The rest of paper is organized as follows: first, have presented: The target of CG rating project, Potential Contributions of Study, background of Tehran Stock Exchange (TSE) and corporate governance in Iran. Second, we review Theoretical background and hypotheses development and in the last section we present the conclusion and policy recommendations, as well as its potential practical application for future studies.

Background of Tehran Stock Exchange & The target of CG rating project

The idea of having a well-organized stock market to speed up the process of industrialization of the country dates back to 1930's when Bank Melli Iran started a study about the subject. A report completed in 1936 worked out the details for the formation of a stock market and laid down the preliminary foundation to proceed with the plan. The outbreak of the World War II and subsequent economic and political events delayed the establishment of the stock exchange up to the year 1967 when the Stock Exchange Act was ratified. The Tehran Stock Exchange (TSE), opened in 1968 under the shah, all but died after Iran's Islamic revolution and the ensuing war with Iraq, re-emerging in fits and starts in the late 1980's. Though tiny compared with equity markets in New York, London or Tokyo, the Tehran exchange's market cap has increased from $17 billion in June 1999, when the current boom began, to $44 billion, with 400 listed companies, up from 220 a decade ago. The amount of money traded daily has quintupled in the last two years, to around $50 million in March, a rate comparable to that of the exchanges in other Middle East and North African countries, excluding Turkey. As many global equities markets have languished, the Tehran Stock Exchange has performed magnificently, topping world markets in the last few years and rewarding investors with 125 percent gains in the fiscal year ended March 21 and another 15 percent since. Managers of United States emerging market funds rarely even watch the exchange. Jonathan Asante, chief economist and manager of two emerging market funds worth $120 million for London-based Farmington Investment Management, the British partner of Maunder Capital Management in the United States, said markets in Iran and other oil-rich gulf countries were too pricey (Daragahi 2004).

As stated above, investing in TSE has increased in current year. In the course of, Over rials 15 billion (US$1.5 million) in foreign investment has been made in the Tehran Stock Exchange (TSE) during the first quarter of current Iranian year (starting on March 21, 2008), a bourse official said. The caretaker

of TSE noted some rials 388 billion in foreign investment had been made in the TSE during March 2007-March 2008.

The target of CG rating project are: 1) To produce useful results of aggregated data for the relevant authorities (e.g. the Tehran Stock Exchange) and create an aggregate score for the Iranian listed companies participating, thus demonstrating strengths and weaknesses to be taken into account for policy making. 2) To provide an independent and reliable tool for all investors who believe that a thorough examination of CG practices will lead to increased long-term shareholder value. The importance of the tool increases in a framework of a small open capital market that aims to attract sophisticated international investors. 3. Form a basis for comparison with future exercises and offer a tool that will allow correlation of the results with stock value and profitability to check the extent to which investors pay a premium for companies with high ratings.

Potential Contributions of Study

One of the main contributions of the project was the consensus that resulted from a very close collaboration between the TSE (which financed the study and had a vivid interest in practical results), an academic research centre (which could guarantee methodology and impartiality) and representatives of market participants (who provided thorough inputs and assured the practical value of the results). In order to achieve the highest possible consensus and obtain market-oriented outcomes, a Special Advisory Committee on Corporate Governance was convened consisting of members of all the relevant agents (the Tehran Stock Exchange, TSE Research and Development Center, Islamic Parliament Research Center) to advise the researchers on practical matters related to their work. Also, to provide a comprehensive and specific rating regarding all CG criteria for each company, enabling firms to use their individual results in order to measure themselves against several benchmarks. Furthermore The evidence reported in this paper is important not only for Iran but also for other emerging markets in the process of attempting to improve their corporate governance practices.

Corporate Governance in Iran

A characteristic of corporate governance in Iran approximates internal governance structures - systems where all the listed companies in country are owned and controlled by a few, major shareholders. These shareholders are often divided into different groups: the foundation group, the creditor banks (which are a small group), other companies or the government. The major shareholder's supervision depends on certain activities such as buying controlling stock and the role of institutional investors. Minor shareholders have no supervisory role. However, auditing the financial statements of companies on the stock exchange is mandatory. But, there is no rating institution in Iran or any system for proper supervision of internal control mechanisms. Despite recent concerns in the field about boards of directors' and other issues related to executive management, such as dividing the responsibilities between executives and managers, the role of nonexecutive managers are very weak in Iran and there is seemingly no concern about supervising organizational morality.(Mashayekhi & Mashayekh , 2008)

Fortunately, in late 2004, the TSE Research and Development Center published the first edition of the Code of Corporate Governance in Iran. The 22 clauses contain some necessary definitions, management, board, and shareholder responsibilities, financial disclosures, accountability, and auditing concepts. This code was edited in 2005 based on the ownership structure, the capital market situation, and the Trade Law. The second edition of Code of Corporate Governance in Iran has 5 chapters and 37 clauses. This code was announced via media and implemented by many companies.

Theoretical background and hypotheses development

Agency theory explains how to best address the problems of goal congruency and information asymmetry between the principals (shareholders) and agents (managers). Effective corporate governance structures help to prevent agency conflicts by acting as a monitoring device designed to align management's goals with those of the shareholder. The structure allows for compensation packages, which provide managers with an incentive to maximize the value of the firm. Hence, agency theory suggests better corporate performance established through measured corporate governance will lead to lower agency costs, higher stock prices and better long-term performance as managers are better supervised because a system of accountability, i.e. corporate governance, exists.

The agency model identifies number of governance mechanisms which realign the interests of agents and principals and so reduce agency costs (McKnight, Weir 2008). The movement from exclusive ownership to collective ownership introduced a novel subject in the area of financial management, which was termed by Berl & Mins (1932) as the Agency problem. Jensen & Mc Ling (1976) while illustrating the fundamentals of agency theory stated that the managers of a company as the "agent" and the shareholder's as the "principle". In the other words, the shareholder, who is the owner, of the company, delegate day-to-day decision making in the company to the directors, who are shareholder's agents? The problem that arises as a result of this system of corporate ownership is that the agents do not necessarily make decision in the best interest of the principle (Jill Solomon, 2007, 17). This issue has caused a conflict of interest and brings about the agency costs which are the cost of agency produced from the stockholders attempts to control the managers. These attempts include the plans and contracts made between the manager(s) and the stockholders. Corporate governance systems comprise the techniques used to protect the interests of those that provide the resources essential to the operations of a business entity.

A basic assumption is that managers are likely to place personal goals ahead of corporate goals resulting in a conflict of interests between stockholders and the management itself. In general, agency costs also arise whenever there is an "information asymmetry" between the corporation and outsiders because insiders (the corporation) know more about a company and its future prospects than outsiders (investors) do. (Steven M. Mints2005).

If the market mechanism and shareholder's ability to express them selves are not enough to monitor and control managerial behavior, some sort of regulation or formal guidance is needed. Indeed, if markets are perfectly

efficient and companies could compete in an efficient market for funds, artificial initiatives aimed at reforming corporate governance would be redundant. However, markets or not perfectly competitive and therefore intervention is necessary in other to improve corporate governance, help companies to raise finance and make companies more accountable to their shareholders and other stakeholders. Agency problems do exist between companies and their shareholders throughout the world, and governments are intervening by producing policy documents and codes of corporate governance best practice at and amazing rate (Jill Solomon, 2007: 20, 21). Hence, the asymmetrically of the information and the presence of benefit contrasts derived from Agency Theory, so implementation of corporate governance rules is unavoidable.

As stated above, In Iran the stock exchange organization (SEO), in the process of internationalizing the stock exchange and developing the privatization process, which is a requirement of the World Bank and the international monetary fund, attempted to generalize the corporate governance regulation in 2007, which has not been executed up to now, although some firms have applied it voluntarily. Therefore, with regarding the weakness of leg structures intransparency of financial reports and public ownership (the report of parliament's center of researches) are the problems of the most emerging markets. It seems necessary that the required researches be carried out in the universities first and after evaluating the circumstances, the required mechanisms are provided for corporate governance to apply. Then With regarding the theoretical bases and the necessity of conducting this research, In Iran's emerging stock exchange, the main research question is:
"Is there a positive relationship between the firm's performance and corporate governance score in the firms accepted in the exchange market?"

As stated above, this study proceeds in two parts. The first part deals with determinants of corporate governance. In the second part, we explore the determinants of firm value. In the first part, we regress SCORE on a vector of x variables with and without ownership variables. In the second part, we test for a correlation between SCORE and performance measures indicated either by Tobin's q or by Return on Assets (ROA) and MTB. We add the variables found in part one to be associated with higher governance rankings as controls to filter out their effects on firm performance. Following what we have done in part one, we run regressions including and excluding ownership variables in part two.

PART (I)

Based on the theoretical considerations and on the empirical research previously described, we have developed several hypotheses that relate ownership and company-specific characteristics to corporate governance practices in Iran.

The hypotheses and the independent variables

INST

Institutional investors today are far more involved in all areas of corporate decision making and have been encouraged to take on a more active role by the recommendations in corporate governance codes of practice and policy

documents. Institutional stockholders, which mostly possess a large share of the firms stock, have the necessary opportunities and capabilities to supervise the managers and in this way can influence the management decisions. In contrast to boards of directors, institutional investors have become increasingly willing to use their ownership rights to pressure managers to act in the best interest of the shareholders (Cornett et al. 2008). Based on agency theory, the management's fringe benefit is based on profit; the managers will be active in applying the regulations and rules and will try their best in the firms profit making. Institutional investors have two incentives for managing their portfolio of investments: 1) fiduciary responsibilities and 2) higher investment performance. To satisfy their fiduciary responsibilities, institutions develop a prudent/selective investment policy and continuously monitor performance (Arbel et al. 1983).

EDUM

Both agency and contingency theories lead us to think that the corporate governance structure of the company may be related to reporting practices, specifically to disclosure practices. So, board composition may be an interesting variable to consider because it will reflect the role of independent directors. More disclosure can be expected from companies with a higher proportion of independent directors. On the other hand, if the board has a high proportion of non-independent directors, less disclosure can be expected since they have access to inside information. As such, if the board includes representatives of shareholders, they do not have to rely extensively on public disclosure since they have access to internal information.   (Lopes & Rodrigues 2007)

INDE

Boards of directors are a crucial part of the corporate structure. They are the link between people who provide capital (the shareholders) and the people who use that capital to create value (the managers). Hence the board's primary role is to monitor management on behalf the shareholders. Managers, especially top management, must look after the health of the corporation, and this involves balancing the multiple claims of conflicting stakeholders. Owner want higher financial returns, while costumers want more money spent on research and development. Employees want higher wages and better benefits (Allhoff & Vaydya 2005:259). As stated, Board structure is an important corporate governance mechanism. The existing studies have suggested that board characteristic like size, power concentration, the existence of domination individual, the presence of audit committees with certain features, the proportion of non-executive and independent members have an influence on accounting information quality (Goodwin & Seow(2002) Farinha & Viana(2004) Pucheta & Fuentes(2007)).

BLOCK

Kenneth et al. (1995) note the substitution effects between outside directors, block holders, and incentives to insiders using eighty one U.S. bank-holding companies in his study. Both Dedman and Elisabeth (2002) and Young (2000) investigate the board structure determinants before and after Cadbury Report. They either find managerial entrenchment is reduced or non executive directors

are increased following the imposition of new standards of "best practice" regarding board structure. Lei& Teen (2004), show that insider shareholdings and block holdings are negative and significant, whereas institutional shareholdings are positive and significant with corporate governance practice.

As stated above, we examine the four mechanisms used in controlling agency problems: non-executives managers, block holdings, institutional shareholdings and disclosure. In addition, we also include a comprehensive measure of governance using a corporate governance scorecard and measuring governance over a longer time period.

FSIZE

There are several arguments that can be used to link size to disclosure as a corporate governance mechanism. As Watts and Zimmerman (1990) argue, political costs are higher in larger companies, and so larger companies are more likely to show higher levels of disclosure since it improves confidence and reduces political costs. Also, larger companies are supposed to have superior information systems, so additional disclosure is supposedly less costly in larger companies than in smaller ones. Moreover, proprietary costs related to competitive disadvantages of additional disclosure (Verrecchia, 1983) are smaller as company size increases (Lopes & Rodriguez 2007). Certainly the firm size determines the amount and range of firms' activities. Larger firms, because of their more contacts with the shareholders and the existence of more control mechanisms have a less amount of commercial risk, so we expect that large firms have a higher corporate governance score. To calculate the firm's size criteria is the same as the mean of sum of assets, the firm's stock exchange value and amount of sale. We use sale's figures as proxy for size because regarding the high rate of inflation in Iran, the sale figures present more relevant information.

The hypotheses and the dependent variables

Corporate Governance Score (CGS): Most studies on firm-level evidence on corporate governance practices gather their information using questionnaires filled by the companies themselves. This methodology presents various potential problems, among others: a low response rate, especially from those companies whose corporate governance practices are poor (self-selection bias); and, for the firms that do respond to the questionnaire, there is a tendency to present themselves not as they are at the moment when the questionnaire is being completed, but as they want to see themselves in the future (self-report bias). In our paper we follow a different route to construct our CGS. In the same spirit of Garay & González (2008), we answer the questions ourselves using publicly available information. The Corporate Governance Score (CGS) was constructed based on 21 questions pertaining to different corporate governance practices. We answered these questions for each of the 125 Iranian firms that were listed in the TSE. The answer to each question is either "Yes" or "No." If the answer is "Yes," we add 1 and if the answer is "No," we add 0. All answers are based on publicly available information. These 21 Questions were answered after reviewing each firm's financial statements, bylaws, minutes of the boards of directors and shareholders' meetings, and annual reports available at WWW.rdis.com.

To summarize, in part one, the model is specified as:

$$SCORE_{it} = \alpha_i + \beta_1\,INST_{it} + \beta_2\,INDE_{it} + \beta_3\,EDUM_{it} + \beta_4\,BLOCK_{it} + \mu_{it} \qquad (1)$$

$$SCORE_{it} = \alpha_i + \beta_5\,FSIZE_{it} + \beta_6\left(\frac{K}{S}\right)_{it} + \beta_7\left(\frac{Y}{S}\right)_{it} + \mu_{it} \qquad (2)$$

$$SCORE_{it} = \alpha_i + \beta_5\,FSIZE_{it} + \beta_6\left(\frac{K}{S}\right)_{it} + \beta_7\left(\frac{Y}{S}\right)_{it} + \beta_1\,INST_{it}$$
$$+\beta_8\,DDUM_{it} + \beta_2\,INDE_{it} + \beta_4\,BLOCK_{it} + \mu_{it} \qquad (3)$$

Where:
SCORE: The corporate government score
INDE: The percentage of outsider managers
INST: The percentage of institutional stockholders
FSIZE: Natural Logarithm Sale:
K/S: The ration of property, plant and equipment to sale
Y/S: The ratio of operational profit (loss) to sale
BLOCK: the percentage of block stockholders
INST: The percentage of Institutional stockholders
INDE: The percentage of the outsider managers
EDUM: Is a dummy variable meaning that if there is no related- parties transition it equals to one and zero otherwise.
DDUM: Is a dummy variable meaning that if the numbers of outsider managers are more than the insider managers it equals to one and zero otherwise.

Control Variables

We use the following three variables as controls: company size (FSIZE), measured as the natural logarithm of the sale, The ration of property, plant and equipment to sale (K/S) and The ratio of operational profit (loss) to sale(Y/S). Information regarding each one of these variables was obtained from the financial statement.

Hypotheses Part (I):
A: corporate governance practice has relationship with **ownership characteristics** in companies listed on the Tehran stock exchange.
  Sub Hypotheses:
- Corporate governance practice has positive relationship with institutional stockholders.
- Corporate governance practice has positive relationship with Non-executive managers.
- Corporate governance practice has negative relationship with related party transactions.

- Corporate governance practice has positive relationship with block holders.

B: corporate governance practice has relationship with **company-specific characteristics** in companies listed on the Tehran stock exchange. (size of firm)

PART (II)

Empirical research on corporate governance use either market-based measures or accounting-based measures to assess firm performance. Epps& Cereola (2007) use ROA as an operating performance indicator. Lei & Teen (2004), Brown & Caylor (2004), Brown & Caylor (2006), Garay & Gonzales (2008), use Tobin's q as an operating performance indicator.

According to the Agency Theory which states that good corporate governance leads to a decrease in the expected return rate and consequently leads to a more proper evaluation of the stock price in long run. The firm's performance arises from executing the rules and methods created by the board. The separation of executive duties and monitoring duties in economic entities and implementing the same procedure in the board structure is truly one of the main achievements of scientific view to the issue of corporate governance. Today the presence of dependent and outsider members along with insider members in the board is exactly in the direction of this critical principle, namely, the separation of supervision from execution. The presence of responsible but outsider individuals in the board arranges the affairs in a way that the main responsibility of these persons becomes the supervision of the insider directors, and in this direction the necessary monitoring tools like the reward committee and accounting committee have been forecasted to apply monitor duties.

Also firms with an independent board and higher ROE, have more marginal net profit and stock profit (Brown & killer 2004). Therefore, it is expected that the firm performance has a significant relationship with corporate governance score which has been explained based on the different management and governance criteria according to what has been mentioned in the introduction part of article, some dummy variables have been used for this purpose to be achieved. After discovering the relationship between the factors affecting corporate governance, we attempted to test the main hypothesis, namely: " There is a positive relationship between the firm performance and the corporate governance score in the firms' accepted in the exchange market "

We use three alternative dependent variables to test our hypothesis. First, we use the Tobin's q; this variable was computed as the market value of the firm's assets ([(No. of common shares ×Price of shares at calendar year end) + Book value of Preferred Capital + Book value of total liabilities]/ Book value of total assets) divided by the book value of assets. Tobin's q can be considered the classic valuation measure and has been used extensively in the corporate governance literature. Tobin's q reflects growth opportunities (and, more generally, expectations of the firm's prospects in future years) through the impact of these factors on market value.

The second dependent variable is the price-to-book ratio (price-to-book value or PBV), measured as the quotient between per share market price and book value. The price to book is a valuation measure that has been used in corporate governance studies by authors such as Garay & González (2008) for Venezuela. Finally, we use the ROA as the third of our dependent variables, Return on assets is a measure of operating performance, which shows an investor what earnings a firm has generated from its invested capital assets. ROA in the current study is defined as income before extraordinary items for the fiscal period divided by total assets for that same period. Managers are directly responsible for the operations of the business and therefore the utilization of the firms' assets. Thus, ROA allows users to assess how well a firms' corporate governance system is in securing and motivating efficient management of the firm (Epps& Cereola (2007)) [173].

As stated above, the following models are for part two analysis.

$$Q_{it} = \alpha_i + \beta_9\,SCORE_{it} + \beta_5 FSIZE_{it} + \beta_6\left(\frac{K}{S}\right)_{it} + \beta_7\left(\frac{Y}{S}\right)_{it} + \beta_8\,DDUM_{it}$$

$$+\beta_1 INST_{it} + \beta_2 INDE_{it} + \beta_3 EDUM_{it} + \mu_{it} \qquad (4)$$

Since the percentage of the block stockholders affects corporate governance score and finally performance, we imported the block stockholders as control variable in the final model.

$$Q_{it} = \alpha_i + \beta_9\,SCORE_{it} + \beta_5 FSIZE_{it} + \beta_6\left(\frac{K}{S}\right)_{it} + \beta_7\left(\frac{Y}{S}\right)_{it} + \beta_8\,DDUM_{it}$$

$$+\beta_1 INST_{it} + \beta_2 INDE_{it} + \beta_3 EDUM_{it} + \beta_4 BLOCK_{it} + \mu_{it} \qquad (5)$$

Where:

Q: [(No. of common shares ×Price of shares at calendar year end) + Book value of Preferred Capital + Book value of total liabilities]/ Book value of total assets. Other variables are the same as previously defined.

$$Q_t = \left(\frac{PS + CS + DEBT}{TA}\right)$$

Whether or not on the relevant literatures and theories of corporate governance and corporate value, the paper proposes a theoretical framework shown in figure 1. Under the conceptual framework this study will verify the following hypotheses:
Main Hypothesis:
Better corporate governance practices will be positively related to firm valuation in Iran.

---

[173] Information regarding each one of these variables was obtained from the TSE Website & www.rids.com and corresponds to year-end values.

ECONOMETRIC ANALYSIS

In order to perform the statistical tests and the multivariate regressions, a preliminary analysis of the information available was carried out following a procedure similar to that used by Garay & González (2008); companies without any market transaction during the year were deleted from the sample. In Table 1 we report the descriptive statistics for the variables used in the analysis that follows. In our sample has a price-to-book multiple equal to 2.61 and a Tobin's q equal to 2.77. Also average ROA as a performance measurement was 0.91 show that, is in proportion to low score. In terms of our CGS, the reduced sample of 125 firms shows an average value equal to 12.77 over a maximum of 21 points (one point for each question answered as "yes"), or 59 percent in percentage terms. Low level for companies listed on the Tehran stock exchange, this is consistent with the fact that owner structure is governmental also information disclosure and other legal requirements are weak.

Insert Table 1

In Table 2 we report a pair-wise correlation matrix for the variables used in this study. It shows that the CGS is positively correlated to the three alternative dependent variables previously defined (MB, ROA and TQ). With respect to the firm's size (FSIZE), unlike the findings obtained by Garay & González (2008), we obtain a negative and significant coefficient for our sample. In other words, larger firms tend to exhibit better corporate governance practices. But, owner structure in big company is governmental in Iran, as weak corporate governance practice is normal.

Insert Table 2

Result of first part's models

As shown in Table 3, To test first hypothesis, we estimate regression (1) setting Score$_{it}$ equals to corporate governance score in period t. the results of regression indicate that There is a significant positive relationship between the percentage of institutional stockholders and the corporate governance score. The coefficient on INST is positive (0.03) and significant at the 1% level (t = 2.77). Recursive partitioning analysis yields somewhat stronger explanatory power (R^2 = 38 percent). Durbin-Watson test also shows lack of autocorrelation (the 5th row of result in Table3).then we inter INDE as a control variable because, outsider managers can affect corporate governance mechanism, but we have not found significant relationship between it with SCORE (see Table 3). Therefore the percentage of institutional stockholders as a factor with positive effect, affects on corporate governance score. Also there is a significant negative relationship between the percentage of block holders (BLOCK) and the corporate governance score. The coefficient on BLOCK is negative (-0.03) and significant at the 1% level (t = -3.56). In other words, block holders have not given view for firm directing.

Next, we replace ownership with firm characteristics as explanatory variables. Hence we estimate regression (2) setting Score$_{it}$ equals to corporate governance score in period t. the results of regression indicate that There is a significant negative relationship between the firm's size and the corporate

governance score. The coefficient on FSIZE is negative (0.62) and significant at the 1% level (t = -3.63). Recursive partitioning analysis yields somewhat stronger explanatory power (R^2 = 38 percent).Durbin-Watson test also show lack of autocorrelation (see the last row of result in Table3).

Finally, our model specifications in the four columns of Table 3 include ownership in combination with firm characteristics (the combined model). As shown in Table 3, the results reemphasize the negative relationship between the firm size and the corporate governance score. The control variables, the percentage of institutional stockholders have a positive significant relationship with corporate governance score. However, the control variables, the ratio of operational profit or loss to sale, the percentage of outsider managers and the dummy variable DDUM did not have a significant relationship with corporate governance. Durbin-Watson test also approves the significance of this model. Hence, corporate governance practice has relationship with **ownership and company-specific characteristics** in companies listed on the Tehran stock exchange.

Insert Table 3

Result of second part's models (Firm performance)

Tables 4 present regression results of firm operating & economic performance as a function of corporate governance variables. In Table 4, we treat reported performance, Tobin's q, MB, ROA, as the dependent variables. We also include firm size (log of sale) as a control variable for operating performance in these regressions.

Tobin's q

The results of regression (4) indicate that there is a significant positive relationship between the corporate governance score and performance. The coefficient on SCORE is positive (1.12) and significant at the 1% level (t = 3.48). Recursive partitioning analysis yields somewhat stronger explanatory power (R^2 = 45 percent). Durbin-Watson test also shows lack of autocorrelation (the last row of result in Table4). Model 5 includes all the control variables considered together (t = 3.40, p < .01).

MB

The results of regression (4) indicate that there is a significant positive relationship between the corporate governance score and performance. The coefficient on SCORE is positive (1.12) and significant at the 1% level (t = 6.16). Recursive partitioning analysis yields somewhat stronger explanatory power (R^2 = 52 percent). Durbin-Watson test also shows lack of autocorrelation (the last row of result in Table4). Model 5 includes all the control variables considered together (t = 6.10, p < .01).

ROA

The results of regression (4) indicate that there is a significant positive relationship between the corporate governance score and performance. The coefficient on SCORE is positive (0.02) and significant at the 5% level (t = 1.87). Recursive partitioning analysis yields somewhat stronger explanatory power (R^2 = 66 percent). Durbin-Watson test also shows lack of autocorrelation (the last row of result in Table4). Model 5 includes all the control variables considered together (t = 2.00, p < .05).

Insert Table 4

Overall, we find a positive and significant relation between firm valuation (MB, Tobin's q and ROA) and our CGS. Firms with a better CGI are more valuable for investors in terms of their MB multiple and their Tobin's q. Results also suggest that in a weak investor protection environment such as Iran, firms are able to send strong signals to the market by voluntarily improving their corporate governance practices, something that allows them to differentiate from the rest.

Discussion and Conclusion

The results of hypothesis testing, using the information from 125 accepted firms in the firms listed on the Tehran stock exchange, during 2004-2006 shows that there is a relationship between a firm performance and the corporate governance score (See Figure 1).

The result of first group hypothesis testing showed that there is a significant positive relationship between the institutional stockholders (like banks, insurance companies, and Islamic Revolution Institutional etc.) and the corporate governance score. But the variables of institutional stockholders are able to explain a good percentage of the change in corporate governance score, and it is due to this high effect that institutional stockholders can exert in implementing their desired managerial policies. The findings of the current research were complied with Lee & Teans findings (Lee & Tean, 2007) who found out that there is a positive relationship between the institutional stockholders and the corporate governance score. And in contrast to Cornett et al's findings (cornet et.al, 2008) we believe that institutional stockholders require more information disclosure and more transparency. Also our findings shoe that, there is a significant negative relationship between the block holders and the corporate governance score. Perhaps, one of the reasons of this significant negative relationship is the governmental nature of block holders and minority of other stockholder in ownership structure; it's led to less accountability which is a bench market for the governmental managers.

Our Finding affirms the presence of a negative relationship between the firm size and the corporate governance score, too. In other words, larger firms tend to exhibit better corporate governance practices. But, owner structure in big company is governmental in Iran, as weak corporate governance practice is normal. Although the findings are in contrast to Clopper & Low (2004) and Aggraval et al. (2006). However, Lee (2007) concluded that there is a nonlinear relationship between the firm size and the corporate governance score. Other findings show the presence of a positive relationship between corporate governance score and the firm's performance. By entrance of the variables related to the characteristics of the owners, the model's predicting power decreased, due to the fact that the institutional stockholders and block stockholders intervention prevent the firm's favorable performance. The findings were complied with Mc Cannel & Servas (1990), Lee & Tean (2007), Black (2001), and Brown & killer (2004). Also the findings are in contrast to Theodoral (1998) and Epps & Creola (2007).

Generally, the results of this study are in compliance with Mashayekhi & Mashayekh(2008) findings, who state that, " role of non-executive managers is very weak in Iran and there is seemingly no concern about supervising organizational morality " (Mashayekhi & Mashayekh, 2008). The institutional

stockholders have not been able to use their power utility and facilities to improve the governance indexes. Nevertheless, the exchange market's requirements to establish the regulations which firms have to perform corporate governance mechanism cause to decrease the monitoring problem of company. Because of the inaccessibility of the firm's reports after announcing the corporate governance regulations in 2007, it was not possible to investigate the effects of its execution. Although, the findings showed that we can rely on the corporate governance score and declare it as one of the important factors of the stock exchange in the future of Iran's exchange market. As the findings showed, the information about corporate governance score can be, considered the *" relevant information"*, thus it suggests Iranian markets & other emerging markets that: Some pieces of information relating to the corporate governance score are provided by SEO or any other related accounting organization which is offered through management notes and reports to the market & investors. Also, we think these findings are able to help the investors for determination of their portfolio regarding corporate governance score and the selection of a strategy based on corporate governance score in choosing portfolio. Finally, keep in mind that, the 125-sample firms of the present study were chosen according to the access to data. Hence scientific caution must be exercised in generalizing its findings to other firms. One of the main obstacles in this study was the lack of organizations which would provide corporate governance rating of Iranian company. We hope that with the economic growth and the development of stock exchange in Iran, we will have such organization for the future researches, though in a limited scale. In this orientation we sure expect the contribution of international organizations such as IOSCO and OECD which are highly essential. Also there was no access to the information about R&D in Iranian firms, and, since this variable affects the SCORE, we were not able to determine its effect on the models. Therefore, its intervention may have had some impact on the results.

INVESTIGATING THE JOINT EFFECTS OF STRATEGY, ENVIRONMENT AND CONTROL STRUCTURE

Lindawati Gani,Universitas Indonesia
Johnny Jermias, Simon Fraser University

Abstract

The purpose of this study is to investigate the effects of misfit between competitive environment, business strategy and control structure on performance. We argue that the misfit between competitive environment, business strategy and control structure has significant negative implications on shareholder value creation associated with firms' Joint Venture formation. Based on data of publicly-traded US manufacturing firms that announce a joint venture formation, we found that firms that have perfect fit are valued higher than those with both strategy and structural misfits and also those with structural misfit. Contradictory result was found when comparing firms with perfect fit with those that have strategy misfit. Further analyses indicate that all those strategy misfit firms operate in high entry barriers, where firms can compete effectively using either innovation or cost efficiency strategy due to the fact that they possess resources that are difficult to be imitated by their competitors.

Keywords: Business strategy; Environment; Control; Contingency theory.

The formation of domestic as well as international joint ventures (IJVs) is typically based on the premise that the new ventures will create shareholder value for participating firms. Yet, empirical studies investigating the capital market implications of joint venture formation have reported mixed and often contradictory results. Indeed, recent surveys have documented just how pervasive and severe these inconsistencies are (Robson, Leonidou & Katsikeas, 2002). Not only have studies failed to establish whether joint venture formation creates shareholder value for parents, there is little consistency across studies regarding the impact of individual variables on such value creation (Merchant, 2000).

One reason for the mixed results seems to be the approach adopted in previous research which, usually, has investigated the singular effect of strategic and macro-economic variables on parents' shareholder value. Indeed, prior joint venture studies have seldom explicitly recognized the contingent nature of relationships among parents' competitive environment, JV strategy, JV control structure, and shareholder value (e.g., Merchant, 2000; Sim & Ali, 1998). This neglect is surprising because scholars in strategic management (e.g., Miller, 1987) as well as other fields such as accounting (e.g., Bruns and Waterhouse, 1975) have argued for the need to consider these elements simultaneously. Moreover, researchers have frequently reported that fit among firms' environment, strategy and structure has a positive effect on firm performance (e.g., Chenhall & Langfield-Smith, 1988; Gupta & Govindrajan, 1984; Jermias & Gani, 2004; Miller, 1987; Miller & Freisen, 1982; Robinson and McDougall, 2001; Rumelt, 1974). In fact, a recent study suggested that fit among internal and external variables affected shareholder value creation via JVs (Merchant, 2004).

This study advances the JV literature by engaging a contingency perspective to better understand the shareholder valuation effects associated with firms' JV formation. Drawing upon insights offered in the strategy and accounting literatures, this study argues that creation of shareholder value associated with JV formation depends on the (initial) fit among environment, strategy, and control structure. Moreover, the study deconstructs the notion of organizational fit (misfit) in terms of: i) strategy fit (misfit) and ii) control structure fit (misfit). It investigates the individual as well as joint effects of strategy-structure fit (misfit) on parents' shareholder value. Specifically, the study predicts that capital markets will evaluate strategy and/or structure misfits less favorably relative to the case where both these elements agree with the demands of JVs' competitive environment.

Examining the performance impact of strategy-structure misfits in the context of international JVs is important because as many as 80% of these ventures fail to achieve their intended objectives (Kanter, 1989) and sparse explanations of such failures in the literature (Robson, et al., 2002). Indeed, as Burton, Lauridsen & Obel

(2002) argue, it is empirically and managerially important to investigate the impact of organizational misfits because managers react to them due to their performance implications. Thus, this study asks the following research question: Given parents' competitive environment, how do capital markets evaluate JV strategy and/or JV control structure misfits vis-à-vis "perfect fit" when international JVs are first publicly announced?

The remainder of the paper is organized as follows. Section 2 briefly summarizes the JV literature pertaining to influences on shareholder value creation via JVs. Section 3 generates the study's hypotheses whereas section 4 describes its methodology. Section 5 reports the study's findings. The final section discusses these findings and highlights key implications for future research.

LITERATURE REVIEW

Given the popularity of JVs, numerous studies have investigated the relationship between JV formation and shareholder value creation (e.g., Gulati, 1998). Although these studies have identified a wide array of influences on parents' capital market performance, most of these influences can be conveniently grouped into three categories of variables: i) environmental variables, ii) strategic variables, and iii) structural variables. In the first group belong macro variables such as cultural distance between parents' home countries, level of political risk in the JV host country, and industry conditions in parents' core business (e.g., Lummer & McConnell, 1990; Madhavan & Prescott, 1995; Park & Ungson, 1997). In the second group belong indicators of parents' JV strategies; they include variables such as parent-venture business relatedness, type(s) of functional activity to be undertaken via JVs, and parents' JV motivations (e.g., Bleeke & Ernst, 1991; Das, Sen & Sengupta, 1998; Koh & Venkatraman, 1991). Finally, the third group consists of structural variables such as

equity distribution between partners and JV decision-making structure (e.g., Harrigan, 1988; Lummer & McConnell, 1990; Saxton, 1997).

HYPOTHESIS DEVELOPMENT

As noted earlier, previous research into the relationship between above-mentioned variables and parents' shareholder value has often reported contradictory results. Recent JV studies have suggested the lack of contingency perspective as a potential reason for these conflicting findings (Merchant, 2000; Sim & Ali, 1998). More positively, it would be useful to move towards a study of interactions among theoretically inter-connected variables (e.g., Ginsberg and Venkatraman, 1985).

Harvey (1982) argues a contingency approach to strategy research is based on the premise that an optimal strategy exists for a given set of environmental and firm-specific conditions. Likewise, Sandberg (1986) suggests that to create economic wealth for themselves, firms must align their strategies and structural variables to achieve a fit with their competitive environment. Thus, a model for testing contingent relationships among environment, strategy and structure assumes that a fit across these variables will generate better performance than will a misfit (Doty, Glick & Huber, 1993). Conversely, misfit across these variables will lower firm performance relative to the scenario where these elements are aligned.

[Insert Figure 1 here]

Figure 1 shows the contingent relationship between environment, strategy and control structure. Cells 4 and 5 indicate the perfect fit among these three variables. Firms in Cell 4 are those operate in an environment characterized by low entry barriers, choose a strategy of efficiency, and adopt a dominant control structure. Firms in Cell 5 are those operate in an environment characterized by high entry barriers, choose a strategy of innovation, and adopt a shared control structure. Cells 2 and 7 indicate the strategy misfit. Firms in cell 2 are those operate in an environment characterized by low

entry barriers, choose a strategy of innovation, and adopt a dominant control structure. Firms in cell 7 are those operate in an environment characterized by high entry barriers, choose a strategy of cost efficiency, and adopt a shared control structure. Cells 3 and 6 indicate the structural misfit. Firms in Cell 3 are those operate in an environment characterized by low entry barriers, choose a strategy of efficiency, and adopt a shared control structure. Firms in Cell 6 are those operate in an environment characterized by high entry barriers, choose a strategy of innovation, and adopt a dominant control structure. Cells 1 and 8 indicate both strategy and structural misfits. Firms in cell 1 are those operate in an environment characterized by low entry barriers, choose a strategy of innovation, and adopt a shared control structure. Firms in cell 8 are those operate in an environment characterized by low entry barriers, choose a strategy of cost efficiency, and adopt a dominant control structure.

We predict that strategy *and* structural misfits, structural misfit alone, and strategy misfit alone, are associated with shareholder value destruction. Foster (1986) proposes that contextual variables such as competitive environment and strategic orientation of the firms should be taken into consideration when investigating the relationship between types of control and firm performance. Other researchers (e.g., Manu, 1992; Douglas and Rhee, 1989) speculate that an important issue in examining the relationship between structural/strategic variables and performance is the extent to which differences in environmental conditions influence the strategic orientation and types of control structure for optimum performance.

We adopt the environment-strategy-structure paradigm proposed by Lenz, (1981) to investigate the joint effects of environment, strategy, and control structure on shareholder value at the announcement of IJV formation. This approach suggests that business environment serves as important factors in the strategy formulation (Hambrick, 1982; Bourgeois, 1985; Anderson and Paine, 1975) and control structures are adopted

to suit the firm's chosen strategy (Rumelt, 1974; Channon, 1973; Chandler, 1962). A fit among environment, strategy and control structure will positively affect performance. This approach is based on the premise that there is no one best way to organize, and that any one way of organizing is not equally effective under all conditions (Galbraith, 1973). Rather, this approach suggests that a firm should select a strategy that matches the environment in which the firm operates and the chosen strategy should be aligned with a proper control structure to positively affect performance.

Strategy Misfit (cell 2 and 7)

The strategy misfit deals with environment and strategy relationship. The premise is that competitive environment (i.e., entry barriers) influences a firm's strategic choice. When a firm enters into joint ventures with few resources whose deployment outcomes competitors cannot duplicate (i.e., low entry barriers), current or potential competing firms can implement the same strategy but using different resources to erode the firm's sustainable competitive advantage (Dierickx and Cool, 1989; Reed and DeFillippi, 1990). Such erosion fundamentally stems from reduction in the level of causal ambiguity (Lippman and Rumelt, 1982) surrounding the socially complex architecture of resources deployed (Dierickx and Cool, 1989) by the firm. Reed and DeFillipi, (1990) argue that the reduction of ambiguity allows the competitors to observe and understand the source of competitive advantage and permit them to target their actions with the result that the erosion in the firm's sustainable competitive environment will occur at a greater rate. In such an environment, firms should plan their activity reasonably well, meet the competition, and realize efficiency (Burton, et al., 2002). High performing firms in an environment characterized by low entry barriers are those who adopt a strategy of cost efficiency by focusing on aggressive construction of efficient scale facilities, vigorous pursuit of cost reduction from experience, tight cost and overhead control, avoidance of marginal customer accounts, and cost minimization

in areas like research and development, service, sales force, and advertising (Porter, 1985). A cost efficiency firm tries to keep its product offerings stable over time and focus on narrow product lines in order to minimize inventory carrying costs as well as to benefit from scale economies (Gupta, 1987). Although these practices reduce the firms' ability to innovate and to respond to changes in competitive environment, they increase efficiency. Therefore, a cost efficiency strategy is a fit with low entry barrier environment but a misfit with high entry barrier environment.

In contrast, a firm who enters into joint ventures under high entry barriers signals a more profitable resource deployment as compared to those of incumbent and potential competitors (Bleeke and Erns, 1991; Heil and Robertson, 1991; Rotem and Amit, 1996). The lack of that firm's sensitivity to its rivals' actions indicates that such firm has resources whose competitive advantage can only be minimally eroded by competitors (Richardson, 1959), at least in the short-term. This would be the case when the firm possesses resources that are valuable, rare, non-imitable, non-substitutable, and non-tradable (Barney, 1991; Dierickx and Cool, 1989). In such an environment, firms tend to have enough resources to invest in research and development activities to increase their competitive advantage in terms of unique resources/products. High performing firms in high entry barrier environment tend to select one or more attributes that many customers in an industry perceive as important and uniquely positions themselves to meet those needs (Porter, 1985). To support their strategy of producing innovative and unique products, it is essential that firms invest in research and development activities to produce new and innovative products that are superior to others in the market (Mia and Clarke, 1999). Firms will then be rewarded by their ability to command premium prices and generate long term profitability (Calantone et al., 1995). In addition, innovative products can also create barriers to entry of rivals, attract new customers, and change the rules of competition in the industry (Golder and

Tellis, 1993). Innovative firms tend to be characterized by higher costs from innovation and are not focused on efficiency. Their ability to project into the environment with new ideas and products will sustain their competitive advantage in terms of difficult-to-imitate resources and outcomes. Therefore, a strategy of innovation is a fit with an environment characterized by high entry barriers but a misfit with an environment characterized by low entry barriers.

The relationship between environment and strategy has been well studied (Miles and Snow, 1978; Porter, 1985; Miller, 1987; Venkatraman and Prescott, 1990) and empirical findings tend to support the environment-strategy linkage (Zahra, 1996; Adler, 1989; Miller, 1987; Bourgeois, 1985). Based on a survey of established manufacturing companies in southeastern states, Zahra (1996), for example, found that firms operate in high entry barriers tend to choose a strategy of pioneering, and radical product technologies while firms operate in a low entry barrier tend to choose a strategy of followership and incremental product and process technologies. Miller, (1987) use both published American database (called static variable) and questionnaire sent to Canadian and Australian companies (called change variable) to investigate the impact of competitive environment on the strategy formulation. He reports that the level of environmental pressure (i.e., entry barriers) was positively associated with the strategy of innovation but was negatively associated with conservative cost control strategy. Bourgeois (1985) uses a combination of interview, questionnaires and secondary data, to investigate the impact of fit between environment and strategy on firm performance. He found that congruence between environmental uncertainty and firm strategy is positively related to economic performance. That is, when the barriers to entry are low, high performing firms are those that pursue a strategy of cost efficiency whereas in an environment characterized by high entry barriers, high performing firms are associated with a strategy of innovation. Using Miles and Snow's

strategic typology, Hambrick (1982) found that strategic differences between prospectors (firms that focus on innovation) and defenders (firms that focus on efficiency) occur primarily through internal analysis of the environment and political process and not through unequal possession of information. He concluded that the result supports the view that a firm's strategic choice depend on the environment in which the firm operates.

Structural Misfit (cell 3 and 6)

The structural misfit deals with the relationship between control structure and strategy. The premise is that control structure should be designed in such a way to suit the chosen strategy. With its primary emphasis on cost reduction, a cost efficiency firm prefers to keep its product offerings stable overtime and have narrow product lines in order to minimize inventory carrying costs as well as to benefit from scale economies (Hambrick, 1983). In addition, cost efficiency firms tend to employ routine tasks and produce standard, undifferentiated products. As such, the knowledge of means and ends is relatively high and task programmability is also high. Miles and Snow (1978) characterized the control structure of cost efficiency firms as very detailed, emphasizing on problem solving, and highly centralized. These authors also propose that control may also be achieved through creating highly specialized work roles, formalized job descriptions, and standard operating procedures. Similarly, Porter (1985) suggests that highly structured organizations are suitable for a cost efficiency focus. Govindarajan and Fisher (1990) propose that firms emphasizing on efficiency should use tight control systems to limit managers' discretionary spending and to focus management efforts on performing their tasks efficiently. Therefore, control structures that are highly centralized and formal (dominant control structure) is suitable for firms pursuing a strategy of cost efficiency because the information required to make

decisions is programmable and can be formalized neglecting the possibility of overburdening the hierarchy.

Firms that pursue a strategy of innovation, by contrast, tend to pursue novel opportunities in the marketplace and require new fabrication and marketing techniques which require high involvements of managers within the firm (Miller, 1987). Prior research has found that strategy of innovation is associated with high level of uncertainty (e.g., Govindarajan, 1986; Lawrence and Lorsch, 1967; Burns and Stalker, 1961). Govindarajan (1986), for example, argues that innovative firms would face higher uncertainty due to the following reasons: First, with strong emphasis on new product developments, innovative firms will face high uncertainty since they are betting on products that have not yet crystallized. Second, firms employing a strategy of innovation tend to have a broad set of product in order to create uniqueness. Previous researchers (e.g., Gupta, 1987; Chandler, 1962) have argued that product breadth is associated with high environmental complexity and consequently with uncertainty. Finally, creating and sustaining innovation requires incurring discretionary expenditures in several areas such as improvement of quality and speed of delivery, advertising to build product image, and research and development. Accordingly, implementing an innovation strategy is likely to require decisions making by intuitive judgment. Because creativity and innovativeness are crucial to differentiate themselves in the market, firms that adopt a strategy of innovation will benefit more from a control structure that promote high involvement and freedom of their managers (i.e., shared control structure) than those that adopt a low cost strategy. In addition, as uncertainty increases, information processed tend to be unstructured and more complex. As a results, more exceptions arise that must be referred upward in the hierarchy which might be overloaded and serious delays develop between the upward transmission of information about new situations and a response to that information downward

(Tushman and Nadler, 1978). An effective way to deal with such a situation is to move the level of decision making to where information exists rather than to bring it upward in the hierarchy, suggesting decentralization in decision making is a proper response to increased uncertainty and to prevent from overburdening the top management with unnecessary information (Govindarajan, 1986; Tushman and Nadler, 1978).

Empirical research has generally supported the strategy-control structure linkage (Simons, 1990; Govindarajan, 1988; Miller, 1987; Hambrick, 1981). Miller (1987), for example, reports that centralized, formal control structure is positively related to cost efficiency strategy but negatively related to strategy of innovation. In an in-depth study of two firms using two different strategy (innovation and cost efficiency), Simons (1990), reports that the innovative firm uses more decentralized control system while the cost efficiency firm uses more centralized control structure. Based on data from strategic business unit general managers and their superiors from 24 firms on the Fortune 500 list, Govindarajan (1988) finds that innovative firms use more decentralized control structure while cost efficiency firms use more centralized control structure. This author also reports that strategic business units employing a strategy of innovation rely more on loose control mechanisms and strategic business units employing a strategy of cost efficiency rely more on tight control system.

The preceding discussions suggest that a dominant control structure is a fit for firms pursuing a strategy of cost efficiency but a misfit for firms pursuing a strategy of innovation. In contrast, a shared control structure is a fit for firms pursuing a strategy of innovation but a misfit for firms pursuing a strategy of cost efficiency.

We predict that the degree of fit among environment, strategy and control structure will be associated with shareholder value creation while a strategy and/or structural misfit will be associated with shareholder value destruction. Specifically, the following hypotheses will be tested:

H1: At the announcement of IJV formation, investors will value Strategy and structural misfits (cell 1 and 8) lower than the perfect fit (cell 4 and 5)

H2: At the announcement of IJV formation, investors will value structural misfit (cell 3 and 6) lower than the perfect fit (cell 4 and 5).

H3: At the announcement of IJV formation, investor will value strategy misfit (cell 2 and 7) lower than the perfect fit (cell 4 and 5)

Research Methodology

Sample selection

The sample is restricted to publicly-traded U.S. manufacturing firms that announce a joint venture formation for the period of 1986-1993. The manufacturing industry was selected as the research sample because firms in this industry tend to employ different types of strategy to compete effectively. In addition, firms in this industry have been facing fierce competition both domestically and internationally to capture local and world's market share (Meric et al., 2002) and therefore are expected to respond to their competitive environment by adopting a strategy and control structure that fit the environment. The use of a single industry sample also minimizes the problem of sample heterogeneity (Moores and Yuen, 2001).

