so it is advisable to establish a company with the latest technology in producing such packets.
5. Tetra pack seven layer sterile pockets are imported from abroad so it is logical to have such a company in this province.
6. Findings show that rice and flour producing companies provide 40% of their need from other provinces so it is recommended:

At least one modern company is needed to produce 50, 80,100, and 40 kilo sacks of kinds of thread.

7. Findings indicate that macaroni producing companies have to import 45% OF Califon, beta carton from Tehran and other provinces.
8. Findings show that 45% of packet Acid citric and Anti oxide is imported from Malaysia and Indonesia.

9. Finding show that 73% of dairy producing companies which produce cheese, cream and pasteurized milk produce less them their nominal capacity so it is advisable to help such companies increase their capacity using expertise and knowledge of experts.

10. Findings indicate that 68% of flour and bread producing companies in Golestan province produce less than their read capacity.

It is necessary for these companies to produce more because people really need them. It is useful to do more researches to know more problems ahead of producing companies in Golestan province