Data were collected from an online data source, the *Dow Jones News Retrieval Service*. We search for announcements of joint venture formation between publicly-traded U.S. manufacturing firms and non-U.S. partners for the period of 1986-1993. To minimize the confounding effects of various economically relevant events (e.g., restructuring) on market performance measures, we follow McWilliams and Siegel's (1997) suggestion to eliminate firms who announced events other than joint venture formation during the two-day "announcement window" of interest consisting of the day

a firm's joint venture participation was first publicly announced and the following day. The numbers of IJV formation announcements that meet this data requirement are 417.

To form the database for this study, additional data were collected from a variety of sources. CRSP tapes provide information about the dependent variable (abnormal returns). The *Value Line Investment Surveys* provide information about the environment (i.e., entry barriers). The *Dow Jones News Retrieval Service* also provides data about types of strategy, and types of control structure. These additional data requirements reduce our sample firms to 74.

[Insert Table 1 here]

Variable Measurement

Abnormal return

Abnormal returns are measured as the difference between stock market return associated with the announcement of the firm's participation in a JV (i.e., actual return), and the firm's historical return (i.e., normal return). Following a standard market model, the abnormal return on day t for each firm i is calculated as $AR_{it} = R_{it} - (a_i + b_i * R_{mt})$, where R_{it} = actual rate of return for firm i on day t; a_i = the estimated intercept for firm i; b_i = the slope of parameters for firm i; and R_{mt} = rate of return on the value-weighted market portfolio on day t. The model was estimated over a 200-day period beginning 51 days before the announcement of JV formation. The abnormal returns are cumulated over the two-day announcement window. This aggregation is a common practice in event studies, and is done to account for capital markets reaction to announcements that may have been made after trading hours (McWilliams & Siegel, 1997)..

Environment

Environment is measured based on content analyses (Webber, 1990) of the descriptive information about firm-level entry barriers own by American parents in their core business provided in *Value Line Investment Surveys*. This information was analyzed for indicators of firm-level entry barriers. In most cases, the tone and content of analyst report tend to be stable, so it is relatively easy to assess the magnitude of firm-level entry barriers. In cases where the tone and content of an analyst's report were of a mixed nature, the observation was dropped from analysis. We measure entry barriers on a five-point ordinal scale (1=low entry barriers to 5=high entry barriers). In general, this protocol fully agrees with suggestions for operationalizing resource-based concepts related to subjective measurement of entry barriers (e.g., see Godfrey and Hill, 1995; Robins and Wiersema, 1995; Rouse and Daellenbach, 1999). Following are two examples of information used to classify the environment as high entry barriers and low entry barriers found in the *Value Line Investment Surveys*.

> **AN EXAMPLE OF HIGH ENTRY BARRIERS. An example of 'unique resources'.** "Unit shipments in the forms industry have declined…and profit margins have been squeezed significantly as a result of structural changes…[Standard Register's] forms business has been helped during this period by *proprietary* electronic systems…These forms processing systems, as well as the equipment division's *expertise* …should continue to enable [Standard Register's] forms segment to outpace the industry incoming years" (emphasis added).

> **AN EXAMPLE OF LOW ENTRY BARRIERS. An example of 'substitutability of resource deployment outcomes'.** AT&T has launched a new residential calling plan...We [at *Value Line*] see this new program as a defensive maneuver. It appears aimed <u>at stemming the loss of residential customers to rivals</u> MCI Communications' *Friends and Family* and Sprint's *The Most* plans" (underline added).

Strategy

This study uses Porter's (1980) strategy framework, since that conceptualization is considered by many as academically well accepted and internally

consistent (Dess and Davis, 1984; Hambrick, 1983). Porter (1980) argues that to achieve a sustainable competitive advantage, a firm must choose either to compete on the basis of efficiency (low cost) or innovation (product differentiation). A firm's strategic orientation is determined based on information provided by the parent company regarding its motivation to form the IJVs. We only include firms that clearly indicate whether the IJV establishment is a vehicle to increase efficiency or to promote the firm's ability to innovate. Following are two examples of motivation underlying the IJV formation found in the *Value Line Investment Surveys*.

> **An example of 'efficiency-seeking' STRATEGY.** "The joint venture will…encompass manufacturing plants, parts distribution depots, engineering, training, and test centers and administrative offices in the U.S., Canada, and Brazil" (Source: JV formation announcement). <u>Value Line</u> elaborates: "The year…saw [the firm] take *significant* steps…including joint venture agreements *in order to gain economies of scale*" (emphasis added).

> **An example of 'INNOVATION' STRATEGY. An example of 'resource efficiency'.** "The pricing of mature drug products has been under pressure, due to [America's] efforts to control healthcare costs. Generic competition is also likely to remain keen.   Nonetheless, market penetration by newly launched products and further product introductions...*should bring about higher profits* [for American Cyanamid]...Cyanamid's overall product development efforts *should pay off over time*...[The company's] agricultural group *should also perform well*, having *already gained a strong presence in many global markets*" (emphasis added).

.

Control Structure

Control structure is determined based on information about the types of control the parent company wants to use to manage the newly created joint venture, available in the *Dow Jones News Retrieval Service*. This study classifies the control structure used by the parent firm to manage the IJVs into two categories: shared control structure and dominant control structure. We exclude firms that do not state clearly their intention to use a particular control structure. Following are two examples of the types of control structure use by the parent company to manage the IJV.

Example 1 of 'unilateral' decision-making. "Coca-Cola Amatil Ltd. of Australia and Budapesti Kiloripari Vallalat said they entered an agreement to form a joint venture company…Coca-Cola Amatil [a subsidiary] of Coca-Cola Co. *will have management control*." (Source: JV formation announcement; emphasis added).

Example 2 of 'unilateral' decision-making. "Union [a joint venture partner] will be the developer and operator of the new Dow-Sarnia storage pool, and will also *administer* the joint agreement." (Source: JV formation announcement; emphasis added).

Example 3 of 'unilateral' decision-making. "Gillette Co. said it signed a joint venture with a Soviet concern to make…razor blades, shaving systems and disposable razors…Gillette would have *management control* and a 65% equity stake in the company." (Source: JV formation announcement; emphasis added).

Example of 'shared' decision-making. "Gexa Corp. said it has reached a final joint venture agreement with Echo Bay…The venture will be *directed* by a management committee comprised of members from *both* companies." (Source: JV formation announcement; emphasis added).

Statistical Analyses and Results

Of the 74 firms, 24 firms shows perfect fit, 4 firms have both strategy and structural misfits, 19 firms have structural misfit, and 27 firms have strategy misfit. Table 2 presents the descriptive statistics and the results of the General Linear Model procedures of analyzing the effects of misfits on shareholder value. Consistent with our predictions, the mean abnormal returns for IJVs with both misfits (-0.0039) and IJVs with structural misfit (-0.0082) are lower than those of IJVs that have perfect fit (0.0032). Contrary to our prediction, however, the mean abnormal returns of IJVs with strategy misfit (0.0035) are slightly higher than that of IJVs that have perfect fit (0.0032).

[Insert Table 2 here]

The overall F-statistics for the General Linear Model procedure is significant (F = 4.26; p = 0.0020) indicating that the fit and misfits conditions significantly affect the

variation in the abnormal returns. Hypothesis H1 predicts that investors will value IJVs that have both strategy and structural misfits lower than IJVs that have perfect fit. The results reveal that the abnormal returns of IJVs that have both strategy and structural misfits are significantly lower than those of IJVs that have perfect fit (F = 2.25; p = 0.0693)[174]. These results confirm hypothesis H1. Hypothesis H2 expects that investors will value IJVs that have structural misfit lower than IJVs that have perfect fit. The results show that the abnormal returns of IJVs that have structural misfit are significantly lower than those of IJVs that have perfect fit (F = 15.22; p = 0.0001). These results are consistent with hypothesis H2. Hypothesis H3 predicts that investors will value IJVs that have strategy misfit lower than IJVs that have perfect fit. The results show that the abnormal returns of IJVs that have strategy misfit is significantly higher than those of IJVs that have perfect fit (F = 7.77; p = 0.0035). These results contradict hypothesis H3.

[Insert Table 3 here]

We conducted further analyses to investigate the contradictory results regarding hypothesis H3. We partition our sample based on the two levels of entry barriers (low and high). Table 3 shows the descriptive statistics of the sample firms partitioned by the level of entry barriers.

[Insert Table 3 here]

[Insert Figure 2 here]

Table 3 reveals that all the IJVs that have strategy misfit operate in the high entry barriers environment. It might be that when firms possess resources that are hard to be imitated by their competitors, firms can compete effectively using either innovative or cost efficiency strategy and, therefore investors do not penalize firms that

---

[174] All reported p-values are one-tailed because we are testing directional hypotheses.

have strategy misfits when entry barriers are high and pay more attention to information about fit (misfit) when the entry barriers are low.

To investigate whether investors value fit (misfit) differently across different levels of entry barriers, we compare the abnormal returns of IJVs that have perfect fit and both strategy and structural misfits in low entry barriers with those in high entry barriers. Figure 2 illustrates the abnormal returns of the sample firms under conditions of fit (misfit) partitioned by the level of entry barriers. As shown in Figure 2, IJVs that have strategy *and* structural misfits in low entry barriers are valued lower than IJVs that have strategy *and* structural misfits in high entry barriers (mean abnormal returns of -0.014 and 0.027 respectively). In addition, IJVs that have perfect fit in low entry barriers are valued higher than IJVs that have perfect fit in high entry barriers (mean abnormal returns of 0.0599 and -0.002 respectively)[175]. The results of these additional procedures indicate that investors pay more attention and impound the information about fit/misfits into the stock price more when the entry barriers are low as compared to when the entry barriers are high. This is not surprising because when the entry barriers are low, firms performance are very sensitive to competitive pressure. By contrast, when the entry barriers are high, firms performance tend to be stable due to less competitive pressure.

Discussion and Direction for Future Research

This study investigates the effects of fit (misfits) among environment, strategy, and control structure on share holder wealth on the announcement of IJVs formation. Consistent with our predictions, this study found that IJVs that have perfect fit are valued higher than those with both strategy and structural misfits and also those with structural misfit. One contradictory result was found when comparing IJVs that have

---

[175] We cannot make other comparisons due to limited number of observations (some cells do not have any observations).

perfect fit with those that have strategy misfit. While we expect that IJVs that have perfect fit will be valued higher than those with strategy misfit, the result shows the opposite. Further analyses indicate that all cases that show strategy misfit are firms operate in high entry barriers. One potential explanation for this contradictory result is that under high entry barriers, firms can compete effectively using either innovation or cost efficiency strategy due to the fact that the firms possess resources that are difficult to be imitated by their competitors. Further investigations also confirm our argument that investors tend to pay more attention to information about fit (misfit) when the entry barriers are low as compared to when the entry barriers are high.

This study makes three contributions to the literature investigating the relationship between the announcement of IJV formation and share holder value. First, we use the concept of fit among environment, strategy, and control structure and investigate the effects of fit (misfit) on share holder value creation (destruction). Although this concept is widely used in accounting and strategic management literature, it has not been tested in the context of IJVs. Second, we deconstruct the notion of fit into strategy and structural misfits and investigate their individual and joint effects on shareholder value creation (destruction) associated with initial public announcement of IJV formation. Third, we find that the notion of fit among environment, strategy, and control structure matters. The higher abnormal returns of IJVs that have perfect fit as compared to those with both strategy and structural misfits, and those with structural misfit is consistent with the widely held belief in the accounting and strategic management literature that the fit between environment, strategy and control structure positively affect performance.

The results of this study, however, should be interpreted in light of two limitations. First, the competitive environment used in this study is based on a subjective measure of firm-level entry barriers. It might not necessarily reflect the true

1091

nature of competitive environment faced by the firms. Future research might consider other measures of environment such as earning volatility or types of technology. Second, this study uses data from manufacturing sectors. Future research needs to examine whether the results reported in this study can be extended to other industry. Although the use of single industry data minimizes the sample heterogeneity problems, our understanding of the impact of fit among environment, strategy, and control structure would be enhanced if it is generalized across industry.

Environmental Effects on the Relationship between Misfits and Fit

COMPREHENSIVE EVALUATION OF THE POLICY IMPLEMENTATION OF GUIDELINES FOR THE PRESENTATION AND DISCLOSURE OF ISSUERS AND PUBLIC COMPANIES' FINANCIAL STATEMENT

Sylvia Veronica Siregar, Yan Rahadian, and Ira Annisa Abdullah
University of Indonesia,

Abstract

In 2005 Bapepam issued Circulation No. SE-02/PM/2002 about P3LKE (Guidelines for the Presentation and Disclosure of Issuers and Public Companies' Financial Statement), that regulates the standardization of issuer's financial statement disclosure based on industry types. This guideline is applicable for 13 industries, namely manufacture, investment, hospital, highway, hotel, restaurant, communication, construction, trade, transportation, real estate, animal husbandry and plantation. This research aims to evaluate the aforementioned policy implementation by analyzing the issuer's disclosure degree (P3LKE index) at the Indonesia Stock Exchange in 2007 and the progress of issuer's disclosure in 2001-2007 as well as studying the factors that influence the disclosure level. The research sample comes from the 11 abovementioned industries (hospital and restaurant not included because there were no issuers from these industries in 2007).

The P3LKE index in 2007 was still significantly low at approximately 28%. Disclosure level tends to increase from 2001 (the year prior to the issuance of P3LKE) at 22% to 25-27% in 2002-2007, but the increase is relatively small at 3-5%.

Assessment result shows that corporate governance components (rights of shareholders, equitable treatment of shareholders, role of stakeholders, disclosure and transparency) have positive effects towards disclosure level, while responsibility of board does not have a significant effect. This result shows that in general good CG will improve company's disclosure, although it also indicates the lack of effectiveness of the role of board of directors and commissioners towards the practices of company disclosure. These findings support the argument that large companies have political costs and bigger resources so they must and are able to perform a more extensive disclosure in the financial statement.

Keyword: P3LKE, Disclosure, Mandatory Disclosure, Corporate Governance

1. Introduction

In 2002, Bapepam (Indonesian Capital Market and Financial Supervisory Agency) issued Bapepam's Circulation No. SE-02/PM/2002 about P3LKE (Guidelines for the Presentation and Disclosure of Issuers and Public Companies' Financial Statement). This guideline regulates the standardization of issuer's financial statement disclosure based on industry types. This guideline was made effective on 27 December 2002 for issuers in 13 types of industries namely manufacture, investment, hospital, highway, hotel, restaurant, communication, construction, trade, transportation, real estate, animal husbandry and plantation.

The standardization of P3LKE is aimed to improve the quality of issuer's financial statement disclosure at the Indonesian Stock Exchange (IDX). The quality improvement of financial statement disclosure is hoped to reduce asymmetric information between managements and investors as well as among investors themselves, which in the end can increase the value of the company (Verrechia, 2001). Several empirical studies such as Botosan (1997), Sengupta (1998), Mardiyah (2000) indirectly find positive influence of disclosure towards company value. Therefore the quality improvement of financial statement disclosure with the implementation of P3LKE is hoped to be able to reduce asymmetric information, so that market capitalization and company value are improved.

However, several empirical studies about P3LKE in Indonesia such as 2005), Siagian, Siregar, and Rahadian (2006), also Batu (2007) find evidence that issuer's level of compliance towards P3LKE in manufacture sector is still relatively low, at approximately 60-65%.

The compliance level towards P3LKE is supposed to be at or at least close to 100% because P3LKE's requirements are mandatory. Siagian, Siregar, and Rahadian – SSR (2006) also is unable to find a positive effect of P3LKE-based-disclosure (measured in index score) towards corporate governance practices and company value. It is as though this result indicates that the implementation of P3LKE is not effective and does not have a positive influence on the improvement of Indonesia's stock market.

Kadarusman (2007) conducted a more in-depth research about the effectiveness of P3LKE by comparing the level of disclosure before and after the implementation of P3LKE. Kadarusman (2007) found evidence that the implementation of P3LKE has relatively improved the disclosure quality of issuer's financial statement.
Aside to that Kadarusman (2007) also found negative impact of P3LKE's index towards the aggressiveness of profit management. In other words higher disclosure (higher P3LKE's index) has negative effect towards profit management. In general Kadarusman

(2007)'s research provides different conclusion with the researches of Setianto (2005), SSR (2006), and Batu (2007), that although the issuers level of compliance towards P3LKE is absolutely low, but relatively the implementation of P3LKE has improved the disclosure quality. In contrary with SSR (2006), Kadarusman (2007) found evidence of the influence of disclosure level towards profit management.

Nevertheless there are several important questions that have not been answered in the researches of Setianto (2005), SSR (2006), Batu (2007), and Kadarusman (2007). First, those researches have not been able to answer why P3LKE's mandatory regulations have low compliance level. This can show how weak the enforcement of the regulator is or how it is influenced by the operation of P3LKE's index measurement in those studies, or there were other influencing factors.

Second, those researches only used companies that came from manufacture industry as research samples. What about the compliance level of companies (issuers) in other sectors and what about the compliance level of companies (issuers) in general? What are the factors that contribute to the difference of compliance level of companies per industry sector and in general?

Third, those researches had not examined the development of compliance level towards P3LKE in a time-series manner. Kadarusman (2007) only compared the compliance level before the implementation of P3LKE, which was in 2001, and the compliance level after the implementation of P3LKE, which was in 2005. Was there a gradual improvement during P3LKE's implementation in 2002-2007? What factors that affect the improvement (or decline) of the compliance level towards P3LKE each year?

This research attempts to answer those questions and / or loopholes of the abovementioned researches. This research will conduct a qualitative and explorative study to identify the factors that affect issuer's compliance level towards the aforementioned Bapepam-LK's regulation, by questionnaires and or interviews of parties related to the presentation of issuer's financial statement. This research will formulate a disclosure index measurement instrument by referring to P3LKE's regulations which will be used to calculate the disclosure level of all companies in 11 industries that already have P3LKE's index.[179]

---

[179] In 2002 Bapepam-LK issued P3LKE for 13 industries, i.e. manufacture, highway, construction, plantation, telecommunication, hotel, transportation, investment, animal husbandry, trade, real estate, restaurant, and hospital. However based on the 2007 Bapepam-LK classification no issuers existed in the restaurant and hospital industry, so these two industries are not included in the scope of this research.

The P3LKE's index calculation will be conducted on more years, that is 2001-2007. Followed by examination of factors that affect the compliance level.

This research becomes imperative considering Bapepam-LK plan to issue P3LKE regulations for five other industries, i.e. mining, oil and gas, life insurance, loss insurance and financial institution. A comprehensive evaluation of P3LKE's implementation on several industries will give a critical illustration about the effectiveness and difficulties faced in the implementation and will become valuable information in determining the next P3LKE's policy issuance and other stock market policies.

The sample for this research is all companies in several industry sectors that already have P3LKE, such as manufacture, highway, construction, plantation, telecommunication, hotel, transportation, investment, animal husbandry, trade and real estate. Observed years start from 2001 until 2007. The year 2001 is selected to represent the preceding year before P3LKE's implementation and to avoid the 1997-1998 crisis effect. Observed years end at 2007 which is the latest company financial statement until the end of this research period. Sample selection to be done is related with data availability to operate all variables used in this research.

2. Research Method

The existence of asymmetrical information can obstruct the optimum investment allocation, especially in stock market. A sufficient disclosure is one way to repress that asymmetrical information. Although each company has incentives to carry out voluntary disclosure in signaling structure, but with the goal to protect investors in general then the regulation concerning minimal disclosure is nonetheless required.

Related with the abovementioned minimal disclosure, Bapepam-LK has issued regulation about the presentation and disclosure of issuer's financial statement, which is called P3LKE (Guidelines for the Presentation and Disclosure of Issuers and Public Companies' Financial Statement). That regulation is presented through Bapepam's Circulation Letter No. SE-02/PM/2002 about the Guidelines for the Presentation and Disclosure of Issuers and Public Companies' Financial Statement. This guideline is effective per 27 December 2002 for issuers in 13 industries namely manufacture, investment, hospital, highway, hotel, restaurant, communication, real estate, animal husbandry, and plantation.

Several preceding studies had been conducted to show the effects or benefits of disclosure in repressing asymmetric information, directly or indirectly. Botosan (1997),

for instance, find indirect evidence of the influence of disclosure level towards company value. A similar issue found by Sengupta (1998), which is the existence of a negative and significant correlation between disclosure quality and cost of debt, whether it is calculated using yield to maturity or effective interest cost.

A research in Indonesia by Mardiyah (2000), which adopted the research by Botosan (1997), obtains a similar result where better disclosure level will reduce cost of equity. Utama (2003) also suggest that with the improvement of disclosure level, companies can achieve stock market efficiency, more liquid stocks, and in the end can increase company's capitalization and also gaining lower capital cost.

Meanwhile, several other empirical studies examine the factors influencing company disclosure level. Buhr and Freedman (2001) indicate that culture and institutional infrastructure of a company also affect the level of voluntary and compulsory disclosure in the financial reports of companies in each country. Whereas Ostberg (2006) finds evidence that a compulsory disclosure regulation and a good law protection level of investors will result in higher disclosure level. Other study by Srinivasan (2006) concludes that company size positively affects disclosure level.

A few other empirical studies in Indonesia try to develop an index measuring disclosure level of listed companies. Gunawan (2000) shows the disclosure level of those companies is only 39.34%, while the influencing factors of the disclosure level are company size and ratio of liability to asset. Another research by Irwanto (2000) which examine information disclosure in the financial reports of banks in 1990, found evidence that those banks' compliance level in information disclosure averagely only reached 58.3%.

Whereas Pardede (2001) shows that in 1996, the variables affecting the adequacy of disclosure level were company size, liquidity level, leverage level and compliance level when submitting financial statement. While in 1999, the affecting variables were company size, leverage level, type of public accountants who performed the audit and how often the company became analysis subject.

Next Fitriany (2001) shows that companies' compulsory disclosure levels barely reached 59.8% and voluntary disclosure level averaged at 45.46%. Factors found that influenced the compulsory disclosure level index were company size, company status, company type, profitability rate, and the public accountant who performed the audit. Whereas voluntary disclosure index were by the same variables except type of company (industry cluster).

Bachtiar (2003) adopted the disclosure index made by Fitriany (2001) and uses it to test a simultaneous equation between disclosure level with profit management of

companies listed in IDX before and after the financial crisis. Her research shows that company size significantly affected disclosure level. Other research by Amalia (2005) who compared the disclosure level developed by Botosan (1997) with financial report disclosure administered in Head of Bapepam-LK Decree No. Kep-38/PM/1996, find evidence that only company size and ownership structure have significant influence to scope of voluntary disclosure in yearly company financial reporting.

Several other researches try to develop disclosure indices based on P3LKE's regulations. Setianto (2005) examines P3LKE's disclosure level of manufacturing companies listed in IDX in 2002-2003. His research shows that the compulsory disclosure levels of those companies were relatively low, approximately at 47.97% - 77.03% with an average of 64.37% in 2002, and approximately at 49.7% - 100% with an average of 65.28% in 2003. Setianto (2005) also find that the existence if audit committee, the scale of public accountant office who performed the audit, and company size each had a positive connection with disclosure level.

Further study by Batu (2007), also using P3LKE disclosure level, examines the compulsory disclosure level of manufacturing companies listed in IDX during 2003-2005. The conclusion is that the compulsory disclosure level of those companies averaged at 53%. The influencing factors of the compulsory disclosure level are company size and asset utilization.

A research involving P3LKE index was also conducted by Siagian, Siregar, and Rahadian – SSR (2006) who examined whether there was simultaneous correlation among ownership structure, corporate governance, reporting quality, and company value. P3LKE index was used as a measurement of reporting quality. The result shows that none of those variables significantly influenced P3LKE index disclosure level.

P3LKE index from SSR (2006) research indicates that there was little increase in compliance level towards P3LKE from 2003 to 2004, at 61.73% to 62.06%. This compliance index level is relatively not high enough and does not show a significant increase from 2003 to 2004. Although there are differences in both total score and individual score in each category for 2003 and 2004, there is no statistically significant difference between both scores in those years.

This research conducted a retest to calculate P3LKE index and P3LKE index ranking per industry, P3LKE index ranking in overall, and index development each year. Afterwards an empirical examination is conducted to identify P3LKE index influencing factors.

Several factors believed to have influence towards disclosure are corporate governance practice, audit quality, company size, company age, and company

profitability. With the implementation of corporate governance in a company, external disclosure is supposed to be more transparent, including compliance towards P3LKE disclosure. Haniffa & Cooke (2002) discover that corporate governance positively influenced the level of company disclosure (both voluntary and compulsory). This research will use corporate governance index to calculate the performance of corporate governance in companies.

Audit quality according to DeAngelo (1981) is joint probability to detect and report material error in financial reports. She argues that audit quality improves with the size of public accountant size because bigger public accountant has more ability to specialize and innovate through technology so that the possibility of a big public accountant to find violation in accounting system is more probable. It is also stated that big public accountant has more to lose should an audit error happens. Therefore public accountant size is often used in researches as proxy to audit quality.

Watts & Zimmerman (1986) also assert similarly. Singhvi and Desai (1971) find a significant correlation between public accountant and disclosure quality. Additionally Fitriany (2001) in her research find that the size of public accountant has positive influence towards disclosure level.

Agency theory states that big companies have bigger agency concerns than smaller companies (Jensen and Meckling, 1976). Watts & Zimmerman (1978) also state that bigger companies faced bigger political problems and attract bigger attention from regulators, market and public, therefore bigger companies have incentives to improve and maintain their reputation and corporate image. More information disclosure is one way to reduce agency cost and as a mean for company to build public accountability. Besides that big companies have more resources, so that companies can finance information availability for internal as well as external needs (Singhvi and Desai, 1971).

According to Marwata (2001), company age is presumed to have positive influence due to voluntary disclosure quality. The basic reasoning is that more mature companies have more experience in publishing annual financial reports. Companies with more experience know better the constituents need for their companies' information. Al-Shammari (2008) found that company maturity significantly has positive influence towards voluntary disclosure in companies in Kuwait.

Based on signaling theory it is stated that companies with higher profitability will have incentives to differentiate them with other non-achieving companies, so that they can acquire capital with cheaper cost. One way is to disclose more. Moreover, with higher profitability management has more resources for a more extensive disclosure to stockholders.

The research model to be used to examine the influencing factors of disclosure is:

P3LKE = a_0 + a_1 CG_INDEX + a_2 AUDIT + a_3 SIZE + a_4 AGE + a_5 ROA + e (1a)

Where:

P3LKE = P3LKE index score

CG_INDEX = CG index score, calculated based on corporate governance checklist using secondary data. All questions in the checklist are categorized into 5 sections in accordance to OECD principals, which are:

   1. Rights of shareholders (RIGHT_SH)

   2. Equal treatment of shareholders (EQ_SH)

   3. Role of stakeholders (ROLE_ST)

   4. Disclosure and transparency (DISC_TR)

   5. Responsibility of board (RESP_BRD)

AUDIT = audit quality, where 1 is for companies audited by Big 4 Public Accountants and 0 is the opposite.

SIZE = natural logarithm of total asset

AGE = company's listing age in IDX

ROA = *return on assets*

To identify the effect of each component towards P3LKE index, a research model such as below is used:

P3LKE = b_0 + b_1 RIGHT_SH + b_2 EQ_SH + b_3 ROLE_ST + b_4 DISC_TR
+ b_5 RESP_BRD+ b_6 AUDIT + b_7 SIZE + b_8 AGE + b_9 ROA + e   (1b)

The main variable used in this study is P3LKE financial report disclosure level index based on SE-02/PM/2002. This research developed a checklist from P3LKE regulations. There are three possible answers of each item in the checklist, Yes (company disclosed according to SE-02/PM/2002), No (company did not disclose according to SE-02/PM/2002), or Not Applicable (N/A) (company does not have any transactions or accounts related so no disclosure is necessary). P3LKE index is obtained with the formula: *Σ Yes / total items in checklist.*

The sample of this research is all company population listed in IDX for 11 industries, namely manufacture, highway, construction, plantation, telecommunication, hotel, transportation, investment, animal husbandry, trade and real estate, which already has P3LKE's requirements and that there is at least 1 company included in either one of those industries. Sample selection will only be based on data availability.

Based on data availability, a sample size of 228 companies is obtained for P3LKE index calculation in 2007. For hypotheses testing of factors influencing

disclosure index, our sample size is reduced to 190 companies because of incomplete data.

4. Results and Discussion

4.1. P3LKE Index

Descriptive statistic from P3LKE index in 2007 is illustrated in Table 1. The total companies listed in IDX that became the sample in P3LKE index calculation for 2007 are 228 companies. Those companies are spread among 11 industries i.e. real estate, trade, animal husbandry, investment, transportation, hotel, telecommunication, plantation, construction, highway and manufacture. The majority of sample is included in manufacture industry, 118 companies (51.8%). Whereas the industry with the least companies is highway industry (2 companies).

Table 2 illustrates the calculation of all samples with and without including the investment industry. This calculation is done because the investment industry has a simpler complexity compared to other industries. This can be seen in the comparison of number of items in P3LKE checklist for investment industry which is 150 whereas for other industries range at 627-720 items.

Based on the calculation of P3LKE index in 2007, it can be identified that the average compliance level towards P3LKE for all sample companies by including (not including investment industry) is still low at 28.34% (27.91%). The low P3LKE index average appears fairly spread, revealed by the average deviation standard at 5-6%.

To examine the development of issuer's disclosure level, a calculation using P3LKE index is conducted starting from 2001 until 2007, especially for manufacturing industry. This limitation is done regarding the lack of time and the number of companies included in manufacturing industry is the biggest compared to other industries, so it is expected the result can give an overall illustration of disclosure for all issuers. Table 4.4 and Graphic 4.1 present the disclosure development of manufacture industry in 2001-2007.

The level of disclosure in Table 2 and Graphic 1 only took account of 77 companies in manufacture industry which data is available from 2001 until 2007. From that table and graphic, an increasing development of disclosure level from 2001 until 2004 is visible, but afterwards declining in 2005, although it is increasing once more in 2006 and 2007. The year 2001 was the year before P3LKE was issued and it is noticeable that year shows the lowest disclosure level at approximately only 22%. Starting from 2002 is the period where P3LKE implementation has started and an increase in disclosure level is indeed recognizable at 25-27%. Even though there is an

increase but it is relatively insignificant at 3-5% from the period prior to P3LKE implementation.

Table 1

P3LKE Index Descriptive Statistics Year 2007

Industry	N	Mean	Std. Dev.
Manufacture	118	27,59%	4,69%
Real Estate	32	28,59%	5,97%
Trade	29	26,81%	5,58%
Animal Husbandry	10	26,06%	5,85%
Transportation	9	30,39%	4,85%
Telecommunication	6	32,52%	6,66%
Plantation	6	32,01%	7,52%
Hotel	4	28,21%	9,52%
Construction	3	24,64%	7,56%
Highway	2	28,51%	1,74%
Investment	9	38,81%	11,76%
Total – including Investment	228	28,34%	6,12%
Total – not including Investment	219	27,91%	5,40%

Table 2

Manufacture Industry P3LKE Index Years 2001-2007

Year	P3LKE Index
2001	21,98%
2002	25,97%
2003	27,18%
2004	27,28%
2005	24,94%
2006	26,24%
2007	27,19%

Graphic 1

Manufacture Industry Disclosure Level Development

Years 2001-2007

Based on the abovementioned result the compliance level towards P3LKE is still insufficiently high. This finding needs to be of Bapepam-LK's attention as the stock market regulator that issued this P3LKE regulation and also of IDX's. Bapepam-LK and IDX need to do a more stringent supervision regarding public companies compliance of P3LKE and to find out the problems faced by those companies in implementing P3LKE. Other than that, one of the things that caused low disclosure level as explained above is the numerous items in the checklist with N/A value. This is important because often it is not easy to perform a disclosure because indeed that transaction is not applicable for the aforesaid company or because the company has that transaction but for one reason or another did not disclose it (No). If this issue can be identified then P3LKE index calculation no longer need to include items with N/A value but only items with Yes or No values.

To discover the problems faced by companies in implementing P3LKE and the difficulty in awarding No or N/A value and also the opinions of related parties of the abovementioned Bapepam's regulation a Focus Group Discussion was conducted with various public accountants from different Public Accountant Firms (PAF). A public accountant is an independent party who audited a company's financial statement to assert an opinion about the fairness of financial statements, therefore they are in a position of ample understanding about company disclosure and the problems in P3LKE implementation.

Based on the aforementioned FGD several things are acquired:

1. The absence of disclosure for certain items in a financial statement may be caused by several things:
   a. Transaction does not exist in the company
   b. The value is immaterial, thus no need for disclosure
2. P3LKE must refer to VIII.G.7 and PSAK, because P3LKE is not a standard but a reporting model.
3. Since several standards in PSAK have been revised since 2002, then P3LKE must be revised periodically so that it is always up to date with the newest accounting standard.

4.2 Factors Influencing Disclosure Index

Descriptive statistic of the variables used can be seen at Table 3. P3LKE index value is approximately 28%. While CG index value is adequate at 60.5% and the variation in sample is fairly low at approximately 6.7%. Whereas for the highest average value of the 5 components of CG index is in the Equitable Treatment of Shareholders component, the lowest in Board Responsibilities component. The low value in Board Responsibility component may indicate the ineffectiveness of the board, both directors and commissioners, in the company.

Only 41.6% of companies were audited by Big 4 PAF while the rest were audited by non Big 4 PAF. The size of the companies varied, the smallest had a total asset of Rp 2,167 million and the largest had Rp 82,059 million. Company age also varied from companies that had just been listed in IDX (2 years) and ones that had been listed for 30 years. While if seen from profitability level, the average ROA is small at only 5.1%.

Table 4 provides a regression result of factors influencing disclosure level using P3LKE index. Examination result in Panel A shows that CG index does not prove to have positive influence to P3LKE index. This result is contrary to Haniffa & Cooke (2002) who found that corporate governance practices had positive influence towards disclosure. To see if there are any CG components affecting P3LKE index will be seen in the next examination.

Table 3

Descriptive Statistics

Variable	Min	Max	Mean	Std. Dev.
P3LKE	0,146	0,560	0,286	0,063
CG_INDEX	0,461	0,804	0,605	0,067

ROA	0,034	1,041	0,150	
Adj. R2	0.471			
F-stat	19,713			
p-value (F-stat)	0,000 ***			

Contrary to expectation, AUDIT variable had significant negative influence towards P3LKE index. This result is opposite to the finding of Singhvi and Desai (1971) and Fitriany (2001) who in their research found that the scale of public accountant firms had positive influence in disclosure level. The correlation result (untabulated) shows that AUDIT had significant positive influence with P3LKE index, while multi-variants testing showed negative influence. This finding may be the result of a fairly strong positive correlation between SIZE and AUDIT. The correlation of AUDIT with SIZE is biggest compared to other independent variables in the equation (1a). Positive correlation between SIZE and AUDIT shows that big companies tend to choose to be audited by Big 4 PAF compared to small companies.

Company size have significant positive influence on P3LKE index. This result supports the argument that states that bigger companies have bigger political cost so that they must and are able to do a broader disclosure in financial statements. This result is possible to be influenced by how P3LKE index was calculated where it accounted all items in the checklist so that bigger companies (with more complex transactions) are possible to have higher P3LKE index compared to smaller companies.

AGE and ROA variables showed insignificant result which means the listing age of companies and profitability level do not have any effect on the disclosure level. This might be caused by the compulsory nature of P3LKE so age and company profitability did not affect it.

Test result in panel B shows that 4 out of 5 components of CG have positive influence to disclosure level, i.e. rights of shareholders, equitable treatment of shareholders, role of stakeholders, disclosure and transparency. Only 1 component, that is responsibility of board, that does not have a significant effect on disclosure level. Based on the descriptive statistics explained on the previous part, it is identified that responsibility of board component is the CG index component with the lowest average value compared to other components. The low average value and the insignificancy of aforementioned CG component can indicate the ineffectiveness of board, both directors and commissioners, including company's disclosure practices.

5.   Conclusion

P3LKE index for 2007 was rather low at approximately 28%. The low P3LKE index average appeared to be evenly spread, revealed from the average value of deviation standard at 5-6%. While the average P3LKE index for each industry, namely manufacture, real estate, trade, animal husbandry, transportation, telecommunication,

plantation, hotel, construction, highway and investment, is: 27,59%, 28,59%, 26,81%, 26,06%, 30,39%, 32,52%, 32,01%, 28,21%, 24,64%, 28,51%, dan 38,81%.

The development of disclosure level (P3LKE index) tends to increase from 2001 until 2007. 2001 was the year when P3LKE was issued and in that year the disclosure level was the lowest at approximately 22%. 2002 and the following years are the period where P3LKE has been implemented and showed an increase in disclosure to 25-27%. Although there was an increase, it was not significant at just approximately 3-5%.

Test result in panel B showed that 4 out of 5 components of CG have positive influence to disclosure level, i.e. rights of shareholders, equitable treatment of shareholders, role of stakeholders, disclosure and transparency. Only 1 component, that is responsibility of board, that does not have a significant effect on disclosure level. That component is the CG index component with the lowest average value compared to other components. The low average value and the insignificancy of aforementioned CG component can indicate the ineffectiveness of board, both directors and commissioners, including company's disclosure practices.

Furthermore, company size also has positive significant influence to P3LKE index. This result supports the argument that states that bigger companies have bigger political cost so that they must and are able to do a broader disclosure in financial statements. This result is possible to be influenced by how P3LKE index was calculated where it accounted all items in the checklist so that bigger companies (with more complex transactions) are possible to have higher P3LKE index compared to smaller companies.

This research has several limitations. First, judgment is often needed which may cause subjectivity in determining whether a disclosure item in P3LKE is given a value of No (not implementing) or N/A (not applicable). Second, the research period to see the time series of P3LKE index development is limited to manufacture industry only and the research period to test factors influencing issuer's compliance of P3LKE is just 1 year only, in 2007. Third, CG index calculation is based only on secondary data, so that not all aspects of CG implementation in the company are obtained. The scope of items in the checklist is also not guaranteed to precisely show the effectiveness of a company's corporate governance implementation. Last, the exclusion of time log aspect in the research model. For example, CG implementation in year t will only affect the quality of disclosure in year t+1.

This research has an implication for regulator in that they need to review the implementation of P3LKE and to give reward and punishment for the execution of that regulation, as well as to formulate P3LKE based on VIII.G.7 and PSAK and to

periodically update P3LKE adjusted to the latest development of PSAK, at the minimal of once a year.

DETERMINANTS AND EARNINGS QUALITY OF THE VOLUNTARY FILERS OF XBRL IN KOREA

Yun Sung Koh, Kyonggi University
*Ho-Young Lee, Yonsei University
Chaewon Esther Ra, Yonsei University

Summary: In the last few years, there have been efforts to improve accounting quality and transparency. As a part of these efforts, accounting regulators developed a new financial reporting tool named XBRL, based on XML. The tagging of XBRL to each accounting item means that world-wide information users can expect to see the same characteristics in a specific item, and so users can retrieve and analyze information with no concerns about the substance of the information that they collect. The efficiency and effectiveness of financial information should therefore be markedly improved.

From August 2006, the FSS (Financial Supervisory Service) in Korea has started to carry out a voluntary program with 251 voluntary filers, and XBRL Korea has already finished developing and publishing "K-GAAP Common (including finance and non-finance industries) Taxonomy," in 2007. We investigate what are the main factors in leading these voluntary filers in Korea to adopt the XBRL system considering three incentives (external financing, governance structure and auditing), and whether their earnings quality is better than for the control group.

We find that firms are more likely to adopt XBRL voluntarily when the lower level of firm performance and the more activities of external financing. We also find that the higher portion of foreign investors and the more voluntary filings of XBRL. And also voluntary adopters have a tendency to hire the main auditors, and they disclose their financial information more promptly. For earnings quality, our results show that three kinds of absolute discretionary accruals of voluntary XBRL filers are lower than those of their control group. The results suggest that firms' financial and auditing incentives and foreign shareholders equity influence whether or not to adopt this new financial reporting system, XBRL, voluntarily. We also find that the earnings quality of voluntary XRBL filers is better than for the control group.

Keywords: XBRL, voluntary filer, earnings quality

I. INTRODUCTION

What factors lead firms to adopt a new system voluntarily, and how is the earnings quality of early adopters affected? These are questions we can be faced with when we see a change in paradigm or system. With the rapid growth of internet-based technologies, the financial reporting system also should make fundamental systematic changes, from paper-based to web-based, and from HTML (Hyper Text Markup Language) to XBRL (eXtensible Business Reporting Language) on the web. There always have been early and voluntary participants in these new phases, and they, and their intention to accept the changes rapidly, are of great interest to scholars, especially in connection with financial reporting matters.

In the last few years, there have been moves to improve accounting transparency, especially after serious accounting frauds such as the Enron debacle in 2001. As a part of these efforts, specific ideas for accounting and financial information users came from the information technologies, XML. By using XML, regulators and scholars have designed an internationally-standardized accounting taxonomy system for the information on financial statements, and have called this taxonomy the XBRL system. The XBRL tagging system means that information users world-wide can expect to meet the same characteristics in a specific item, so that those users can retrieve and analyze information with confidence, which in turn improves the efficiency and effectiveness of financial information (No and Boritz, 2008).

The SEC (Securities and Exchange Commission) in the U.S. adopted a voluntary XBRL filing program in 2005, and several developed countries such as the U.K. and Japan have already made, or plan to make XBRL mandatory. To follow this international trend, the FSS (Financial Supervisory Service) in Korea started to carry

out a voluntary program with 251 voluntary filers in August 2006, and XBRL Korea

finished developing and publishing the "K-GAAP Common (including finance and non-

finance industries) Taxonomy" in 2007.

Actually, Korea is the first runner of world financial markets to start this new

financial system in earnest since many countries have tried developing their own

taxonomies of XBRL. In case of US market, SEC still has remained on the stage of trial

and error since March, 2005, for about 2 years and more[180]. So it will be a very

meaningful work to investigate what are the incentives of XBRL voluntary filers and

how about their quality of earnings.

We investigate what factors affect to take part in the voluntary filing program

of XBRL in Korea and whether the earnings quality of these voluntary filers is better

than those of their control group. According to the signaling hypothesis, voluntary

disclosure can reveal or give a good signal of a firm's type or quality (Healy and Palepu,

2001; Ahn, 1995). Also firms have an incentive to reduce their cost of capital (Lang and

Lundholm, 2000; Healy and Palepu, 1993) through information asymmetry, and escape

troublesome litigation or firm-control problems (Skinner, 1994; DeAngelo, 1988). We

consider these intentions, and divide their incentives to join in the voluntary program

into three parts - external financing incentive, governance structure incentive and

auditing incentive.

There have also been many studies of the relationship between earnings quality

and information transparency; the stronger the protection internally or externally, the

more there is suitable disclosure, and the higher quality of earnings (Leuz et al., 2003;

Chung et al., 2003; Gassen and Sellhorn, 2006). The XBRL system can help to increase

---

[180] www.fss.or.kr

information transparency through standardized financial information, and also increase the ease with which users such as regulators, auditors, financial institutions and investors can compare firms' information. With regard to these matters, we check the earnings quality of voluntary XBRL files in Korea.

Korea is the leader of XBRL system not only as a participant of this landmark, but as the first-runner of it. Different with other XBRL-related studies, we investigate more varieties of factors which can be the important incentives of voluntary XBRL filing. Moreover, we examine whether XBRL system is useful to ensure the reliability of accounting information, as an ultimate aim. So our results can become a proper precedent of adopting XBRL for other countries. Our study contributes to an understanding of the main characteristics of XBRL voluntary filers in Korea, and checks the quality of their information.

The remainder of our paper is as follows: in section 2, we discuss the background and related prior studies. We describe our research methodologies in section 3, and provide the empirical results in section 4. The last section gives the summary and conclusion of our study.

II. LITERATURE REVIEW AND MOTIVATION

As described by XBRL International, "XBRL is a language for the electronic communication of business and financial data which is revolutionizing business reporting around the world" (www.xbrl.org).[1] Different from the previous financial HTML reporting system, the XBRL system is built up of the XML languages, and has

---

[1] There are 17 jurisdictions including Korea, and 9 provisional jurisdictions in XBRL International as of September 2008. Each member must get approval for their own taxonomy from XBRL International.

internationally-standardized tags for each item of financial data. This world-wide tagging system can give information users more convenience and flexibility in searching, retrieving and analyzing information. Users, including investors, regulators and financial institutions, can therefore collect whatever financial information they want, wherever they are, and in whichever jurisdiction they are interested in, because each specific item of financial data has a standardized identifying tag. Pinsker (2003) states that "in XBRL, not only is the information displayed easily, but it also can be manipulated using any hardware or software package", unlike HTML, which can only display information on the internet. This feature of XBRL is of great benefit in reducing the cost of information - the time and effort to obtain, interpret, and convert information to the format a user may want - are hugely reduced.

Premuroso and Bhattacharya (2008) investigated whether early and voluntary filers of financial information in the XBRL format show features of superior corporate governance and firm performance. They compared governance and performance with their control group by using various financial proxies. As the main proxy for corporate governance, they used the *Gov_Score* provided by Institutional Shareholder Services (ISS), as this score can capture each firm's internal and external governance level, and is also related to both firm performance and valuation. They also use six financial variables to observe the differences in operational performance between voluntary XBRL filers and their control firms.[2] They found voluntary XBRL filers show a higher level of corporate governance, have a greater ability to cope with requests for short-term debt redemption, and tend to be larger firms. According to these results, they conclude

---

[2] Current ratio, net profit margin, ROE, big-4 auditing firms, leverage, and total assets.

that superior corporate governance works as a catalyst to cause firms to accept and adopt the new financial reporting system, XBRL, early and voluntarily.

Ra et al. (2007) link the effect of XBRL introduction to information asymmetry, and find that the introduction of the initial and partial version of the XBRL system is associated with information asymmetry amongst investors in the KSE (Korea Stock Exchange).[3] In this study, they used bid-ask spreads around the date of annual earnings disclosure as a proxy for information asymmetry, and looked at whether bid-ask spreads lowered after the introduction of the partial XBRL system. They find that the weaker the information environment of a firm - measured by the share of foreign investors, firm size and analyst following - the greater reduction of information asymmetry from introducing XBRL. They report that bid-ask spreads significantly decrease after XBRL adoption and firms with a weaker information environment experience this reduction more strongly.

Hodge and Maines (2004) verify how much improvement there could be in the ability to find firm-specific information, including foot-notes, more easily and exactly if information users could use search-facilitating technology. Using a 2 by 2 matrix empirical design according to whether participants could use search-facilitating tools when they looked for firm information in detail, and whether sample firms offered stock option-related information on their income statements, they observed how participants could acquire and integrate detailed information on firms' stock option compensation. The more complicated and varied the information, the more there was search-facilitating technology, and the more possibilities to find the stock option-related information in the

---

[3] From October 2004, KSE developed and provided the KIND-XBRL system with very simplified initial functions, as a kind of testing. Under this system, information users could compare various financial items with market data for a cross-sectional or time-series analysis.

footnotes. Moreover, some participants could integrate the stock option-related information in firms' income statements with the connected information in the footnotes when they used XBRL-enabled search engines, enabling them to use this information in their investment-related decision-making.

There have been several studies about voluntary disclosure. Lang and Lundholm (2000) looked at whether the voluntary disclosure of firm-specific information connected with an equity offering could play a part in reducing information asymmetry. To check this phenomenon, they examined the difference in post-announcement returns between equity-offering firms and matched non-offering firms. Consequently, firms that planned to offer equities augmented their disclosure activity, and this change contributed to creating a large gap between the pre-offering returns of the two groups. Interestingly, however, it seemed that information users in markets regarded this sudden information overflow as a sort of hype, so that firms that over-disclosed prior to equity offerings experienced a steeper downturn in stock returns than those with a consistent disclosure level. Authors interpreted these results as showing that voluntary disclosure at a proper level is very helpful in reducing information asymmetry, but that the increased disclosure activity may lead to negative price adjustments in certain circumstances, although in general it can be a useful way to lower the cost of capital.

In spite of the great benefits of the XBRL system, there have not been many papers studying its effects. This is due in part to the short time since the development and introduction of the XBRL concept, meaning that there was not a large enough sample or time period to verify the effects of its introduction - many developed and developing countries are still constructing their XBRL taxonomies, or waiting to obtain

1127

approval for the finished system. It may therefore be meaningful to examine the feature of the firms who adopt the XBRL system voluntarily, especially in Korea. Korea is one country which has undertaken the international change from a paper-based financial reporting system to an internet-based concept, and towards greater accounting transparency, very rapidly. From 2001, the FSS in Korea has provided an internet-based financial reporting system named DART (Data Analysis, Retrieval and Transfer), and started to adopt an XBRL-based financial reporting from 2007, with the K-GAAP taxonomies. We can lay the ground for studies about the various effects of the XBRL system on information users, and add more evidence concerning the main factors associated with the early and voluntary adoption of XBRL, and the earnings quality of the early filers.

III. Hypotheses Development

3.1. Determinants of the Voluntary Filers of XBRL

3.1.1. Financial Incentives

Lang and Lundholm (2000) point up that the equity-issuing firms may increase their disclosure to reduce information asymmetries and to hype the stocks, and managers more increase their voluntary disclosure frequencies strategically if the time-series of earnings show the positive patterns (Miller, 2002). Miller (2002) also argues that firms with increase earnings growth carry out more disclosure activities.

If firms face with a downturn of earnings, then they may have some incentive to manage earnings to avoid the fall of their actual value. These possibilities of earnings' management can be connected with information asymmetry problems and more

monitoring costs (DeAngelo, 1976; Carslaw, 1988; Bowen et al., 2008). And also if firms have more possibilities of information asymmetry, they have more incentive to signal. That is, they need to reduce their costs of external financing through the activities of disclosure, because the increasing explanation power of intangible factors of firm-value like as growth opportunities make the information gap between the management and outside shareholders, this gap leads to increase their costs of financing (Smith and Watts, 1992; Gaver and Gaver, 1993).

According to these prior studies about the relationship between a firm's financial status and disclosure activities, we can guess that there are positive connections of XBRL voluntary filers with their financial status.

H1: There is a positive relation between the voluntary filers of XBRL and financial incentives.

H1-1: There is a positive relation between the voluntary filers of XBRL and firms' performance.

H1-2: There is a positive relation between the voluntary filers of XBRL and new external financing activities.

3.1.2. Governance Structure Incentive.

Ashbaugh-Skaife et al. (2007) argue that sales growth, portion of inventories, big 4 auditors, and institutional shareholders have a positive correlation with an internal control deficiency report, but that firm size, and a litigious industry, show the opposite effect. Ahn et al. (2007) find that a higher share of foreign investors and a larger firm size encourage voluntary disclosure. There is another paper which studies the

1129

relationship between corporate governance and disclosure practices in Korea: Lee and Sohn (2005) find that the higher the proportion of outside directors, the more equity is held by foreign and institutional investors, the less by management, and the higher the level of disclosure. Ahn and Lee (2005) find out that minority shareholders want to get more information through public disclosure to reduce information asymmetry, but largest shareholders are not likely to prefer or don't need public disclosure more.

More sophisticated investors with analytical skills and information capabilities have strong monitoring, and these investors encourage firms to do their disclosure activities more (Pound, 1988; Jensen and Meckling, 1976). On the basis of these studies about corporate governance and voluntary disclosure, we set up our hypotheses of corporate governance incentives to adopt XBRL system voluntarily.

H2: There is a positive (or negative) relation between the voluntary filers of XBRL and governance structure incentives.

H2-1: There is a positive relation between the voluntary filers of XBRL and the proportion of foreign shareholders' equity.

H2-2: There is a negative relation between the voluntary filers of XBRL and the proportion of major shareholders' equity.

H2-3: There is a positive relation between the voluntary filers of XBRL and the proportion of minor shareholders' equity.

H2-4: There is a positive relation between the voluntary filers of XBRL and **the** proportion of outside directors.

3.1.3. Auditing Incentive

Asthana and Krishnan (2006) study whether audit/non-audit fees and information system fees affect the adoption of a new SEC rule on auditor fee disclosure. They find that the greater the non-audit fees that firms pay, the larger the firms, and the higher the possibility that they adopt the new rule and gain its benefits (as it helps firms to reduce negative perceptions about non-audit services). Kim and Koh (2007) investigate the relationship between audit delay, or an abnormal audit, and earnings management. Earnings management, as measured by discretionary accruals, has a positive correlation with audit delay.

XBRL voluntary filers usually prefer to good quality of auditing (BIG4 auditors) and BIG4 auditors usually carry out their auditing works efficiently and systemically. So they can publish the financial and auditing reports of their clients more promptly (Premuroso and Bhattacharya, 2008; Ahmed, 2003).

H3: There is a positive (negative) relation between the voluntary filers of XBRL and auditing incentives.

H3-1: There is a positive relation between the voluntary filers of XBRL and audit quality.

H3-2: There is a negative relation between the voluntary filers of XBRL and audit delay.

3.2. Earnings Quality

According to Carslaw (1988), if any firm has a higher possibility of earnings' management, then this possibility may give a serious problem of information asymmetry between the management and outside information users. So this information

asymmetry can be a cause of increased cost of capital (Bowen et al., 2008). Then, to reduce their monitoring costs, information users can require firms to do more disclosure activities.

Francis et al. (2008) find out firms with a good quality of earnings show more voluntary disclosure activity than firms with a bad quality of earnings. And also the higher earnings volatility or the higher level of earnings smoothing, and the lower disclosure level or the less voluntary disclosure (Yhim et al., 2003; Lapointe-Antunes et al., 2006). Gassan and Sellhon (2006) state that the early adopters of IFRS show high quality of accruals, and their earnings persistence are also high. We may therefore infer that the earnings quality of early and voluntary adopters is better than for the non-adopters. By reason of the results of above studies, we can hypothesize that there is a positive relation of XBRL voluntary filers with earnings quality measures.

H4: There is a positive relation between the voluntary filers of XBRL and earnings quality.

Ⅳ. RESEARCH METHODOLOGY

On the basis of these prior studies, we divide our logistic regression model to verify the determinants of XBRL voluntary filers into 3 parts by each incentive - 1) financing incentive, 2) governance structure incentive and 3) auditing incentive. We select 16 possible factors for 3 logistic regression models, and 8 factors among them are used as independent variables for 3-incentive based models (firm performance, new external financing for external financing incentive; foreign/major/minor shareholders'

equity, proportion of outside directors for governance structure incentive; audit quality, audit delay for auditing incentive). The rest of them (firm size, cash flow from operating activities, current ratio, change of debt ratio, change of sales, Tobin's Q, listing period, export dependence) are for being used as common factors and controlling firms' characteristics.

(1) Financial Incentives

$$XBRL=\alpha_0+(\alpha_1 FP+\alpha_2 FIN)$$

$$+\alpha_3 SIZE+\alpha_4 OCFS+\alpha_5 CUR+\alpha_6 CLEV+\alpha_7 CSALES+\alpha_8 TQ+\alpha_9 FY+\alpha_{10} DEXP+\sum\alpha_{11,1\sim j}IND$$
$$+\varepsilon$$

(2) Corporate Governance Incentives

$$XBRL=\beta_0+(\beta_1 MSH+\beta_2 SSH+\beta_3 FSH+\beta_4 OBODRD)$$

$$+\beta_5 SIZE+\beta_6 OCFS+\beta_7 CUR+$$
$$\beta_8 CLEV+\beta_9 CSALES+\beta_{10} TQ+\beta_{11} FY+\beta_{12} DEXP+\sum\beta_{13,1\sim j}IND+\zeta$$

(3) Auditing Incentives

$$XBRL=\gamma_0+(\gamma_0 BIG4+\gamma_0 OARL)$$

$$+\gamma_3 SIZE+\gamma_4 OCFS+\gamma_5 CUR+\gamma_6 CLEV+\gamma_7 CSALES+\gamma_8 TQ+\gamma_9 FY+\gamma_{10} DEXP+\sum\gamma_{11,1\sim j}IND+\tau$$

XBRL: 1 if XBRL voluntary filers, or 0; FP: Firm performance, 1 if $NI_t>NI_{t-1}$, or 0; FIN: New external financing, 1 if [the issue of bonds or equities]$_{t\ or\ t-1}$, or 0; MSH: % of major shareholders; SSH: % of minor shareholders; FSH: % of foreign shareholders; OBODRD: 1 if %(outside directors) > 25 or more, else 0 [181]; BIG4: 4 main audit firms in Korea; OARL: Audit delay, # of calendar days from fiscal year-end to date of the auditor's report; SIZE: Natural logarithm of total assets; OCFS: Cash flow from operating activities, scaled by total assets; CUR: Current ratio, current assets divided by current liabilities; CLEV: Change of debt ratio(DR=total liabilities divided by total assets), $(DR_t-DR_{t-1})/DR_{t-1}$; CSALES: Change of sales, (total sales$_t$ -total sales$_{t-1}$)/total sales$_{t-1}$; TQ: Tobin's Q, {(# of common-shares outstanding*closing price)+total liabilities}/total assets; FY: Listing period on a stock exchange; DEXP: Export dependence, foreign sales/total sales; IND: industry-specific dummies

---

[181] According to the Securities and Exchange Law of Korea, listing companies in Korea should organize their board of directors with more than 25% of outside directors.

XBRL is a dummy variable which takes the value of 1, if a firm is a voluntary filer of XBRL. FP is a proxy of firms' performance which takes the value of 1, if a firm's earnings of current fiscal year are larger than those of last year. And a firm tries to finance externally in this year, and then FIN takes 1. 3 governance proxies (MSH, SSH, FSH) are measured the proportions of each major/minor/foreign shareholders' equities and outside directors. Lee and Sohn (2005) find out that corporate governance and firm size affect the firms' decision of voluntary disclosure. Minority shareholders, high leveraged firms (CLEV) also carry out an important role in voluntary disclosure (Ahn and Lee, 2005). Outside directors (OBODRD) is a dummy variable taking the value of 1, when firms fill up the 25% and more of outside directors on their board of directors. Size is a natural logarithm of total assets, and OCFS is a cash flow from operating activities drawing out from the cash flow statement. Current ratio (CUR) is the relative size of current assets to current liabilities, which means firms' liquidities. Tobin's Q (TQ) works as a proxy of firms' growth opportunities, measured by the ratio of the sum of market value and total liabilities to total assets. Chung (2000) refers to the firms' listing period (FY) as a factor of voluntary disclosure of the management's forecasting information. If any other circumstances are same among firms, information users would like to get more information about the firms with a relatively short listing period rather than with a long listing period. This is because the longer listing period of a firm and the more accumulated information to be used by information users. He also argues a firm with higher export dependence (DEXP) has more incentive to disclose voluntarily, but this argument is not supported statistically.

To observe the earnings quality of voluntary filers of the XBRL system, we use regression analysis with matched firms. Our regression models with 3 kinds of DAs and definitions of each variable in model (2) are as follows:

$$\text{ADA (APDA or ACDA)} = \alpha_0 + \alpha_1 XBRL + \alpha_2 SIZE + \alpha_3 LOSS + \alpha_4 CUR + \alpha_5 MSH + \alpha_6 FSH$$
$$+ \alpha_7 TA + \alpha_8 OCFS + \alpha_9 CSALES + \sum \alpha_{10,1 \sim j} ID + \varepsilon$$

ADA: Absolute value of DA from Modified-Jones model; APDA: Absolute value of DA from Performance-Matched model; ACDA: Absolute value of DA from Cash flow model; XBRL: 1 if XBRL voluntary filers, or 0; SIZE: Natural logarithm of total assets; LOSS: 1 if $NI_t<0$, or 0; CUR: Current ratio, current assets divided by current liabilities; MSH: % of major shareholders; FSH: % of foreign shareholders; TA: Total accrual$_{t-1}$, $NI_{t-1} - OCFS_{t-1}$; OCFS: Cash flow from operating activities, scaled by total assets; CSALES: Change of sales, (total sales$_t$ -total sales$_{t-1}$)/total sales$_{t-1}$; ID: Industry-specific dummies;

In many studies about earnings quality management, the estimated discretionary accruals (hereafter, 'DA') have been used as useful proxies for earnings quality or management. There have been a few revised models to estimate DA since Jones (1991); from these, we take the modified-Jones model (Dechow et al., 1995)[182], the performance-matched modified-Jones model (Kothari et al., 2005)[5] and the cash flow model (Dechow and Dichev, 2002)[183].

Generally 7 or 8 firm-specific items turn out to affect to the estimation of DA (Choi, 2005; Cheon, 2003; Cho and Park, 2006), so we need to control these items when we use the estimated number of accruals as a dependent variable - firm size, net loss

[182] $TA_{it} = \beta_0 + \beta_1(1/ASSETS_{it-1}) + \beta_2(\Delta SALES_{it} - \Delta AR_{it}) + \beta_3 PPE_{it} + \upsilon_{it}$

TA_{it}: ($\triangle$current assets-$\triangle$cash and short-term investments -$\triangle$current liabilities +$\triangle$debt in current liabilities - depreciation and amortization)/lagged total assets, Asset$_{it-1}$: lagged total assets, $\triangle SALES_{it}$: change in sales scaled by lagged total assets, PPE$_{it}$: net property, plant and equipment scaled by lagged total assets

Performance-matched DA is a kind of abnormal concept subtracting the DA of matched firms from those of testing firms. Matched firms are selected if they have the nearest ROA$_t$ or ROA$_{t-1}$ to their testing firms.

[183] $TA_{it} = \beta_0 + \beta_1 CF_{it} + \beta_2 CF_{it-1} + \beta_3 CF_{it+1} + \upsilon_{it}$

ACC$_{it}$: (earnings taken from cash flow statements – cash flow from operations)/averaged total assets , CF$_{it}$/ CF$_{it-1}$/ CF$_{it+1}$: cash flow from operation of each term of t-1/t/t+1 scaled by averaged total assets

dummy, current ratio, major and foreign shareholders' equity holdings, lagged total accruals, cash flow from operating activities, and change of sales. According to the political cost hypothesis, firms with a large size have an incentive to reduce their reported earnings (Watts & Zimmerman, 1986). Other internal factors possible to affect the level or direction of discretionary accruals are profitability, current ratio and cash flow from operating activities. Because the downturn of earnings growth or loss of firms leads directly into the fall of their actual value, it is possible for firms with negative earnings to tolerate their earnings management (DeAngelo, 1986). DeFond and Jiambalvo (1994) point out that the higher debt dependence, the more possibility of earnings management. So firms with an enough ability to discharge their liabilities have less incentive to manage their earnings. And also there is a negative relation of accrual to cash flow due to matching principle and different timing of actual cash inflow or outflow (Dechow, 1994). Major and Foreign shareholders' equity are on the basis of information asymmetry problem, considering that the higher information asymmetry and the greater potential of earnings management. Foreign investors generally require the higher level of reliability of firms' financial information, and owner dominated companies have less incentives of earnings management since the dominant shareholders already have a enough grip of the firm's situation (Carslaw, 1988).Along with these variables, we also include industry to capture the industry-specific effects which we cannot control just with the special items in the two models.

Ⅴ. EMPIRICAL RESULTS

5.1. Sample Selection

We obtained 488 sample firms, including matched firms, from the firms listed on the KSE (Korea Stock Exchange) in 2006. Amongst these sample firms, the total

number of voluntary XBRL filers is 122, and we took the 366 matched samples[184] on

the basis of industry and firm size, to compare them with the voluntary XBRL filers.

Table 1 shows the numbers of total sample firms and the XBRL filers by each industry.

****
Insert Table 1 about here
****

5.2 Descriptive Statistics

To gain a good grasp of the characteristics of the variables in our two models,

we first undertook a descriptive analysis. The descriptive statistics for the 22 variables -

XBRL, FP, FIN, MSH, SSH, FSH, OBODRD, BIG4, OARL, SIZE, OCFS, CUR,

CLEV, CSALES, TQ, FY, DEXP, ADA, APDA, ACDA, LOSS, TA - are provided in

Table 2[185]

****
Insert Table2 about here
****

As both of the dependent and independent variables, almost statistics for XBRL

have the value of 0 except maximum and 3'rd quartile numbers (=1). This stands to

reason, because our matched sample is about three times the size of the number of

voluntary filers. In our sample firms, there are more firms with decreased net income,

compared with lagged net income, than those with increased one (FP). Connected with

these increasing pattern of performance, we can also find out many firms are suffering

---

[184] Zmijewski (1984) investigated how to decrease two possible biases, choice-based sample biases and sample selection biases. According to his research, we collect out target firms (XBRL voluntary filers) and their control samples in the ratio of 1:2.5 (approximately 1:3).

[185] To avoid the effects of extreme values, we truncated variables on the basis of 5% and 95% of each distribution.

the loss of their performance (LOSS). And also our sample firms show a tendency more to raise their new activities of external financing (FIN).

From an angle of governance structure incentive, the each proportion of the major and minor shareholders' equities is 33.3% and 36.8%, and on average, they are invested from foreign shareholders for about 11.5% of their total capital. And we can see that there are not many firms to call in more than 25% of outside directors (OBODRD). In case of auditing incentives, about 63.7% firms have their auditing from BIG4 accounting firms and the period of time from fiscal year-end to auditor's reporting have the range between cover a range between 20 to 61 days with the mean-audit-delay of about 39 days.

Almost firms tend to reduce their dependence of liabilities, and simultaneously secure the short-term capacity of redemption. The mean of Tobin's Q ratio is 1.102, so we can guess it rarely for firms to be valued over their book value. The levels of two dependent variables for regression analyses (ADA and ACDA) look almost alike, but performance-matched DA (APDA) shows a bit different pattern. That is, the level of abnormal DA is higher than another two variables of DA.

5.3. T-test and correlation Analysis

The first thing we want to establish is what factors really make a difference in the choice of whether or not firms participate in the XBRL voluntary filing program and how about the earnings' quality of the XBRL voluntary filers. Before we look for them using logistic and regression analyses, we can make a sketch of the differences between two groups. In Table 3, XBRL voluntary filers hold less continuous pattern of earnings' growth (FP, t=-2.170[**]) and try more externally financing than their control group. If a

firm shows a negative score of earnings or a drop of earnings, then this leads directly into the fall of their actual value so that this firm has an incentive to overlook earnings' management (DeAngelo, 1976). Anyway, the more chances of earnings' management mean the higher possibilities of information asymmetry between the management and outside information users (Carslaw, 1988), and the more cost of capital (Bowen et al., 2008). Accordingly, the higher tendency of earnings' growth of XBRL voluntary filers can be linked with the less cost of capital due to the reduce information asymmetry, so that XBRL voluntary filers is likely to do more external financing than non-filers (FIN, t=2.740[**]). But, none the less, their dependence on total liabilities shows a declining pattern different with matched firms (CLEV, t=-0.110[*]).

There are an indirect evidence for the rapidity and efficiency of the formation and verification of financial information. On average, XBRL voluntary filers put about 37 days in preparing their auditor's report, and have about 2.4 days-difference significantly with their matched firms (OARL, t=-1.910[*]). But, even though their verifying process of financial information is less delayed, it may be meaningless if information users can't use the information with confidence of good quality of it. This matter can be ascertained by 3 proxies of earnings quality – ADA, APDA, ACDA. Like as prior studies (Francis et al., 2008; Yhim et al., 2003; Lapointe-Antunes et al., 2006), XBRL voluntary filers also show the lower levels of DAs (that is, the higher levels of earnings quality in a general meaning) consistently in 3 proxies than their matched group, and all of these are statistically significant. So we can see the more rapid preparation of audit report and the higher quality of earnings of XBRL voluntary filers. We can guess that these results are related to the size of firms and their auditors. XBRL voluntary filers usually prefer to BIG4 auditors and show a tendency to a larger firm

size and a higher portion of foreign investors (Premuroso and Bhattacharya, 2008; Ahn et al., 2007; Ahn and Lee, 2005). In general, foreign or institutional investors are more sophisticated, but have less possibility to access to the information of domestic firms easily and sufficiently. To reduce their monitoring costs, they can put pressure on firms to disclosure more actively (Jensen and Meckling, 1976; Lee and Sohn, 2005).

****

Insert Table 3 about here

****

Table 4 shows the Pearson correlation coefficients among variables for multivariate analyses – logistic and regression analyses. In panel A for variables included in our logistic regression model, 6 variables (FP, FIN, FSH, BIG4, OARL, SIZE, TQ) show the same pattern with the results of t-test to the dependent variable, XBRL. XBRL filers have the higher preference to make a contract with the big auditors for their financial information, and the directions of FP and FIN of XBRL voluntary filers seem to have an opposite pattern. And also this pattern is connected with a negative correlation between FP and FIN. This reverse correlation of FP and FIN can be proved circumstantially by the relationship of them with cash flow (OCFS) or liquidity (CUR). So we guess that more external financing activities as well as less continuous earnings growth are the distinctive features of XBRL voluntary filers.

We also present the result of correlation analysis for our second model of regression in panel B. First of all, our three proxies for earnings quality (ADA, APDA, ACDA) have significant relationship with each other. Though APDA is a kind of abnormal-DA concept which extracts industry-mean DA from each firm's DA, these positive and strong relationships mean that our three proxies have the same characters.

Various prior studies refer to the positive relationship between earnings quality and voluntary disclosure (Francis et al, 2008; Yhim et al., 2003; Lapointe-Antunes et al., 2006). Like the preceding results of t-test, three DAs have a reverse correlation with XBRL voluntary filers dummy, that is, the more voluntary filers of XBRL and the higher earnings quality. And also, loss firms have the stronger incentive to manage earnings to avoid reporting their losses or earnings decreases (Burgsthahler and Dichev, 1997).

5.4. Logistic Analysis: main factors in adopting XBRL voluntarily

To establish the main factors in the voluntary adoption of XBRL the possible variables, we undertook a logistic analysis from three different angles (financial incentives, governance structure incentives and auditing incentives. The possible variables were included in our logistic regression model according to the results of prior studies, but we carried out a sensitivity analysis on the variables from firm performance (= continuous earnings growth, FP)to audit delay (OARL) in order to check their validity and endogeneity.

The results of the logistic analysis tell us that five items – from two financial incentives (firm performance, FP; new external financing, FIN), one governance incentive (foreign shareholders' equity, FSH), and two auditing incentives (main audit firms in Korea, BIG4; and audit delay, OARL) – have significant influences on the choice of voluntary XBRL filers. But there are not any factors to affect the firms' decisions of XBRL adoption in the view of governance structure incentives except

foreign shareholders' equity (FSH). And 3 factors (firm size, SIZE; decreased debt ratio, CLEV; Tobin's Q, TQ) among control variables act as the common factors which encourage firms to join the voluntary program of XBRL filing.

****
Insert Table 5 about here
****

Earnings surprise can be used as a means of private information events, and users with private information encourage a voluntary disclosure to acquire benefits from their private information (Brown et al., 2008). And firms with increased earnings performance carry out more disclosure activities including their earnings announcements (Miller, 2002). But not matched with these prior studies, the smaller portion of the earnings growth (or negative earnings surprises) and the more voluntary filing to XBRL system (FP, -0.520[**]). Firms increase their disclosure activities to reduce the cost of capital for external financing due to information asymmetry (Carslaw, 1988; Bowen et al., 2008), and these stories are matched with the result of logistic analysis to XBRL voluntary filers (FIN, 0.177[**]).

In general, main auditors like as Big 4 have more incentives to compel disclosure standards more strictly and extensively for their reputation (Wang et al., 2008). These allow them to monitor and lead firms to increased voluntary disclosure, matched with our result from a viewpoint of auditing incentives (BIG4, 0.445[*]). It looks a matter of course for firms with a reason of audit delay or reporting lag to hesitate about taking part in the voluntary filing program of XBRL (OARL, -0.016[**]). Moreover, Block holders want to reduce their monitoring cost (Sengupta, 2004), and large-sized firms or firms with a big audit firm have an incentive or capacity to report their financial

information more promptly (Ahmed, 2003). Negative correlations of audit delay with relative measures (MSH, BIG4, SIZE) in Table 4 back up what characteristics of firms with a delayed-reporting pattern might be and through what path they reach the less-voluntary-filing-decision of XBRL.

Not like various prior studies, governance-structure measures don't affect whether or not to join in the voluntary program of XBRL filing except foreign shareholders equity (FSH). Firms with the strengthened monitoring activities of independent corporate boards are likely to perform suitable disclosure-related activities, ensuring that firms try to communicate with investors and give good signals of transparency (Cai et al., 2006; Ajinkya et al., 2005; Gul and Leung, 2004; Forker, 1992; Eng and Mak, 2003; Fama, 1980). Outside investors force the higher level of firms' disclosure to reduce information asymmetry (Jensen and Meckling, 1976). The higher portions of foreign shareholders encourage firms to adopt a new reporting system, and this is statistically significant (FSH, 1.102[*]). In our cases, only two governance proxies (foreign shareholders, FSH; main shareholders' equity, MSH[186]) support the results of prior studies.

Lastly, the statistics of change of debt ratio (CLEV) say that the more increased debt ratio and the lower possibilities of XBRL voluntary filing of firms. These results show different aspects from prior studies, which mention that highly leveraged firms disclose more financial information to reduce their creditors' monitoring costs and convince of their debt solvencies (Premuroso and Bhattacharya, 2008; Jensen and Meckling, 1976).

---

[186] Block shareholders have no effect on corporate disclosure activities or the information quality of firms, especially in Korea (Cheon, 2003; Ahn and Lee, 2005).

To sum up all the results of the logistic analysis, firm performance (FP), new external financing (FIN), foreign shareholders equity (FSH) and main audit firms in Korea (BIG4) lead a firm to take up the XBRL system voluntarily. But if firms usually show not a prompt disclosure pattern (OARL), then they are further away from the participation of XBRL voluntary program.

5.5. Regression Analysis: earnings quality of voluntary XBRL filers

There have been several researches that show that early adopters of a new accounting regulation or voluntary disclosers of information show good quality of earnings, or that good earnings quality will induce firms to make voluntary disclosures (Gassan and Sellhon, 2006; Francis et al., 2008). Following these results, our second research interest in this paper is whether voluntary XBRL filers really show a high quality of earnings; the results of the regression analysis to check this are shown in Table 6.

The explanatory powers of the regression analyses of the dependent variables (ADA, APDA and ACDA) are about form 7% and 8%. The all F-statistics show significant values at the 1% level, meaning each variable in the regression model is an explanatory factor for three dependent variables. Francis el al. (2008) says that firms with good earnings quality carry out more broad activities of disclosure, voluntarily. The dummy variables for our primary focus, XBRL, exhibit negative coefficients for each (-0.006 to -0.013), and their coefficients are significant at the 1% or 5% significance level - that is, the earnings quality of voluntary XBRL filers is better than that of their control group.

****

Insert Table 6 about here

1144

In the case of foreign shareholders equity (FSH) and lagged total accrual (TA), these items have the negative relations to absolute discretionary accruals (ADA, APDA and ACDA) as various prior studies. According to the efficient monitoring theory, more sophisticated investors with analytical skills and information capabilities have strong monitoring power so that they suppress a firm's incentive to manage earnings (Pound, 1988). Different with prior studies, major shareholders (MSH) fulfill their monitoring role very strongly. Dechow (1994) said that there is a negative relation between accrual and cash flow caused by different timing of actual cash flow from accounting numbers. But our results of cash flow (OCFS) are not consistent across three regression models. Especially the direction with Modified-Jones DA (ADA) supports the story of above, but other two models are not likely that. On the whole, other control variables show the consistent patterns in their directions and significances.

Ⅵ. CONCLUSION

We investigated what factors affect firms' choices to join in the voluntary program of XBRL filing in Korea, and whether XBRL voluntary filers' earnings quality are better than for their control group. We selected firm-specific variables for our empirical model, with regard both to three kinds of firms' incentives to participate in the voluntary program, and to the control matters of firms' characteristics. Considering the proper function of the XBRL system within the information process, we also checked the earnings quality of voluntary XBRL filers in Korea.

Our empirical results show that voluntary XBRL adopters are more likely to have a lower level of firm performance, that is, continuous earnings growth. The results also show that voluntary XBRL adopters are more apt to do their external financing activities. The each relationship of the likelihood of early adoption with main auditors and audit report lag suggests that auditors can perform their work in a more efficient manner with the XBRL system. And also foreign shareholders, the only significant factor among governance proxies, play an important role in firms' voluntary adoption of XBRL system.

We also examined whether the earnings quality of voluntary XBRL filers is better than the control group of companies which do not participate in the voluntary program. The empirical results show that the absolute discretionary accruals of XBRL filers computed with the modified-Jones Model, the performance-adjusted modified-Jones model and cash flow model are lower than those of the control group, suggesting that XBRL systems enhance the quality of accounting information. Based on our empirical findings, we conclude, with caution, that firms' internal and external controls of financial information are important in accepting this new financial reporting system.

Future study may examine whether XBRL systems reduce the cost of capital or improve market efficiency by providing better quality accounting information to the financial markets. Our study contributes to building the foundations of further extended studies about the XBRL system.

4.2 Islamic Accounting, Banking and Finance

ACCOUNTING AND ACCOUNTABILITY IN ISLAMIC RELIGIOUS BASED ORGANIZATIONS: THE CASE OF PESANTREN IN INDONESIA

Hasan Basri, Universitas Syiah Kuala
AK Siti-Nabiha, Universiti Sains Malaysia

Abstract

Religious-based organizations, especially, Islamic based organizations have long played a very significant role in providing a lot of services for society. One of the most important organizations, in Indonesia, is called pesantren [Islamic boarding school] that provide education services at minimal cost for students. They received a lot of funds either from government or from society at large. However, there are concerns that accounting and accountability practices in this kind of organizations are less than satisfactory. Thus, the aim of this paper s to explain the accounting and accountability practices in pesantren in Indonesia. A case study of a pesantren is undertaken the data generated from interviews people inside and outside the organization and also review of documents. An overview of the management of pesantren is provided. This is followed by a discussion of the accountability relationship as well as the accounting and its role in the organization. Finally, the financial arrangement and the role of board in enhancing accountability were also discussed in this paper

INTRODUCTION

There has been growth in research in religious organizations as noted by many researchers (see Laughlin, 1988, 1990; Walker, 2002; Booth, 1993; Rahim and Goddard, 1998; Lewis, 2001, 2006), but there are only few researches that examined the issues of accounting in religious organization (Booth, 1993). Most researches in this area have been focused primary on economic and political factors. Only recently, researchers are beginning to look at some of the broader managerial issues of non profit organization. Consequently, there are growing numbers of literature on non profit organizations that attempts to understand accounting and accountability as an organizationally situated practice. However, only limited number of researchers examined Islamic religious organizations, specifically educational institutions. Furthermore, the issue of accounting

and accountability in Islamic religious organizations have been generally unexplored in accounting academic literature (see, Ezzamel, and Carmona, 2006).

In Indonesia, the country with the largest Muslim population, religious organization, particularly, Islamic religious institutions have provided a lot of services for society. One of the most important institutions is Islamic boarding school or in Indonesia is called "pesantren" that provides education services at minimal costs for students. Currently, there are 14,656 pesantren operating in the country (see Directorate of Religious Education and Pesantren, 2005, p. 18). In the NAD[184] province in which this case study conducted and the only part of Indonesia which has the legal right to apply Islamic law (shari'a), there are 852 Dayah (they are typically called pesantren elsewhere in Indonesia) in 2007[185]. These pesantren are mainly owned by foundation and private owners. As such, their operations depend mainly on public support and trust.

Due to the lack of information regarding financial accountability in these organizations, a lot of anecdotal evidence suggests the lack of public accountability and transparency in these organizations. A study is needed to examine accounting and accountability practices in Islamic religious organizations. As such, the objective of this paper is to investigate and to provide detailed information about one of Islamic boarding school in Indonesia. It focuses on the finding of the research pertaining to accounting information and accountability relationship in a single case study.

METHODOLOGICAL APPROACH

---

[184] NAD is the abbreviation of Nanggroe Aceh Darussalam. It refers to the name of a province in Indonesia
[185] Sources, the Department of Religious Affair, Banda Aceh-Indonesia.

Interpretive case study is seen as the most appropriate method for this study since accounting and accountability practices in religious organization is social phenomena and value based activities which encompass, moral, spiritual, material and social aspects (see Hameed, 2000; Sulaiman, 2005, p. 36). The social world is a subjective construction of human which is being continuously changed or reaffirmed. Hence, there is no universally valid rule and value of accounting and accountability practices. This research approach, accordingly, is consistent and compatible with the epistemological and ontological assumptions in which the world and reality are interpreted by people in the context of historical and social practices (Rowlands, 2005).

The data for this study were mainly derived from semi structure interviews, documents and observation. The focus on multiple data sources for this single case study will allow a greater "depth" of data regarding the accounting and accountability practices of the organization case and perception underlying why accounting and accountability reports are presented in the way they are (see Lightbody, 2005). Eleven semi structures interviews were conducted with key informants both inside and outside of the organization case who have some leadership responsibility in this pesantren entity. These consist of director of the organization case, unit managers, from difference divisions, students, member of foundation committee, director of government agency and director of organizational donors who frequently provide donation for local Islamic religious organizations as well as Muslim scholars. In order to cover as broad range of issues as possible, the case organization is large modern Islamic Boarding school operating in Aceh, Indonesia.

The paper is structured as follows. It starts with an overview of the case organization [Pesantren Peace][186]. Then, it is followed by management of pesantren and its financial transparency. The next section presents the accountability relationship as well as the accounting and its role in the pesantren. The financial arrangement and the role of board in enhancing accountability were also discussed in this paper.

OVERVIEW OF PESANTREN PEACE

Pesantren Peace [187] is one of the Islamic boarding schools in the NAD province, Indonesia. This 25 hectares pesantren complex is operating under the wing of Yayasan [Foundation] Kita [188]. Besides pesantren Peace, this foundation also runs another educational service unit. The director of the foundation together with its committee members determines the appointment of directors of the institutions under its management. The committee of the foundation does not interfere directly in the running of organizations under its care. The organization structure of Foundation Kita is presented in figure 1.

Organization Structure
Foundation Kita

FOUNDATION COMMITEE

PESANTREN PEACE

Figure 1 : Organization Structure of Foundation Kita

---

[186] The name of the organization has been change to ensure confidentiality.

[187] Pesantren Peace refers to the name of pesantren institution used as the real name is disguise to ensure confidentiality. Organization case disguised.

[188] Foundation Kita refers to the name of foundation that oversees the Pesantren Peace disguised.

The operation of the Pesantren Peace is under the supervision of the director of pesantren and foundation committee of the Foundation Kita. Pesantren Peace was established in 1961 by a number of community leaders who care for the development of education in Aceh. This Pesantren is claimed to be one of the biggest and modern pesantren in the NAD Province. Two educational institutions are run by the Pesantren Peace. Within its compound one can find madrasah aliyah (senior high school) and madrasah sanawiyah (junior high school). Both of these educational institutions are opened to boys and girls from various family backgrounds.

The main activity of the Pesantren Peace is providing educational service at the junior and senior levels of high school at lower costs. Pesantren Peace serves as private provider of educational services. The overall education activities throughout the pesantren are coordinated by the management of pesantren. As an Islamic educational institution, Pesantren Peace is first and foremost, a place of education and learning. The pesantren mission statements emphasis on intellectual aspects in providing education for Muslim students.

As a modern pesantren, or usually also called pesantren terpadu (integrated pesantren), this institution follows the standard curriculum set by the government, in this case, the standard curriculum set by the Department of Religious Affair of the Indonesian government. In addition, the students are also taught kitab kuning[189] [classical Islamic text book] curriculum as a specific characteristic of pesantren. Class sizes at both schools are about 30 students per class which consistent with the standard of government schools. During school hours all students have to wear school uniform. Female students are obligated to cover their hair or in other words have to wear

_____

[189] Called Kuning, yellow, after the tint paper of books brought from Middle East in the early twentieth (Martin, 1990, p.1).

1165

"hijab" [190]. After school hours students have to study kitab kuning**.** These learning activities usually take place in the afternoon and at night.

Teaching is conducted in Indonesian Language. Even though, students are encouraged to use Arabic and English when they talk each other, in practice, however, students still prefer to converse in Acehnese or Indonesian.   Seen from this point of views, this pesantren fulfils a dual function as an institution of formal and informal learning that espouses a broad learning concept. Even though pesantren Peace is a non government organization (NGO), the studying and teaching process is not contradictory to the government run educational institutions. Therefore, the system adopted by Pesantren Peace can match the standard of any public schools**.**

Pesantren Peace certificates are regarded as being equal standards as those of public school by the Indonesian government. Thus, all of Pesantren Peace graduates qualify to continue their education in the public institutions at the post secondary level. Many of their graduates later attend universities. Some of them continue their study either in Islamic religious institutions in Middle East or in non religious universities either in Indonesia or overseas.

In 2008 Pesantren Peace has 1,803 students, consist of 825 male students and 978 female students. The total numbers of teachers employed are 178. They consist of 150 temporary teachers, 25 permanent teachers, 2 contract teachers, and 30 are government officers are assigned to teach at the pesantren Peace, and 8 volunteer teachers**.** All teaching staff, except government officers who are assigned to teach in pesantren is salaried and paid on a monthly basis by the management of pesantren.

---

[190] Hijab is the Arabic term, frequently used in Malaysia, refers to the dress worn by Muslim women that cover hair and neck. (see also MSN Encarta Dictionaries)

In recruiting staff, the management of pesantren considered the educational background of teaching staff as an important aspect or criteria in recruitment process, especially, for teaching position. The minimum qualification required for teaching staff is a bachelor's degree and for the administrative staff is a high school certificated.

The management is open to recruit either administrative or teaching staff regardless of which institutions they graduated from. Nevertheless, the majority of teaching staff had graduate from Pesantren Peace. The basic salaries for the staff can be as low as 500,000 rupiahs [Indonesian currency] or equal to US$ 50 and as high as 2,000,000 rupiahs or equal to US$ 200. Some staffs are also provided housing in the pesantren complex. Currently, 30 staffs together with their families are staying within the complex. They are only required to pay electricity bill. All students are housed in dormitory for boys and girls respectively. Foods for students are cooked in the different premises and served three times daily. The cost of studying and staying in Pesantren Peace is 300,000 rupiahs or equal US$ 30 per month. The fee covers foods and accommodation.

The funds collected from students are administrated by Finance Section of the Pesantren. The above figures show that pesantren provides services for students at low cost. Even though this pesantren now charges higher fees than previously, they are still significantly cheaper than non pesantren educational institutions, even compared to the government run high school institutions. When asked how does the pesantren manage this limited budget to fulfil the need of students. The director of pesantren said:

> [Laughing] I don't know how to do it, but we try to manage them effectively and efficiently. I think it is a matter of honesty.

MANAGEMENT OF PESANTREN PEACE

Historically, religious organizations are managed   by people who have very little knowledge of financial management. However, such a situation is not happened to the Pesantren Peace. Currently, Pesantren Peace is managed by a director or usually called "Mudir" who exercises overall control of pesantren and its affair. The director is not formally trained in religious study. He is a dedicated and successful man who had experiences in managing business organization. He is also the son of one of the founders of Pesantren Peace. The director is assisted by one deputy director, also refer to as "Wakil Direktur" (who hold degree in Islamic studies from the University of Al Azhar, Cairo), a secretary, and treasurer [Head of Finance Section]. Furthermore, the Director is also assisted by several sections head. Except those who are working in finance unit, almost all of unit managers are graduates of Pesantren Peace. Managers of both schools, for example, are alumni's of Pesantren Peace who have already hold university degree in education, and one of them is now doing master program in education. The organizational structure of Pesantren Peace is illustrated in figure 2

Organization Structure
Pesantren Peace

Figure 2 : Organization Structure of Pesantren Peace.

The above figure shows that the highest authority in the organization of the Pesantren Peace is in the hands of Director. All people in the organization structure are responsible to the director for the activities performed. However, unlike in the traditional pesantren in which the leader of pesantren "Tengku" has total power and authority to control any aspect of pesantren, the role of director in Pesantren Peace to some extent is restricted. He also has to consult with the foundation committee as the director explained:

> The other parties involved are definitely the committee of foundation. If I do not carry out my task well, of course the foundation committee has the right to pose questions. They will caution me.

The director of Pesantren Peace was appointed by the director of the Foundation Kita. Historically, Bupati, [the regent] of the District of Aceh Timur [Eastern] automatically

become the director of the Foundation Kita and he is eligible to appoint the Director of

Pesantren Peace. As the director of pesantren commented:

> Historically, the Head of the District automatically become the director of the Foundation. Since [the city] achieve a city status, it is the mayor who automatically becomes the director of the foundation. It is the mayor who appointed me as the director of pesantren.

In managing the pesantren, the director acknowledges that he has full autonomy and

authority to develop all aspects of the pesantren. He is responsible for the development

and advancement of pesantren to serve the community.

The management of pesantren did not formulate any formal standard guidelines or

procedures in managing the pesantren operation. There process of formulating the

guidelines and procedures are just started as commented by the human resource

manager said:

> We now try to develop one which includes recruitment and leave procedures. It is, however, not yet ready for use as a standard procedure since it is not fully completed and still needs to be further evaluated.

There is also a group called Majelis Istihsyar [Advisory Board] in this organization. This

advisory board comprises of 10 senior persons that have been long involved in

Pesantren Peace activities and their duties are to provide direction and guidance for the

management in various aspects, except for financial matters. They are not compensated

for their services, since they work on a voluntary basis.

FINANCIAL TRANSPARENCY IN PESANTREN PEACE

The issues of financial transparency and whether or not a non profit organization, should

make their financial information available to the public is a complicated subject. Even

though, the majority of scholars, including Muslim scholars, agree that such information

should be made public, not every foundation is ready and voluntarily publish such

information. Not every one agrees that such information should be made public. The

Manager of Human Resources indicated that so far the management of Pesantren

Peace has not made its financial information available to the public. As he elaborated:

> It is difficult to apply ideal things in such community. On the one hand, we want a complete public transparency through media etc. On the other hand, due to the lack of understanding on the part of community, they tend to use mass media to criticize any minor issues and to damage the image of the institution. I saw such tendency, especially here.

Ideally the public is entitled to the basic of information about the organization but it is

very difficult to implement it in practice. Pesantren Peace is reluctance to make its

financial figures available to the public since due to the fear that some people will use

the information for irresponsible purposes such as to harm the existence of the

organization or creates a lot of problems to the organization. The same view was also

expressed by the director of Pesantren Peace. He affirmed that providing organization

financial information to the public is good to avoid negative issues. However, the

organization needs to be very careful. Seen from this light, reluctance of Pesantren

Peace to make its financial information available for the public might be judged as

somewhat irrelevant to the best interests of the organization. Also, it possibly can create

a lot of problems to the organization. These kinds of views are also found in other

studies in the area of non profit organizations accountability as noted by Kuan et al,

(2003, p. 14).

> There are many reasons why even the legitimate NPOs are reluctant to make public their financial figures that we might judge as somewhat irrelevant or unfounded. For instance, an NPO successful in fundraising might not want to advertise too much its success for fear that the public will think it has enough money and will stop giving. Another example might be of an NPO relying on government funding that is reluctant to advertise the amount of subsidies it received for its projects because it is fearful of competition from other NPOs.

In case of Pesantren Peace, the director emphasized that the management of pesantren

provided its financial accountability report to the foundation committee since the

committee is the "representative of society at large", to the government and to private organizational donors. However, there is no financial report given to individual donors who usually contribute a small amount. This is reflected from the following comments of the director of the Pesantren Peace. As he said:

> We only provide reports for any donation received from organizational such as BRR191 or local government...There are always financial report submitted to the foundation committee…No financial reports has ever been made public …unless it is concerning with a great amount of money. As long as I know no single member of the community had ever requested for financial information.

The above quotes imply that the willingness of this organization to provide financial accountability is not free from the demand and enforcement from other parties. Because government, private organizational donors or foundation committee, for examples, usually have power to impose on the recipient of fund, i.e., Pesantren Peace to ensure the donations are properly utilized. It is usually done through the use of reporting and monitoring activities. While, the society or individual donors who contribute the small amount usually do not withdrew their donations or demand accountability reports. This may be a logical position for the management of Pesantren Peace, since if the management rejects the demand for accountability made by funding bodies the organization may lose funding.

Furthermore, the management of the Pesantren Peace is also accountable to its targeting beneficiaries through the annual general meeting with students' parents. This is reflected from the statement of Human Resources Manager. As he said:

> There is no specific forum for financial explanation to public, it never happens. It is only for student parents. And it is not only explaining the financial situation of the pesantren and it happens only during annual meeting.

---

[191] Badan Rehabilitasi dan Rekonstruksi (Rehabilitation and Reconstruction Board) Organization established on April 16, 2005, to implement Aceh and Nias,Indonesia post-tsunami *reconstruction*

Thus, the accountability in this institution is defined in term of reporting its financial affair only to the government, to certain private organizational donors and to the students' parents as its beneficiaries. The management of pesantren does not view the general public at large as a key audience or stakeholders for the purpose of reporting its financial information. This is also happened to many other NPOs as documented in previous research of foundation as Kuan et al (2003, P.266) explains:

> The organization felt that dealing one on one with funding agency by complying with its reporting regulation was enough and didn't see the need for the public disclosure. For this organization, and perhaps for many other NPOs, accountability to general public mostly means letting the public know about the work and the results achieved by the organization, but it does not necessarily imply that the organization has to make its financial information available.

In spite of this, the director highlighted that accountability to public is important but not in term of providing financial figures. As he explained:

> The most important thing is to provide information to the public such as the number of students on our scholarship to study either in Egypt or Java. Our graduates are generally of high quality. Basically these are the information we provide to the public. We do not provide our financial information.

The management of pesantren uses program outcome approach to show its accountability to society. This might be a logical position for some of the non profit organization, such as the Pesantren Peace where it receives financial support mainly from certain donors and provides services for a certain group of people in the community. However, these reasons are somewhat not consistent with the view of Muslim scholars as reflected in the comments of the Muslim scholar:

> So by right the Muslim has direct accountability, the donors, and from the Islamic point of view, even though you are not a donor, you also have direct accountability, for example the recipients, the recipients of zakat money for example, why are you one of the stakeholders, reason is, you have the right to receive from that money, to the poor, and in fact the Muslim at large, all the Muslim public.

The management of the Pesantren Peace also implements what they called "open financial management" as commented by the Director of the pesantren:

What I am doing right now is an open financial management. Suppose, we receive some donations, I always inform all members [organization staff]. Therefore, my financial administration is somewhat open which is different from previous administration.

The human resources manager acknowledged that it is a strong willingness of the pesantren is transparent; however this has not been undertaken mainly because they do not have the person with the required skill:

We have strong willingness to show financial transparency. However, we have a big constraint in term of human resource. It takes an expert to establish good transparency at our institution. Our constraint is lack of skilful staff.

It is important to note that that in the past, Pesantren Peace received a lot of fund from local [district] government and public donations, either from individual donor or organizational donors. As mentioned, the Director of foundation committee was always held by the chief of District of Aceh Timur (The Regent). Therefore, Pesantren Peace received a lot of fund from the District government. Consequently, Pesantren Peace holds a lot of fixed assets, such as land, school buildings, dormitories, mosque, etc. As director of pesantren said:

In the past, based on the previous foundation regulation, every regent was appointed to be the head of the foundation. Therefore, there are a lot of local resources. There was financial deduction from various government budgets which is injected to the pesantren. Thus, although this is a private institution there were many government officials working for this pesantren. As a result, we now have such a big pesantren which is because of the support that we received from the local [district] government.

No one in the pesantren entitle to claim any individual rights of ownership over these assets. Notwithstanding, few documents of fixed assets such land certificates are still registered in the name individual persons and in the process of transferring the titles. However there as some problems as mentioned by the director:

Some of the lands still remain under the name of the former directors of pesantren. It is because Pesantren [Peace] didn't have required documents back then. So that the land affairs agency refused to transfer them under Pesantren Peace's name (Director of Pesantren).

Furthermore, Pesantren Peace does not have the proper documents of the fixed assets owned. Currently the main financial sources of funds are now students fees, and special financial aid from government agencies such as [Department from Religious Affair] to cover operating cost of school. The donations from local government and private donors cannot be expected regularly. There is almost no financial source received from the Foundation Kita as its patronage.

ACCOUNTABILITY RELATIONSHIP IN THE PESANTREN PEACE

Pesantren Peace views itself as accountable to three different levels of stakeholders. Firstly, it's accountability to donors, either private organizational donors, or government donor. Secondly, it's accountability to one another and themselves, as the unit manager, staff, foundation committee, and its partners. Thirdly, it's accountability to those who are served by the organization, in this case the community in which their children are educated by the pesantren [students' parents].

There are three types of accountability relationships, i.e., upward, lateral and downward accountability in the pesantren. Upward accountability is accountability to donors. Downward accountability refers to accountability to the clients or to individuals or groups to whom NGO provided goods and services (Christensen and Ebrahim, 2004). Whereas, literal accountability is an extension of the upward and downward accountability, and this refers to organizations accountability to their staff, their mission, goal and their partners (Christensen and Ebrahim, 2004, Jordan, 2005). Lateral accountability also means that manager of each unit in the organization has the responsibility to give account to its superior or to the higher authority.

In case of upward accountability, the management of Pesantren Peace only fulfils financial accountability to government and private organizational donors. There is no financial accountability to the individual donors. This accountability is shown through sending reports and through verbal explanations during monitoring visit from the donors. Pesantren Peace always receives monitoring visit from either government agencies or organizational donor that provided financial aid. This is also highlighted by the Directors of two donor institutions. As they said:

> After giving financial support, Department of Religious Affairs makes a field visit to monitor financial spending, and also to ask the beneficiaries to give account of expenditures made together with physical evidences
>
> (Head of Government Agency)

> Yes, when we donate money to them, we also some time visit their organizations to ensure that they are transparent, accountable, and also have good management both financial and general administration…our monitoring team visit the field and office to ensure the quality and the progress of the project
>
> (Director of a Private Organizational Donor).

In term of literal accountability, each head of unit within the pesantren has to give account to the Director of the pesantren either periodically or by request. All of them have to make sure that financial resources are used properly. This is usually ensured through both formal accountability [written] reports and informal accountability [explanations].As Manager of Human Resources said:

> Reports from unit's managers are always required either through meeting, formal [written] or informal explanation.

While accountability to it's beneficiaries as downward accountability is done by giving oral explanation and discussion during annual meeting with students' parents. Clearly, accountability relationship in Pesantren Peace is "multi-layered" accountability is performed through different tools to different audience.   Table 1 provides a summary a various accountability tools used by Pesantren Peace.

	Accountability To Whom	Accountability Tools
Upward/External Accountability	◆Private Organizational Donors ◆Government Agency	◆Formal [written] Report ◆Expenditure evidence [Invoices] and photo of physical progress for certain donor ◆Verbal explanations to donor during monitoring visit team
Literal/Internal	◆Foundation Committee [Board] ◆Unit Managers, Staff	◆Formal [written reports] ◆Expenditure evidence [invoices] ◆Staff Meeting ◆Informal communication among staff ◆Phone conversation ◆Attending board meeting ◆Regular contact with School managers
Downward Accountability	Beneficiaries Students' Parents	Verbal explanation and discussion during general annual meeting.

Table 1: A Summary a Various Accountability Tools Used By Pesantren Peace.

Interestingly, despite the hierarchical nature of the Pesantren Peace, there are different accountability requirements for the fund used by certain sub units of the pesantren. For example, special financial aid received from the government such as BOS [School Operating Cost] fund. The government, in this case Department of Religious Affair directly transfers this kind of fund to the account of the school units, not to the pesantren account. This transfer of fund follows the government policy in which the units [schools] must be administrated separately. Thus, the school managers have their own treasurers, and the schools are only directly accountable for this fund to the government agency by complying with the government reporting regulations. Whereas, to the director of the pesantren, they only need to inform the total amount of such special fund received and disbursed.

Figure 3 illustrates diagrammatically the financial accountability relationship adopted by the Pesantren Peace.

Figure 3: The Financial Accountability Relationship Adopted by the Pesantren Peace.

The above figure shows that there are various stakeholders to which Pesantren Peace is supposed to be accountable. These stakeholders can be broken down in to two main groups. Those out side the organization or called external stakeholders and those inside the organization or internal stakeholders. Among external stakeholders three main groups are identified. They are donors who provide charitable support, students' parents (clients) who use pesantren services, and the community that benefits indirectly from the services. Whereas inside the organization, two different groups that have a stake in pesantren are identified. They are foundation committee and the staff.

This seems that the Pesantren Peace views itself as steward of the fund entrusted to it's institution with the requirement to give an account of it's stewardship to it's stakeholders. The management of pesantren has to provide a link between amanah [trust] and a total accountability and responsibility to human being. This belief is consistent with the concept of accountability as manifestation of Islamic teaching in which Muslims cannot separate between accountability to God from accountability to human being. Thus, as an Islamic religious organization, the pesantren has to satisfy accountability obligations to a range of stakeholders including government, private corporate donors, clients and members, as an integral part to satisfy accountability obligation to God.

ACCOUNTING AND ITS ROLE IN PESANTREN PEACE

The field of accounting in non profit organization, particularly, religious organizations has been the subject of previous study (see Laughlin, 1990; Rahim and Goddard, 1998). It purpose is to obtain an instrument for internal and external stake holders to be used to manage and monitor the organization mission development. For example, when a non profit organization receive a donation it is essential to quickly record the amount and report how it is spent. It is argued that ideally accounting and financial reporting system lead to better decision making either for internal management or external stake holders, such as government and donors. Besides that, as mentioned in the literature, accounting information has long been used as the main accountability tools in any organizations activities, regardless of their objectives and missions.

In case of Pesantren Peace, the management sees accounting as an instrument that plays a very significant role in the organization as reflected from the explanation of Human resources manager :

> Accounting is indeed very necessary for an organization, like in this pesantren. I do
> not see accounting only from the viewpoint of working professionalism or the

standards used. Even in Islamic teaching, as a matter of fact, accounting, record, report etc are very important. No matter how well a person carry out a task there would be bad assumption from other parties if it was not accompanied by good recording.

He further said:

I believe accounting is absolutely important and it is a part of religious activities because Islam encourages recording. It can be establish if supported by a good accounting, as well as good transparency. I think it is very crucial.

This view is also reinforced by the Director of pesantren. As he said:

In the past this pesantren was a mess, unorganized, because of poor accounting practices. They were only concern about the religion. I think accounting is also part of religion.

This understanding implies that for the management of Pesantren Peace, accounting activities are viewed as activities that have no contradiction with the   pesantren mission and it is perceived as an integral components of managing the pesantren institution or in other words sacred in nature. Thus, in practice accounting is not treated as irrelevant to the organization mission as it was documented in previous research of some religious organizations.

 In short, a sacred secular divide where accounting is viewed as secular activities is not the case for Pesantren Peace. This departs from the major finding of previous research such as the Church of England conducted by Laughlin(1988, 1990) in the sacred/profane dichotomy. However, it is consistent with the concept of accounting activities identified in the previous research on Islamic religious organizations conducted by Rahim and Goddard (1998).

Contrary to what the management of Pesantren Peace said, in practice the accounting in this organization is not functioned maximally. Accounting activities are performed by people who have administration skill and not by professional accountants since the pesantren does not employ the professional accountant. As director said:

1180

> The finance unit manager is not good at accounting, but I coach her based on my experience in industry I was involved…I have to say that there are some recording are not suitable. Therefore, I try my best to improve it. Hopefully it is getting better.

This quote implies that even though accounting is considered to play an important role to support the achievement of the goal of Pesantren. The management of the Pesantren Peace does not pay enough attention for accounting activities. This also can be seen from the system used, in which all transactions are still processed manually, even though, Pesantren Peace have had huge assets to be managed. As a result, the accounting section is unable to implement good accounting practices. Furthermore, there is also no accounting procedures manual regarding accounting practices

Pesantren Peace produces both monthly and annual reports which consist of simple cash income and expenditure reports. The information is about transactions and the cash balance during a reporting period. The reports rarely, if ever are used to evaluate past performance. There is no other financial report prepared by finance section. The financial reports provided are used for both accountability and for decision making purposes. Even though, in practices, it more focuses on accountability to its financial sources in order to make itself accountable for its actions. This is reflected in the following comments:

> Financial report is basically used to show financial accountability to the donors and also to help decision making of what to do with the existing financial situation (Human Resource Manager).

> Financial reports are used to make decision and also for the accountability to the Foundation committee and the donors. For instance, the construction of the building should be delayed because of financial problems [insufficient finance] (Director of Pesantren)

Thus, the accounting practices in the pesantren mainly focuses on control of receipts and disbursement of fund through providing monthly and annually cash receipts and cash disbursement reports which are mainly used for accountability purposes. There is no consolidation financial report provided to provide an overall financial condition of

Pesantren Peace. The format used is likely similar to what it is called fund accounting. In the pesantren, budgets are produced occasionally and only for physical development as Director said:

> No written budget is prepared, except for physical construction. It has been a standard, for general kitchen for example, it can be predictable. But still the budget should have been made. I have made a lot of improvement since my coming here in 2004, and I think we are heading to the right direction.

For physical construction, the budget is some time used to measure the effectiveness the efficiency of the materials used through comparison the budget figures with the actual figures. This is depicted from the statement below:

> For building construction, I directly supervise, for example, I ask question why they bought 100 sacks cement while in the budget there are only 50 sacks written (Director of Pesantren).

Thus, budgeting is not seen as part of accounting activities as well as accountability mechanism. The budget was not perceived as the most important organizational process with respect to accountability purpose. As mentioned, none of those who involve in management team have accounting or management educational background. It is also important to note that in this institution fund spent is not classified as program and administrative expenses. As a consequence, seen from accounting point of view the management cannot measure the organization performance. Since, one way to judge an NPO's performance is "to measure the amount of resources the organization spends on providing program services (to carry out its purpose) vs. what it spends on management and general expenses and fundraising. For most organizations, a higher percentage of resources spent on program services than on management and fundraising is considered a positive performance indicator" (Henderson et all, 2002, 3).

INTERNAL CONTROL AND FINANCIAL ARRANGEMENT

There have been a number of previous studies that have documented the important of good administration and internal control in religious organizations such as churches and mosques. Internal control theory suggests that good internal control structure will result in less embezzlement (see West and Zech 2008;   Sulaiman, 2007; Berry, 2005). This study explores two aspects of financial arrangement of Pesantren Peace. They are the administration and internal control procedures of the receipts of revenue and the disbursement of fund.

Cash Receipts

In Pesantren Peace, particularly, the ways the Finance section handled receipts or fund collected either from students, donors and society are under policies of the management of pesantren. There are three control activities for this affair, which are the recording aspect, the physical custody of the fund and the segregation of duties.

 At a collection stage, a cashbook for cash received is maintained. The accounting section records all it's financial transactions in cash book as the head of finance said that "all cash inflow and cash outflow are recorded in a special cash book". Pesantren Peace appointed two cashiers to handle the collection of cash, the Chief of cashier and another one is assistant cashier. A report of collections is given by Chief of Cashier to the Head of Finance Section [treasurer] [192] for recording in the cash book. The task and responsibility of counting and recording of the collections in a cash book are segregated to different officers as explained by the head of finance

> The cashiers have to do calculation every afternoon. Then they submit it to me. I also counted the amount based on the receipts submitted to see if it corresponds with the cashier calculation. (Head of Finance Section)

---

[192] Head of Finance Section is some time called treasurer

This is very important to avoid losses resulting from financial misused because embezzlements often occur when trusted employee have access to both assets and financial records. Therefore, a fundamental tenet of internal accounting controls is to keep the financial records keeping separate from those individuals that have access to assets, especially cash (see West and Zech, 2008)

Thus, there is a financial control procedure in Pesantren peace for the collection of fund. Amazingly, all officers of accounting section have limited knowledge of internal control; even they do not even know the advantages of the segregation of duties of counting and recording of collection activities. When asked why the pesantren need to segregate this task? The Finance Section Head explained that she did not know that this task should be segregate for the purpose of internal control. As she said: "To tell you the truth, I don't really understand why we need the segregation of duties." They just follow the policies made by the director of the pesantren. Whereas, the director of Pesantren Peace realized the importance this segregation of task due his prior working experience in managing business organization. As he said:

> I was the manager of [business organization] which has activities throughout Aceh. Therefore, I was asked to lead this pesantren. The knowledge that I gain from the company helps me a lot in leading this institution.

All cash received are kept in a safe "locked box on pesantren premise" since the cash receipts are not always banked since part of it are used for daily expenditures. A monthly report of cash receipt is routinely prepared by accounting section. Four copies of monthly collection reports are send to the director of the pesantren. As the head of the Finance Section said:

> We submit four copies of monthly report of cash received to the director. Then the director decides to whom the report will be submitted whether to foundation committee or any other parties. It is the concern of director.

In the pesantren, at least four persons, i.e., the director, director, the deputy-director, secretary and head of finance unit have the information about donation and other aids received from society.

Cash Disbursement

Major disbursements are sometime made by cash. Serial numbered cheques are only used if there is no cash. Salary payments are made by cheques. If disbursements are made by cheques, two people are required to sign the cheque, i.e., the Director of pesantren and the Head of Finance Section. An invoice is treated as a mandatory supporting document for payment in this organization. Except for routine disbursement such as expenditures for kitchen, all   invoices for other goods and services expenditures are required to be checked for accuracy, and approved by Director of Pesantren before payment is initiated either using cash or using cheque. The Head of the Finance Section will not issued cash before getting approval from the Director of Pesantren. All disbursements use official receipts as based for recording for the treasurer to record in cash book. The pesantren does not maintain a petty cash fund. For such disbursement, the pesantren also issued from the same source used for major disbursements. The small disbursements are also initiated with vouchers that have to be approved by a responsible officer, in this case.

THE ROLE OF BOARD IN ENHANCING ACCOUNTABILITY OF PESANTREN PEACE

Financial accountability can be improved by several measures. One of them is that the organization should have a board of director that compose of independent individuals, including some not directly connected with or interest in the organization. In non profit

organization, the board can play a critical role not only to make selection of the director of the organization, but also play a central role in enhancing accountability of the organization in ensuring that the organization resource are used wisely and the mission is fulfilled (Kuan et al, 2003). In practice, the board members of non profit organizations, including religious institutions usually consist of volunteers, whose efforts are mainly dedicated towards advancing the missions of the organization. Previous study of foundation conducted by Kuan et al (2003) documented that the most important responsibility of their foundation board members is to verify an organization annual work plan followed by verifying and approving annual budgets and financial accounts and defining organization tasks and operational procedures. It is also mentioned that board governance as an important issue when discussing accountability topic of non profit organizations. Even, some view that it is extremely important for the board of directors to play a central role in accountability.

In the context of Pesantren Peace board members or those who are eligible in monitoring and ensuring proper organizational accountability are referred to the committee of Foundation Kita. This foundation committee, currently consist of 8 persons, which consist of one Director, one Deputy Director, one Secretary, one Deputy Secretary, one Treasurer, and three advisory. In the past the Director of foundation committee was also the director of Pesantren Peace.

> Previously, board, Chairman of board was also the director of this pesantren. He was the one who supervised and at the same time managed the pesantren. (Human Resources Manager)

Consequently, the board played very limited role and their function in enhancing financial accountability of pesantren is rather weak. Their function is mainly on giving final

approval of decisions made by the director of Pesantren Peace. This is depicted from the following quote

> When we receive fund like for the school operational fund, the foundation committee just signed the paper so that the money can be spent legally. Never have I been invited, never. It is us who invite them [foundation committee members].

However, with the new regulation, now those who hold position as an executive member of Pesantren Peace are not allowed to be part of foundation committee. This policy has been in line with the literatures of foundation accountability which suggested that a strong oversight board must be independent from management practice (Jordan, 2005). From the management control system point of view, this segregation is very important, because if any board members is directly benefiting from the work of the organization, it can create a conflict of interest.

Seen from their involvement in the development of Pesantren Peace, currently, committee of Foundation Kita is considered as passive. They are not involved with fund rising efforts of the pesantren. Furthermore, they do not set the initiatives to invite the director of pesantren and his members for financial accountability meetings, and also never review and verifying the financial report prepared by management of pesantren. This is reflected from the following comments:

> The supervision is actually necessary. The committee should monitor and provide advice and guidance to us. But, it never happens. They only come when we invite them. If we don't invite them they do not come. I think it is a real set back and it should not be that way (Director of Pesantren).

> The persons who have the knowledge about the pesantren business are previous committee members. The current committee members are somewhat passive, since reshuffle just took place. Because of the reshuffle they have to start from the beginning. They are not very well informed about the assets and financial condition of pesantren
> (A Committee Member of the Foundation).

Interestingly, the Director of Pesantren Peace tends to accept the passivity of foundation and he never makes efforts to get them to be more involved. This passive committee is

because of factors such as the low degree of professionalism of board committee and the busyness of the committee members themselves. None of board members holds degree or has training in accounting or management. They do not understand their roles in overseeing the pesantren. As a consequence, they cannot perform their duties as it is required.

Nevertheless, the foundation committee has expressed their willingness to be more involved and participate actively to advance the organization mission. As explained by a treasurer of committee members of foundation Kita:

> Now the foundation committee has made a plan to examine and audit the two institutions under the foundation. In the first meeting held in the beginning of March 09, they asked the directors of the two institutions to describe the assets condition of the respective institutions.

This initiative is also acknowledged by Human Resource Manager as he explained:

> They started to invite us [pesantren management] at the beginning of March. That was the initial step of the foundation committee…They would like to know the real condition of the pesantren in general, including its management and its finances.

According to the treasurer of foundation committee, the audit team itself will compose of Committee members of Foundation Kita and all of them serve voluntarily, and independent from any financial interest in the pesantren organization.

CONCLUSION

Pesantren Peace reflects another approach to Muslim education in the NAD province-Indonesia at present. It is creating a new type of modern Islamic boarding school in the region. In fulfilling its role as Islamic educational institution, this pesantren offers both the standard curriculum set by the Indonesian government and traditional religious topic [classical Islamic text book]. As such this institution is usually called modern pesantren or integrated pesantren by the community. Even though Pesantren Peace is non government organization, the system adopted can match the standard of any public

schools. Unlike many other pesantren graduates who cannot qualify to enter the post of secondary school, Pesantren Peace graduates qualify to continue their education in at public institutions either in Indonesia or overseas. The organization mission emphasis on intellectual aspects in providing education for Muslim students and to nurture them to become pioneers in implementing Islamic law comprehensively and establish civilized society, particularly, in the NAD province-Indonesia.

This Islamic boarding school is owned by a foundation in which the operation depend mainly on public trust and support. It received a lot of fund from the local government and public donation, either from individual donors or organizational donors. Pesantren Peace views itself as accountable to three levels of stakeholders. Firstly, it's accountability to donors, either private organizational donor or government donor. Secondly it's accountability to one another and themselves, as unit manager, staff, and foundation committee. Thirdly, it's accountability to those who are served by the organization, in this case the community whose children are educated by the pesantren.

The management of Pesantren Peace views financial report as an instrument that play a very significant role in enhancing accountability, and accounting activities are viewed as activities that have no contradiction with the pesantren mission. This is departs from major findings of previous research in religious organizations such as the Church of England conducted by Laughlin (1998, 1990) in which accounting activities was not treated as relevant to the organization mission.

Notwithstanding, in practices the management of Pesantren Peace does not pay enough attention to accounting activities. Accounting in pesantren is done by people who are not professional accountant. None of those involved in management team have accounting

and management educational background. As a result, the organization is unable to implement good accounting practices. Even though, this institution has had huge assets to be managed. The overall impression of accounting practice in Pesantren Peace is less develop and it only focuses on control of receipts and disbursement of fund through providing monthly and annually cash receipt and cash disbursement reports which are mainly used for accountability purposes. There is no consolidation financial report provided to picture the overall financial condition of the organization.

In the study found that currently the foundation committee play very limited role and their function in enhancing financial accountability of pesantren is rather weak. They do not set the initiatives to invite the director of pesantren and his members for financial accountability meeting, and also never review and verifying the financial report prepared by management of pesantren. Interestingly, the director of pesantren tends to accept this passivity and he never make efforts to get them to be more involved.

Thus, there is the need to improve the accounting and accountability of the pesantren. The more an organization provide complete information to the public about its management, and its finance, the more the public will have confidence in it and willing to support it (Kuan at al, 2003). Hence, all non profit organization, include those that define themselves as Islamic-based religious organizations should view providing financial information to the public as an opportunity to increase public understanding of their work rather just unwelcome it as a demand to be met since accountability improves the trust and confidence of those with whom the charity deals specifically the donors and the beneficiaries of funds.

THE IDEAL SHARI'AH AUDIT FOR ISLAMIC FINANCIAL INSTITUTIONS (IFIs): PERCEPTIONS OF ACCOUNTING ACADEMICIANS, AUDIT PRACTITIONERS AND SHARI'AH SCHOLARS IN MALAYSIA

Ratna Mulyany, International Islamic University Malaysia
Shahul Hameed Hj. Mohamed Ibrahim, International Center for Education in Islamic Finance (INCEIF)

Abstract

Shariah auditing has currently emerged as an important subject of discussion inline with the advance development of Islamic Financial Institutions (IFIs) which subsequently demand for the proper governance of the Shari'ah compliance issues. As a new emerging discipline, its scope of study, subject matter and body of knowledge is still in the process of development. This research aims to discern the perceptions of accounting academicians, audit practitioners and Shari'ah scholars on the subject of Shari'ah auditing.

By focusing on the fundamental issues of Shari'ah auditing for IFIs, this study has utilized the literature in this area and mail questionnaires to gather the data. The questionnaires aims at obtaining respondents' perceptions towards the fundamental issues in Shari'ah auditing i.e. the understanding of the term "Shari'ah audit", the appointment of Shari'ah auditors as well as their qualification requirements, areas to be audited under Shari'ah audit, the content of Shari'ah audit report, regulatory framework for Shari'ah audit practice, and the standards to be applied in performing Shari'ah audit.

The mail questionnaires were distributed to the accounting lecturers teaching in the Accounting Program at public universities in Malaysia, audit practitioners, and Shari'ah committee members of the Islamic commercial banks and Islamic subsidiaries of the commercial banks in Malaysia. This study reports an urgent call for the systematic development of the discipline Shari'ah audit. Most of the respondents also perceived the significant need for the establishment of a regulatory body to oversee the practice of Shari'ah audit, the standardized qualification and competence requirements for Shari'ah auditors, and a more comprehensive content of Shari'ah audit report.

1. INTRODUCTION

The emergence of Islamic financial institutions (IFIs) has created a new reality within the global finance arena, and supports the development of Islamic economics in particular. At its core, the research conducted on Islamic economics has increased tremendously in the past few decades. Though the effort to formulate the ideal Islamic economic system is still ongoing but its development triggers significant changes in many aspects of business activities, such as in the areas of accounting and auditing.

In the field of auditing, the establishment of IFIs results in a new dimension of auditing, i.e. Shari'ah audit, which is in addition to conventional audit. Its philosophies and basic principles are however, not new, having been practiced in the time of Prophet Muhammad (p.b.u.h) and His companions. Subsequently, those principles also were carried over during the time of Ummayyads and Abbasids (Khan, 2001). However, it is not the purpose of this study to provide in depth discussion on auditing practices in the early Islamic era.

Shari'ah audit might be simply defined as an audit to attest for Shari'ah compliance. However, how to comprehensively define the discipline of Shari'ah audit? Who are qualified to perform the task? What is the scope of Shari'ah audit? How do we audit the various dimensions of Shari'ah? Does Shari'ah audit necessitate a dedicated regulatory and supervisory framework on its own? These are among the questions that are yet to be resolved with regards to the Shari'ah audit. As a result, the theory of Shari'ah audit as well its practice is little known and heterogeneous across the countries. This phenomena has been largely caused by the absence of an established framework for Shari'ah audit that can serve as a guideline as compared to the conventional audit.

Ideally, there should not be any separation between "conventional audit", which refers to financial audit, and Shari'ah audit. In line with this, Karim (1990) contended that religious auditors and external (i.e. financial) auditors are supposed to come from the same organizational body since Islam does not separate between *religion* and *business*. Islam perceives all human activities are integrated and they should not be seen as exclusive from one to another. If those activities, e.g. business, rituals, etc., are performed with the right intention, they will be accounted as *ibadah* in the eye of Allah and deserve rewards accordingly. Therefore, if Shari'ah is explored and understood in the right way, it would be very comprehensive and covers all elements of human life. Hence, financial matters, social and environmental issues are all concerns of the Shari'ah. This is supported by Khan (2001) where he asserts that in public life, the objectives of Shari'ah may be summarized as evolving a society in which the values of freedom, mutual trust, consultation, accountability, public welfare, transparency in public policy, the rule of law, and elimination of injustice, corruption and fraud are supreme.

2. LITERATURE REVIEW

Very limited studies have been devoted to Shari'ah audit. The society at large and the business world particularly, are still confined to conventional audit which focuses on financial statement audit. Even though certain groups of academicians have embarked on the idea of social or ethical audit which initiate a different view on auditing, however this movement is still challenged in terms of recognition (Gray et. al., 1996).

Since there are very limited studies exploring the auditing from Islamic perspective hence this study attempts to explore the writings which can be related to the field of this study. To date we have writings which attempt to explore the conceptual framework of auditing from Islamic perspective (e.g. Khan, 1985; Briston & El Ashker, 1986; Harahap; 2002), writings which highlight the auditing issues in Islamic banks (Al Abji, 1989; Janahi, 2000; Simpson & Willing, 2000) and the studies on the role, functions, responsibility and independence of Shari'ah advisors (for example Abu Mouamer, 1989; Abdallah, 1990; Abdul Rahman et al., 2004; Shafei, 2005).

Apart from the above, there are also studies that compare the different models of the roles of Shari'ah Supervisory Board (SSB) and external auditors in Islamic banks (Banaga, 1994), the notion of independence between SSB and external auditors (Karim, 1990) and possible interaction between the two parties (Hood & Bucheery, 1999). The relevance of Islamic auditing to the public audit institutions has for instance been explored by Khan (2001) who analyzes the role of Supreme Audit Institutions (SAIs) in the Islamic economy. The latest study which is more comprehensive in identifying the issues and challenges of Shari'ah compliance process in the IFIs is a paper by Grais & Pellegrini (2006) on corporate governance and Shari'ah compliance in institutions offering Islamic financial services. Their study has explored the limitations in relying the Shari'ah compliance assurance to the internal party (i.e. SSB) and proposed an effective framework to monitor and asses Shari'ah compliance.

Of the various concerns highlighted by those writings, there has been one common proposal stressed by the scholars which is the need for a proper theoretical, practical as well as regulatory framework of Shari'ah compliance assessment in the IFIs or even in the other Islamic institutions. This further signifies the importance of the systematic institution of the discipline of Shari'ah audit. Even though many scholars have regarded SSB as religious auditors and equate the functions of SSB as the functions of religious (i.e. Shari'ah) auditing (see for example Briston & El Ashker, 1986; Abu Mouamer, 1989; Karim, 1990; Abdallah, 1994; Hood & Bucheery, 1999), there seems a limitation in such assumption. As highlighted by several of the above studies, by considering the current structure of the SSBs there seem to be major concern of whether SSBs are well qualified and also independent enough to perform the duty of Shari'ah audit. There is also the question of whether the concept of Shari'ah audit be confined to the current functions of SSBs. On the other hand, empowering the external auditors to perform Shari'ah audit might also create a dilemma of whether they have necessary expertise and qualification in the field of Shari'ah.

The earliest study that could be traced with regards to Sharia'h audit is a study by Khan (1985) who provided one of the initial discussions on auditing in Islamic framework. He introduced the issue of Islamic auditing by exploring auditing practices in the early age of Islam. Deriving from that background, Khan (1985) proposed a framework of auditing in Islamic economy. Khan (1985) refers auditing in Islamic economy as a normative art which is inspired from the moral code of the Shari'ah. He opined that as opposed to auditors in the capitalist framework, auditors in the Islamic economy are not only answerable to the management and shareholders but also to the society at large. Auditors, while assessing the Shari'ah adherence of entity's financial statements, are expected to carry out their main responsibility of '*amr bil ma'ruf wa nahi 'an al-munkar* (enjoining the proper and forbidding the improper).

Al Abji (1989) seems to support Khan's (1985) argument where he criticized the function of conventional auditors in Islamic investment companies and banks. He did not specifically address the issue of Shari'ah audit; however his main concern is that function and responsibility of auditors have to be revised in order to meet the requirements of unique characteristics of investment in Islamic banks. As Khan (1985) distinguished the characteristics of auditors in capitalist framework versus Islamic economy, Al Abji (1989) with the same point of view also argued that official duty of the auditor changes in all its dimensions in accordance with the economic, political and social changes that take place. Thus, Al Abji (1989) contended that the establishment of Islamic economic system absolutely gives impact on the duties of auditors. By specifically looking at the issues of functions of auditors in Islamic banks, Al Abji's (1989) study further suggested to develop the responsibility of the auditors so as to cover the group of depositors and for depositors to form an organizational system (i.e. general assembly for depositors).

Karim (1990) analyzed the independence of auditors in a different cultural setting by comparing the notion of religious audit (performed by SSB) and external audit in Islamic banks. He argued that the perceived independence of the SSB is very much influenced by moral-religious values, while that of the external auditors is largely affected by economic factors. Karim (1990) also argued that another incentive for SSB's independence is due to the belief that a rational management would be very keen to adhere to religious precepts since the cost it would bear for a reported breach would be more than the cost it can impose on the SSB. He further elaborated that if religious auditors report any misrepresentation in the bank's financial statements that are due to a violation of Islamic principles then the consumers of these statements are likely to react in a manner which could be detrimental to the bank's management. Karim (1990) opines that ideally both SSB and external auditors should be from one organisational body since Islam does not recognize any separation between business and religion. Therefore, accounting principles compatible with Islamic law must be developed as guidance for those who conduct the financial audit for Islamic financial institutions or Islamic enterprise and be familiar with the various religious rulings which have a bearing on the financial matters of the bank.

Unlike the previous studies which were theoretical in nature, Hood & Bucheery (1999) initiated an empirical study on audit expectation gap between financial and religious

(Islamic) auditors in Bahrain. Hood & Bucheery (1999) further argued that religious audit in Bahrain seems to complement financial audit by external auditors. Nevertheless, they wondered if religious auditors have a set of religious statements to audit as compared to financial statements of financial auditors. By using sample size of 100 (79% response rate) which consist of auditors (Financial and Religious), auditees (Management and Internal Audit), users (Loan Officers and Investment Analysts), and general public (Undergraduates and Lawyers), they found that financial audit expectation gap does exist in Bahrain but not for religious auditors. They also found that financial auditors and religious auditors in Bahrain seem unaware of what each other does. Hood & Bucheery (1999) presumed that this finding might be due to respondents' lack of understanding on the subject of religious audit.

Another empirical study on Shari'ah audit is by Abdul Rahman et al. (2004) who provided preliminary assessment on the responsibility & independence of Shari'ah advisors of Islamic banks. The sample of the study consists of bank managers of Islamic banks and Islamic banking windows in Malaysia. The result of their study which was based on the perceptions of bank managers implied a significant need for a proper regulation on the role and function of Shari'ah advisors. The study also indicates the Shari'ah advisors to be more legally, socially and religiously responsible toward external shareholders. Abdul Rahman et al. (2004) found several factors which can improve the independence of the Shari'ah advisors. They are the existence of SSB, the level of Shari'ah background, the reputation of Shari'ah advisors, be members of National Shari'ah Advisory Council[193], and non-executive role of the Shari'ah advisors.

Obviously, by analyzing the existing literature and the current state of auditing for Islamic banks one should realize that Shari'ah auditing faces many unresolved issues. One of the fundamental absences in Shari'ah auditing is surely its theoretical foundation and besides that there are several other issues that need to be explored in this subject. Hence this study aims at instituting a more comprehensive understanding of Shari'ah audit, viewing Shari'ah audit in the context of Islamic financial institutions from a broader perspective where it is an independent discipline which encompass a bigger audit scope and hence serious concern should be undertaken to establish the subject systematically, and put it in practice accordingly.

3. RESEARCH OBJECTIVE & RESEARCH METHOD

3.1 Research Objective[194]

Specifically, this research aims to explore the perceptions of accounting academicians, audit practitioners and Shari'ah scholars in Malaysia with regards to the issues of Shari'ah auditing. It is the vision of the researchers that through the opinions derived from the study, the subject of Shari'ah audit will be further enriched and nurtured as a distinct discipline.

To accomplish the above objective hence four research questions were formulated as follows:

1. *What should be the definition of Shari'ah audit?* This question examines the awareness of respondents of the term Shari'ah audit and its definition.

2. *Who should perform Shari'ah audit?* This question seeks to identify who are supposed to perform Shari'ah audit, what are the qualification and competence requirements for Shari'ah audit auditors, and who should appoint Shari'ah auditors.

3. *What should be the scope of Shari'ah audit?* This question encompasses the investigation on the business areas to be audited under Shari'ah audit, the extent of Shari'ah audit, timing of Shari'ah audit, and the importance and the content of Shari'ah audit report.

4. *What is the ideal regulatory framework of Shari'ah audit?* This question seeks to identify the framework of regulation and supervision of Shari'ah audit in terms of the regulatory body and its role, and also on standard application.

3.2 Respondents' Background

The respondents for this study comprise of the Muslim accounting academicians of public universities in peninsular Malaysia, Muslim audit practitioners in peninsular Malaysia, and members of Shari'ah committee of Islamic commercial banks (ICB) and Islamic subsidiaries of commercial banks (ISCB) in Malaysia. The first group of respondents for this study is Muslim accounting academicians which are defined as the Muslim lecturers teaching at the Accounting Program in public universities in peninsular Malaysia. The listing of accounting lecturers of each university has been extracted from its respective website to identify the total population of this group. It is decided to have 50% sample size from this group of respondents.

---

[194] Since this study is considered as exploratory in nature, hence neither hypotheses nor prepositions have been developed.

Table 1 - Derivation of Sample Size for Accounting Academicians[195]

No.	List of Public Universities	Acctg. Program	No. of Acctg. Lecturers	Sample
1	Universiti Malaya (UM)	√	31	16
2	Universiti Kebangsaan Malaysia (UKM)	√	40	20
3	Universiti Teknologi Mara (UiTM)	√	86	43
4	International Islamic University (IIUM)	√	34	17
5	Universiti Putra Malaysia (UPM)	√	38	19
6	Universiti Utara Malaysia (UUM)	√	126	63
7	Universiti Sains Malaysia (USM)	√	9	5
8	Universiti Darul Iman Malaysia (UDM)	√	10	5
	Total Population/Sample		374	187

The second population for this study is Muslim audit practitioners. The listing of the auditors has been extracted from the list of delegates to the National Accounting Conference (NAC) 2006 which was held in November 2006. The list of delegates has been published in the website of the Malaysian Institute of Accountants (MIA). In addition, the researcher utilize several contact persons of the practical training audit firms listing from Department of Accounting, IIUM, to make up a bigger sample size.

Table 2 - Composition of Audit Practitioners Participating in this Study

No	Audit Practitioners	No. of Respondents
1.	Partners	41
2.	Principals	3
3.	Managers	48
4.	Audit Seniors	27
5.	Others	7
	Total	**126**

The third population of this study is the members of the Shari'ah Committee or Shari'ah Supervisory Board (SSB) of the Islamic commercial banks (ICB) and Islamic subsidiaries of commercial banks (ISCB) in Malaysia. Based on the data published by Bank Negara Malaysia, as in November 2006, there are two Islamic commercial banks and eight Islamic subsidiaries of commercial banks in Malaysia. Since the population is small, the sample size would consist of the entire population. The details of the population group are derived from the websites of respective Islamic commercial banks and Islamic subsidiaries of commercial banks in Malaysia. To obtain a high response rate, since we believe that most of SSB members are not working full time in IFIs and most of them are lecturers in various academic institutions in Malaysia, hence we also mailed the questionnaires to their respective universities. For those who are not known

---

[195] Data presented here was retrieved on November 2006.

what their permanent job positions are, the researcher then only mail the questionnaires to the respective banks where they are sitting as the members of SSB.

Table 3 – Population/Sample Size of Shari'ah Committee Members

No.	ICB/ISCB	No. of Sharia'h Committee Members
1	Bank Islam	7
2	Bank Muamalat	4

5	Kuwait Finance House	6
6	RHB Islamic Bank	4
7	Affin Islamic Bank	4
8	AmIslamic Bank	3
9	Hong Leong Islamic Bank	3
10	EONCAP Islamic Bank	5
Total Population/Sample		**45**

3.3.   Questionnaire Design

The questionnaire is divided into six sections. The first section, Part A, aims at answering the first research question of the study. The second part of the questionnaire, Part B, intends to gauge the perceptions of the respondents on the appointment of Shari'ah auditors and their qualification requirements, which is the second research question.

Part C of the questionnaire is to address the research question number three which is what should be the scope and the scale of Shari'ah audit. The last research question of this study on the regulatory framework for Shari'ah audit is inculcated in the Part D of the questionnaire. Part E of the questionnaire is an open-ended question where the respondents are asked whether they have any suggestion or recommendation pertaining to Shari'ah audit. Finally, the last section of the questionnaire aims at identifying the demographic background of respondents.

4. FINDINGS & ANALYSIS

The responses were analyzed using descriptive statistics from SPSS for Windows version 11. To conduct "between-groups" analysis, this study will utilize Kruskal-Wallis Test, the non-parametric alternative to a one-way between-groups analysis of variance. Pallant (2003) highlighted that this type of non-parametric statistic allows the comparison of the scores on some continuous variables for three or more groups. Based on the Kruskal-Wallis test, if the significant level (presented as **Asymp. Sig.**) is a value less than .05 then

it can be concluded that there is a statistically significant difference across the three groups (Pallant, 2003).

4.1 Response Rate

The questionnaires were mailed to 187 accounting lecturers, 126 audit practitioners, and 45 Shari'ah committee members of Islamic Commercial Banks and Islamic Subsidiaries of Commercial banks in peninsular Malaysia (please refer to the previous section for details of sample derivation).

Out of the total of 359 questionnaires distributed, 100 were returned which results in an overall response rate of 28 percent. Of the total questionnaires returned, two questionnaires were intentionally left unanswered by the respondents and only few were incomplete. The incomplete questionnaires were considered usable in this study since the incompletion of certain parts of the questionnaires is regarded as minimal and does not affect the overall analysis. Table 4 provides the summary of the overall response rate for each group of respondents.

Table 4 - Response Rate

No.	Respondents	Total Distributed		Total Received		Total Used		Response Rate (%)
		No	%	No	%	No	%	
1.	Accounting lectures	187	52.1	62	62	60	61.2	33.2
2.	Auditors	126	35.1	27	27	27	27.6	21.4
3.	Shari'ah Committee	46	12.8	11	11	11	11.2	23.9
	Total	**359**	**100**	**100**	**100**	**98**	**100**	**27.9**

4.2 Demographic Analysis

To identify demographic information of the respondents, the respondents were requested to answer eight basic questions regarding gender, age, job/position, organization, highest qualification, specialization, professional qualification in accounting, and working experience. Since the information on job position, organization, and specialization are mostly unanswered by the respondents, these three particulars will not be presented in this section. Table 5, 6, and 7 summarize the demographic background of the respondents.

From Table 5, it can be seen that in overall, 45.9 percent of the respondents are male and 47.9 percent are female. Based on the group classification, accounting lecturers are however dominated by female respondents, whereby most of the respondents for the auditors and the Shari'ah scholars are male. In term of the age of the respondents, nearly

half of the respondents are within the range of 30 to 39 years old, 30 percent are within 40 to 49 years old, 12 percent are above 50 years and only 8 percent are within 20 to 29 years. Even though age might not be an absolute indication of level of maturity, however these figures somehow reflect that the majority of the respondents in this study are considered matured.

Table 5 - Respondents' Gender and Age

	Accounting Lecturers		Auditors		Shari'ah scholars		Total	
	N	%	N	%	N	%	N	%
Gender:								
Male	17	28.3	19	70.4	9	81.8	45	45.9
Female	37	61.7	8	29.6	2	18.2	47	47.9
Missing	6	10	-	-		-	6	6.1
	60	**100**	**27**	**100**	**11**	**100**	**98**	**100**
Age:								
20-29 years	5	8.3	3	11.1			8	8.2
30-39 years	33	55	14	51.9	1	9.1	48	49
40-49 years	12	20	8	29.6	6	54.5	26	26.5
Above 50 years	6	10	2	7.4	4	36.4	12	12.2
Missing	4	6.7		-	-	-	4	4.1
	60	**100**	**27**	**100**	**11**	**100**	**98**	**100**

Table 6 further illustrates the education and working experience of the respondents. In overall, 50 percent of the respondents possessed Master degrees while the rest were partly degree holders and PhD holders accordingly. While academicians and Shari'ah committee members mostly possess Master degrees, auditors on the other hand are degree holders and only 3 respondents are having Masters. This composition can be rationalized since auditors are mostly degree graduates and having Master qualification is perhaps not popular among the auditors.

In addition, 50 percent of the total respondents are having professional qualification in accounting. While 43% of the academicians have professional certification in accounting, majority of the auditors (81%) possess the certification and only one of the Shari'ah scholars has the certification. In term of working experience, more than 50% of the sample (54%) have been working for about 6-15 years. The rest of respondents are almost equally divided into the other ranges of working years. Given that majority of respondents posses Master degree and professional qualification in accounting and have been working for about 6-15 years, therefore it is expected that they would give fruitful and credible responses to this study.

Table 6 - Respondents' Educational Background & Working Experience

	Accounting Lecturers		Auditors		Shari'ah scholars		Total	
	N	%	N	%	N	%	N	%
Highest Qualification:								
Diploma	-	-	-	-	1	9.1	1	1
Degree	-	-	23	85.2	-	-	23	23.5

Master	44	73.3	3	11.1	2	18.2	49	50
PhD	14	23.3	-	-	7	63.6	21	21.4
Missing	2	3.3	1	3.7	1	9.1	4	4.1
	60	**100**	**27**	**100**	**11**	**100**	**98**	**100**
Professional Qualification in Accounting:							
Yes							
No	26	43.3	22	81.5	1	9.1	49	50
Missing	32	53.3	4	14.8	9	81.8	45	45.9
	2	3.3	1	3.7	1	9.1	4	4.1
	60	**100**	**27**	**100**	**11**	**100**	**98**	**100**
Working Experience:							
0 – 5 Years	10	16.7	3	11.1	-	-	13	13.3
6 – 15 Years	36	60.0	14	51.9	3	27.3	53	54.1
16 – 20 Years	6	10.0	7	25.9	2	18.2	15	15.3
Above 20 Years	6	10.0	3	11.1	5	45.5	14	14.3
Missing	2	3.3	-	-	1	9.1	3	3
	60	**100**	**27**	**100**	**11**	**100**	**98**	**100**

Since there is no significant variation in the job position of accounting academicians (Most of the respondents fill up their positions as "lecturer") and Shari'ah committee members, table 7 is solely dedicated to portray the job position of auditors. It can be seen that most of the auditors participating in this study are the owners or partners of the audit firms (37%) followed by managers (26%), supervisors (19%) and associates for only 7 %. More participation from higher level of audit practitioners would hopefully enrich the opinion gathered from this study.

Table 7 – Job Position of Auditors

	N	**%**
Partner	10	37
Manager	7	25.9
Supervisor	5	18.5
Associates	2	7.4
Missing	3	11.1
Total	**27**	**100**

4.3. Statistical Analysis for Each of the Research Questions

4.3.1. Research Question No.1

The first research question is to identify the importance of establishing the discipline of Shari'ah audit as well as its definition. This question examines the awareness of respondents of the term Shari'ah audit and the importance of establishing the discipline of Shari'ah audit. Since there has been no standardized and formal definition given to Shari'ah audit, this question also examine the appropriateness of the definition of "Shari'ah review" by AAOIFI to be equated to the understanding of Shari'ah audit.

4.3.1.1 The Awareness of the Term "Shari'ah audit"

As the issue of Shari'ah audit is closely associated with the position of SSB, hence as expected that most of the Shari'ah scholars (64%) are aware of the term "Shari'ah audit" as opposed to most of the auditors (70%) who are not aware or not sure of the term "Shari'ah audit". Whereby for the academicians, nearly 50% are aware of the term "Shari'ah audit" and the rest are not sure or not aware of such term.

Table 8 - Awareness of the term "Shari'ah Audit"

No.	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall	
		N	%	N	%	N	%	N	%
1.	Awareness of the term "Shari'ah Audit":								
	Yes	28	46.7	7	26	7	63.6	42	42.8
	Not Sure	9	15	5	18.5	-	-	14	14.3
	No	22	36.6	14	51.8	3	27.3	39	39.8
	Missing	1	1.7	1	3.7	1	9.1	3	3.1
		60	**100**	**27**	**100**	**11**	**100**	**98**	**100**

4.3.1.2 The Importance of Developing the Discipline "Shari'ah Audit"

According to the findings in table 9, it can be inferred that the overall respondents highly believed the importance of establishing the discipline of Shari'ah audit (mean of 4.50), but to the lesser extent regard the appropriateness of the definition of "Shari'ah review" by AAOIFI to be equated to the understanding of Shari'ah audit. Even though the mean for statement no.3 on the appropriateness of the definition of "Shari'ah review" by AAOIFI to be equated to the understanding of Shari'ah audit is still considered high (4.23) but it is still much lower than the mean score for the previous statement.

Table 9 - The Importance of Developing the Discipline "Shari'ah Audit"

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
2.	It is important to develop another discipline namely "Shari'ah audit" apart from the	60	4.55	27	4.29	11	4.73	98	**4.50**	0.081

	existing auditing areas (e.g. financial audit, social audit, etc.)								
3.	The definition of Shari'ah audit for IFIs can be equated to the definition of "Shari'ah review" by AAOIFI which is: "An examination of the extent of an IFI's compliance, in all its activities with the Shari'ah"	59	4.15	27	4.37	11	4.27	97	4.23	0.831

Among the reasons put by some of the respondents who disagree to define Shari'ah audit based on such definition are; 1) Shari'ah review (AAOIFI) is not an audit, 2) compliance only is not sufficient – it must accord with the spirit of the Shari'ah – issue of substance over form, 3) the definition should not only limit to "activities" of IFIs but also "products and services", 4) to measure the extent of compliance it must have benchmark. As the definition of Shari'ah review by AAOIFI is not intended to comprehend the term Shari'ah audit therefore further effort need to be put, perhaps by AAOIFI, to formulate the proper definition of Shari'ah audit and implement it in the practice of IFIs all over the world.

Moreover, the term "review" should be understood differently from the term "audit". While the former implicate a lower assurance level, the latter has a more comprehensive assurance level. CPA Australia (2006: 44) stated that "Review engagement is a service where the auditor's objective is to provide a moderate level of assurance, being a lower level of assurance than that provided by an audit". Review has also been defined as "a formal assessment of an activity with the intention of suggesting or implementing changes" or a review "implies an audit type investigation that does not meet the full requirements of Generally Accepted Auditing Standards (GAAS)" (O'Regan, 2004: 224-225). Therefore, perhaps Shari'ah review should not be equated with the term Shari'ah audit as the understanding of the terminology between the two terms are significantly different.

Furthermore, the Kruskall-Wallis test reveals no significant difference between the three groups' opinions on the statement no.2 and no.3. This indicates that the respondents from various backgrounds are basically in the same inclination in their responses towards these two statements.

4.3.2. Research Question No.2

The second research question is to investigate the qualification requirements for Shari'ah auditors. This question seeks to identify who are supposed to perform Shari'ah audit, who should appoint the Shari'ah auditors and what are the qualification and competence requirements for Shari'ah auditors.

4.3.2.1 Who Should Perform Shari'ah Audit?

To investigate the respondents' perception on who should perform Shari'ah audit, the respondents were requested to select among the five categories which are; 1) conventional external auditor, 2) Islamic Jurists ('Ulama), 3) Internal auditors under supervision of SSB, 4) SSB, 5) Shari'ah auditors – a new group of professionals who are specifically certified in Shari'ah audit. Interestingly about 87% of respondents agree to the Shari'ah auditors (new group professionals who are specifically certified in Shari'ah audit) to perform the function of Shari'ah audit. This finding indicates a demand for the new profession so called Shari'ah auditors to be established instead of delegating to the existing other parties to perform the function of Shari'ah audit. The profession of Shari'ah auditors as proposed by this study is congruent to the concept of effective framework to monitor and assess Shari'ah compliance in IFIs as suggested by Grais & Pellegrini (2006) where they place Shari'ah audit firm as part of the external process of monitoring and assessing the Shari'ah compliance and SSB is positioned in the internal process accordingly.

Table 10 - Who should perform Shari'ah audit for IFIs

No	Statement	Acctg Lecturers		Auditors		Shari'ah scholars		Total	
		N	%	N	%	N	%	N	%

		60	**100**	**27**	**100**	**11**	**100**	**98**	**100**

4.3.2.2 Who Should Appoint Shari'ah Auditors?

For the appointment of Shari'ah auditors, 60% of the overall respondents perceive that the Shari'ah auditors should be appointed by a newly established regulatory and supervisory body which is dedicated to oversee the practice of Shari'ah audit. The reason could be that other parties might be perceived as not sufficiently independent to appoint the auditors. In the conventional auditing practice, it has been widely criticized that shareholders are not in the best party to appoint the auditors and this idea seems to also be agreed in the case of Shari'ah audit by the respondents who mostly disagree to the statement 5a

Table 11 - Who should appoint Shari'ah auditors for IFIs

4.3.2.3 The Competence & Qualification Requirements for Shari'ah Auditors

The respondents also highly believe the importance of establishing the competence and qualification requirements for Shari'ah auditors (Mean of 4.65). Interestingly the respondents subsequently demand the Shari'ah auditors to have a minimum qualification of degree or professional qualification in accounting and specialized certification in Shari'ah audit (mean of 4.53). Even though mean score for statement 7b is also considered high (4.31), however it is not as high as the score for statement 7c. This finding is congruent with the finding in the statement no 4 where the respondents support for the

establishment of the new professionals so called Shari'ah auditors who are specifically certified in Shari'ah audit. What more can be conveyed here that we need to start somewhere to institute profession of Shari'ah auditors by inculcating proper curriculum to the universities or even establishing a dedicated institution offering a professional certification in Shari'ah audit.

Since the significance level for statement no 6 is .023 therefore it suggests that there has been a significant difference between the three groups' responses on the statement no. 6. An inspection of the mean ranks for the groups further suggests that the Shari'ah scholars had the highest scores, with the auditors reporting the lowest. This could be due to the high awareness of the Shari'ah scholars on the nature of Shari'ah audit work and therefore they see the utmost significance of establishing a proper qualification and competence requirements for Shari'ah auditors.

Table 12 - Competence and Qualification Requirements of Shari'ah Auditors

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
6.	It is important for a body to set up qualification and competence requirements for Shari'ah auditors	59	4.68	27	4.48	9	5	95	**4.65**	**.023**
7.	Minimum qualification of the Shari'ah auditor:									
	a) Degree/Professional in accounting	38	3.76	21	4.29	4	3.75	63	3.94	.193
	b) Degree/Professional in accounting & Fiqh (Islamic Law)	43	4.42	24	4.08	6	4.50	73	4.31	.094
	c) Degree/Professional qualification in accounting and specialized certification in Shari'ah audit	54	4.54	24	4.37	10	4.90	88	**4.53**	.076

4.3.3. Research Question No.3

The third research question is to examine the scope of Shari'ah audit. This question encompasses the investigation on the business areas to be audited under Shari'ah audit, the extent of Shari'ah audit, timing of Shari'ah audit, and the importance and content of Shari'ah audit report.

4.3.3.1 Areas to be Audited Under Shari'ah Audit

From table 13 it can be seen that Zakat matter is still regarded as the most significant aspect to be audited in the IFI with mean of 4.66. Other areas which are regarded as important by most of the respondents are contracts and agreements (mean of 4.60), processes and procedures (mean of 4.58), financial system & reporting (mean of 4.47) and business policies (mean of 4.46). Except for those areas, unfortunately the respondents do not regard other aspects of business activities as highly important as the previously mentioned areas especially in the aspect of human resource management (mean of 3.90) and IT system (mean of 3.70).

Table 13 - Areas to be audited under Shari'ah audit:

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
8a.	Business policies	58	4.46	27	4.41	11	4.54	96	**4.46**	.772
8b.	Processes and procedures	59	4.54	27	4.55	11	4.82	97	**4.58**	.461
8c.	Contracts and agreements	59	4.59	27	4.52	11	4.82	97	**4.60**	.294
8d.	Financial system & reporting	60	4.53	27	4.41	10	4.30	97	**4.47**	.342
8e.	Human resource management	58	4.12	25	3.48	11	3.64	94	3.90	**.001**
8f.	Social activities & contribution	60	4.17	26	3.77	11	4	97	4.04	.071
8g.	Environmental impact of operations	59	4.17	26	3.65	11	3.91	96	4.00	.071
8h.	Marketing & advertising	59	4.15	26	3.50	11	4.36	96	4.00	**.002**
8i.	Reports & circulars	59	4.12	26	4.00	11	4.18	96	4.09	.671
8j.	Zakat calculation & payment	59	4.66	27	4.59	11	4.82	97	**4.66**	.474
8k.	IT system	56	3.70	27	3.78	11	3.54	94	3.70	.832

For the non-parametric test on the areas to be audited under Shari'ah audit, the study found significant difference across the three groups' responses for the statement 8e (human resource management) and statement 8h (marketing and advertising). Comparing the mean ranks for the three sets of scores, it appears that the accounting academicians put highest significance on the aspect of human resource management as compared with the other groups, and the auditors reporting the lowest. Perhaps this variation lies in the different perspectives of "theorist" (academicians) and "practitioners" (auditors) on this issue where the former might believe that human resource management is one of the areas that need to be concerned in an auditing process and the latter might not see the significance of this area or it is perhaps not practical (measurable) for them to audit this area of the IFIs operations.

With regards to the issue of "marketing and advertising", the mean ranks comparison shows that the Shari'ah scholars had the highest score whilst the auditors had the lowest.

One possible explanation is perhaps that Shari'ah scholars might see marketing and advertising as one of the sensitive issues in the IFIs operations. It is where perhaps Shari'ah violence could occur where Shari'ah principles might not be fully observed when introducing, marketing and advertising the IFIs products or services to the consumers.

4.3.3.2 To What Extent and When Should Shari'ah Audit Should be Performed?

Table 14 and 15 are concerned with the extent of Shari'ah audit and when it should be performed. It can be seen from table 14 that even though highest percentage of respondents (41%) prefer the adoption of sampling method in Shari'ah audit however the difference in the percentages among the three choices is not that significant. While 30% of the respondents argue for Shari'ah audit to be performed for every single activity of the IFI, for instance another 28% leave it to the auditors to decide (as deemed adequate by the auditors). These results signify that the respondents are significantly varied in their selection to which extent Shari'ah audit should be performed. Since the term "Shari'ah compliance" implies a broader understanding, responsibility and accountability (i.e. in this world and hereafter), there could be a dilemma of whether the audit to attest such compliance is sufficient by relying on the sampling method or the satisfactory opinion by the auditors, or we should go beyond those assumptions by checking and assuring every single activity of the IFIs are in compliant with the Shari'ah precepts. To opt for full audit might be time consuming and costly or some people might claim it is inefficient. On the other hand, how the auditors would be responsible and accountable of their opinion if it is based only on partial audit (i.e. by using sampling method). Here further intense scholarly discussions and research by the prominent scholars in Islamic accounting are needed to resolve this issue.

Table 14 - To What Extent Shari'ah Audit should be Performed?

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall	
		N	%	N	%	N	%	N	%
9a.	Every single activity	20	33.9	5	18.5	4	44.4	29	30.5
9b.	As assumed satisfactory by the auditors	19	32.2	6	22.2	2	22.2	27	28.4
9c.	Using sampling method	20	33.9	16	59.3	3	33.3	**39**	41.1
		59	**100**	**27**	**100**	**9**	**100**	**95**	**100**

Table 15 - When Should Shari'ah Audit be Performed?

No	Statement	Acctg. Lecturers	Auditors	Shari'ah scholars	Overall

		N	%	N	%	N	%	N	%
10a.	Throughout financial year	32	53.3	15	57.7	3	33.3	**50**	52.6
10b.	During new product application	-	-	3	11.5	1	9.1	4	4.2
10c.	At the end of financial year	28	46.7	8	30.8	5	55.6	41	43.1
		60	**100**	**26**	**100**	**9**	**100**	**95**	**100**

As for the view of when Shari'ah audit should be performed, almost 53% of the respondents urge for Shari'ah audit to be performed throughout financial year, and 43% see it should be performed at the end of financial year and only 4% opine the audit to be performed only during new product application. This statement is very closely linked to the above statement. Apart from the variation of the responses for the statement 9, the results of the statement 10 somehow signal that the respondents are in favour of more extensive or more comprehensive audit for IFIs since more than 50% of them opt for Shari'ah audit to be performed throughout financial year.

4.3.3.3 The Importance and content of Shari'ah Audit Report

The following table for instance presents the findings on the importance of Shari'ah audit report. With no statistical difference across the three groups' opinions, the mean score of 4.64 confirm that the respondents highly believe in the utmost significance of issuing and publishing the Shari'ah audit report.

Table 16 - Importance of Shari'ah Audit Report

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
11.	It is important for Shari'ah auditors to issue and publish Shari'ah audit report.	60	4.70	27	4.44	11	4.82	98	**4.64**	.051

Even though the Shari'ah audit report is strongly perceived important, there is as yet no detailed Shari'ah audit report issued by any IFI in Malaysia. Therefore, it is the aim of the findings in table 17 to identify what are supposed to be the content of the report. As shown in table 17, all of the proposed contents of Shari'ah audit report are perceived important at varying degrees. Among the most significant matters to be included in the report are; the opinion on the extent of Shari'ah compliance (mean of 4.68), process and procedures taken in performing Shari'ah audit (mean of 4.65), findings i.e. detailed breach and violence of Shari'ah principles by IFIs (mean of 4.64), and the objective of Shari'ah audit (mean of 4.63).

Table 17 - The content of Shari'ah audit report

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
12.	The objective of Shari'ah audit	59	4.66	27	4.55	11	4.63	97	**4.63**	.402
13.	Process and procedures taken in performing Shari'ah audit	60	4.70	27	4.52	11	4.73	98	**4.65**	.281
14.	Opinion on the extent of Shari'ah compliance	59	4.69	27	4.59	11	4.82	97	**4.68**	.270
15.	Findings (e.g. detailed breach and violence of Shari'ah principles by IFIs)	60	4.70	27	4.48	11	4.73	98	**4.64**	.281
16.	Implications	60	4.60	26	4.15	10	4.50	96	4.47	**.034**
17.	Recommendations for improvements	59	4.57	26	4.08	11	4.54	96	4.44	**.011**

The findings in table 17 clearly hint for an urgent call to go beyond from the current Shari'ah audit report, especially in the case of Malaysia, which only contain a short statement reporting that "the IFIs operation is in compliant with Shari'ah principles". A more detailed report is deemed necessary for; 1) the consumers to be assured that the IFIs are in compliance with the Shari'ah principles, 2) the Shari'ah auditors to be more accountable and transparent in their job, and for 3) the IFIs to identify their performance in term of Shari'ah compliance.

With regards to the "between-groups" analysis, the study found significant differences for the statements 16 and 17. The mean ranks for both statements indicate that the accounting academicians had the highest scores while the auditors report the lowest. We believe the work background between the academicians and the auditors have very much influenced their responses towards these statements. The academicians who are idealist in nature might see these two items as important to be included in the report while the auditors who are experienced in the auditing environment, are somehow neutral of whether the items are appropriate to be included as these matters might be considered sensitive and should not be disclosed to the public.

4.3.3.4 The Extension of Shari'ah Audit to Other Islamic Institutions

Apart from examining the importance of Shari'ah audit report and its contents, this section also seeks to explore the possibility of extending the concept of Shari'ah audit to other Islamic institutions such as Islamic companies or Waqf & Zakat institutions. As shown in table 18 there is a high demand for the concept to be also applied to other

Islamic institutions besides the IFIs. This is evidenced by a high mean score of 4.66 resulted and there is no significant difference between the group means.

In addition, the respondents were also requested to give their view on need to rank the performance of IFIs based on the outcomes of Shari'ah audit. However such need is not perceived to be strongly important (mean 4.02) as compared to the previous statement. There are no statistically significant differences in the responses between the three groups on these two statements.

Table 18 - The extension of Shari'ah Audit to Other Islamic Institutions

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
18.	Shari'ah audit should be extended to other Islamic institutions (e.g. Islamic companies, Waqf & Zakat institutions etc.)	60	4.68	27	4.63	11	4.64	98	**4.66**	.665
19.	The performance of IFIs (based on Shari'ah audit) should be ranked.	60	4.08	27	3.85	11	4.09	98	4.02	.323

4.3.4. Research Question No.4

The last research question is to investigate the regulatory framework of Shari'ah audit. This question seeks to identify the framework of regulation and supervision of Shari'ah audit in terms of the regulatory body and its role, and also on the standards to be applied in performing Shari'ah audit.

4.3.4.1 The Regulatory Body for Shari'ah Audit

As the findings in table 19 imply that in overall the respondents highly perceive the importance of establishing an external independent body to oversee the practice of Shari'ah audit. Specifically, they mostly agree to the prominent Islamic and accounting scholars to be members of the body, followed by the representative from country's central bank.

The proposed roles of such body have been seen important by the respondents at varying degrees. Predominantly the body is expected to regulate the standards in performing Shari'ah audit (mean of 4.60), evaluating the practice of Shari'ah audit (mean of 4.48),

promoting research and education in Shari'ah audit (mean of 4.36), licensing, appointing, supervising, monitoring and disciplining the Shari'ah auditors (mean of 4.35), and ranking the performance of IFIs in term of Shari'ah compliance (mean of 4.26). Apparently there are statistical significant differences of the three groups' opinions on all the statements in the table 19.

Table 19 - The Regulatory Body for Shari'ah Audit

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
20.	It is important to set up an external independent body to oversee the Shari'ah audit practice	59	4.49	26	4.34	11	4.45	96	**4.45**	.665
21.	The members of the body:									
	a) Prominent Islamic and accounting scholars	59	4.63	27	4.41	11	4.64	97	**4.57**	.286
	b) Representative of country's central bank	58	4.24	26	4.27	7	4.00	91	4.23	.670
	c) Partners of big audit firms	56	3.86	26	3.54	8	3.62	90	3.74	.718
22.	Roles of the body:									
	a) Regulating the standards to be adopted in performing Shari'ah audit	60	4.62	26	4.46	10	4.90	96	**4.60**	.117
	b) Promoting research and education in Shari'ah audit	60	4.35	25	4.40	10	4.30	95	4.36	.893
	c) Licensing, appointing, supervising, monitoring and disciplining the Shari'ah auditors	60	4.48	26	4.11	10	4.20	96	4.35	.325
	d) Evaluating the practice of Shari'ah audit	59	4.56	26	4.23	10	4.70	95	**4.48**	.060
	e) Ranking the performance of IFIs in term of Shari'ah compliance (based on the result of Shari'ah audit)	60	4.27	26	4.12	10	4.60	96	4.26	.236

4.3.4.2 **The Standards to be Applied in Shari'ah Audit Performance**

Finally, table 20 indicates that AAOIFI Shari'ah standards (mean of 4.53) as well as AAOIFI accounting standards (mean of 4.44) are viewed as the most appropriate standards to be applied in Shari'ah audit followed by local Shari'ah standards (mean of 4.32). It is clear that the standards promulgated by AAOIFI are regarded as the most

appropriate guidelines in conducting Shari'ah audit for IFIs. However significant effort has to also be made to ensure its enforcement in the practice.

Table 20 - The Standards to be Applied in Shari'ah Audit Performance

No	Statement	Acctg. Lecturers		Auditors		Shari'ah scholars		Overall		Kruskal-Wallis Test (Asymp. Sig.)
		N	Mean	N	Mean	N	Mean	N	Mean	
23a.	AAOIFI accounting standards	57	4.39	23	4.39	11	4.82	91	**4.44**	.116
23b.	AAOIFI Shari'ah standards	60	4.50	22	4.50	10	4.80	92	**4.53**	.338
23c.	Central bank's standards	58	4.09	21	3.81	10	4.70	89	4.09	**.021**
23d.	Local Shari'ah standards	57	4.35	22	4.18	10	4.50	89	**4.32**	.767
23e.	International auditing standards	57	3.88	21	4.00	10	4.40	88	3.97	.140
23f.	Local accounting standards	54	3.83	18	3.94	10	4.40	82	3.93	.074

4.4. Summary of the Findings

To summarize the above findings, the following are the main findings of this study:
- It is important to develop the discipline of Shari'ah audit and define the subject in a comprehensive manner.
- Shari'ah audit should be performed by new professionals called "Shari'ah auditors" who are specifically certified in Shari'ah audit and they must be appointed by a new independent body dedicated to oversee the practice of Shari'ah audit.
- It is important to establish and standardize the qualification and competence requirements for Shari'ah auditor who are supposed to have minimum degree/professional qualification in accounting and specialized certification in Shari'ah audit.
- Among the areas of the business activities that should be looked intensely in Shari'ah audit work are; Zakat calculation and payment, contracts and agreements, processes and procedures, financial system & reporting, and business policies. However, the scope of Shari'ah audit work should also probably be extended to other aspects such as marketing & advertising, human resource management, and social & environmental contributions, as Shari'ah encompasses every aspect of human life.
- In performing Shari'ah audit, it is important to find a mechanism besides the sampling method as the nature of the responsibility and accountability is different from the conventional one.
- It is important to issue and publish Shari'ah audit report which should contain the objective of Shari'ah audit, process and procedures taken in performing Shari'ah audit, the opinion on the extent of Shari'ah compliance, , findings i.e. detailed

breach and violence of Shari'ah principles by IFIs, , implications, and recommendations for improvement.

- Shari'ah audit should be extended to other Islamic institutions such as waqf & Zakat institutions and Islamic companies.
- It is important of establishing an external independent body to oversee the practice of Shari'ah audit which might consist of the prominent Islamic and accounting scholars and the representative from country's central bank.
- Predominantly the body is responsible to regulate the standards in performing Shari'ah audit, evaluating the practice of Shari'ah audit, promoting research and education in Shari'ah audit, licensing, appointing, supervising, monitoring and disciplining the Shari'ah auditors, and ranking the performance of IFIs in term of Shari'ah compliance.
- AAOIFI Shari'ah standards, AAOIFI accounting standards, and local Shari'ah standards are viewed as the most appropriate standards to be applied in Shari'ah audit.

4.5. Limitations and Potential Research

Despite its contribution as a preliminary survey in a very new emerging field, this study is limited in the sense it is still exploratory in nature. Due to limited literature available in this field, therefore, there is no specific theory existing on this subject. However, with support by other relevant literature perhaps this study can be one of initial effort in building up an established theory for Shari'ah audit.

Another limitation is the instrument used in this study which is the self-administered questionnaire. Since it was developed by the researchers themselves and has not been tested widely, it might have deficiencies and perhaps its content might not have been covered to an appropriate degree of breadth to meet the objective of the study. In addition, the response rate of this study is considered quite low. Even though it is still acceptable, a low response rate could affect the generalization of the result.

Potential research to be conducted in this area can be on the same topic but with different groups of respondents and different country, or on Shari'ah audit reporting style, comparative studies of Shari'ah audit practices across the Muslim countries, or case studies of different Islamic banks in implementing Shari'ah audit, etc.

5. CONCLUSION

This paper discusses the perceptions of accounting academicians, audit practitioners, and Shari'ah scholars, especially in the context of Malaysia, on the fundamental issues of Shari'ah audit. This study has attempted to investigate the respondents' perceptions towards the understanding of the term "Shari'ah audit", the appointment of Shari'ah auditors as well as their qualification requirements, areas to be audited under Shari'ah audit, the content of Shari'ah audit report, regulatory framework for Shari'ah audit practice, and the standards to be applied in performing Shari'ah audit.

Currently, the structures and processes established within an Islamic Financial Institutions (IFIs) for monitoring and evaluating Shari'ah compliance rely essentially on the arrangements internal to the institutions, i.e. SSB (Grais & Pellegrini, 2006). This arrangement has its advantages as well the limitations. While the paper of Grais & Pellegrini (2006) has suggested a framework for an effective assurance of Shari'ah compliance which include the internal and external process, this study has extended their study by examining the framework of Shari'ah audit which fall under the external process of their proposed framework.

Despite the different profession of the respondents, this study found the common agreement of the respondents towards establishing the discipline of Shari'ah audit and develop the necessary framework and infrastructure for the discipline accordingly. In conclusion, this study found an urgent call for the systematic development of the discipline Shari'ah audit. It involves from the very basic of: 1) defining the subject in an appropriate manner, 2) standardizing the qualification and competence requirements for Shari'ah auditors who are well equipped not only with accounting and auditing techniques but also specifically certified in Shari'ah audit, 3) identifying the scope, the extent, and the timing of Shari'ah audit, 4) regulating and standardizing the content of Shari'ah audit report, 5) establishing the independent body to regulate and enforce the standards and empower this body with other relevant roles such as to evaluate the practice of Shari'ah audit and to promote the research and education in Shari'ah audit, and 6) applying the AAOIFI standards into the practice of Shari'ah audit.

It is clearly a long overdue for the relevant parties to resolve the above issues. While this paper might not give the complete remedy to this very new emerging field, it however has provided pointers for further research and discussions to this area. Hopefully the proposed ideas in this study can be further utilized for the benefit of the enrichment of the subject of Shari'ah audit.

THE COST OF EQUITY EFFECTS OF ACCRUALS QUALITY AND OWNERSHIP STRUCTURE

Radziah Abdul Latiff *, Universiti Kebangsaan Malaysia
Fauziah Md Taib, Universiti Sains Malaysia

Abstract

This study examines the cost of equity effects of two sources of information risk; the quality/precision of information and the information asymmetry between the ultimate controlling shareholder/party and other shareholders, for a sample of Malaysian listed companies. The quality of information is proxied by the quality of earnings. Three measures of earnings quality are used; discretionary total and current accruals based on modified Jones (1991) model and accrual quality based on the Dechow and Dichev (2002) model. Asymmetric information between the controlling and other shareholders/parties is measured by the cash flow/voting rights of the controlling party/shareholder. This study also examine if the other substantial shareholder has a cost of equity effect for the role in reducing information asymmetry and in leaking proprietary information to the public. Consistent with previous research, all the earnings quality measures are significantly associated with the cost of equity estimated based on Ohlson and Juettner-Nauroth (2000). Whilst there is no evidence of relationship between cash flow/voting rights and cost of equity, there is a significant and consistent negative association between substantial shareholders' voting rights and cost of equity.

1. Introduction

This study examines whether the quality of information in terms of the imprecision of information and in terms of the domain of information (that is whether private or public), explains differences in cost of equity. There have been many studies that examine the imprecision of information as proxied by earnings quality, and cost of equity (Botosan

(1997), Botosan and Plumlee (2001), Chen, Chen and Wei (2003), Francis, LaFond, Olsson ans Schipper (2004)). However, there is a dearth of studies especially in the Asian region, that examines whether the domain of information brought about by the characteristics of ownership structure has a cost of equity effect. Given the well documented evidence of Asian companies' ownership being concentrated and being characterized by high degree of separation of ownership and control, it is important to examine if such ownership structure is priced.

Samples of companies taken in past studies by Claessens, Djankov and Lang (2000) and Fan and Wong (2002) that include Malaysian companies indicate the existence of ownership concentration through shareholding of multiple layers of companies, thus the term pyramidal structure. This type of shareholding creates a disparity between cash flow rights (associated with ownership) and voting rights (associated with control). Though s55 of the Malaysian Companies Act 1965 requires one share to have one vote to prevent such disparity, in substance in pyramidal structure such disparity exists. Such disparity enhances the control of the ultimate shareholder beyond what is afford to him by his apparent direct shareholding.

In a study by Francis, Schipper and Vincent 2005 based on US companies where there is a provision to issue shares that carry more than one vote it is found that the shareholders who hold the inferior shares with one vote each discount the price of shares accordingly knowing the voting power of the other class of shares.

In Malaysia it is common for companies to be held by a few substantial shareholders with shareholdings far higher than the threshold 5%, instead of just one substantial shareholder with the majority controlling rights, even though one may be with the highest shareholding and the apparent controlling party,. The

1223

following extracts from annual reports of ACP Industries Berhad illustrates this type of ownership concentration.

Table 1.1 *ACP Industries Berhad- Analysis of Shareholdings as at 16 August 2004*

	Direct Interest		Indirect Interest	
Shareholders	**Number of Shares**	**%**	**Number of Shares**	**%**
Metacorp Berhad	38,734,790	29.02		
MTD Capital Berhad			38,734,790	29.02
Lambang Simfoni Sdn Bhd			38,734,790	29.02
Employees Provident Fund Board	20,499,000	15.36		

Metacorp Berhad, MTD Capital Berhad and Lambang Simfoni Sdn Bhd are companies under the control of Dato' Dr Nik Hussain Abdul Rahman and his family members. Dato' Dr Nik Hussain and family are the controlling shareholder. However, the Employees Provident Fund Board with shareholding of around 15% could play a significant role in monitoring the controlling party actions.

The existence of substantial shareholders i.e shareholders other than the ultimate controlling shareholder, who own more than 5% could potentially reduce the information asymmetry between the controlling and non-controlling shareholders. According to Kaplan and Minton (1994), Pound (1988) and Shleifer and Vishney (1986) a substantial shareholder has a role in controlling agency problems by actively monitoring the controlling party who in a widely held company, is the management. Similar role could be played by substantial shareholders in companies with concentrated ownership.

This study, although is limited by the sample size and is limited to Malaysia, contributes towards the literature on the cost of equity effect of asymmetric information, by characterizing asymmetric information brought about by ownership structure. This study also examines the cost of equity effect of earnings quality as the earnings quality

as shown by previous studies is a primary driver of the cost of equity/capital, and if the cost of equity effect of ownership structure is distinct from earnings quality.

2. Literature review

2.1 Information risk and cost of capital

In extant asset pricing theories such as the Capital Asset Pricing Model (CAPM) and Arbitrage Pricing Theory (APT) the only risk that is priced is the systematic risk of a company. Other idiosyncratic risks such as information quality are not priced as investors could diversify away such risks by holding a portfolio of large number of shares. Easley and O'Hara (2001) and Leuz and Verrechia (2005) establish a theoretical link between information risk and companies cost of capital counter to extant theories. Easley and O'Hara (2001) show that the composition of public and private information could influence a company's cost of capital. Investors would want higher return from companies that have more private and less public information. The high return reflect the risk that uninformed investors have to face by holding shares of such companies. Thus information risk is a type of systematic risk that is priced. Leuz and Verrechia (2005) demonstrate that higher information quality lowers the cost of capital because information quality could actually affect a company cash flow and not just perceived cash flow. In other words if the quality of information such as earnings is suspected then intuitively investors would want a higher return on their investment to compensate for the risk that they are taking.

2.2 Ownership structure – separation of ownership and control, and information risk

Ownership structure of a company refers to the distribution of control and ownership in the company. Control is the ability to affect decisions and for shareholders

this is represented by voting power. While ownership is the right to cash flows of the company and is proportionate to shareholdings. In general, the separation of ownership and control of companies results in information asymmetry and agency related problems namely moral hazards, between those in control of and those who are not.

In early studies such as Berle and Means (1932) and Jensen and Meckling (1976), the problem has always been characterized along the conflict of interest between a manager who is in control and shareholders who own the company and bears the cash flow consequences of any action. Managers do not own significantly any shares. However more recent studies characterize the conflict as between the controlling shareholders (who could also be the manager), i.e shareholders who have acquired sufficient number of shares to be able to affect decisions, and the other or non-controlling shareholders (Shleifer & Vishny 1997).

However as the cash flow rights of controlling party increases, there is more wealth maximizing benefits to the company as there would be less expropriating tendency by the controlling party and less monitoring costs (Jensen and Meckling (1976)). The results of the following empirical studies are consistent with this analysis.

Claessens, Djankov, Fan and Lang (1998a), examine expropriation of non-controlling shareholders' wealth in the context of corporate diversification policy for 2000 companies in nine East Asian countries in the period between 1991 and 1996. They found that diversification is associated with the disparity between cash flow and control rights. Further, there is evidence that the larger the disparity the more the diversification. This is proven true especially at higher level of control. The larger the disparity the more incentive to expropriate as the link between the controlling shareholders' wealth and the company performance is weaker.

In a separate study, Claessens, Djankov, Fan and Lang (1998b), establish the existence of expropriation by examining the association between each of cash flow and

control rights, and market value. The study is a cross sectional study of 2658 companies in East Asia in 1996. The found negative association between control rights and market value, and positive association between cash flow rights and market value. This is especially so when cash flow rights are low and control rights are high, which they conclude, suggest expropriation of non-controlling shareholders' wealth.

Ownership could become separated from control through holdings of shares with different voting power, or through holdings of shares in a pyramid structure. This latter type of control is reported to be more common in East Asia, for example in Malaysia as described earlier. Harris and Raviv (1988) and Grossman and Hart (1988), analyze theoretically the separation of control and ownership problem through the holdings of dual class of shares. They conclude that such separation leads to lower accountability and specifically lead to situations where the controlling party could take actions to maximize his utility while bearing costs not in proportion to the shareholdings.

There has not been any studies in the US that test ownership structure and the cost of equity. This is so because in the US ownership is diffused and if disparity of cash flow and voting rights exists they are through the existence of dual class shares and at low level of control. Also the existence of dual class shares requires disclosure and therefore is transparent. Fan and Wong (2002) although examine ownership structure and earnings informativeness, it is on the premise that concentrated ownership through pyramidal ownership structure inhibits information to the public.

Whilst earnings quality poses risk in terms of reliability/precision of information, ownership structure poses risk in terms of amount of information that is private. The more private the information the higher the required return. This is the essence of the theoretical studies of Easley and O'Hara (2004) and Leuz and Verrecchia (2004) as discussed in Francis et al (2004).

A study by Chen et al (2003) examine the effects of various corporate governance mechanisms and disclosure level on the cost of equity. They found significant negative association between corporate governance mechanisms and disclosure level, and cost of equity. Their study was on Asia's emerging markets which include 42 Malaysian listed companies.

2.3 Earnings quality and information risk

A number of researches explore the link between information quality as proxied by a number of measures, and cost of equity. As most studies focus on the usage of information by equity investors, the measure for required return is the cost of equity. Botosan (1997) examines the relationship between disclosure level and cost equity. She developed a voluntary disclosure index from information in annual reports as proxy to disclosure level or quality. Estimates of cost of equity are based on the valuation formula developed by Edwards and Bell (1961), Ohlson (1995) and Feltham and Ohlson (1995) which states that market price of a company's share is equal to the sum of expected dividends discounted at the company's cost of equity. Botosan (1997) found a negative association between disclosure level and cost of equity, after controlling for market risk (beta) and company's size for companies that attract a low analyst following. However no significant association was found for companies that have high analyst following. The reason for this is that the disclosure index may not capture fully the level of information provided to investors as analysts play a significant role in disclosure.

Botosan and Plumlee (2001) reexamine the association between disclosure and cost of equity by segregating different forms of disclosure quality i.e level and timely. Findings for relationship between disclosure level and cost of equity confirm previous results. However a positive association was found between timely disclosure and cost of

equity which is contrary to theoretical assertion. An explanation for this is that timely disclosure increases volatility of share prices and hence cost of equity.

Francis et al (2004) examine the relationship between earnings attributes as proxy to information quality and cost of equity. Earnings attributes are categorized as market based and accounting based, each as described earlier. As a whole their findings confirm previous results of negative relationship between earnings quality and cost of equity. When considered individually the accounting based earnings attributes, in particular accrual quality, have larger effect on cost of equity than market based attributes.

3. Methodology

3.1 Data sources

The required accounting data, market value, book to market value, prices and beta are obtained from Datastream data base for the financial year end 2004 or as at financial year end 2004 as applicable. For the purpose of estimating accrual quality accounting data for year 2003 and 2005 are also required. Estimated earnings per share for years 2005 and 2006 required for calculating cost of equity are downloaded from Bloomberg data base services in January 2005.

3.2 Sample profile

The sample comprises of companies with IBES's estimated earnings per share for year 2005 and 2006. The sample size is first reduced due to the availability of data for the estimation of cost of equity (Table 3.1). Since the data requirements varies for the calculation of the earnings quality measures, the composition of companies are further reduced into two samples- 1) ABRES and 2) ABSDATCA/ABSDATA (Table 3.2).

ABRES denotes the accrual quality as measured by the absolute residual from the regression of total current accrual on current, last and next period cash flows. ABSDATCA/ABSDATA denotes the discretionary current accruals and discretionary total accruals.

Table 3.1 Sample

Number of companies with estimated earnings forecasts	213
Eliminated due to change in accounting year end and insufficient data to calculate cost of equity	10
	203

Table 3.2 Sample size based on available data for the calculation of earnings quality variables

		(%)**Market Capitalization**
ABRES	141	31
ABSDATCA /ABSDATA	151	32

3.3 Variable definition and measurement

3.3.1 Accruals quality

There are two measures of accrual quality as operationalized in Aboody, Hughes and Liu (2005) based on models developed by Jones 1991, Dechow, Sloan and Sweeney (1995) and Dechow and Dichev (2002) . The first measure of accruals quality is defined as the amount of discretionary accruals (DA) or abnormal accruals. Large DA is associated with low quality. First non-discretionary accruals (NDA) is measured from a model developed by Jones 1991 and subsequently modified by Dechow et al 1995. This modified version is used in many earnings management studies. The estimation is done in the following way (time t refers to year 2004):

$$NDA_t/ A_{t-1} = \alpha(1/A_{t-1}) + \beta (\Delta REV_t - \Delta REC_t)/ A_{t-1} + \gamma PPE_t/ A_{t-1}$$

Where,

NDA_t - Non-discretionary accruals at time t

A_{t-1} — Total assets at t-1

ΔREV_t — Change in revenues

ΔREC_t — Change in receivables

PPE_t — Plant, property and equipment at t

The coefficients α, β and γ are estimated from coefficients a, b and c of the following cross-sectional regression by industry :

$$TA_t/A_{t-1} = a\,(1/A_{t-1}) + b\,\Delta REV_t/A_{t-1} + \gamma PPE_t/A_{t-1} + \delta_t$$

Then, $\qquad DA = TA_t/A_{t-1} - NDA_t/A_{t-1}$

Where,

$\qquad$ TA = Total accruals

$\qquad\qquad$ = Change in current assets – Change in current liabilities –

$\qquad\qquad$ Change in cash + Change in short term debt – Depreciation

In the following analysis the absolute DA is taken and the acronym ABSDATA (absolute discretionary total accruals) is assigned to the variable. The following analysis will also use the current accrual variation of the above model as given below.

$$NCA_t/A_{t-1} \quad = \quad \alpha(1/A_{t-1}) + \beta\,(\Delta REV_t - \Delta REC_t)/A_{t-1}$$

Where,

$\qquad NCA_t$ — Non-discretionary current accruals at time t

The coefficients α, β and γ are estimated from coefficients a, b and c of the following cross-sectional regression by industry :

$$TCA_t/A_{t-1} = a\,(1/A_{t-1}) + b\,\Delta REV_t/A_{t-1} + \delta_t$$

Then discretionary current accruals (DCA),

$$DCA_t = TCA_t/A_{t-1} - NCA_t/A_{t-1}$$

Where,

$\qquad TCA_t$ = Total current accruals

1231

      = Change in current assets – Change in current liabilities – Change in cash + Change in short term debt

  In the analysis the acronym ABSDATCA (absolute discretionary total current accrual) is used. The Bursa Malaysia classification of industry is used for the cross sectional regression. The larger the discretionary accruals whether based on total accruals (ABSDATA) or total current accruals (ABSDATCA) the poorer the earnings quality.

  The second measure of accrual quality is based on Dechow and Dichev (2002) model. It simply measures quality as how well accruals map current cash flows to last and future cash flows. It is the residual from the regression of changes in working capital of past, current and future cash flow. This study will use the cross sectional version operationalized in Aboody et al. as follows.

$$TCA_{j,t} / Avasset_{j,t} = a + b\ CFO_{t-1} / Avasset_{j,t} + c\ CFO_t / Avasset_{j,t} +$$
$$d\ CFO_{t+1} / Avasset_{j,t} + \delta_t$$

Where,

CFO = cash flow

   = net income before extraordinary item – TA (total accruals)

   Avasset - average asset ovet t and t-1

  The coefficients a,b,c and d will be applied to individual companies current, past and future cash flows.

  The difference between the predicted and actual company's total current accrual is the residual used as a measure of earnings quality. The acronym ABRES (absolute residual) is assigned to the variable. The larger the value of ABRES the poorer the quality of earnings as the current accruals do not map well with current, past and future cash flows. If the residuals is small, this means that the total current accruals is largely translated into cash flows.

3.3.2 Times series versus cross section versions of Jones 1991 and Dechow and Dichev 2002

This study uses the cross sectional regressions to obtain the relevant parameters in the respective models as in Aboody et al (2005). Francis et al 2004 uses the time series version to obtain the absolute residuals. The cross sectional version arguably provides 'noisy measure' due to differences across companies in the same industry (Francis et al (2004)), however the measure would not be bias towards companies that survive longer as would a measure from the time series version.

For the purpose of this research, on balance, the cross sectional approach is preferred as the time series approach provides parameters that are a company's own benchmark measures.. Previous study, Mohd Salleh 2003, on Malaysian data indicates that the cross sectional approach provides measures that produce significant results.

3.3.3 Ownership structure

Ownership structure refers to the distribution of control (measured by the voting rights) and ownership (measured by cash flow rights) or rights to benefits/cash. A controlling party holds more than 20% of shares. A controlling party can be an individual or a group of related individuals. A group of individuals are related if they are of the same family or hold the shares through a single common entity such as a company or a partnership. The relationship between individuals is analyzed from disclosure of analysis of shareholders' in the financial reports.

For this purpose companies are divided between those with pyramidal structure (PYS) and those without pyramidal structure (NPYS). For PYS companies both cash

flow and voting rights of companies are collected and for NPYS the cash flow and voting rights are equal.

Further, for PYS the ownership structure measure is the cash flow to voting rights ratio. The lower the ratio, the larger the disparity between cash flow and voting rights and the wider is the separation between ownership and control.

3.3.3.1. Calculation of the ownership structure variable

PYS companies. The calculation of cash flow and voting rights is based on the method used in Claessens et. al. (2000), and in other researches (Fan & Wong 2002). Voting rights is taken as the 'weakest link' in the chain of voting rights. The main weakness in this method is that it does not take into account the existence of other controlling shareholders. The inclusion of the other substantial shareholder addresses this weakness.

For the sampled companies in Malaysia the cash flow and voting rights chain will be extracted and analyzed from the shareholder's statistics pages of the annual report. It is also necessary to use information on the company profile, such as structure of the whole group of companies in which the company belongs, which is sourced from annual reports or the official website of the company. The following shows such calculations for ACP Industries Berhad.

The structure of ACP could be understood by also looking at Metacorp Berhad and MTD Capital Bhd shareholder's statistics. The group (refer to figure 3.1) could be traced to Dato' Dr Nik Hussain Abdul Rahman (NHAR), although there are other substantial shareholders. NHAR and family members are substantial shareholders of Nikvest Sdn Bhd and Alloy Consolidated Sdn Bhd.

Figure 3.1

Nikvest Sdn Bhd   Alloy Consolidated Sdn Bhd

$= (21.18\% \times 74.17\% \times 29.02) + (15\% \times 74.17\% \times 29.02)$
$= 7.78\%$

Voting rights
$= 21.18\% + 15\%$
$= 36.18\%$

NPYS companies. NPYS companies will be analyzed into widely held or manager control, and not widely held. Widely held is the situation where none of the shareholders have more than 20% shareholdings. In other words no shareholder has gained effective control and therefore control is in the hands of manager. For these manager controlled companies, the voting rights equals the cash flow rights which is simply the percentage holdings of shares by the manager if any. This is consistent with Jensen and Meckling (1976) analysis, although they begin from 100% owner controlled situation without outside shareholdings. The agency related problems begins as outside shareholdings exist. Thus manager controlled situation is the agency problem at its worst.

Consider for the moment the interest alignment theory, the lower the voting rights held by the controlling manager the higher is the expectation of inappropriate behavior. Thus this is consistent with the reading of cash flow to voting rights ratio of PYS

companies and expectation of inappropriate behavior by the controlling party of the PYS companies.

For non-widely held companies, the cash flow/ voting rights of the shareholders with the highest shareholdings will be documented. Even though there is no disparity between cash flow and voting rights and considering the interest alignment theory, the lower the voting rights held by the controlling shareholder the higher is the expectation of inappropriate behavior. Thus this is consistent with the reading of cash flow to voting rights ratio of PYS companies and widely held companies described earlier, and expectation of inappropriate behavior by the controlling party of the PYS companies and widely held companies.

3.3.3.2 Substantial shareholders

Substantial shareholders are those with shareholdings of more than 5% and listed as such in the analysis of shareholders' statistics in the financial reports. Having identified the ultimate controlling party, the shareholder with the next highest shareholding is identified as the substantial shareholder. This substantial shareholder is therefore not related to the ultimate controlling party and expected to have a monitoring role. Referring to MTD Capital Bhd example earlier the substantial shareholder is the Employees' Provident Fund with voting rights of 9.11%. For this purpose Ruslan Sulaiman and Mohd Dom Ahmad, though appear not to have any family connections with Dato' Nik Hussain are deemed to be related as they all have interest in various companies. The truly unrelated is the Employees' Provident Fund.

3.3.4 Cost of equity

The measure of COE is estimated based on Ohlson and Juettner-Nauroth 2000 (OJN) and as operationalized in Chen et al 2003 as follows.

$$P_t = \frac{FEPS_{t+1}}{COE} + \frac{(FEPS_{t+2} - FEPS_{t+1} - COE \times FEPS_{t+1}(1-POUT))}{COE(COE-g)}$$

Which then rearrange to find COE (and where POUT- Dividend pay out ratio)

$$COE = A + \left(A^2 + \frac{FEPS_{t+1}}{P_t} \left(\frac{(FEPS_{t+2} - FEPS_{t+1}}{FEPS_{t+1}} - g \right) \right)^{0.5}$$

Where, $A = \frac{1}{2} \left(g + \frac{POUT \times FEPS_{t+1}}{P_t} \right)$

P_t -   Share price at time t

FEPS   -   Forecasted earnings per share

POUT   -   Dividend payout ratio

g   -   estimated long term growth

The long term growth in this estimation is proxied by the inflation rate of 1.4% for year 2004 and that is the company wide economic growth.

4. Results

4.1 General descriptive statistics

Table 4.1 shows the proportion of companies that are with ultimate controlling party having controlling rights through layers of companies (pyramidal ownership) and those that are with ultimate controlling party having direct controlling rights (non-pyramidal).

Table 4.1 Breakdown of companies with pyramidal(PYS) and non-pyramidal ownership(NON-PYS)

Sample	PYS	NON-PYS
ABRES (141)	40	101

	(28%)	(72%)
ABSDATCA /ABSDATA (151)	46 (30%)	105 (70%)

Table 4.2 and table 4.3 show the descriptive statistics for each variable in each of the two samples. The values of each variable used in the regressions are as estimated or calculated. Only for both the discretionary accruals variables (ABSDATCA and ABSDATA) the logged form is used as the calculated form is highly skewed as shown in table 4.3. As given in table 4.4 the skewness and kurtosis problems of the logged form (LABSCA and LABSTA) is much lesser than the original form of the variable.

Even though some of the other variables are skewed and peaked, they are not transformed as the transformed variables are not much improved and to prevent further reduction of sample size. Besides as discussed in Tabachnik. and Fidell (2001) transformation poses interpretation problem and not widely recommended. Further, with the given sample sizes Central Limit Theorem is relied on to predict normality. Market values (MV) and book to market (BTMV) are transformed (LGMV and LBTMV) as MV are large and transformation of BTMV achieved univariate normality.

4.2 Descriptive statistics for ownership structure

The cash flow, voting/control rights and ratio of voting/control rights are found to be higher than those reported in Claessens (1998b) study, where it is reported that the mean of cash flow rights is 24%, voting/control rights is 28% and the mean ratio of cash flow to voting/controlling rights is 85%. However the means for cash flow and voting rights for the samples in this study are found to be higher as given in the following table, whilst the ratio of cash flow to voting rights is lower in this study than in Claessen (1998b).

Table 4.5 Descriptive statistics of cash flow and voting rights and ratio of cash flow to voting rights

Claessens et al (1998b)'s sample is taken in 1996, the year before the Asian financial crisis. Thus for the year under study, the disparity indicated by the cash flow/voting rights ratio appears to be higher than Claessens et al (1998b) study and at a higher level of control as indicated by the mean voting rights.

Another point to note is that samples in Claessens et al (1998 b) and Claessens, Djankov and Lang (2000) are based on availability of ownership structure data on Worldscope database which largely comprises of large companies. The share of the total market capitalization of the Malaysian companies in the sample is 74% (Claessens et al 2000). The share of market capitalization of the companies in the samples in this study is between 27%-32%. Since it is based on availability of IBES analysts' earnings

forecasts it comprises of companies of interest to analysts which are not just large companies but also newly listed and not as large.

4.3 Bivariate collenearity of all variables in each sample

Table 4.6 and Table 4.7 show the Pearson correlation coefficients and the associated significant levels of all variables in the ABRES and the ABSDATCA/ABSDATA samples respectively.

4.4 Multivariate analysis

To determine if the earnings quality and the ownership structure variables each has a distinct effect on cost of equity, the cost of equity is regressed individually on the respective variables as follows.

$COE = \varphi_0 + \varphi_1\,SIZE + \varphi_2\beta + \varphi_3\,BTMV + \delta$

$COE = \varphi_0 + \varphi_1\,Earnings\ quality + \delta$

$COE = \varphi_0 + \varphi_1\,CFVR + \delta$

$COE = \varphi_0 + \varphi_2\,SSVR + \delta$

The results are given in Table 4.8 (ABRES sample) and Table 4.11 (ABSDATCA/ABSDATA sample). The coefficients of size, book to market, each of the earnings quality measures are of the expected sign and significant at the least 5% level. The coefficient of substantial shareholders' voting rights is negative in both samples and significant. However the coefficient of cash flow/voting rights and beta are not significant in both samples.

COE is then regressed on the established risk factors (size, beta and book to market ratio) and each of earnings quality and ownership structure variables as follows.

$COE = \varphi_0 + \varphi_1\,Earnings\ quality + \varphi_2\,SIZE + \varphi_3\beta + \varphi_4\,BTMV + \delta$

$COE = \varphi_0 + \varphi_1\,CFVR + \varphi_2\,SIZE + \varphi_3\beta + \varphi_4\,BTMV + \delta$

$COE = \varphi_0 + \varphi_1\,SSVR + \varphi_2\,SIZE + \varphi_3\beta + \varphi_4\,BTMV + \delta$

The results are given in Table 4.9 (ABRES sample) and Table 4.12 (ABSDATCA/ABSDATA sample). The significance and sign of each of the earnings quality and ownership structure variables do not change when these variables are

regressed individually with the risk factors (size, beta and book to market ratio) for each sample.

The results for the full regression is given in Table 4.10 (ABRES sample) and Table 4.13 (ABSDATCA/ABSDATA sample). The full regression is:

$$COE = \varphi_0 + \varphi_1 \text{ Earnings quality} + \varphi_2 CFVR + \varphi_3 SSVR + \varphi_4 SIZE + \varphi_5 \beta + \varphi_6 BTMV + \delta$$

Similar to the results of previous regressions, apart from risk factors size and book to market, all three measures of earnings quality and substantial shareholders' voting rights explained significantly the variation in cost of equity. Thus the significance of each of the earnings quality measures and the substantial shareholders' voting rights in explaining cost of equity is distinct and not driven by the underlying inter relationship between the explanatory variables.

5. Discussion/ Conclusion

A caveat is in order for the small sample size. As described in section 3.2 the sample size is reduced a number of times by the lack of information to estimate the variables. Even though the final sample size is sufficient for the statistical analyses employed, the statistical inference made is somewhat limited for generalization. The results shed some light on the relationships studied and provide some evidence to

support the hypotheses tested. Future research that includes more companies and years is needed to provide a robust set of results.

The hypothesized relationship between cash flow/voting rights and cost of equity is not supported. The comparison between Claessens (1998b) sample and the samples under study provides an insight why this is so. Table 4.5 indicates that even the minimum voting rights found in the samples in this study is quite close to the mean of 28% in Claessens (1998b) study. Seventy five percent of companies in the samples have ultimate controlling party with voting rights above 36%/38%. Similarly the mean cash flow rights in all samples in this study are almost twice that reported in Claessens (1998b). 75% of the companies have ultimate controlling party with cash flow rights above 28%.

Similar pattern is observed in Fan and Wong (2002) whose study includes 177 Malaysian companies. The mean voting rights is 31% whilst the mean cash flow rights is reported to be 26%. As in Claessens et al (1998b) study the reported mean CFVR is 85%. Further both Claessens et al (1998b) and Fan and Wong (2002) capped the voting rights at 50%. They stopped analyzing the voting rights of the ultimate controlling party once the voting rights breaches 50%. So the maximum voting rights for the companies in the sample is 50%.

Certainly the off setting effect of increasing cash flow rights and increasing voting rights is complex and merit more research. Previous research such as Claessens (1998b) found that at a higher level of control the tendency to expropriate, which is expected in information asymmetry situations, is higher. However the insignificant result in this study suggests that even though the disparity between cash flow and voting rights exists, at higher level of control and even higher level of cash flow, market does not price the disparity because the ultimate controlling party is not expected to expropriate or inhibit information as the cash consequence of his action is more significant.

Finally the lack of significant association between cash flow/voting rights disparity and the cost of equity, could be due to the effective presence of a substantial shareholder. As found, substantial shareholders' voting rights, SSVR, is fairly consistent in showing negative association with cost of equity.

The significant negative relationship with cost of equity suggests that a lower percentage holding of substantial shareholder poses information risk. This is consistent with the theory in general, as an increase in voting rights afford the substantial shareholder more bargaining power for inclusion in the decision making process such as being a member of the board of directors. Therefore this increase the chance of more information flow to the public, information which otherwise would be in the proprietary control of the ultimate controlling party. This result contributes towards the 'information argument' (Fan & Wong 2002). That is the presence of others other than the controlling party increase the likelihood that proprietary knowledge of the company is shared to the others and decrease the likelihood that it is concentrated to certain individual which leads to opacity of information. The wider the set of informed individuals the greater the likelihood that information 'leaks' to the public and thus reduce the company's information risk.

Previous researches (Jung and Kwon (2002), Koh (2003) and Chung, Firth and Kim (2004)) associate substantial shareholder's voting rights with earnings quality measure. The cost of equity effect, that is the information risk effect, has never been examined. The finding that substantial shareholders' shareholding is priced is a new and significant contribution not only in the Malaysian context but also elsewhere. Thus not only substantial shareholder is an important mechanism, it is also perceived as such by the market.

The hypothesis that there is a cost of equity effect of earnings quality is largely supported. There is nothing new in this finding except that this study examines

companies in an emerging market. Therefore even in an emerging market investors are sophisticated and do price earnings quality with low earnings quality being perceived as information risks.

Whilst there have been many studies on Malaysian companies that examine earnings quality, especially abnormal accruals in relation to many variables such as board characteristics, managerial ownership, etc. there has never been any Malaysian studies that prove that abnormal accruals are priced. The consequence of this is that the preparer may gain in manipulation of accounts but they stand to lose in terms of higher required return by investors.

This research has looked at one dimension of the ultimate controlling party and that is the cash flow/voting rights disparity. However the ability and potential to inhibit information may be explained by another layer of control and that is control obtained by direct possession of knowledge regarding the operations. This is achieved by direct involvement with operation or close relationship with those in direct involvement. This research has not differentiate the ultimate controlling party who are and are not in executive position. In the same line of argument this research has not separated out the substantial shareholders who are in actual fact a partner of the ultimate controlling party and the substantial shareholders who are really an outsider. Obviously the presence of the former may impair its monitoring role and thus may not 'leak' information to the public.

THE EFFECT OF MANAGERIAL OWNERSHIP ON THE COST OF DEBT:
EMPIRICAL EVIDENCE FROM JAPAN
Akinobu Shuto, Kobe University
Norio Kitagawa, Kobe University
First version: June 2009

Abstract: We examine the effect of managerial ownership on interest rate spread on corporate bonds for Japanese firms. First, we find that managerial ownership is positively associated with interest rate spread after controlling for other aspects of the Japanese ownership structure, cross-shareholding and stable shareholdings by financial institutions. Second, by employing factor analysis to measure the agency cost of debt based on financial variables, we find that managerial ownership has a higher correlation with interest rate spread when the agency cost of debt at the time of bond issue is larger. Our results suggest that prospective bondholders use managerial ownership information to anticipate a firm's future agency cost of debt, and estimate it to be higher when the current agency cost of debt at bond issue is larger. Further, our results indicate that accounting information is useful for estimating the agency cost of debt and increasing the efficiency of bond contracts.

I. Introduction

This study examines the effect of managerial ownership on the cost of debt. Specifically, it investigates the relationship between managerial ownership and the cost of debt as measured by the interest rate spread on corporate bonds for Japanese firms.

Agency theory predicts that the shareholdings of managers help align the managers' interests with those of the shareholders (Jensen and Meckling 1976). This incentive alignment effect is expected to have a greater impact as managerial ownership increases. This suggests that as managerial ownership increases, corporate performance also increases (Morck et al. 1988). On the other hand, however, the theory also suggests that managerial shareholdings lead to a conflict between shareholders and bondholders (Jensen and Meckling 1976; Myers 1977). In particular, limited liability shareholders may have an incentive to expropriate bondholders' wealth through investments and financial decisions aimed at reducing the value of the firm's outstanding debt.

For example, owner-managers by levered firms may have an incentive to invest in projects that are riskier than those specified by bondholders. This is commonly called the "***risk-shifting problem***." Further, owner-managers have an incentive to conduct wealth transfers by financing activities such as changes in the dividend policy and the issuance of additional debt. In an efficient market, rational bondholders should recognize owner-managers' incentives to increase shareholder wealth at the expense of their wealth and should accordingly adjust the required yield.

Some empirical investigations support the prediction of agency theory. Ortiz-Molina (2006) and Bagnani et al. (1994) empirically tested the implication of the ***risk-shifting problem***. Ortiz-Molina (2006) provides evidence that managerial ownership is

positively correlated with the yield spread of corporate bonds. Bagnani et al. (1994) indicate that an increase in managerial ownership increases the cost of debt measured by bond return premia when managerial ownership is low. Consistent with the implication of the theory, these results suggest that bondholders obtain price protection against the potential agency cost of debt. Furthermore, the authors argue that the relation between shareholdings by managers and the cost of debt is nonmonotonic, and they provide some evidence in support of their argument.

Our study is also related to the studies focusing on the effect of the corporate governance structure on the cost of debt. Anderson et al. (2003) investigate the impact of the founding family ownership structure on the agency cost of debt and indicate that family ownership is associated with a lower cost of debt financing. Bhojraj and Sengupta (2003) explore the link between governance mechanisms and bond yields and ratings. They reveal that the cost of debt on new debt issues is negatively associated with the percentage of shares held by the institutions and the fraction of the board comprising non-officers (i.e., stronger external control of the board). Overall results indicate that corporate governance mechanisms could affect the cost of debt by mitigating agency costs.

The first research objective of this study is to examine the relationship between managerial ownership and the cost of debt for Japanese firms. Following the empirical implication of the theory, we hypothesize that managerial ownership is positively associated with the interest rate spread. In addition to managerial ownership, we explore the effect of other ownerships in the Japanese corporate ownership structure on the cost

of debt because it is often argued that Japanese ownership structures have unique characteristics as compared to those of other countries.

We control the effect of two institutional ownerships: cross-shareholding and stable shareholding by financial institutions. Cross-shareholding, which refers to mutually exchanging equity shares in a pair of firms, has been a common practice in Japan. Further, stable shareholding by financial institutions, mainly represented by the main bank, is a unique practice and was a grave concern during the 1990s in Japan. We examine the functioning of these Japanese ownership structures in a bond market setting.

We find support for the hypothesis that managerial ownership has a positive association with interest rate spread. The results suggest that prospective bondholders in Japan perceive managerial ownership as a structure that increases the potential conflict between shareholders and bondholders, and they incorporate this perception in the pricing of new corporate bond issues. Moreover, we find that stable shareholding is positively associated with interest rate spread, while cross-shareholding exhibits no significant correlation in this regard. The findings are consistent with the argument that stable shareholdings by financial institutions play an active role in reducing managerial opportunism and mitigating the wealth transfer problem between bondholders and shareholders.

The second research objective of this study is to examine the effect of the potential agency cost of debt of bond-issuing firms at the time of issue on the relation between managerial ownership and the cost of debt. As predicted by the theory, managerial shareholdings may induce opportunistic behavior by firm managers aimed at increasing

their benefits at the expense of bondholders' wealth. Our first result is consistent with the implication of the theory.

If firm managers have already engaged in moral hazard behaviors or have a wide range of options for this purpose at the time of bond issue, bond investors would estimate a higher future agency cost of debt and default risk for the firm because prospective bondholders consider that such managers exhibit a high probability to conduct actions that transfer the wealth of bondholders to them after bond issue, which results in an increase of the interest rate spread. Therefore, we hypothesized that managerial ownership has a higher correlation with the interest rate spread when the agency cost of debt at issuing bonds is already larger.

To measure the agency cost of debt of bond issuing firms, we reduce six financial variables related to the agency cost of debt to a single index by using factor analysis. Our results indicate that managerial ownership has a stronger effect on interest rate spread when the agency cost of debt is larger, which supports our hypothesis.

Further, we conduct some analyses to verify the validity of our hypothesis because a part of our results is not consistent with the results of prior studies. Bagnani et al. (1994) indicate that managerial ownership is nonmonotonically related to the cost of debt. They advocate that at high ownership levels, managerial ownership is negatively correlated to the cost of debt because of two reasons: the first reason is that large shareholdings by managers could induce firm managers to be more concerned about the nonsystematic risk of firms, which reduces the *risk-shifting problem*. The second reason is that when managerial ownership is high, managers can become entrenched and their risk choice is not dependent on the preference of shareholders. Both arguments assume

that at high ownership levels, the positive effect of managerial ownership on managerial

risk-taking can be weaker, and as a result, managerial ownership is expected to be

nonlinearly associated with the cost of debt.

To address the possibility of this nonlinear relationship, we perform regression

analyses by employing the quadratic form regression model. The result does not indicate

that the relation between managerial ownership and interest rate spread is nonmonotonic,

as indicated by Bagnani et al. (1994). The result reveals that managerial ownership is

positively and linearly associated with interest rate spread. In the subsequent section, we

present possible explanations as to why our results differ from those of Bagnani et al.

(1994).

To ensure the robustness of our results, we conduct further analyses such as those

on bond rating and the potential endogeneity problem and those conducted using the

Fama and Macbeth (1973) approach. We find that our results are robust under these

additional analyses.

This study makes several contributions to the literature on finance and accounting,

and the understanding of practice of the Japanese bond market. First, our results suggest

that Japanese bond investors use managerial ownership information to anticipate a firm's

future agency cost of debt, and that they incorporate this prediction in determining the

bond yield spread. In addition, the results indicate that bond investors estimate a firm's

future default risk to be higher when the agency cost of debt at issuing bond is already

larger. Therefore, our results indicate that managerial ownership is an important

determinant of bond yield spread in the processes of the Japanese bond market.

Second, this study contributes to prior studies by clarifying that the agency cost of debt at the time of bond issue affects the anticipation of the future potential agency cost of debt that reflects the interest rate spread. While prior studies consider managerial opportunistic behaviors arising from the conflict between bondholders and shareholders only from the perspective of the risk-shifting problem (Ortiz-Molina 2006; Bagnani et al. 1994), this study develops hypotheses based on inclusive opportunistic behaviors by managers and constructs a composite measure for the degree of the agency cost of debt. These procedures contribute to the verification of the validity of theoretical hypothesis based on the agency cost of debt, and they discriminate the alternative hypotheses.

Further, these results support the utility of accounting information in debt contracting because they suggest that prospective bondholders use financial information to anticipate the potential agency cost of debt in decision making for bond investments. Although we already know that accounting information provides ex post benefits to bondholders through accounting-based debt covenants in the debt contracting process (Watts and Zimmerman 1986), our results indicate the ex ante role of accounting information in the debt contracting process. This acts as evidence suggesting that accounting information plays an important role in increasing the efficiency of bond contracts.

Finally, this is the first study that examines the effect of Japanese corporate ownership on the cost of debt in the Japanese bond market. It is often advocated that the Japanese ownership structure is quite different from that of other countries. Previous studies have investigated the impact of the Japanese ownership structure on firm performance (Prowse 1992; Lichtenberg and Pushner 1994; Morck et al. 2000). Our

1258

study contributes to these studies by resolving the functioning of the Japanese ownership structure in a bond contract setting.

Further, it should be noted that in our result, managerial ownership has a strong effect on the interest rate spread after controlling for other aspects of ownership structure, cross-shareholding and stable shareholding by financial institutions, which are often emphasized as characteristics of the Japanese ownership structure. Although previous studies examining the Japanese ownership structure generally focus on the findings related to the unique aspects of ownership structure, such as cross-shareholding and main banks, our results reveal that the empirical implication of the traditional agency theory on managerial ownership is supported by the analyses for the Japanese bond market, which is consistent with the findings of analyses for US firms (Ortiz-Molina 2006; Bagnani et al. 1994).

The remainder of this paper is organized as follows. Section II describes the theoretical background and develops the hypotheses. Section III explains the research model for testing our hypotheses. Section IV outlines the sample selection procedure and describes the variables used in this analysis. Section V reports the empirical results on the relation between managerial ownership and interest rate spread. Section VI summarizes the results of additional analyses. Finally, Section VII concludes the study with a summary.

II. Hypothesis development

Managerial ownership and the cost of debt

Our first research objective is to examine the effect of managerial ownership on the cost of debt. Prior studies indicate that shareholdings held by managers create a conflict of interest between shareholders and bondholders (Jensen and Meckling 1976; Myers 1977). This conflict induces owner-managers to take investment and financing decisions that benefit them at the expense of the bondholders. With respect to the investment decisions, owner-managers have an incentive to transfer wealth to shareholders from bondholders by taking excessive risk, which is referred to as risk-shifting or asset substitution. Consequently, according to the theory, it is expected that as managerial ownership increases, firm managers become more likely to make investment decisions involving higher risks that are consistent with the interests of the shareholders, at the expense of the bondholders.

The other source of conflicts of interest between shareholders and bondholders involves financing decisions such as dividend policy and the issuance of new debt. Owner-managers have an incentive to distribute cash funds themselves when firms are financed partially by debt (Myers 1977). For instance, firm managers may forgo positive net present value projects, and instead, pay dividends to shareholders or repurchase shares. Furthermore, managers could sell existing business assets and distribute the proceeds to shareholders by dividends or share repurchase. In the extreme case, such managerial behaviors could sell off all business assets through a discretionary dividend policy, leaving the bondholders with an "empty corporate shell."

Finally, it is often argued that the issuance of additional debt also transfers wealth from the original bondholders to the managers and consequently creates costs that reduce the value of the firms (Watts and Zimmerman 1986). In practice, the owner-managers can

issue additional corporate bonds after the original bond is issued. The issuance of new

debt dilutes the value of existing debt. The dilution is particularly strong if the new debt

is either secured or senior to the original debt (Tirole 2006).

Since rational bondholders know that their interests might conflict with the

interests of owner-managers, they would demand a higher interest rate on corporate

bonds as a compensation for the added risk on the risk-shifting and discretionary

financing behaviors by owner-managers. This higher interest rate is the way bondholders

obtain price protection against the possibility that owner-managers will take actions that

benefit shareholders but harm bondholders.[196] Thus, this argument leads to our first

hypothesis that shareholdings of managers increase the cost of debt.

Hypothesis 1: Managerial ownership is positively associated with the cost of debt.

The effect of the potential agency cost of debt on the relation between managerial

ownership and the cost of debt

Our second research objective is to examine the effect of the potential agency cost

of debt of bond issue firms at the time of issue on the relation between managerial

ownership and the cost of debt. In the development of the first hypothesis, we assume

that owner-managers take investment and financing decisions that benefit them at the

expense of bondholders, and that bondholders use managerial ownership information to

predict a firm's future agency cost of debt.

---

[196] Another way to reduce conflicts of interest between bondholders and shareholders is to write bond covenants that restrict the owner-managers' behaviors to harm bondholders' wealth (Smith and Warner 1979). However, McDaniel (1986) indicates that while the use of bond covenants reduces the agency cost of debt, the protection offered by these covenants cannot totally eliminate the conflicts between bondholders and shareholders.

If firm managers have already engaged in opportunistic behavior that increases the agency cost of debt or have a wide range of options for this purpose at the time of bond issue, prospective bondholders are likely to anticipate a higher future agency cost of debt and default risk for the firm. The behaviors of managers, such as highly risky investment, excessive dividend payment, and frequent insurance of debt before the corporate bond issue, would make prospective bondholders more sensitive to firms' future agency costs of debt arising from shareholding by managers. The bondholders would consider that such managers have a high incentive in transferring the wealth of bondholders to them after the bond issue.

In reality, although it is difficult for the bond inventors to completely grasp the agency cost of debt, they can estimate it by using accounting information in financial statements to a certain extent. Prior studies indicate that some financial variables are useful in measuring the potential conflict between bondholders and shareholders (Long and Malits 1985; Titman and Wessels 1988; Prowse 1990; Hwang and Kim 1998; Ahmed et al. 2002). We expect that prospective bondholders can grasp the agency cost of debt by observing financial variables at the time of bond issue and incorporate their estimation in the pricing of new corporate bond issues.

Therefore, we expect that the shareholding of managers has a stronger effect on the cost of debt when the potential agency cost of debt at issuing bonds is larger.

Hypothesis 2: Managerial ownership has a higher correlation with the interest rate spread when the agency cost of debt at the time of bond issue is larger.

We should note that some prior studies reveal the possibility that managerial ownership is nonlinearly associated with the cost of debt, which suggests the existence of alternative hypotheses. Bagnani et al. (1994) and Ortiz-Molina (2006) argue that at low ownership levels, managerial ownership is positively correlated to the cost of debt due to the risk-shifting problem, which is consistent with our first hypothesis. However, they also advocate that at high ownership levels, managerial ownership has a negative correlation with the cost of debt. Consequently, it is expected that the relation between managerial ownership and the cost of debt is nonmonotonic. The aforementioned studies present two possible explanations about the negative relation between managerial ownership and the cost of debt at high ownership levels. First, as managerial shareholding increases, the firm managers would be more concerned with the nonsystematic risk of the firms because their wealth is less diversified (Saunders et al. 1990), which reduces the risk-shifting problem.

Second, at high ownership levels, managers can become entrenched because they can use their control of votes to protect their position, and thus, their decisions regarding risk-taking are not dependent on the preferences of the shareholders (Morck et al. 1988). Both theoretical considerations suggest that managerial ownership is not positively associated with the cost of debt at high ownership levels.

The empirical results remain mixed and inconclusive. Bagnani et al. (1994) indicate that the relation between managerial ownership and bondholder returns is nonmonotonic according to their hypothesis. On the other hand, Ortiz-Molina (2006) provides evidence that although the shareholdings of managers, including stock option

holdings, are nonlinearly associated with yield spread, managerial ownership does not

have a nonmonotonic relationship with yield spread. Overall, with respect to the

empirical investigation on the effect of managerial ownership, only the findings of

Bagnani et al. (1994) indicate a nonlinear effect of managerial ownership on the cost of

debt.

With regard to the reason for the inconclusive results mentioned above, numerous

points about the validity of their hypothesis development on nonmonotonic relationships

can be considered. While this study develops hypotheses based on the inclusive

implication of the theory of agency cost of debt, they discuss the effect of managerial

ownership only from the perspective of the risk-shifting problem and do not consider

other managerial behaviors such as financing decisions. This lack of consideration may

reduce the validity of their hypothesis because the expected effect of managerial

ownership related to financing decisions does not clearly suggest that the relation

between managerial ownership and the cost of debt is nonmonotonic.

Further, with respect to the managerial entrenchment effect that the aforementioned

studies depend upon in their hypotheses development, we can derive an opposite

prediction about the relation between managerial ownership and the cost of debt. Prior

studies provide evidence that entrenched managers decrease firm performance because of

their opportunistic behaviors (Morck, Shleifer, and Vishny 1988; McConnell and Servaes

1990; Short and Keasey 1999).[197] Since such opportunistic behaviors decrease firm

values and increase the default risks of the firms, we also expect that managerial

ownership increases the bond yield spread, following the implication of the managerial

---

[197] With regard to Japanese firms, prior studies have clarified the entrenchment effect from some perspectives: firm performance (Teshima 2004), earnings management (Teshima and Shuto 2008), and accounting conservatism (Shuto and Takada 2008).

entrenchment effect, which implies a positive association between managerial ownership and the cost of debt.

Thus, this leads to **an empirical question** whether there is a nonmonotonic relation between managerial ownership and the cost of debt. Hence, in Section VI, we conduct an additional examination assuming that there is a nonmonotonic relation between managerial ownership and interest rate spread and compare the obtained results with those of prior studies.

III. Research design

Research model to test hypothesis 1

To test hypothesis 1, we examine the association between managerial ownership and bond yield spread by estimating the following model:

$$SPREAD = C + \beta_1 MO + \beta_2 CROSS + \beta_3 FSTABLE + \beta_4 MARGIN + \beta_5 DER$$

$$+ \beta_6 INCR + \beta_7 LNASIZE + \beta_8 BSIZE + \beta_9 MATURE$$

$$+ \beta_{10} BCFIRM + \beta_{11} RISKP + YEAR + \varepsilon, \tag{1}$$

where

$SPREAD$ = the interest rate spread on the first straight bond issued of the fiscal year; the spread is the difference between the interest rates on the bond issued by the firm and on government bonds

MO = the fraction of the shares owned by directors at the end of fiscal year t

CROSS = the fraction of the shares owned by cross-shareholders at the end of fiscal

year t

FSTABLE = the fraction of stable shareholdings by financial institutions at the end of

fiscal year t

MARGIN = the operating income divided by net sales at the end of fiscal year t

DER = the debt equity ratio at the end of fiscal year t

INCR = the interest coverage ratio at the end of fiscal year t

LNASIZE = the natural log of total assets at the end of fiscal year t

BSIZE = the log of the issue size

MATUR = the number of years till maturity

BMCOMP = an indicator variable that takes the value of one if a bond management

company is established, and zero otherwise

RISKP = the risk premium (the average values of *SPREAD* on R&I's A bonds for the

month of issue)

We use the interest rate spread on straight bond issues (*SPREAD*) to measure the cost of debt. As a proxy for managerial ownership (*MO*), we use the ratio of the shares owned by the directors on the board. The ratio of the shares owned by *all* directors should be used in this study because prior studies such as Aoki (1990) and Milgrom and Roberts (1992) argue that the Japanese corporate governance system functions more through consensus than through a CEO-dominated system, as is the case in the US. Further, they argue that Japanese board members make decisions as a group. Teshima and Shuto (2008) examine the effect of managerial ownership on the earnings management behavior

for Japanese firms. They also use the ratio of the shares owned by all directors as a proxy for managerial ownership.[198] If the relationship between managerial ownership and the cost of debt is similar to the prediction of hypothesis 1, the coefficient of *MO* would be expected to be positive.

Institutional ownership could also influence managerial behavior, and for Japanese firms, the influence of cross-shareholding (*CROSS*) and stable shareholdings (*FSTABLE*) by financial institutions is noticeable (Prowse 1990; Lichtenberg and Pushner 1994; Isagawa 2007). The stable shareholdings by financial institutions, mainly represented by main banks, would have a positive effect on the cost of debt. Since the stable shareholders, including main banks, have superior information and ability to monitor the inefficient behaviors of firm managers, the cost of debt of firms with a high number of stable shareholders is expected to be lower.

Shareholders that are cross-owned are also expected to have an incentive to monitor firm managers because they share a relationship with the firms as trade partners (Osano 1996; Isagawa 2007). Further, cross-shareholding strengthens the stability of firm management by decreasing the threat of a hostile takeover, permitting managers to develop operations according to a long-term perspective. The perspective may be consistent with the interests of the bondholders, and it may lower the cost of debt.[199] In contrast, we can also predict that cross-shareholding would have a negative effect on the cost of debt. It is often argued that ***cross-shareholding*** enhances managerial

---

[198] Further, prior studies examining executive compensation for Japanese firms usually employ total cash compensation data of the board directors as a proxy for executive compensation and present significant results (Kaplan 1994; Joh 1999; Shuto 2007). This is consistent with the above argument.

[199] Anderson et al. (2003) examine the relation between founding family ownership and the cost of debt, and argue that the family's strong interest in the firm's long-term survival could mitigate the divergence of interests between bondholders and shareholders.

entrenchment (Prowse 1992; Sheard 1994; Isagawa 2007), and the increased agency costs associated with managerial opportunism may increase the cost of debt. Therefore, while the coefficient on *FSTABLE* is expected to be negative, the expected sign on *CROSS* cannot be predicted.

Following Sengupta (1998) and Shuto et al. (2009), we set the control variables for the cost of debt.[200] The cost of debt can be explained in the following terms: (1) characteristics of the issuer, (2) characteristics of the issued bonds, and (3) market conditions.

For the variables controlling the characteristics of the issuer, we employ the operating income divided by net sales (*MARGIN*), debt equity ratio (*DER*), interest coverage ratio (*INCR*), and natural log of the total assets (*LNASIZE*). Firms with a higher profit margin and interest coverage ratio are expected to enjoy a lower *SPREAD*. Further, asset-rich firms are expected to have a lower *SPREAD* because of their solvency. Therefore, the expected signs of the coefficients on these control variables (*MARGIN*, *INCR*, and *LASSET*) are all negative. In contrast, we expect that the firms with a higher debt equity ratio have a higher *SPREAD* because the debt equity ratio reflects the default risk of the firm. The coefficient on *DER* is expected to be positive.

As a proxy for the characteristics of issued bonds, we use the log of the total amount of the bond (*BSIZE*), the number of years till maturity (*MATURE*), and the dummy variable (*BMCOMP*) that takes the value one if the bond management company that monitors the bond on behalf of the bondholders is established, else, its value is zero. Following the economies of scale in underwriting, the issue size would be negatively

---

[200] Sengupta (1998) examines the effect of disclosure quality on the bond interest rate for US firms, and Shuto et al. (2009) investigate the bond yield spread for Japanese firms.

related to *SPREAD*. Bonds with a longer maturity period are expected to have a higher

SPREAD because of their greater default risk exposure. Bonds that are monitored by a

bond management company would enjoy a lower *SPREAD* because the establishment of

the bond management company is expected to contribute toward protecting the

bondholder. The expected signs of the coefficients of *BSIZE* and *BMCOMP* are negative,

and the expected sign of the coefficient of *MATURE* is positive.

Finally, we use risk premium (*RISKP*) as a control variable proxy for market

conditions. *RISKP* denotes the average values of *SPREAD* on bonds that are rated as *A* by

Rating and Investment Information Inc. (R&I) for the month of issue of the bonds.[201] We

expect the sign of the coefficient of *RISKP* to be positive because this variable is

expected to capture the time series variation in the risk premium over the business cycle.

Research model to test hypothesis 2

To measure the potential conflict between bondholders and shareholders (i.e., the

agency cost of debt), we construct a composite measure of the degree of the agency cost

of debt. Specifically, we reduce the following six financial variables related to the agency

cost of debt into a single index by using factor analysis:

ACD 1 = R&D expenditure/sales

ACD 2 = 1 − (fixed assets/total assets)

ACD 3 = cash and marketable securities/total assets

---

[201] Sengupta (1998, p.464) calculated this variable on the basis of the interest rate of Moody's *AAA* bonds. However, we could not calculate the average *SPREAD* for the month of issue because there were insufficient issued bonds with the *AAA* rating to calculate *RISKP* in our sample. Following Shuto et al. (2009), we then used *SPREAD* on R&I's A bonds to compute *RISKP*.

ACD 4 = common dividends/total assets

ACD 5 = the standard deviation of *ROA* (net income/total assets) for the past five years

ACD 6 = the standard deviation of leverage (total debt/total assets) for the past five
years

These financial variables are expected to capture the severity of potential agency conflict between shareholders and bondholders. The first three variables (*ACD* 1, *ACD* 2, and *ACD* 3) are widely used in prior studies and are expected to measure the extent to which firm managers with risk-shifting incentives can engage in wealth-transferring investment policies that cannot be easily detected by the bondholders (Long and Malits 1985; Titman and Wessels 1988; Prowse 1990; Hwang and Kim 1998).

ACD 1 is the measure of the research and development intensity of the firms. *ACD* 2 is the proportion of the firm's assets not involved in fixed plant and equipment. These assets can be regarded as sources for the potential agency cost of debt because firm managers with risk-shifting incentives are likely to have a wide range of options for discretionary behavior and use these assets for other risky investments. *ACD* 3 measures the short-term liquidity of the firm's assets. Cash and marketable securities are expected to be another source of agency conflicts because of the risk-shifting incentives of managers because managers can substitute these assets for risky assets with relative ease.

The last three variables (*ACD* 4, *ACD* 5, and *ACD* 6) are generally based on the definition of Ahmed et al. (2002) who employ proxies for bondholder-shareholder conflicts over dividend policy. *ACD* 4 is the level of dividends, measured as a percentage of the assets. If a firm pays a high level of dividend, then the bondholders are more likely

to be concerned about the firm's dividend policy. Paying a high level of dividend is a typical moral hazard problem, and it possibly indicates more severe bondholder-shareholder conflicts over dividend policy.

ACD 5 is the proxy for the firm's operating uncertainty measured by the standard deviation of its return on assets. Watts (1993) and Ahmed et al. (2002) argue that greater uncertainty about future profits implies a greater risk that excess dividends based on temporarily inflated earnings may be paid to shareholders. Thus, greater uncertainty in this regard is likely to increase bondholder-shareholder conflicts over dividend policy.

Finally, we calculate *ACD* 6, as measured by the standard deviation of leverage (total debt/total assets), for grasping the moral hazard behaviors of managers on debt financing decisions. Firm managers can issue other debt instruments after the original debt is issued. The issuance of additional debt transfers wealth from the original debt holders to the managers, and in the process, creates a cost that reduces the value of firms (Watts and Zimmerman 1986). We use the volatility of leverage to measure the agency cost of debt on debt financing decisions because the frequent issuance of additional debt is likely to increase it.

Prior studies assume that *each* of these variables can be proxy for the potential agency cost of debt and obtain the results that are consistent with their assumption. In practice, however, it is likely that rational bondholders estimate the agency cost of debt of issuer firms by considering various types of moral hazard behaviors of managers *simultaneously* and take investment decisions. Focusing on a single variable does not completely capture the conflict between bondholders and shareholders, the agency cost of debt. Therefore, to comprehensively estimate the agency cost of debt of issuer firms, we

construct a composite measure of the degree of the agency cost of debt by using factor

analysis to reduce the above six financial variables into a single index.

【Insert Table 1 about here】

Factor analysis assumes that attribute measures are intercorrelated and that they

exert load on a single factor. Panel A of Table 1 reveals that the correlations among the

six financial variables are all positive and most of the correlations are significant as

expected. Panel B of Table 1 shows that a single factor loaded by these six attribute

measures justifies around 33.5% of the cumulative variance. Panel C of Table 1 reports

the factor loadings, all of which have positive signs as expected. Overall, the results

suggest that our factor analysis provide useful composite measures for the degree of the

agency cost of debt.[202]

To test hypothesis 2, we estimate the following models by using a calculated

composite measure of the agency cost of debt (*ACD*):

$$SPREAD = C + \beta_1 MO + \beta_2 MO*ACD + \beta_3 CROSS + \beta_4 FSTABLE$$

$$+ \beta_5 MARGIN + \beta_6 DER + \beta_7 INCR + \beta_8 LNASIZE + \beta_9 BSIZE$$

$$+ \beta_{10} MATURE + \beta_{11} BCFIRM + \beta_{12} RISKP + YEAR + \varepsilon, \qquad (2)$$

where

ACD = the agency cost of debt, computed using factor analysis based on six financial

variables: (1) R&D expenditures/sales, (2) 1 − (fixed assets/total assets), (3) cash

---

and marketable securities/total assets, (4) common dividends/total assets, (5) the standard deviation of *ROA* (net income/total assets) for the past five years, and (6) the standard deviation of leverage (total debt/total assets) for the past five years.

The positive (negative) coefficient of *MO*ACD* provides evidence that the association between managerial ownership and interest rate spread is greater (smaller) when the agency cost of debt at issuing corporate bonds is larger (smaller). Therefore, the expected sign of the coefficient of *MO*ACD* for supporting hypothesis 2 is positive.

IV. Sample selection and descriptive statistics

Sample selection

The sample of Japanese firms was selected on the basis of the following criteria:

i) The firms issued straight bonds from April 1997 to March 2004.

ii) Banks, securities firms, insurance firms, and other financial institutions are eliminated from this study.

iii) The firms' financial year ends in March.

iv) **The financial statements, stock prices, and bond issue data necessary for this study are available from the respective databases mentioned below.**

The data on bond issues during the sample period are collected from the *Bond database* issued by I-N Information Systems Ltd. This database provides detailed security-specific information on corporate bonds, including interest rate spread, total

amount of the bond, number of years till maturity, and credit rating. We collected data

regarding managerial ownership, financial statements, and stock prices from *Nikkei*

NEEDS - Financial QUEST of Nikkei Media Marketing. The other corporate ownership

variables, cross-shareholdings and stable shareholdings, were obtained from the NLI

Research Institute, *the Data Package of Cross-Shareholding and Stable Shareholding*.

Cross-shareholders include all domestic companies listed on the Japanese stock markets

at the end of the fiscal year. The stable shareholdings are defined as the fraction of the

shares that are owned by stable shareholders at the end of the fiscal year. Stable

shareholders include financial institutions, trust banks, and other financial institutions

(i.e., brokerage companies and securities finance companies).[203]

Bond information must be matched with corporate ownership and financial

statement data. If the firm issues the bond for fiscal period *t*, then corporate ownership

and other financial statement data for the period *t – 1* are matched with the bond. The

accounting data is based on consolidated financial statements.[204] In order to ensure that

the results are not sensitive to extreme values, observations in the highest and lowest one

percent of *SPREAD* and of each accounting variable were omitted. The final sample

consisted of 643 firm-year observations.

Descriptive statistics

Table 2 presents descriptive statistics for the variables used in this study. It shows

that the mean (median) yield spread of a corporate bond over a government bond having

---

[203] These also include parent companies.

[204] We also conducted robustness tests by using unconsolidated financial statements because consolidated financial statements were not required for *primary* financial statements under the Securities and Exchange Law of Japan before March 2000 (Shuto 2009). The results based on unconsolidated financial statements data are consistent with those of the analyses of the body.

the same characteristics is about 0.61% (0.51%), with a standard deviation of 0.425. For

our sample, the mean (median) percentage of managerial ownership (*MO*) is 0.007

(0.001), which exhibits fair skewness distribution. This value is lower than that of prior

studies that have examined the managerial ownership of Japanese firms (Teshima 2004;

Shuto and Takada 2008; Teshima and Shuto 2008).

【Insert Table 2 about here】

In our opinion, the lower value arises from the fact that our sample is restricted to

firms that issue corporate bonds. Since it is likely that the firms that issue bonds are

relatively large and mature, the managerial ownership of these firms is expected to be

smaller.[205] Further, we can observe that the value of managerial ownership in the sample

of Ortiz-Molina (2006) for US firms is considerably smaller than that of prior studies.

The value of cross-shareholding ownership (*CROSS*) is 12.6%, whereas that of stable

shareholding ownership (*FSTABLE*) is 16%.

【Insert Table 3 about here】

Table 3 indicates the correlations matrix for the variables on the analysis of cost of

debt. The lower left-hand portion of the table reports the Pearson correlations, and the

---

[205] Prior studies that examine Japanese firms indicate that managerial ownership is negatively
correlated with firm size, which support our consideration. For example, Shuto and Takada
(2008), which examines Japanese firms from 1990 and 2005, indicate that managerial ownership
is negatively and significantly correlated with firm size (The coefficient of spearman correlation =
– 0.438, *p*-value = 0.000). In our sample, Table 3 also indicates that *MO* is negatively correlated
with *LNASIZE*.

upper right-hand portion presents the Spearman rank-order correlations. The Pearson correlations reveal that *MO* is positively correlated with *SPREAD* (0.16), as expected. Table 3 also shows that *MO* is positively correlated with *ACD* (0.13), and that *ACD* is positively correlated with *SPREAD* (0.30). The results suggest that managerial ownership is positively associated with the agency cost of debt for the fiscal year immediately preceding the bond issue, and that the agency cost of debt is positively associated with interest rate spread.

V. Main results

Managerial ownership and interest rate spread

We estimate regression model (1) to test hypothesis 1, the results of which are summarized in Table 4. The reported *t*-statistics are based on the heteroscedasticity-corrected covariance matrix by White (1980). In model (1), the coefficient of *MO* is 1.829 and significantly positive at the less than 0.01 level, as expected. This result holds after controlling for the other ownership structure, characteristics of the issuer, characteristics of the issued bonds, and market conditions. Thus, managerial ownership has an incremental explanatory power for the cost of debt when the other ownership structure and control variables are given. The result suggests that prospective bondholders interpret an increase in managerial ownership as an increase in the conflict of interest between bondholders and shareholders. This supports our first hypothesis.

【Insert Table 4 about here】

Further, we find that the coefficient on *FSTABLE* is significantly negative at the less than 0.01 level. The result is consistent with our prediction that stable shareholdings by financial institutions have a favorable impact on the cost of debt through efficient monitoring. This finding indicates that firms facing stronger external and effective monitoring by financial institutions are rewarded with lower yield spreads. The coefficient on *CROSS* is not significant, which suggests that cross-shareholdings have no impact on the cost of debt in the presence of other ownerships and control variables. With respect to control variables, they have their expected signs, except for *INCURE* and *MATUR*, and are statistically significant at conventional levels.

Agency cost of debt, managerial ownership, and interest rate spread

Table 5 shows the regression result of model (2) to test hypothesis 2. To support hypothesis 2, we expect the coefficient of *MO*ACD* to be positive in the model. In model (2), the coefficient of *MO*ACD* is 3.839 and significantly positive at the less than 0.01 level, as hypothesized. We also find that the coefficient on *MO* is no longer positive. The result indicates that managerial ownership has a stronger effect on interest rate spread when the agency cost of debt at the time of corporate bond issue is larger. This finding is consistent with hypothesis 2. We observe that our control variables have their expected signs, except for *MATUR*, and that most of the variables are statistically significant at conventional levels.

【Insert Table 5 about here】

1277

Overall, the evidence from Section V suggests that prospective bondholders use managerial ownership information to anticipate a firm's future agency cost of debt and default risk, and then they incorporate this prediction in the pricing of new corporate bond issues. Further, bond investors are likely to estimate a firm's future agency cost of debt and default risk higher when managers have already engaged in an action that transfers wealth from the bondholders to the shareholders or when managers have a wide range of options for this purpose at the time of bond issue.

VI. Additional analyses

The nonlinearity of managerial ownership and the cost of debt

As discussed in Section II, some prior studies suggest the possibility that managerial ownership is nonmonotonically related to the cost of debt (Bagnani et al. 1994; Ortis-Molina 2006). To address the possibility of the nonlinearity of managerial ownership and the cost of debt, we estimate the following model.

$$SPREAD = C + \beta_1 MO + \beta_2 MO^2 + \beta_3 CROSS + \beta_4 FSTABLE + \beta_5 MARGIN$$

$$+ \beta_6 DER + \beta_7 INCR + \beta_8 LNASIZE + \beta_9 BSIZE + \beta_{10} MATURE$$

$$+ \beta_{11} BCFIRM + \beta_{12} RISKP + YEAR + \varepsilon, (3)$$

where

MO^2 = the square of the fraction of the shares owned by directors

Although a piecewise regression model is used in the prior studies (Bagnani et al. 1994; Ortis-Molina 2006), we use the quadratic form mentioned above. Short and Keasey (1999) argue that the empirical application of the piecewise regression model has a drawback: it allows the coefficients of the managerial ownership variables to change only at predetermined levels of ownership. Since there is no theoretical guidance for the choice of the turning points on the piecewise regression model, we test the relationship between managerial ownership and the cost of debt using the quadratic form, which allows the turning points to be determined endogenously.

【Insert Table 6 about here】

Table 7 indicates the regression results. It shows that while the coefficient of MO is significantly positive, the coefficient of MO^2 is not significant. It also reveals that the explanatory power (adjusted R²) of model (3) is 0.562, which is slightly lower than that of model (1) in Table 1 (0.563). These results suggest that MO^2 has no incremental explanatory power for interest rate spread and is not consistent with the assumption that the relation between the cost of debt and managerial ownership is nonmonotonic.

In addition to the discussion regarding Section II, we can suggest two possible reasons for our results being different from those of Bagnani et al. (1994). First, as stated above, Bagnani et al. use a piecewise regression model to test the hypothesis. Second, we also indicate the possibility of sample selection biases because they obtained the sample from the list of Fortune 500 companies, which comprises only those firms whose revenues are extremely high.

The effect of bond rating on the relation between managerial ownership and the cost of debt

Our results are consistent with hypothesis 2 indicating that the association between managerial ownership and interest rate spread is greater when the agency cost of debt at the time of corporate bond issue is larger. To verify the robustness of the results, we estimate the regression model using the bond rating instead of *ACD* because the bond rating is often assumed to reflect an agency cost of debt and a firm's default risk (Sengupta 1998; Bhojraj and Sengupta 2003; Shuto et al. 2009).

Further, Bhojraj and Sengupta (2003) argue that the influence of corporate governance mechanisms would be more critical when dealing with debts of poor quality than otherwise. For high-risk firms, bondholders would rely more on the firm's governance structure because traditional measures of past profitability and leverage may not be very informative about future cash flows. Thus, we expect that the ownership structure should have a greater effect on bond yield spread for poorly rated bonds than on high-quality bonds. In particular, we estimate the following regression model:

$$SPREAD = C + \beta_1 MO + \beta_2 MO*RATE + \beta_3 CROSS + \beta_4 FSTABLE +$$

$$\beta_5 MARGIN + \beta_6 DER + \beta_7 INCR + \beta_8 lnASIZE + \beta_9 BSIZE + \beta_{10} MATURE$$

$$+ \beta_{11} BCFIRM + \beta_{12} RISKP + YEAR + \varepsilon, (4)$$

where *RATE* takes the value 1 through 10, representing the bond ratings of AAA, AA$^+$,

AA, AA$^-$, A$^+$, A, A$^-$, BBB$^+$, BBB, and BBB$^-$, respectively.[206]

We expect the coefficient on *MO*RATE* to be negative in model (4). The result of

the regression with the interaction term is given in Table 7. In model (4), the coefficient

of *MO*RATE* is positive and statistically significant at the 0.05 level, as expected. The

result reveals that managerial ownership has stronger effects on bond yield spread for

lower rated bonds, which is consistent with the results of the previous section and the

implication of the theory.

【Insert Table 7 about here】

Endogeneity of managerial ownership and the cost of debt

Our results suggest that shareholding of managers increase the cost of debt because

rational bondholders use managerial ownership information to anticipate a firm's future

agency cost of debt and default risk. While interpreting the results, we should consider

the joint determination of managerial ownership and the cost of debt. Firm managers may

consider the cost of capital of the firms when deciding whether or not to hold stocks of

their firms. If *MO* and *SPREAD* are jointly determined, the estimated results are biased

and difficult to interpret. To solve this simultaneity problem, we use a simultaneous

equation model in which the shareholding of managers and the interest rate spread are

jointly determined. Specifically, we consider the following system of equations:

---

[206] The bond rating used in this analysis is from *Rating and Investment Information Inc* (R&I), the most comprehensive and popular database on bond ratings in Japan.

$$SPREAD = C + \beta_1 MO + \beta_2 CROSS + \beta_3 FSTABLE + \beta_4 MARGIN + \beta_5 DER$$

$$+ \beta_6 INCR + \beta_7 lnASIZE + \beta_8 BSIZE + \beta_9 MATURE + \beta_{10} BCFIRM$$

$$+ \beta_{11} RISKP + YEAR + \varepsilon \qquad\qquad (5)$$

$$MO = C + \beta_1 SPREAD + INSTRUMENTS + \varepsilon (6)$$

We estimate model (5) by conducting a two-stage regression. In the first stage, we regress *MO* on all exogenous variables from models (5) to (6). The estimation of this regression requires the construction of a set of variables (*INSTRUMENTS*) associated with managerial ownership. We use two variables as the instruments: sales growth and 1 − (fixed assets/total assets). In the second stage, we estimate model (5) instead of *MO* using the fitted value from the first stage. This value is labeled as *MOFIT*.[207]

【Insert Table 8 about here】

The results of the estimation of the second-stage regression are summarized in Panel A of Table 8. These results are consistent with those in the previous section: The coefficient of *MOFIT* is positive and statistically significant. We also test **hypothesis 2**

---

[207] Using the Hausman (1978) test, we also assess whether the two variables (*MO* and *SPREAD*) are jointly determined. To conduct this test, we run the second-stage regression, while including both the actual variables and the predicted value from the first-stage regression. The test rejects the null hypothesis that the coefficient of the predicted value is zero (*p*-value = 0.000), which implies that the simultaneity problem does exist.

by using a two-stage regression.[208] Panel B indicates that the coefficient of *MO*ACD* is significantly positive, which supports our second hypothesis. These results suggest that our findings do not merely reflect the simultaneity between managerial ownership and interest rate spread.

Robustness of the results

Finally, we describe the analyses conducted further to verify the robustness of our results. First, we conduct a regression analysis on a year-by-year basis for our sample and estimate the *t*-value based on the approach used by Fama and Macbeth (1973). Since these empirical analyses are based on eight years of pooled cross-sectional data in which the same firm can appear multiple times in the sample, these observations may not be independent. This procedure may involve cross-sectional and autocorrelational problems. It is well known that the Fama and Macbeth (1973) approach can solve these problems and provide a better inference on the estimates.

【Insert Table 9 about here】

The results are summarized in Table 9. Panel A summarizes the results for hypothesis 1. We are mostly able to obtain the same results: the coefficient of *MO* is

---

[208] Specifically, we consider the following system of equations:

$$SPREAD = C + \beta_1 MO + \beta_2 MO*ACD + \beta_3 CROSS + \beta_4 FSTABLE + \beta_5 MARGIN +$$
$$\beta_6 DER + \beta_7 INCR + \beta_8 LNASIZE + \beta_9 BSIZE + \beta_{10} MATURE + \beta_{11} BCFIRM +$$
$$\beta_{12} RISKP + YEAR + \varepsilon(7)$$
$$\boldsymbol{MO = C + \beta_1 SPREAD + INSTRUMENTS + \varepsilon(6)}$$

significantly positive. With respect to the test of hypothesis 2, the regression results are summarized in Panel B of Table 9, which provides evidence supporting hypothesis 2 that the coefficient of *MO*ACD* is significantly positive. Our results are robust under the Fama and Macbeth (1973) approach.

Finally, we also examine the relationship between managerial ownership and the cost of *equity capital*. If managerial ownership reflects the bondholder-shareholder conflict in our research setting, it is expected that managerial ownership would not be positively associated with the cost of equity capital because we cannot correctly predict how the severity of bondholder-shareholder conflict affects the cost of equity capital.[209] We use the cost of equity capital measured using the three-factor model based on the study by Fama and French (1993).[210] With regard to control variables, we added the logarithm of the market value of equity (*MV*) and capital asset pricing model (CAPM) beta estimated using data from 60 months preceding the most recent month of April (*BETA*) to model (1) and deleted the variables of the characteristics of the issued bonds from the model. Our untabulated result shows that the coefficient of *MO* is negative and not significant, which is consistent with our prediction.

VII. Conclusion

Agency theory predicts that shareholdings of managers create a conflict of interest between shareholders and bondholders (Jensen and Meckling 1976; Myers 1977).

---

[209] If the incentive alignment effect on managerial ownership dominates in this setting, we can expect that managerial ownership is negatively associated with the cost of equity capital because the effect has a potential to increase the shareholder value of firms and decrease the cost of equity capital.

[210] For details on the estimation method of the cost of equity capital, see Appendix.

Limited liability shareholders may have an incentive to expropriate bondholders' wealth by taking investment and financial decisions aimed at reducing the value of the firm's outstanding debt. Rational bondholders would demand a higher interest rate to compensate for the added risk on owner-managers' behaviors.

To test the implication of the theory, we investigate the relationship between managerial ownership and the cost of debt, as measured by the interest rate spread on corporate bonds for Japanese firms. We find that managerial ownership is positively associated with interest rate spread on corporate bonds, as expected. We also find that stable shareholding has a significantly positive association with the interest rate spread, while cross-shareholding is not significantly correlated with it.

Further, we expect that the effect of managerial ownership on the cost of debt strengthens when the potential agency cost of debt of firms at the time of bond issue is larger. By employing factor analysis to measure the current agency cost of debt, we find that managerial ownership has a higher correlation with interest rate spread when the potential agency cost of debt at the time of bond issue is larger. The results are robust with respect to additional analyses, including the possibility of a nonlinear relationship, bond ratings, endogeneity problems, and the Fama and Macbeth (1973) approach.

Consequently, our results suggest that prospective bondholders in the Japanese market anticipate a firm's future agency cost of debt by using managerial ownership information and incorporate this prediction in the pricing of new corporate bond issues. Further results suggest that the prospective bondholders estimate a higher firm's future agency cost of debt because of managerial behavior that benefits the managers at the expense of bondholders' wealth when the current agency cost of debt at the time of bond

issue is already larger. Our results also suggest that prospective bondholders perceive stable shareholdings of financial institutions to be mitigating the wealth transfer problem between bondholders and shareholders.

Overall, our results suggest that managerial ownership is an important determinant of bond yield spread in the Japanese bond market. The results also suggest that bond investors focus on the current agency cost of debt at the time of bond issue to determine the interest rate in the bond contract. Further, the results show that accounting information is useful in estimating the agency cost of debt.

Finally, we find that agency theory on the conflict between shareholders and bondholders applies to the practice of the Japanese bond market after controlling for the unique Japanese ownership structure, cross-shareholding, and stable shareholding of financial institutions. While previous studies generally focus on the findings related to the unique ownership structure in Japan, our results indicate that the empirical implication of the traditional agency theory on managerial ownership is also supported by analyses for the Japanese bond market. Our study may be useful for reconsidering the functioning of the unique ownership structure of Japan in the bond market.

Note:

Spearman (Pearson) correlations are above (below) the diagonal.

SPREAD = the interest rate spread on the first straight bond issued of the fiscal year; the spread is the difference between the interest rate on the bond issued by the firm and that on government bonds

MO = fraction of the shares owned by directors

CROSS = fraction of the shares that are cross-owned by non-financial companies (cross-shareholdings).

FSTABLE = fraction of the stable shareholdings by financial institutions

MARGIN = the operating income divided by net sales

DER = the debt equity ratio

INCR = the interest coverage ratio

LNASIZE = the natural log of the total assets

BSIZE = the log of the issue size

MATUR = the years to maturity

BMCOMP = an indicator variable that takes the value of one if a bond management company is established, and zero otherwise

RISKP = the risk premium: the average values of SPREAD on R&I's A bonds for the month of issue

ACD = the agency cost of debt, computed using factor analysis based on six financial variables; 1) R&D expenditures/sales, 2) $1 -$ (fixed assets/total assets), 3) cash and marketable securities/total assets, 4) common dividends/total assets, 5) the standard deviation of *ROA* (net income/total assets) for the past five years, 6) the standard deviation of leverage (total debt/total assets) for the past five years

CEC = the cost of equity capital measured using the three factor model based on Fama and French (1993)

MV = the logarithm of the market value of equity

BETA = CAPM beta estimated using 60 months of data prior to the most recent April

Appendix

Estimation method for the equity cost of capital

To calculate a firm's estimated equity cost of capital (*ECC*), we estimate the following equation.

$$ECC_{i,t} = \overline{R}_{f,t} + \hat{\beta}_{RMRF,i,t} * \overline{(R_M - R_f)_t} + \hat{\beta}_{SMB,i,t} * \overline{SMB_t} + \hat{\beta}_{HML,i,t} * \overline{HML_t}, (1)$$

where $(R_m - R_f)$ is the monthly return of the market portfolio in excess of the risk-free rate. *HML* and *SMB* are the monthly returns to the book-to-market and size factor mimicking portfolios, as described in Fama and French (1993). First, we calculate each factor's average monthly return over a period of 60 months before month *m*. And then, we estimate the expected annual factor returns, $(R_m - R_f)$, HML, and SMB, by compounding the resulting average monthly returns over a period of 12 months before the beginning of the fiscal year. Second, we estimate the betas associated with the firm's return to each of the three factors by estimating the following monthly time series regression, as described in Fama and French (1993). We estimate the following equation by considering the period of the latest 60 months preceding the beginning of the firm's fiscal year.

$$RET_{i,m} - R_{f,m} = \alpha_i + \beta_{RMRF,i}(R_{M,m} - R_{f,m}) + \beta_{SMB,i}SMB_m + \beta_{HML,i}HML_m + \varepsilon_{i,m} (2)$$

FINANCING ALTERNATIVES AND INCENTIVES FOR RENEWABLE ENERGY, FROM THE VIEW POINT OF TURKEY'S MEMBERSHIP TO THE EU

Cem Berk, Marmara University

Summary

In this paper we discuss the approaches to financing conventional energy sources and renewable energy projects from the standpoint of EU-Turkey relation, by focusing on how these transactions differ from more conventional oil trade at the other part of the world. Main features of conventional energy sources and renewable energy are analysed, from the strategic point of view and Turkey's regional position to the surrounding oil and gas producing countries. Strategic alignment and future oriented advantage of the increasing interest for Caspian and Mediterranean oil transfers to EU countries, has been critically evaluated. The incentives and tax-breaks used in EU including Turkey have been studied to illustrate principles and insure understanding. Attention is also given to different financing instruments and -methods. Finally, quantitative analysis and model on the energy incentives in Turkey are also presented in the paper.

1. Introduction

Global warming will result in major environmental, social and economic problems. These negative consequences of are already occurring, and others are inevitable even if the emission of atmospheric greenhouse gases could be stabilized at present levels. In the light of global warming, the political leaders of many countries have accepted that there is an urgent need to reduce greenhouse gas emission on a worldwide scale. At the same time, there is a potential for reducing such emissions by economies in energy use, energy efficiency and by energy generation from alternative, non-carbon-based sources.

Turkey as an emerging market will continue its effort to increase diversifies energy sources and the energy requirements. At present, most of Turkey's home-produced energy is generated from lignite and poor-quality coal; these are problematic in terms of carbon dioxide emission, so there is the possibility that Turkey's contribution to anthropogenic atmospheric carbon dioxide will grow over the coming years. More positively, Turkey has great potential for generating energy from renewable sources. For example, there is considerable possibility of using more hydropower. In addition, many regions of the country are suitable for wind power, and it has been calculated that Turkey could meet a large part of its energy needs from wind farms that could be located along its western seaboard. There are, however, potential barriers to the implementation of such a strategy. Apart from the financial investment that will be needed, there will need to be public support too.[211] (See Appendix 1 for Turkish Energy Sector Details)

Historically, feed-in laws have been the primary mechanism used to support renewable energy (RE) development in both Europe and the US, where there is a track record of some two decades of experience. At present, they are being applied in 16 EU member countries.[212] Green pricing programs allow electricity customers to express their willingness to pay for renewable energy development through direct payments on their monthly utility bills.

2. Energy Market and –policy

---

[211] Kilinc, Stanistreet, Boyes; Incentives and disincentives for using renewable energy: Turkish students' ideas; Renewable and Sustainable Energy Reviews;2008.

[212] European PV Association Position Paper On a Feed-in Tariff for Photovoltaic Solar Electricity;; p.3; 2005.

The attributes of energy policy may include legislation, international treaties, incentives to investment, and guidelines for energy conservation, taxation and other public policy techniques. Frequently the dominant issue in the energy policy is the risk of supply-demand mismatch. Current energy policies also address environmental issues. Some governments state explicit energy policy, but, declared or not, each government practices some type of energy policy. The main elements intrinsic to an energy policy are:

- The energy self-sufficiency
- Energy pricing
- The goals for future energy intensity,
- Ratio of energy consumption to GDP
- Environmental externalities
- The diversification of energy recourses
- The national policy drive province, state and municipal functions
- The incentives accelerating energy sustainability and
- Security of supply.

Gas is an important input for electricity generation in the energy industry and therefore wholesale natural gas and electricity markets are vertically interrelated. The same is true for wholesale and retail electricity markets since retailers buy electricity from wholesalers. Vertical integration is widespread among European energy firms. Moreover, the merger activity appears to be accelerating as competition opportunities expand, incentive regulation diffuses more widely, and regulators have become less hostile to mergers. As a result, the vertically integrated firm can increase profits by raising both its end-user market share and price. Collaborative incentives, however, not only encourage cooperation but may also enhance free riding. Indeed, rewards based on aggregate profits hinder the identification of individual performances. As a consequence, individuals have more incentives to avoid hoping that the others will compensate.[213]

3. Developing Energy Project

The use of non-conventional renewable energy system technologies have received strong incentives in developed countries, especially after the third conference of the parties of Kyoto Protocol. One of the main reasons for these incentives was the existence of a climate change, with global consequences, and with anthropogenic causes mainly related to the use of fossil fuels. As this impact was not included in the fuel prices, the governments that signed the protocol is obligated to give economic incentives for clean technologies, and especially for RE.
Kyoto protocol was a compromise between the industrialized countries and Russia who decided to reduce the CO_2 emissions a 5.4% with respect to the 1990 emissions, for 2010. EU- countries like Denmark (29% of RE on its energy matrix) Germany (9.4%), Spain (3.4%) and Holland (4%) are clear examples where strong incentives for RE were applied, with successful results.[214]
If properly regulated and supported, the expansion of renewable energy could make unquestionable contributions in many areas. But if only left to the market forces, the expected effects may never occur or may even become problems to the society. As sites for renewable energy projects become scarcer and energy demand continues to grow, a derived demand for sites could be explained on the basis of the trade-off between their distance and their productivity. In particular, in a competitive market the change from one isoprofit to another by means of

relocating a project should be associated to a corresponding increase or decrease in the price of the site, whereas sites lying over the same isoprofit should have similar prices. Of course such market will often be influenced by the multiple use of land, in which the implementation of a renewable energy project is just one of the possible uses explaining demand. Same isoprofit should have similar prices. Of course such market will often be influenced by the multiple use nature of land, in which the implementation of a renewable energy project is just one of the possible uses explaining demand.

Technologies, especially wind energy, but also small-scale hydro power, energy from biomass, and solar thermal applications, are economically viable and competitive. The others, especially photovoltaic, depend only on increasing demand and thus production volume to achieve the economy of scale necessary for competitiveness with central generation. This should be seen against the rapidly improving fiscal and economic environment being created in the EU both by European legislation itself swinging into full implementation and the Member States' own programmes and support measures, which despite the short-term macro-economic background, are accelerating rapidly at the time of publication.

In this context, the generation of energy from renewable sources is beginning to gather strength throughout the world, motivating leaders to implement policies aimed at increasing the number of projects according to this line of thinking.

Source: Zulunga, Dyner; Incentives for renewable energy in reformed Latin-American electricity markets: the Colombian case; Journal of Cleaner Production; 2006

Although the reduction of poverty is perhaps the most important concern in the developing countries, there is significant environmental interest associated with the use of new energy sources which will help to reduce the environmental impacts that have been caused by traditional forms of energy based on the combustion of fossil fuels. From simulations carried out for the Colombia market, it is less efficient to promote renewable energies through fiscal policies such as income tax exemption, while other kinds of policies such as direct subsidies have a major effect as far as accelerating the process of technology diffusion. Therefore, it remains for the government to set the appropriate incentives in order to efficiently exploit renewable energy resources.

Although in the process of Turkish market, renewable energy did not occupy a prominent place, there now seems to be a new international trend to develop these resources, which will begin to

play a significant role, especially in meeting the increasing demands for energy in the development and integration process to the EU.[215] Biomass and hydropower generation have an industrial capacity and experience knowledge that lacks in the case of wind.[216]

Well-developed countries like the United States, the United Kingdom, Germany, France and Japan are advancing in the application of special programs and in the introduction of specific laws to stimulate the use of these sources in the electricity generation. An important factor is obvious in the interest of these countries: the predominance of thermoelectric generation using fossils fuels and the negative environmental impact associated to this type of generation. Besides, the electrical sector in both the United Kingdom and the United States underwent a process of restructuring in an attempt to introduce a competitive market in some activities. Faced with this scenario, it became necessary to adopt specific measures to protect electricity generation using alternative energy sources.[217]

A feed-in tariff involves the obligation on the part of a utility to purchase electricity generated by renewable energy producers in its service area at a tariff determined by public authorities and guaranteed for a specific period of time (generally 20 years). A FiT's value represents the full price per kWh received by an independent producer of renewable energy, i.e. including a premium above or additional to the market price, but excluding tax rebates or other production subsidies paid by the government.

Green pricing represents a market solution to various problems associated with regulatory valuation of the non market benefits of renewables. Under green pricing programs, utilities can encourage the development of renewable energy while simultaneously measuring customer support for renewables under semi-competitive conditions. Customers willing to pay a price premium for renewable energy can do so by adding some incremental amount of money to the irregular electricity bills. [218]

Also with the acceptance of Kyoto protocol by developed countries tradable green certificate markets are established. These systems have different designs in different countries but a common feature is that they seek to replace direct public subsidies for renewable energy with incentive systems that use the market mechanism. More precisely, the objective is to create a market where various kinds of green electricity compete on equal terms to relieve the government of the burden of direct involvement in the electricity sector's investment decisions. [219]

4. The reduction of carbon emissions in EU

Environmental issues are increasingly driving energy investments in Europe. EU wants to reduce greenhouse gas emissions by 20% by 2020. EU also wants 10% of its cars and trucks to run on bio fuel, and to ensure that 20% of its power comes from renewable energy sources such as solar and wind power and hydroelectricity. Renewable energy sources currently account for less than 7% of EU energy use. Carbon transactions are defined as purchase contracts whereby one party pays to counter party in return for GHG emissions reductions or for the right to release a given

amount of GHG emissions that the buyer can use to meet its compliance objectives vis-à-vis climate change mitigation. Carbon transactions can be grouped into two main categories.

Allowance-based transactions, in which the buyer purchases emission allowances created and allocated by regulators under cap-and-trade regimes, such as Assigned Amount Units (AAUs) under the Kyoto Protocol, or EUAs under the EU ETS. Such schemes combine environmental performance and flexibility, through trading, in order for mandated participants to meet compliance requirements at the lowest possible cost.

Project-based transactions, in which the buyer purchases emission credits from a project that can verifiably demonstrate GHG emission reductions compared with what would have happened otherwise. The most notable examples of such activities are under the CDM and the JI mechanisms of the Kyoto Protocol, generating CERs and ERUs respectively.

Carbon cap-and-trade regimes allow, for the most part, for the import of credits from project-based transactions for compliance purposes. This helps to achieve the environmental target cost effectively through access to mitigation potentials from additional sectors and additional countries. Mandatory wholesale mechanisms are the other key driver in the U.S. A variation of this, PURPA, led to much of the early wind energy development in the U.S. Other countries, such as Spain and Germany, have also used variations of this mechanism. A weakness of the PURPA/feed-in tariff approach is that it doesn't guarantee any particular long-term growth.

Dr. Engelhard (RWE Rheinbraun) criticised that the caps are only given and only introduced for energy intensive installations, this means that only 1/3 of Greenhouse gases (GHG) of the EU are covered and that the cap in trade is introduced for CO2 not for all six Kyoto gases.Dr. Engelhard reckons with unavoidable distortions in competition and disadvantages for the European industries. Dr. Engelhard expects a transfer of energy intensive production to countries without regulations, this means to Eastern Europe, developing countries or to the United States.

Combining technical assistance with financing, EBRD aims to help local authorities overcome common obstacles to financing energy efficiency:

- Increasing awareness and prioritization of energy efficiency gains

- Allocation of resources for energy audits and project preparation

- Tendering procedures

- Management of larger-scale programs that may need additional dedicated resources.

Investment barriers addressed through credit for municipal EE investments and introduction of the sale of receivables as a means of EE financing.

The renewable sector in Europe has long benefited from environmental concern over fossil-fuel fired plants, and has been further encouraged by European-wide and single-nation commitments to achieving 22% of electrical output from renewable sources by 2010, in order to meet Kyoto Treaty objectives. Renewable Energy Vision in Europe suggests:

- A very high rate of deployment of renewable energy projects is needed
- Additional form of financial support is required
- Cannot rely on market alone
- Regulatory encouragement
- Supporting research and development

Sustainable Energy Fund (SEF), a private, non-profit, financial organization, offers commercial loans for new or retrofit energy-related projects to established commercial, industrial, municipal,

and non-profit entities. SEF will also consider funding or co-funding the energy-portion of a new building construction or a building remodelling project.

Created in 2000, the European Renewable Energy Council - EREC - is an umbrella organisation of the European renewable energy industry, trade and research associations active in the fields of photovoltaic, small hydropower, solar thermal, biomass, wind energy and geothermal energy, thus representing the entire renewable energy sector.[220]

There are several benefits of renewable energy. The most important one is environmental benefits, which include avoiding carbon dioxide (CO_2) emissions which helps to combat climate change. Second, there are national security benefits, such as achieving greater energy independence, as renewable energy is largely a domestic resource; and reducing overall payments to potentially hostile regimes or other groups in countries with oil and natural gas reserves. Third, there are general economic benefits, including possible reductions in the price of fossil fuels by lessening demand for them, and increased stability in energy prices through diversification of power supplies. Finally, in some cases there is a specific economic benefit, when developing renewable energy is the lowest-cost option available, based on avoiding fuel costs and other economic considerations.

5. Financial strategies for energy in Europe

In the early preparation phases of retrofit projects, financial issues, real or imagined, tend to become very important barriers to the realization of innovative low-energy projects in the minds of many decision-makers or technicians involved in the design and implementation of public buildings. This is mostly due to the fact that budgets for public building retrofits are often limited, and decision-makers tend to consider initial costs rather than operating, maintenance or life-cycle costs as those significant for refurbishment.

The possibility of internal allocation of funds by a public enterprise, in order to apply energy efficient retrofitting measures to its own buildings is also quite promising. It is a widespread financing method called project finance and is mostly related to the development non-recourse financing of pipelines, electric generating plants, sports stadiums, industrial facilities and similar

---

[220] EREC is composed of the following European non-profit associations and federations:
AEBIOM (European Biomass Association), EGEC (European Geothermal Energy Council), EPIA (European Photovoltaic Industry Association), ESHA (European Small Hydropower Association), ESTIF (European Solar Thermal Industry Federation), EUBIA (European Biomass Industry Association), EUREC Agency (European Renewable Energy Research Centres Agency), and EWEA (European Wind Energy Association).
The European Renewable Energy Council and the member associations are located in the Renewable Energy House (REH). The REH is a model showcase for renewable energy technologies in a monument-protected building in the European quarter of Brussels.) (EREC is committed to the following objectives: Acting as a forum for exchange of information and discussion on issues related to renewables as well as to represent the European RES industry & research community, Providing information and consultancy on renewable energies for the political decision makers on local, regional, national and international levels, Launching policy initiatives for the creation of positive frameworks for renewable energy sources, Encouraging European technologies, products and services on global markets. Europe is at the forefront of renewable energy development worldwide and has significant experience in the formulation of proactive policy measures in this area. Europe is in fact the global leader in RES technology development. Renewable energy sources (RES) make a major contribution to the security of energy supply, the risk reduction of fuel-based price increase and volatility, the mitigation of climate change, and environmental protection. Renewable energy sources are a key element for sustainable development including the creation of jobs and wealth oriented to thefuture). For more information on EREC and the REH see: www.erec-renewables.org.

capital-intensive infrastructure projects. It encompasses a complex mix of sophisticated legal, financial, regulatory and management issues that only a handful of organizations have mastered. The key factors relating to the project finance include the following:

- Solar, thermal and wind facilities
- Gas processing and liquefaction facilities
- LNG receiving terminals
- Chemical and fertilizer plants
- Paper recycling plants
- Waste-to-energy facilities
- Water treatment facilities and
- Public infrastructure

Long-term project financing is increasingly available in EU and Turkey/ though major deals are difficult to structure and will require innovative approaches. The EBRD also encourages developers to submit a proposal for renewable energy project funding.

The World Bank has been assisting Turkey to develop its market economy helping develop and implement a strategy to take advantage of the Kyoto Protocol in the areas of "green investment" and carbon trading. When the World Bank provides financing to its member countries for investment projects, each project is governed by a legal agreement between the World Bank and the government agency who receives the funds. (See Appendix 2 and 3 for World Bank and European Investment Bank Financed Energy Projects in Turkey).

IFC offers a wide variety of financial products for private sector projects in developing countries. A company or entrepreneur seeking to establish a new venture including energy project or expand an existing enterprise can approach IFC directly by submitting an investment proposal.

Ex-Im Bank has Environmental Standards and Guidelines applied to each project considered under its Loan and Guarantee Programs**.** Environmental Exports Program Consists of pro-active business development and enhancements to existing Ex-Im Bank programs. Support for environmentally-beneficial exports and renewable energy, structured finance involves elements of both corporate and limited recourse project finance. Like project finance, it involves special features to enhance the credit of the borrower. Ex-Im Bank: top priority to support renewable energy and energy efficiency exports.Ex-Im Bank supports short, medium, and long-term financing to creditworthy international customers, and working capital guarantees to U.S. exporters.

Overseas Private Investment Corporation (OPIC) Financing provides medium- to long-term funding through direct loans and loan guaranties to eligible investment projects in emerging markets. Projects are categorised according to their potential impacts, with those given an 'A' rating requiring both an environmental impact assessment (EIA) and an environmental management programme (EMP) to be in place. The largest project known to have been given an A rating is the $3.6 billion BTC pipeline. This connected a new oil field in the Caspian Sea off Azerbaijan to a terminal at Ceyhan in Turkey. Project may also have found a way for the energy efficiency interventions to pay for themselves via the international carbon credit market.

6. Incentives to the Energy Production from Renewable Sources

The incentives are intending exclusively for the production of energy from renewable sources for usage, while they are not available to energy producers that solely intend to sell energy. The parties that may benefit from these incentives are specified in the project notices. The projects include the following programs: "Photovoltaic Cell"; "Sun-energized municipality"; "Projects for smaller islands"; "Photovoltaic plants of high architectural value"; "Solar-energy Program for

Municipalities and gas-works". The increasing production of energy from renewable sources is in fact considered by the EU as a high priority target of the Community.

European incentives for energy investments involve feed in tariffs, price premiums, tradable green certificate, competitive tendering, investment subsidies, and tax incentives. Energy consumption per capita in EU 25 was equivalent to 3, 6 toe in 2005, compared to 7, 8 toe/capita for the USA and 4, 1 toe/capita for Japan. In EU there is a clear trend for more liberalized markets. Poland (17%) and United Kingdom (22%) are countries in which the leading generator's market share is lower whereas in Cyprus and Malta there is only one generator. Romania and Bulgaria are energy intensive countries.

The share of renewable energy should be above 20% by 2010 in EU whereas according to current data Austria (78%) has higher shares of RES. The EU 27 production of primary energy is 871,247,000 toe.), United Kingdom (183,946,000 toe) and Germany (136,850,000 toe) are largest producers. Energy dependency of Europe is 52%. Cyprus (100.2%), and Portugal (88.2%) are more dependent whereas Norway (-609%) is not energy dependent. Below is the EU 27 consumption breakdown of energy resources.

Source: Eurostat May 2008

The mainstay of the new policy is a core energy objective for Europe: that the EU should reduce greenhouse gas emissions from its energy consumption by 20% by 2020. This objective will enable for EU to measure progress in re-directing nowadays energy activity towards one that will fully meet the challenges of sustainability, competitiveness and the supply security. The EU target needs to be seen in the context of the need for international action of industrial nations on climate change. When such a commitment exists, the EU will need to do more. The target should therefore be to increasing the target to a 30% reduction by 2020 and 60-80% by 2050. The concern is not only about climate change, it is also about Europe's security of energy supply, economy and the prosperity of its citizens. Achieving the objective can limit the EU's growing exposure to increased volatility and prices for oil and gas, bring about a more competitive EU energy market, and stimulate technology and employment. [221]

The main criticism of alternative energy is that, even with government assistance, it is still more expensive than many traditional sources of energy. But advocates argue that simply comparing the cost of generating electricity by burning coal with the cost of generating electricity by

---

[221] European Commission; An Energy Policy for Europe - the need for action; Proposed EU Energy Policy; p.2.

capturing the sun's rays misses the point. Energy use imposes other social costs that are hard to quantify.[222]

In EU, there is no framework for fiscal incentives but EU support national direct fiscal measures. The incentives are of various kinds but commonly used are tax reductions and exemptions, flexible depreciation. The aids primarily cover energy efficiency, renewable energy, cogeneration, district heating in the form of tax exemptions and reductions. [223] In 2007 energy and transportation projects of size € 621,256,526 won up to 100% EU grants. Member-States have adopted a variety of policies and mechanisms in order to support renewable energy. The feed-in tariffs are applied in twenty Member-States consisting in obliging the power system to absorb electricity from renewables at a given price or premium. Ten Member-States have implemented a quota system or a purchase obligation system, which consists in obliging electricity suppliers to include renewable energy within their supply portfolio. Many Member-States also use investment subsidies, tax rebates or other incentives to support renewables. Independent of their exact form, all supportive mechanisms for renewables implies a reduction in the cost of capital which provides incentives to investors in renewable energy. Once provided its common usage in the market, renewable energy incentives can be decreased gradually, since by the time the prices will fall due to technological advancement.[224]

7. European Incentives to Energy project

Energy subsidies are widespread and diverse, varying greatly in size and type among fuels, end-use sectors and countries. They also fluctuate over time. Putting a monetary value on some types of subsidies can be extremely difficult. The impact of a particular government intervention on production cost or price has to be differentiated from the effects of all other factors that influence costs and prices. In addition, reliable data on actual selling prices are not always available.

Estimates of the size of subsidies in a given country and to a given fuel depend heavily, therefore, on the definitions and methodologies used and the time period considered. Big differences in definitions can make comparisons of individual studies of the impact of energy subsidies in specific countries or regions difficult and complicate discussions of issues relating to subsidies and their reform. Most studies attempt to measure specific types of subsidy, or use approaches that capture only some of the effects of subsidies.[225]Systems based only on tax incentives are applied in Malta and Finland. In most cases (e.g. Cyprus, UK and the Czech Republic), however, this instrument is used as an additional policy tool.[226]

Financial instruments include economic incentives to promote energy efficiency, as well as fiscal measures. Financial incentives aimed at encouraging investment in energy efficient equipment and processes by reducing the investment cost, either directly (economic incentives) or indirectly (fiscal incentives).

7.1. Economic Incentives

Economic incentives fall into two broad categories: investment subsidies and soft loans. In most of the European countries, the economic incentives are related to energy or environment funds with financing mechanisms that tend to depend increasingly upon the banking system rather than coming from the public budget. The main objective of subsidies is to reduce the investment cost for investor and -consumers. Subsidies can be defined as a fixed amount, as a percentage of the investment, or as a sum proportional to the amount of energy saved. Subsidies may also be given to equipment producers to encourage the development and marketing of energy efficient equipment.

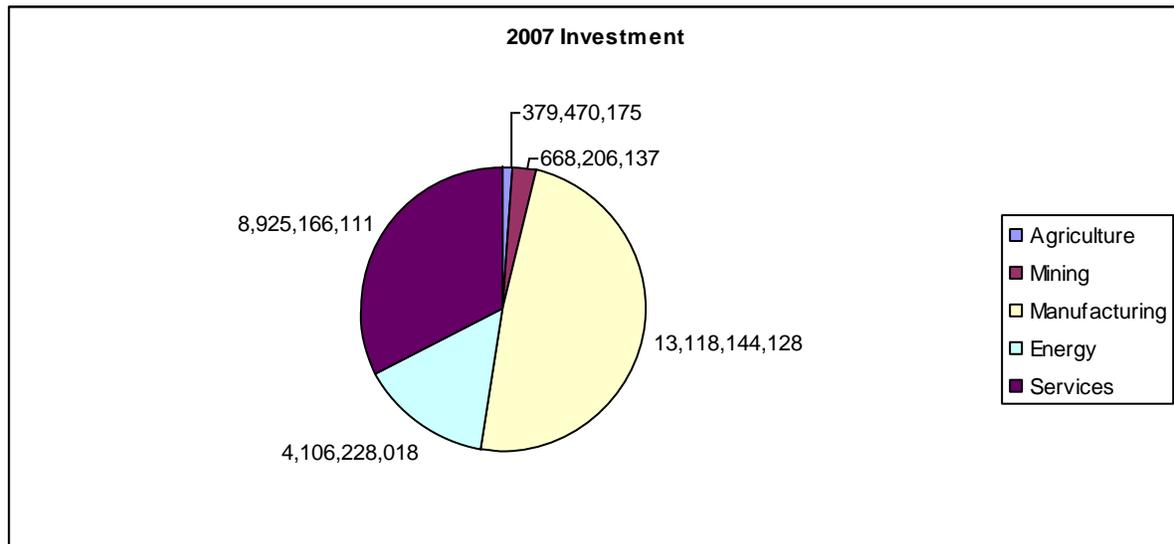
Subsidies schemes often attracted consumers who would have carried out the investments even without the incentive, the so-called "free riders" .Consumers who could use the subsidies and were targets of the scheme did not take advantage of them because they were unaware of their existence. This demonstrates the challenges of informing a multitude of consumers adequately about the existence of the incentives. Finally, subsidy schemes may have a negative impact on the market by leading to an increase in the cost of equipment and to the deployment of equipment with a poor quality. They are also restricted to certain types of investments, with a long payback time but high efficiency gains or to innovative technologies.

Soft loans are offered at subsidized interest rates to consumers who invest in energy efficient technologies and equipment. Soft loans have the advantage of being easily implemented by banking institutions. Nevertheless, due to the current low level of interest rates, such measures are often not attractive to industrial companies. In some cases they are given directly to installers, which seem to be a promising approach in others, if well managed. This removes one important barrier, which is the access of consumers to information as the installers may have a commercial approach to promote energy efficiency.

7.2. Fiscal Incentives

Fiscal incentives include measures to reduce the tax paid by consumers who invest in energy efficiency. They comprise accelerated depreciation, tax credits and tax deductions. Recently, tax reductions on energy efficient equipment or on energy efficiency investments (reduction in VAT rate) have been introduced in many countries. Tax credits and accelerated depreciation are considered better than subsidies, as they are less costly. They can work well if the tax collection rate is sufficiently high. They usually have a poor performance in an economy in recession or in transition. In European countries, tax reduction also exits for clean and efficient cars. Tax concessions for companies that make concrete commitments to energy efficiency gains/ CO_2 reduction and meet their target are also another innovative way to promote investment in energy efficiency and CO2 reduction.

A total of 2.3 billion Euros worth of EU grant funds have been allocated to Turkey to support the country's harmonization process until 2010 within the framework of the Instrument for Pre-Accession Assistance. The EU wants to facilitate Turkey's preparation for EU membership by funding projects. The EU has allocated approximately 1 billion euros of grant funds to Turkey since 2004. All projects and grant funds had a single objective "preparation for EU membership. This is important for two reasons: The first is to help Turkey, as a whole, to reach the economic standards of the EU. And the second is also to try to decrease gaps within Turkey."

Power demand in Turkey is growing faster than anywhere else in the world but China, according to Hilmi Güler, the country's energy minister. He estimates that the electricity sector alone will


need \$100 billion in new investment by 2020. As the government is still struggling to reduce its debt, much, if not most, of this money will have to come from the private sector. Despite liberalization progress, energy prices are still under control of government.[227]

The regulated part of the Turkish electricity market is under the control of government companies, but this will change drastically with the privatisation of the generation and distribution assets starting in early 2008, and is wide open to foreign investment. Turkey aims at full utilisation of indigenous coal and lignite reserves along with hydro and renewable resources. Integration of nuclear energy into the Turkish energy mix will also be one of the main tools in responding to the growing electricity demand while avoiding increasing dependence on imported fossil fuels. Privately owned nuclear power plants corresponding to a total installed capacity of 5,000 MW will be commissioned by 2020. New laws and regulations are also being adapted one by one, recently including the attractive Renewables and Energy Efficiency laws.[228]

The electricity regulation in Turkey aims to provide competitive, transparent market for the players and establish long term bilateral agreements. Accordingly there will be a power exchange market which will operate real time and day-ahead markets. Hourly prices will be established in day-ahead markets based on demand and supply. There will be a balancing market for reserve capacity and a future market that provides hedging for the market participant. Eventually integration with the European markets will be maintained.

Privatization Board of Turkey is working actively to transfer utilities to private sector in order to maintain an efficient, liberal market as in the EU. The privatizations of two electricity distribution companies and a portfolio of 9 power plants including hydroelectric and geothermal took place in 2008 with total revenue of \$ 2, 3 billion. The rest of the electricity distribution network and other government owned power plants including thermal is on privatization schedule. The financing operations of The European Investment Bank in Turkish energy sector has been increased in 2007and 2008.

According to Turkish incentive data; the amount of incentives and the distribution according to sectors are given below. Considering the lack of energy supply and government funds for investment the incentives on energy sector has an important role for Turkish economy.

2007 Investment

[227] Katinka Barysch;Turkey's role in European energy security; Center for European Reform;p.2.
[228] Turkey Trade and Investment ; UK Trade and Investment .

Although there is an increase in the energy investment of Turkey, the lack of supply will carry energy prices upward and the trend investment is expected to increase further in the following years.

Energy market in Turkey is being liberalized, which is mainly motivated by the lack of energy supply and twinning with EU legislation. According to the new energy market law, private sector investment incentives are brought in practice. For renewable energy the government has purchase guarantee which makes financing projects easier. According to the legislation in order to avoid monopolies, a company may not produce more then 20% of Turkey's installed capacity. Energy companies that will start operation before 2012 are exempt from payments related with line lease, and taxes related with all the equipment for the power plant. Also customs are exempt as an incentive measure for energy institutions.

Turkey has a strong potential for solar- and wind energy. The wind energy in Turkey has become important, although it is in construction phase yet. But an emphasis should be given on the development of solar hot water heating. Turkey has considerable geothermal resources that are used primarily for heat supply. Total installed capacity of thermal systems is ca. 25 MWth. The interest to the thermal water utilization is increasing in the last years. There are prospects for binary geothermal plants using existing wells at abandoned oil and gas fields.

8. An Appraisal regional energy resources from the standpoint of Turkish membership to the EU

The potential for strategic realignment in the Eurasia revolves around Turkey and its future. There are different possible scenarios, the most important of which is the full position in the EU membership. The second case is that Turkey is left outside the EU. Another possible alternative is that, Turkey whose patience is exhausted over Europe's incessant demands and decides to go its own way.

There are sufficient energy sources for renewable energy consumption inside Turkey. Moreover oil and gas production of surrounding countries will be transferred to the European centre via

Turkey. Yet Russia would prefer to upgrade the existing Central Asia-Centre gas pipeline with outlets to Ukraine and further to Western Europe.[229] The pipeline goes around the Caspian Sea via Turkmenistan, Kazakhstan and Russia. The three countries are ready to discuss a gas transportation consortium. Statements to this effect were made by Nazarbayev and other high-ranking officials. This project provides for the construction of a pipeline across the bottom of the Caspian Sea with an annual capacity of 30 billion cubic meters of gas, which could be transported to Europe through the Baku-Tbilisi-Erzurum and Nabucco pipelines. The United States suggested the Trans-Caspian project in 1996, but Gazprom objected to it because the pipeline bypasses Russia.

Kazakhstan is the second largest oil producer after who is trying to change towards a free market in energy and encouraging foreign investment to flow its oil and gas resources. Kazakhstan is shifting its trade and energy patterns away from the former Soviet Union and toward its neighbours in Central Asia, the Caucasus, and Turkey. [230]

The United States has stepped in to prevent the collapse of the first project to construct a natural gas pipeline that will bypass Russia. It is pressuring the EU and Central Asian countries to complete plans for the construction of the Nabucco pipeline, which is intended to link up with the Baku-Tbilisi-Erzurum and planned Tran Caspian networks. It will bring gas 3,300 kilometres from Central Asia under the Caspian Sea to Turkey, through Romania, Bulgaria and Hungary to Austria. The $10 billion South Stream pipeline is designed to run from Russia under the Black Sea to Bulgaria, where it divides into a southern branch via Greece to Italy and a northern branch via Serbia and Hungary to Austria.

The primary target of pipeline is to supply Turkey and Georgia. As a transit country, Georgia has rights to take 5% of the annual gas flow through the pipeline in lieu of tariff and can purchase a further 0.5 billion cubic metres of gas a year at a discounted price. In longer perspective South Caucasus Pipeline will supply Europe with Caspian natural gas through the planned Nabucco, Turkey-Greece and Greece-Italy pipelines.

The new Russian route would use Turkey as a transit point for exports to the European Union, in effect creating a direct competitor to Turkish-controlled ventures. Given Ankara's interests in joining the EU, however, Turkish officials are reluctant to be seen as creating hurdles for the project. Turkey clearly favours two other gas export ventures in which it is a direct participant, not merely a transit country. The first, the Nabucco Pipeline, would link Turkey and Austria, via Bulgaria, Romania and Hungary, and expand EU access to Persian Gulf and Caspian Basin supplies. Construction of Nabucco line will be completed in 2011. An associated link – the Baku-Tbilisi-Erzurum pipeline – will connect Turkey to Azerbaijan's Shah Deniz gas field.

The Blue Stream project appears to clash with the European Union's stated goal of diversifying its sources of energy. EU officials expressed a desire to reduce their dependency on Russian exports after a pricing dispute between Russia and Ukraine led to disruptions in EU supplies in early 2006. Turkey supports and tries to contribute to the European Union's efforts to diversify its routes and sources of energy, for such a diversification, there exists the Shah Deniz pipeline, not only the Blue Stream project."

The new way would parallel an existing pipeline under the Black Sea, Blue Stream 1, to Turkey, and then connect with the EU via Greece. The projected construction cost is about $5 billion. Blue Stream 1, which is designed to serve the Turkish market, has been plagued by

---

[230] Vildan SERİN -Elif YÜKSEL Foreign Direct Investment Flows in Kazakhstan: The Role of Energy Sector

underutilization and bickering over prices. There is a chance that Blue Stream 2 could become operational sooner than the Nabucco route, which has already experienced technical delays.

Whether Turkey enters the EU or not raises a host of interesting strategic and security issues that are likely to affect most actors. Turkey's not gaining admission to the EU, by vote or by choice, is a particularly challenging scenario. This set of dynamics surrounds the impact of energy to alter the strategic landscape around the Turkey. The Baku-Tbilisi-Ceyhan pipeline will begin to disgorge at least one million barrels of oil per day directly into the waiting ships, refineries, and perhaps subsidiary pipelines of the Eastern Mediterranean. The BTC brings several new elements to the Eastern Mediterranean's security. On one hand, the BTC is a real umbilical cord to Azerbaijan and Georgia: two states with lots of internal and external problems that look unlikely to be solved in the near future. What happens in these states is likely to affect the operation of the pipeline and, by extension, the economic health of the region and of Europe.

9. The analysis of Turkish investment incentives
i. Gini coefficient

Two different studies are conducted to evaluate the macroeconomic effects of incentive regulation for investments in Turkey, which are brought to eliminate regional inequality of income distribution. First study is focused on Gini coefficient by measuring income distribution in Turkish counties/cities considering variables including GNP/Capita and Number of Incentive Certificates for 49 different counties/cities. Second study focuses on the effect of energy sector as a part of Turkish incentive system to GNP and evaluates the effect of incentives for the sector. Accordingly both studies the efficiency of incentive system has been determined.

The incentive regulation in Turkey aims to control the income distribution in different cities of Turkey details of which are presented in appendix 4.

One of the measures of inequality of income distribution was developed by Gini (1921) and is called the Gini coefficient. Gini is a Lorenz measure which values between 0 and 1. 1 means highest inequality where 0 represents complete equality. Gini coefficient in general is computed with the following formula. [231]

$$G= \left\{ \frac{1}{n^2} \sum_{i=1}^{n} \sum_{j=1}^{n} (Y_i-Y_j) f(Y_i)f(Y_j) \right\} / 2\mu$$

Y_i is the income of i.th county/city, Y_j is the income of j th city, μ arithmetic mean of income $f(Y_i)$ and (Y_j) are the income levels for the cities.

The data for target counties/cities is between 1994-2001. (No data available after 2001) The computed Gini Values are tabulated and given as a graph.

Years	Gini coefficient
1994	0.1935
1995	0.1910
1996	0.2298
1997	0.2230
1998	0.2141
1999	0.2069
2000	0.2030
2001	0.2014

---

[231] Corrado Gini (1921); Measurement of Inequality and Incomes; The Economic Journal 31; p.25.

Gini Value

Gini coefficient being 0.1935 in 1994 reaches its peak value 0.2298 in 1996 The 2001 value is determined as 0,2014. As a result the inequality increases until 1996 and decreases from 1998 which is the positive effect on incentive policy.

ii. Multivariable regression analysis for the impact of energy incentives on Turkish economic growth

The multivariable regression analysis aims to measure the contribution of energy sector incentives to the economy. The dataset used is occurred between 1997-2007 and the econometric software E-views is used to analyse the data. The dependent variable is GNP growth rate, and independent variables are growth of energy sector, gross fixed investments in energy sector, energy sector share of investment incentive certificates.

$$Y = \alpha + \beta_1 X_{1t} + \beta_2 X_{2t} + \beta_3 X_{3t} + u_t$$

Y; Dependent variable, GNP growth rate
   α *is constant*
X_{1t}; Gowth of energy market
X_{2t}; Gross fixed investments by energy sector
X_{3t}; Energy sector subventions.
β's are coefficients indicating the percentage effect of independent variables to GNP.
u_t; error coefficient

The result of regression model is shown below.

Dependent Variable: GNP
Method: Least Squares

GNP= α + β_1*Energy+ β_2*GFIE+ β_3*incentiveE

	Coefficient	Std. Error	t-Statistic	Prob.
α	5.84867	2.608011	-2.24258	0.0661
β_1	1.731636	0.32318	5.35812	0.0017
β_2	-0.00586	0.043871	-1.13349	0.8982
β_3	0.0067	0.142594	1.46986	0.964

		Mean	
R-squared	0.850907	dependent var	3.54
Adjusted R-squared	0.776361	S.D. dependent var	6.248947
S.E. of regression	2.95516	Akaike info criterion	5.294157
Sum squared resid	52.39781	Schwarz criterion	5.415191
Log likelihood	-22.4708	Hannan-Quinn criter.	5.161383
F-statistic	11.41445	Durbin-Watson stat	1.873497
Prob(F-statistic)			

According to the findings of the model, the 1% increase in growth of energy sector will effect GNP growth 1, 73%. Gross fixed investments by energy sector will have no noticeable effect on GNP (-0.00586). 1% change in energy sector subsidies will affect GNP by (no noticeable effect) 0.0067 %.

R-squared value indicates the explanation factor of independent variables to GNP is 0, 85, a considerably important value. T statistics another explanatory figure which are expected around 2, and all the variables have explanatory value.

According to the findings, energy sector and investments in this sector is indispensable for the economic growth. The important factor is the possibility of stable growth in the investments and incentive investments to become fixed investments.

9. Conclusion

Development of energy project, and in particular renewable energy, is enjoying a sustained period of growth that shows no sign of slowing down. The growing support for renewable energy is demonstrated by the numerous incentives that exist to encourage its development, particularly the production tax credit.

The voluntary nature of this mechanism may also entail simpler administrative and regulatory procedures than are needed for mandatory mechanisms. Free market proponents are also likely to welcome leaving green power decisions to the marketplace. If renewable energy becomes comparatively more expensive conventional energy sources may become more attractive to consumers purchasing on the basis of price, as well as those otherwise not willing to pay a significant premium for renewable energy's benefits. Voluntary switching away from green power then means that the other benefits from renewable energy – environmental, national security, and general economic – will no longer be obtained.

The chief strength of the mandatory retail mechanism appears to be the incremental increase in renewable energy it is intended to produce. However, its effectiveness is limited by its application solely to government entities, which are but a small fraction of overall energy consumers. The greatest strength of the voluntary wholesale purchase mechanism may be its administrative ease: voluntary purchases by utilities can largely rely on existing regulatory procedures. A drawback, however, is that voluntary purchases do not reliably ensure any given level of energy project development.

Actually the incentives are not major factors in the investment decisions of companies. But they are mostly a vehicle in promoting new investment in emerging markets. Even though taxation does not appear to be a major factor in companies' investment decisions; it does emerge as a subordinate element in a complex decision situation. Energy companies seem to be more sensitive towards the incentives than companies in conventional sectors.

The State promotion in the counties/cities intends to establishes and develop energy sector investments. But they should be in accordance with international legislation. For the purpose of economic development and welfare, investments are the disposition of capital, in cash or credit facilities, capital goods or transfers of assets designated to the effective production of renewable energy, in accordance with regulation of EU. The positive and negative effects of incentives are discussed in the literature. According to the findings of the article well regulated incentives may lead to more fixed investment by private sector. This will create a positive impact on Turkey's integration to the EU.

4.5 Capital Markets

THE EFFECT OF FOREIGN OWNERSHIP ON THE ASSOCIATION OF DIVIDEND CHANGES AND FUTURE EARNINGS[*]

Tae Goo Kang, Rutgers University,
Chang Woo Lee, Seoul National University
Hye Jeong Nam, Dongguk University

Abstract

This paper examines the effect of foreign ownership on the association between dividend changes and future earnings in Korean firms. Reasoning from the hypothesis that dividend changes convey new information about a firm's future profitability, a dividend increase is seen as a positive signal about the firm's future earnings and profitability. However, the results from prior studies are controversial. Some papers have suggested that dividend changes would mean different things depending on a firm's dividend policy and the motives behind its managers' decision to pay dividends. Foreign investors owned about 38% of the stock in the Korean market in 2007. As the percentage of foreign ownership had grown, many researchers have analyzed the effect of this ownership. To this point no one has definitively answered the question of what impact foreign ownership has on Korean firms has not been established, but most agree that foreign investors do have significant effect on Korean market.

We have predicted that foreign ownership has an important role in the determination of a firm's dividend policy and also affects the relationship between dividend changes and future profitability. We employ a modified model to examine how the relationship between dividend changes and future earnings varies with the presence of foreign ownership. Our results suggest that the dividend increases in firms with higher level of foreign ownership have a positive correlation with earnings increases in the year following the dividend change year. This finding suggests that foreign investors play a positive role in the Korean market and, in particular, that foreign investors in Korea play an important role in monitoring the dividend decisions made by a firm's management.

Key words: Dividend changes; Future earnings; Predictability; Foreign ownership

1. Introduction

This paper investigates the effects of foreign investors on the relationship between dividend changes and the predictability of future earnings. Because foreign investors' ownership in the Korean market has increased substantially since 1992, many researchers have analyzed the effects of foreign ownership on dividend changes. Most papers, however, have focused on the association between foreign investors and the level of the dividend. The purpose of this paper is twofold. The first one is to test whether dividend changes is useful variable to predict future earnings using modified model following Grullon et al. (2005). The second is to investigate the effect of foreign investors on the predictability of dividend change.

Since Lintner (1956) provides important theoretical foundation for the information content of dividends hypothesis, Miller and Modigliani (1961) suggest that dividend changes convey new information about the firms' future profitability. According to dividend signaling theories, dividend increases would present a permanent upward revaluation of the cash flows of firms and a commitment to maintain a higher level of dividends (e.g., Bhattacharaya, 1979; Miller and Rock, 1985; John and Williams, 1985). Based on this prediction, the dividend increase is recognized as a positive signal about the firms' future earnings and profitability. However, the related studies on the relationship between the dividend changes and future earnings suggest mixed results depending on applied assumptions (Watts, 1973; DeAngelo et al., 1996; Benartzi et al., 1997; Nissim and Ziv, 2001; Grullon et al., 2005; Ali and Urcan, 2006). Specifically, Grullon et al. (2005) point out that there is no significant relation between dividend increase and unexpected future earnings changes when they reflect the feature

1324

of the mean reversion phenomenon and autocorrelation of earnings which are non-linear. In this paper, we test the relationship between dividend changes and the predictability of future earnings using Grullon et al. (2005)'s method

The characteristic of dividend is determined by the dividend policy, and further dividend policy has a close relationship with firm's investment decision as well as capital sourcing. Lintner (1956) argued that managers unwilling to change payout ratio without any important change on the firm's future performance. Won and Kim (1992) report that managers are more likely to concern about the internal factors such as net income, divisible surplus, predicted future performance, and the shareholders' preference for dividend policy. More importantly, several studies suggest that the foreign investors have significant effect on Korean market. Park (2004) reports that foreign investors' participation in firms generally pushes up the dividend payments while pulling down investments made in facilities no matter which industry a company is in. Sul and Kim (2006) show that those companies whose majority shareholders are foreign investors tend to pay higher dividends than others whose majority shareholders are domestic investors. In contrast to negative effect of foreign investor, there are empirical studies claiming positive impact of foreign investor in Korean market. Ahn, Shin, and Chang (2005) suggest that foreign investors prefer firms with lower information asymmetry. The study also shows that foreign investors can effectively monitor the management of firm in lessening information asymmetry. Similarly, Park and Lee (2006) suggest that foreign investors' participation in investment of domestic firms can help the firm make more efficient management decision by improving their corporate governance. Thus, Park and

Lee claim that it is problematic to generalize the negative role of foreign investors in Korean market.

Based on this argument, we predict that if foreign investors play an effective monitoring role in dividend policy, dividend change for firms with higher level of foreign investors is a good indicator in predicting future earnings than for firms with lower level of foreign investors. However, if foreign investors play a negative role in dividend decision process, predictability of dividend decreases. We test this prediction through the modified partial adjustment model from the Grullon et al. (2005) to consider non-linearity behaviors of earnings. The empirical results suggest that the dividend increases in firms with higher level of foreign investors have positive relationship with future earnings increases for next one year relative to the dividend change year. Specifically, the predictability of dividends for the low dividend policy of 1992-1996 is significantly positive while the predictability of dividend for the later period of 1999-2003 is insignificant. The empirical results from the test of effect of foreign ownership suggest that after the policy change in year 1998, foreign investors have a positive effect on the relationship between dividend increases and future earnings increases. This result is identical even after controlling for the endogeneity problem by Heckman two-stage analysis. This finding implies that foreign investors in Korea play an important role in monitoring the dividend decision management of a firm.

The rest of paper is organized as follows. Section 2 provides a literature review of the information content of dividend and foreign investor. Section 3 develops hypotheses. Section 4 presents research design and data description. Section 5 provides empirical

results about the relationship between dividend changes and future earnings regarding foreign ownership. Section 6 conducts additional tests, and Section 7 concludes.

2. Literature review

2.1 The information content of dividends

Lintner (1956) suggested that firms increase their dividends when management puts trust on the projection that earnings have consistently increased. Miller and Modigliani (1961) proposed an "information content of dividend" hypothesis that held dividend changes convey new information about a firm's future profitability. John and Williams (1985) suggested that maintaining the level of cash dividends will prevent the devaluation of a firm. Miller and Rock (1985) assumed that managers have internal information about the firm and suggested that managers use dividends as a signal to inform investors about a firm's profitability. What dividend signaling theories offers is theoretic frameworks implying a dividend increase can be an indicator for not only a permanent upward revaluation of the cash flow of a firm but also a firm's commitment to maintain a higher level of dividends. This interpretation allows us to hypothesize that a dividend increase is a positive signal about the firm's future earnings and profitability.

However, there has not been sufficient empirical evidence supporting these signaling theories. In other words, there are little studies proving a positive relationship between dividends and increase in earnings. One of the earliest studies investigating the relationship between dividend changes and future earnings (Watts, 1973), Watts found a positive relationship between the two variables. Yet, the relationship was not statistically

significant. As a result, he concluded that the information content of dividends is not economically meaningful. Another study (DeAngelo et al., 1996) was also not able to support the hypothesis that dividend changes can provide information about future earnings. In concluding the study, the researchers interpreted these results as indicating that management tends to increase dividends based on overly optimistic projection about future earnings. This interpretation, thus, implies that there is little reliable information content to be gleaned from dividend changes. Similarly, Benartzi et al. (1997) found that firms that increase dividends experienced significant earnings increases in the year before and the year of the dividend increase but not in subsequent years.

Nissim and Ziv (2001) used a different model of earnings expectations to investigate the relationship between dividend changes and future profitability. Upon introducing mean reversion in the earnings expectation model and using a more appropriate deflator, they find that dividend increases and unexpected future earnings changes are positively correlated. In the study, Nissim and Ziv were able to obtain information about ,the level of profitability in subsequent years by looking into dividend changes, which is hardly available from market and accounting data. On the other hand, a follow-up study (Grullon et al. 2005) concerns about finding of Nissim and Ziv (2001) by questioning that the linear specification of earnings expectation model used by Nissim and Ziv (2001) was not correct. They brought attention to the point that it is problematic to presume the mean reversion of earnings as a linear processes, which is not. This is because treating linearity when the true functional form is nonlinear would result in the same consequences as overlooking relevant independent variables. For this reason, Grullon and his colleagues claimed what Nissm and Ziv found in their study might not be acceptable. In the study

(Grullon et al. 2005), the authors addressed the mean reversion and auto-correlation issue by using the modified partial adjustment model proposed by Fama and French (2000). Controlling for the nonlinear patterns in the earnings, the study results (Grullon et al., 2005) indicate that the relationship between dividend changes and future earning does not appear statistically significant. Being consistent with the signaling theory of dividends, findings of Ali and Urcan's study (2006) highlight a significantly positive relationship between dividend increases and future earning changes in low dividend premium years. In the high dividend premium years, however, such a relationship does not appear between the two variables. Ali and Urcan interpret the findings that dividend increases in high dividend premium years can possibly occur because managers positively take investors' demands for dividends into account. Won and Kim (1992) showed that managers are mainly concerned about the internal factors, including net income, divisible surplus, predicted future performance, and the shareholders' preference for dividend, when determining dividend policy.

In sum, these findings indicate that the correlation between dividend changes and unexpected earnings would vary depending on market or management constraint for dividend changes.

2.2 Foreign investors in Korea

Foreign investors have been permitted to invest in Korean stock market since 1992, and since that time foreign investors' ownership of stocks has increased sharply, from 4.9% in 1992 to 38% in 2007. As the holdings of foreign investors have grown, researchers have becoming increasingly interested in the impact of foreign investors'

ownership. Besides reporting a crucial influence of foreign investors on the dividend policy, Park (2004) demonstrated a positive relationship of foreign investors' ownership with the increase of dividend payments and the decrease of the investment for facilities. Sul and Kim (2006) examined the effects of foreign shares on the increases in a firm's dividends. Findings of the study indicate that foreign investors who have more than 5% of ownership can exercise their influence on the company's dividend increase. The study also highlights that companies of foreign majority shareholders usually pay higher dividends than companies of domestic majority shareholders.

On the other hand, Ahn, Shin, and Chang (2005) found that foreign investors acquire higher ownership for firms that are covered more closely by analysts and that have lower forecast errors and discretionary accruals. They suggested that foreign investors prefer firms with a lower information asymmetry and that these investors serve as an effective external monitoring system that has the result of lessening information asymmetry. Park and Lee (2006) found that the investment of foreign investors for domestic firms tend to improve corporate governance and consequently, to help the management make more efficient decisions. As shown in these studies, the foreign investors' roles in Korea market are controversial and this leaves rooms for further research.

3. Hypotheses

To investigate the validity of the information content of dividend hypotheses, Park (2004) tested the relationship between dividend changes and profitability in the fiscal years following those changes with Korean firm samples. He found that when employing the method of Nissim and Ziv (2001), dividend changes can predict earnings for the

following year. By contrast, Grullon et al. (2005) found that the correlation between dividend changes and future earnings disappears after controlling for nonlinear patterns in the behavior of earnings.

In this study we revisit the dividend signaling issue by using a model of unexpected earnings that explicitly controls for nonlinear patterns in the behavior of earnings. We check whether the correlation between dividend changes and future profitability of Korean firms stays positive under the method of Grullon et al. (2005). This leads to our first hypothesis:

H1. Dividend changes have a positive relationship with future earnings changes.

Ali and Urcan (2006) found that there exists a significantly positive correlation between dividend increases and changes in unexpected future earnings in low dividend premium periods. In the high dividend premium periods, however, there is no significant correlation between dividend increases and changes in unexpected future earnings. Moreover, they assume that dividend increases in high dividend premium periods are the consequence of manager's concern about the investors' demand for dividends. This, in turns, indicates that the relationship between dividend changes and future earnings will depend in part on managers' motives in determining dividend policy.

Previous researches into the determinants of dividend policy have found that managers take into account various internal constraints, such as earnings and shareholders' preferences about dividends, when they decide the firm's dividend policy. Reasoning from the dividend policy researches and the work of Ali and Urcan (2006), we predict

that ownership structure will have an effect on the relationship between dividend changes and future profitability. This prediction is based on the assumption that the ownership structure is an important factor in determining dividend policy,.

Over the past 15 years foreign investors' presence in the Korean stock market has increased considerably, to the point where foreign investors owned about 38% of the Korean market in 2007. As these foreign investors' holdings have grown, many researchers have analyzed the effects of such foreign ownership. Park (2004) presented that having foreign investors' ownership in firms is likely to increase dividend payments while decreasing the amount of investments for facilities. Sul and Kim (2006) found that the influence of the foreign investors in determining a firm's dividends increases as the percentage of foreign ownership increases. The study also showed that having more foreign than domestic shareholders are likely to indicate higher payment of dividends.

By contrast, Ahn, Shin, and Chang (2005) suggested that foreign investors tend to be inclining toward firms with lower information asymmetry and that these foreign investors can exert their influence in lessening information asymmetry. Park and Lee (2006) propose that foreign investors take an important part in Korean market by making investments in domestic firms. Consequently, this can have positive impacts on corporate governance and therefore more efficient management decisions can be made. In making a conclusion, Park and Lee (2006) point out that due to its complex nature it is not a simple task to generalize the overall impact of foreign investor, although there have been concerns about their negative role in Korea.

To sum up, it seems evident that there is a great agreement on a significant impact of foreign investors in Korean market which is shared by both a positive and a negative

point of view toward their roles. However, there are little theoretical and empirical studies on the foreign investors' impact on Korean market. Given these circumstances, we predict that foreign ownership plays an important role in deciding a firm's dividend policy and, in particular, that it will have an important effect on the relationship between dividend changes and future profitability. This leads to the following hypothesis:

H2. The association between dividend changes and future earnings changes is affected by foreign ownership.

4. Research design and data description

4.1 The relation between dividend changes and future earnings changes

Our first step is to reexamine the relationship between dividend changes and future profitability in the Korean market. We use both the method of Nissim and Ziv (2001) and the method of Grullon et al. (2005). Our basic strategy will be to test the 'information content of dividend' hypothesis by using a regression analysis with dividend changes $(R\triangle DIV_0)$ as an independent variable and future earnings changes as a dependent variable.

Nissim and Ziv (2001) apply the following equation:

$$(E\tau - E\tau_{-1})/B_{-1} = \alpha 0 + \alpha 1 DPC \times R\triangle DIV_0 + \alpha 2 DNC \times R\triangle DIV_0 \qquad (1)$$

$$+ \alpha 3 ROE\tau\text{-}1 + \alpha 4 (E_0 - E_{-1})/B_{-1} + \varepsilon\tau$$

where,

$E\tau$ = earnings before extra ordinary items in year τ, relative to the dividend event year 0

B_{-1} = the book value of equity at the beginning of the dividend event year

$(E\tau - E\tau_{-1})/B_{-1}$ = earnings change from year τ_{-1} to year τ deflated by the book value of the firm's equity at the beginning of the dividend event year.

$R\triangle DIV_0$ = the rate of change in the cash dividend per share relative to the previous year

$$R\triangle DIV_0 = \frac{(DIV_0 - DIV_{-1})}{DIV_{-1}}$$

DIV_0 = dividend at year 0, and DIV_{-1} = dividend at the year before.

DPC (DNC) = 1 when the dividend increases (decreases) and 0 otherwise

$ROE\tau_{-1}$ = net income in year 0 scaled by the book value of the equity at the year 0

Nissim and Ziv (2001) included $ROE\tau_{-1}$ as an explanatory variable, accounting for the tendency of ROE to revert to the mean. Freeman, Ohlson, and Penman (1982), and Fama and French (2000) found that the return on equity, which is positively correlated with current earnings, has a negative relationship with future earnings. This inverse relationship is due to the fact that ROE tends to revert to the mean: a high ROE implies an expected decrease in earnings, and vice versa. Nissim and Ziv also included $(E_0 - E_{-1})/B_{-1}$ as an additional control variable. Dividend changes are highly correlated with contemporaneous earnings changes, so the positive correlation between dividend changes and earnings changes in the two subsequent years may be due to autocorrelation in the earnings change series. Thus Nissim and Ziv include $(E_0 - E_{-1})/B_{-1}$ in order to examine whether dividend changes contain information on future earnings changes, in addition to what can be predicted directly from the earnings change in the dividend change year. We

run the regression models annually and analyze the significance of the means of the coefficients using Fama-MacBeth statistics.

Grullon et al.(2005) use the equation:

$$(E\tau - E\tau_{-1})/B_{-1} = \alpha 0 + \alpha 1 DPC \times R\triangle DIV_0 + \alpha 2 DNC \times R\triangle DIV_0$$

$$+ (\gamma 1 + \gamma 2 NDFED + \gamma 3 NDFED \times DFE + \gamma 4 PDFED \times DFE) \times DFE$$

$$+ (\lambda 1 + \lambda 2 NCED + \lambda 3 NCED \times CE + \lambda 4 PCED \times CE) \times CE + \varepsilon\tau, \text{ (2)}$$

where

$DFE = ROE_0 - E[ROE_0]$,

ROE_0 = return on equity in year 0

$E[ROE_0]$ is the fitted value calculated from the cross-sectional regression of ROE_0 on the logarithm of total assets in year -1, the logarithm of the ratio of market equity to book equity in year -1, and ROE_{-1}.

NDFED (PDFED) = 1 when DFE is negative (positive) and 0 otherwise

$CE = (E_0 - E_{-1})/B_{-1}$.

NCED (PCED) = 1 when CE is negative (positive) and 0 otherwise.

We use a modified partial adjustment model (the Grullon et al.(2005) method) to control for the nonlinear relationship between future earnings changes and past earnings levels and changes. As discussed in Fama and French (2000), the dummy variables and the squared terms are expected to capture the nonlinearity of the reversion to the mean and the earnings autocorrelation. The coefficient on $\gamma 1$ expresses the reversion to the mean when profitability is greater than expected, while $\gamma 2$ expresses the reversion to the mean when the profitability is less than expected. When profitability is much greater or

much less than expected, we use quadratic terms to express the reversion to the mean: $\gamma 3$ for a large negative deviation, and $\gamma 4$ for a large positive deviation of profitability. Similarly, $\lambda 1$, $\lambda 2$, $\lambda 3$, and $\lambda 4$ are used to express the non-linearity in the autocorrelation of changes in profitability.

4.2 Dividend changes and future earnings changes conditional on foreign ownership

We examine the correlation between dividend increases and unexpected changes in future earnings while varying the level of foreign ownership. In particular, we analyze the following model:

$$(E\tau - E\tau_{-1})/B_{-1} = \alpha 0 + \alpha 1 DPC \times R\triangle DIV_0 + \alpha 2 DNC \times R\triangle DIV_0$$

$$+ \alpha 3 FOR + \alpha 4 DPC \times R\triangle DIV_0 \times FOR + \alpha 5 DNC \times R\triangle DIV_0 \times FOR$$

$$+ (\gamma 1 + \gamma 2 NDFED + \gamma 3 NDFED \times DFE + \gamma 4 PDFED \times DFE) \times DFE$$

$$+ (\lambda 1 + \lambda 2 NCED + \lambda 3 NCED \times CE + \lambda 4 PCED \times CE) \times CE + \varepsilon\tau, \quad (3)$$

where FOR is the percentage of a firm's total stock value that is held by foreign investors. The purpose of this variable is to capture the impact of foreign ownership on firms. The term $DPC \times R\triangle DIV0$ expresses the effect of the signaling role played by dividend increases in firms without foreign ownership. The decisions on dividend policy by managers in firms without foreign investors are clearly not affected by foreign investors, while in firms with foreign ownership, the term $DPC \times R\triangle DIV0 \times FOR$ captures the effect of the signaling role of dividend increases. If foreign investors press managers to increase dividend without improvement in firm's performance and managers have to

meet the demand, the coefficient for DPC $\times$ R$\triangle$DIV0$\times$ FOR is negative. On the other hand, if foreign investors behave in a positive way, for example, by monitoring the managers and improving the firm's performance, the coefficient would be positive.

4.3 Sample selection and descriptive statistics

The sample selection procedure for this study was similar to that of Park (2004). The sample included firms in the KSE (Korea Stock Exchange) and KOSDAQ (Korea Securities Dealers Automated Quotation) from the years 1992 through 2003. Financial statement data were collected from KIS-Value, and the stock market data were obtained from the KSRI (Korea Stock Research Institute) Stock Database. We restrict observations to those firms that satisfied three conditions: 1) the dividend change was observable, 2) the firm was not a financial firm, and 3) the dividend change was less than 500%.

<INSERT TABLE1 HERE >

Table 1 shows the annual number of dividend changes for the firms in our sample. The total number of observations of a dividend increase, a dividend decrease, and no dividend change during the sample period was 1,834, 1,839, and 624, respectively. In 1997 and 1998, the total number of dividend increases and dividend decreases was dramatically different from other years. This aberration was caused by the Asian financial crisis, which had a huge impact on Korean economy. Because including data from that period could distort the result of the analysis, the data for these two years were excluded from the sample.

<INSERT TABLE2 HERE >

Table 2 provides descriptive statistics for the three dividend change groups (increase, decrease, and no change). Panel A shows the average amount of dividend change for the dividend increase group, which is 59.2%. Panel C shows the average amount of dividend change for the dividend decrease group, which is -31.1%. For the entire sample the average amount of dividend change is 13.2%. The ROE for each group increases in proportion to the R△DIV of the group, from 0.067 to 0.107. The percentage of ownership by foreign investors (FOR) also increases as R△DIV increases, from 5.5% to 8.01%.

<INSERT TABLE3 HERE >

Table 3 contains Spearman correlation coefficients for dividend increases (below the diagonal) and for dividend decreases (above the diagonal). Foreign ownership is positively correlated with future earnings change. Foreign ownership is also positively and significantly correlated with dividend changes. ROE and future earnings change have a significant negative relationship, which reflects the reversion to the mean discussed above.

5. Results

5.1 Dividend changes and Future earnings changes

Table 4 shows the results of the regression analysis based on equation (1). To alleviate the bias in the regression test statistics due to the cross-sectional correlation in the error term, we use the Fama-MacBeth (1973) procedure to estimate the regression coefficients. First we estimate the cross-sectional regression coefficients for each year

using all the observations in that year. Then we calculate the time-series means and the corresponding t-statistics of the cross-sectional regression coefficients.

<INSERT TABLE4 HERE >

Previous studies have found that the relationship between dividend changes and future earning changes is not symmetric between dividend increases and dividend decreases (DeAngelo and DeAngelo, 1990; Benartzi et al., 1997; Nissim and Ziv, 2001). We thus allow the coefficients for dividend increase and dividend decrease to be different. DPC is a dummy variable that equals one in the case of dividend increases and zero otherwise, while DNC is a dummy variable that equals one whenever the dividend increases and zero otherwise. Both are multiplied by $R\triangle DIV_0$, with $\alpha 1$ the regression coefficient for dividend increases and $\alpha 2$ the regression coefficient for dividend decreases.

Table 4 displays the regression results from equation (1). For $\tau=1$, the coefficient of dividend increase is positive and significant at 10% level, while the coefficient of dividend decrease is positive but not statistically significant. The coefficient for ROE is significant and negative, demonstrating a pattern of reversion to the mean for ROE. For $\tau=2$ the coefficient of dividend decrease is positive and significant at 5% level, implying that a dividend decrease in year 0 is positively correlated with a decrease in future earnings.

Grullon et al. (2005) noted that results from prior studies were based on the assumption that the rate of reversion to the mean and the level of autocorrelation are uniform across all observations. Therefore, to examine the relationship between dividend changes and future earnings changes we use the method of Grullon et al. (2005) which estimates regression through the modified partial adjustment model proposed by Fama

and French (2000). This method allows for nonlinearity in the reversion to the mean and in the autocorrelation process of earnings.

Table 5 shows the regression results from the estimating equation (2). For $\tau=1$, the coefficient of dividend increase is positive and significant at 10% level, while the coefficient of dividend decrease is negative but is not statistically significant. This result is different from the result of Grullon et al. (2005). It seems likely that the difference is due to the low dividend policy that predominated among Korean firms in the period 1992–1996.[232]

<INSERT TABLE5 HERE >

<INSERT TABLE6 HERE >

In Table 6 we test this inference by separating the sample period of 1992-1996 from the later period 1999–2003. The coefficient of dividend increase for the earlier period is positive and significant, while the coefficient of dividend increase for the later period is positive but not significant. This result may be caused by the difference in dividend policy between the two periods.

5.2 Dividend changes and future earnings changes conditional on foreign ownership

In this section, we examine the relationship between dividend increases and unexpected changes in future earnings as the level of foreign ownership varies. The regression estimates for equation (3) are provided in Table 7. Neither the coefficients of

---

[232] In the early period 1992-1996 firms had a low dividend policy. The average dividend rate during the preceding period was 9.3%, while the average dividend rate during the following period was 17%.

dividend changes nor the interaction term for dividend changes and foreign ownership are significant for $\tau=1$ and $\tau=2$. The only statistically significant term is the coefficient of foreign ownership, which is positive. This result could be interpreted as implying that foreign ownership does not have a significant effect on the relationship between dividend changes and future earnings changes.

However, there was an important policy change in 1998. Up to that point foreign investors could not acquire more than 50% of a Korean firm's outstanding shares, but the rule was repealed in 1998. The average amount of foreign ownership among the 25% of firms with the greatest percentage of foreign ownership was 15.6% during the period 1992–1996 but grew to 25.3% in 1999–2003, the four years following the repeal of the rule. Therefore it is possible that the effect of foreign ownership on Korean firms was different during those two periods.

<INSERT TABLE7 HERE>

<INSERT TABLE8 HERE>

In Table 8, we test for an effect of this change in policy by comparing the coefficients calculated separately for these two sample periods, 1992–1996 and 1999–2003. For the earlier period the coefficient on the interaction term for dividend changes versus foreign ownership is negative and not significant, but for the later period the interaction term is positive and significant at 5% level. After the policy change, foreign ownership had a positive effect on the relationship between dividend increases and future earnings increase for the year following the dividend increase year.

5.3 Endogeneity problem

5.3.1 Heckman two-stage analysis

If one examines only the main independent variable, the interaction term between dividend increase and foreign ownership, it is not possible to eliminate selection bias as a potential explanation for the result. That is, if foreign investors choose to invest in performing companies that perform well and if those companies would exhibit a positive correlation between dividend changes and changes in future earnings even without the presence of the foreign investors, the result from the analysis would be same; in this situation the interpretation that foreign investors have a positive effect on the relationship between dividend changes and future earnings changes would be wrong. To address this endogeneity issue, we employ Heckmans' two-stage approach. Because there is no well-accepted evidence to guide the selection of explanatory variables for the probit foreign ownership model, we choose to include six explanatory variables that were identified by Kim et al (2008).

First, we perform a regression on the following equation using data from our population of Korean firms:

$$FH = \alpha_0 \, LEVERAGE + \alpha_1 MTB + \alpha_2 CFO + \alpha_3 SIZE + \alpha_4 SALES + \alpha_5 ROE + \varepsilon \qquad (4)$$

Where,

FH =1 when foreign investors are participated in the firm, 0 otherwise

MTB = market-to-book ratio

CFO = cash flow from operations / book value of equity

SIZE = total asset / book value of equity

SALES = total sales / book value of equity

All other variables are as defined in previous tables.

In the second stage, we incorporate the inverse Mill's ratio and year dummy variables into equation (3) and re-estimate it. The results, displayed in Table 9, are similar to those in Table 7. The coefficient of the interaction term between dividend increase and foreign ownership is still positive and significant after controlling for the endogeneity problem. This suggests that foreign ownership does have an effect on the relationship between dividend changes and future earnings changes.

<INSERT TABLE9 HERE>

5.3.2 The effect of foreign ownership on the likelihood and magnitude of dividend changes

In this section we examine how foreign ownership affects dividend policy, specifically, how it affects the likelihood and the amount of dividend changes. We use logistic models, given in equation (6), to estimate the effect of foreign ownership on the likelihood of dividend changes, and we use the Fama-MacBeth (1973) approach to estimate the effect of foreign ownership on the magnitude of dividend changes, as shown in equation (7). In the Fama-MacBeth approach, one first computes cross-sectional regression coefficients for each year using all of the observations from that year. After that, one calculates the time-series means and the standard deviations of the coefficients.

Panel A in Table 10 shows the results of the regression calculation from the estimating equation (6). The coefficient of foreign ownership is positive when the dependent variable is DPC, suggesting that firms with a larger percentage of foreign ownership are more likely to increase dividends. Panel B displays the results on the effect of foreign ownership on the magnitude of dividend increases. The coefficient of foreign

ownership is positive when the dependent variable is DPC× R△DIV0, suggesting that firms with a larger percentage of foreign ownership have a higher relative amount of dividend increases than firms with less foreign ownership.

    <INSERT TABLE10 HERE>

6. Additional test

6.1 Institutional ownership

We examined the effects of institutional ownership by replacing foreign ownership with institutional ownership and doing a similar analysis. Institutional ownership refers to ownership by financial firms, security corporations, and insurance companies. For the period 1999-2003, the regression analysis for the estimating equation (3) with institutional ownership results in a positive but not significant coefficient.

6.2 Sample selection

The sample used in this study consisted of firms in the KSE (Korea Stock Exchange) and the KOSDAQ (Korea Securities Dealers Automated Quotation). The intention was to use data from all Korean firms as the data set for this study. However, it has been suggested that firms in the KSE and in the KOSDAQ may differ in certain characteristics. KOSDAQ firms are perceived as less predictable, for example, and the regulations for listing are different for KSE firms versus KOSDAQ firms. Therefore we retested equation (3) using only firms in KSE for the period after the 1998 policy change.

Table 11 reports the regression results from the estimating equation (3) using only the firms in the KSE. The coefficient on the interaction term of dividend increase versus

foreign ownership is positive and more significant than the previous result shown in Table 8. The result suggests that the positive relation between dividend changes and future earnings changes is stronger in KSE firms with high levels of foreign ownership. Furthermore, we checked this result with the Heckman two-stage analysis, and the results from that analysis also support this conclusion.

<INSERT TABLE11 HERE>

6.3 Alternative variables

We test profitability in the future as a dependent variable. In untabulated results, we find that the effect of foreign investors in the later period, 1999-2003, is still significant. This result suggests that foreign investors play a positive role in determining dividend policy. We further examine the effect of foreign investor on the relationship between the dividend changes and future earnings by using alternative variables: total dividend (cash + stock dividend) change and dividend rate (cash dividend divided by total assets). The results are identical to the previous results.

7. Conclusion

This paper examines the relationship between dividend changes and future earnings changes among Korean firms and investigates whether ownership by foreign investors has an influence on this relationship. Given the nonlinearity that appears in the reversion-to-the-mean phenomenon, we tested the relationship between dividend changes and

future earnings changes by using the modified partial adjustment model from the Grullon et al. (2005). The model controls for nonlinear relationships between changes in future earnings and past earnings levels and changes. We found that the predictability of dividends is significant in the case of dividend increases, but for dividend decreases it is not statistically significant. We hypothesize that this result reflects the low dividend policy prevalent in the period 1992–1996. Consistent with this prediction, the predictability of dividends for this period is positive and significant while the predictability of dividends for the later period, 1999–2003, is positive but not significant. Based on this result, we conclude that the relationship between dividend changes and future profitability was likely changed by the change in the dividend policy.

In analyzing the effect of foreign ownership on predictability of dividend for the entire period, 1992–2003, we found that the coefficient of dividend change and the interaction term between dividend changes and foreign ownership were not significant for $\tau=1$ and $\tau=2$. This result could be interpreted as implying that the relation between dividend changes and future earnings changes does not depend significantly on the level of foreign ownership. However, there was an important policy change in year 1998, when a rule restricting ownership by foreign investors to a maximum of 50% was repealed. Therefore we check the effect of this change in policy by comparing the period 1992–1996 with the period 1999–2003. We found that after the policy change ownership by foreign investors had a positive effect on the relationship between dividend increase and future earnings increase in the year following the dividend increase year. This result is the same even after using Heckman two-stage analysis to control for the endogeneity problem.

In this study, we found that dividend changes in firms with higher foreign ownership have a positive relationship with future earnings changes in the year following the dividend change year. We further found that the result is pronounced for firms with a dividend increase. This study suggests that foreign investors in Korea play an important role in monitoring a firm's dividend decisions. As a result, news that a firm will increase its dividend implies that the firm is more likely to have positive future earnings.

This table reports estimates of regression relating future earnings changes to current dividend changes. Regression is estimated on the based on the Grullon et al method. This regression use the modified partial adjustment model proposed by Fama and French (2000) to control for the non – linearities in the relation between future earnings changes and lagged earnings level and changes. We use Fama-MacBeth (1973) approach to estimate the regression coefficients.

In this table, we compare two periods from 1992 to 1996 and from 1999 to 2003 by using equation (2)

$(E\tau - E\tau_{-1})/B_{-1}$ = earnings change in year τ from year τ_{-1} deflated by the book value of equity at the beginning of the dividend event year. $R\triangle DIV_0$ = the rate of change in cash dividend per share relative to the previous year. DPC = 1 when dividend increases and 0 otherwise. DNC = 1 when dividend decreases and 0 otherwise. DFE = ROE_0 – $E[ROE_0]$, ROE_0 = return on equity in year 0. $E[ROE_0]$ is the fitted value from the cross-sectional regression of ROE_0 on logarithm of total assets in year -1, the logarithm of market to book ratio of equity in year -1, and ROE_{-1}. NDFED = 1 when DFE is negative and 0 otherwise. PDFED = 1 when DFE is positive and 0 otherwise CE = $(E_0 – E_{-1})/B_{-1}$. NCED = 1 when CE is negative and 0 otherwise. PCED = 1 when CE is positive and 0 otherwise.

We use logistic models to estimate the effect of foreign ownership on the likelihood of dividend changes.
To estimate the effect of foreign ownership on the magnitude of dividend changes, we use Fama-MacBeth (1973) approach. The first stage computes cross-sectional regression coefficients each year using all the observations in that year. In the second stage, the time-series means and standard deviations of coefficients are calculated. The adjusted R^2 is the average adjusted R^2 of the cross-sectional regressions. Regressions are run separately for dividend increase events and dividend decrease events, respectively.
DPC= 1 for positive dividend changes and 0 otherwise. $R△DIV_0$ = the rate of change in cash dividend per share relative to the previous year. LEVERAGE = Leverage ratio. MTB = Market-to-book ratio. PROFITABILITY = ROE ratio. CHA_ASSET = Change in total assets. CAP_INVEST = Capital expenditure/Total asset. TANGIBLE = Tangible asset / Total asset. All other variables are defined in previous tables.

THE IMPACT OF BLOCK-HOLDER OWNERSHIP, FIRM SIZE AND LEVEL OF COMPETITION ON FINANCIAL DISCLOSURE OF MANUFACTURING COMPANIES LISTED IN THE INDONESIA STOCK EXCHANGE

Thomas D. Susmantoro, Cynthia Afriani Utama
University of Indonesia

Abstract

The purpose of this study is to investigate whether the extent of company disclosure in Indonesia are affected by internal factors and external factor. Many previous studies related to disclosure conducted in Indonesia only focus to the internal factors, e.g. firm size and ownership structure (blockholder ownership). Unlike previous studies, we address the impact of competition as an external factor to company disclosure level. This study employs Botosan Index and Herfindahl Index (HI) as a proxy for the extent of disclosure and competition. The result shows that total asset as a proxy for firm size, blockholder ownership and level of competition have positive influence on company disclosure level

Keywords: *Competition, Herfindahl Index, Financial Disclosure, Firm Size, Ownership structure*

I. BACKGROUND

The Agency Theory suggests that there is asymmetric information[233] between management as the agent and the principal (i.e., owner of capital). According to Jensen and Meckling (1976), agency problem occurs when manager hides some information to the principal and diverts the company's asset to maximize his/her utility. As consequences, the agency problem can have a detrimental effect on shareholder value. Lang and Lundholm (1996) state a company can minimize asymmetric information between manager and shareholder by increasing a company's disclosure. Disclosure can be improved by providing not simply mandatory information (mandated disclosure) but additional information (voluntary disclosure) as well.

The advantages of higher disclosure are: 1) Higher disclosure reduces the cost of equity (Botosan (1997); Welker (1995); Marquardt and Wiedman (1998); Leuz and Verrechia (2000); Bloomfield and Wilks (2000); and Hail (2001), Tjakradinata (2000);

---

[233] According to Scott (2000), there are two impacts of asymmetric information: adverse selection and moral hazard. The adverse selection refers to the willingness of the investor who has less information to buy the company stock with the lower price to compensate the agency problem caused by the manager in the future. Moral hazard problem occurs when manager acts inappropriately to the principal who has less information and cannot perfectly monitor the manager.

Sitanggang (2002); Adhariani(2004); and Budiarti (2007)); 2) Higher disclosure reduces the cost of debt (Sengupta, 1998). Higher disclosure improves the lender perception related to default risk of the company. Furthermore, the credit analysts will have more information regarding firm strategy and its ability to repay debt.

Some studies show that large shareholders (blockholders) have a positive relationship with company disclosure (Healy, Hutton and Palepu (1999); Jiambalvo, Rajgopal and Mitchell, Chia and Loh (1995); Aitken, Hooper and Pickering (1997); and Venkatachalam (2002)). The blockholders [234] control the company decision making including the decision related to the company disclosure. The blockholders have a greater willingness to discipline poorly performing management and more incentive to intervene and exercise 'voice' (Mayer (1997), Schmalensee and Willig (1989); and Tirole (1990)).

Other studies find that firm size, which is proxied by value of total assets, has a positive relationship with the extent of company disclosure (Arber, Carvell and Strebel (1983); Merton (1985); Chow and Wong-Boren (1987); King, Pownal and Waymire (1990); Bradbury (1991); Bradburyy (1992); Skinerr (1992); McKinnon and Dalimunthe (1993); and Berger and Hann (2002)). Bradbury (1991) states that firms with higher value of total assets but not followed proportionally by a higher disclosure level will suffer a greater potential loss relative to firms with small assets. Consequently, shareholders tend to increase monitoring and implementation of high disclosure policy for larger firms. Furthermore, Singhvi (1971) states that large firms necessarily implement a high disclosure policy to obtain easier access to financing and to increase stock liquidity.

Previous studies show the influence of blokholders and firm size on the extent of company disclosure. On the other hand, Bilson, Smith and Whaley (2006) stress the influence of competition level as an external factor to the extent of company disclosure. There is a trade-off to implement a higher disclosure. In industry with highly competitive environment, providing more voluntary disclosure in company annual report will have more advantage than industry with less competitive environment. Voluntary disclosure should provide more information about business strategy and their competitive advantage to the investor. Investor's positive perception on company stock would be beneficial to

---

[234] Beside percentage of ownership large (block) holder, Singhvi (1971) uses the other proxy for ownership by using the number of shareholder

the existing stockholder. Verrecchia (2001) explains that in the industry with highly competitive environment, the potential loss caused by new entrants and existing competitors is relatively lower than the industry with low competitive environment. For a company that operates in low competitive environment, voluntary disclosure in the annual report results in more disadvantage than a potential loss caused by increasing competition from new entrants and existing competitors (Darrough and Stoughton (1990); Dye (2001); and Verrecchia (2001)). Furthermore, Dye (2001) states that in industry with low competitive environment, increasing level of company disclosure would cause a potential loss of company cash flow because the competitors reduce the company market share. Therefore, the empirical studies show that competition as an external factor affects a company disclosure level.

Based on previous studies, we can summarize that both firm size and ownership structure as internal factors and competition level as an external factor have a positive influence on company disclosure level. Therefore, the objective of this study is to investigate the influence of large shareholders, firm size and competition level on disclosure level of publicly listed companies in the Indonesia Stock Exchange. We include sample from manufacturing companies due to these companies tend to disclose more items compared to non-manufacture companies (Lincoln and Kalleberg (1990); Cooke (1989); Choi and Hiramatshu (1987); and Stanga (1976)).

The remainder of this paper is organized as follows. The second section provides literature review and hypothesis development. The third section describes research methodology meanwhile the fourth section explains empirical results. The final section provides conclusion and implication.

II. HYPOTHESIS DEVELOPMENT

Healy, Hutton and Palepu (1999); Jiambalvo, Rajgopal and Mitchell, Chia and Loh (1995); Aitken, Hooper and Pickering (1997); and Venkatachalam (2002) show that institutional ownership is positively correlated with company disclosure level. Their studies find that institutional ownership plays an active role in the monitoring and control

of the firm. As a result, they assure that management action align with shareholders' objective.

Mayer (1997), Schmalensee and Willig (1989); and Tirole (1990) state that institutional ownership is able to enforce management to increase voluntary disclosure and finally reduces information asymmetry between management and shareholders. Institutional investors with a greater ownership concentration and higher voting right exert their control over management by using incentives for examples: reward decision (i.e., giving more incentive or bonus to management) or punishment (i.e., to fire and replace the management or no-bonus to management). This finding is affirmed by Michell, Chia dan Loh (1995) dan Aitken, Hooper dan Pickering (1997) as well. They contend that higher dispersed ownership structure is associated with lower level of company disclosure.

Birt, Bilson, Smith and Whaley (2006) conclude that large shareholders (e.g. blockholder) exert control to company decision including disclosure policy. Birt, Bilson, Smith and Whaley (2006) also argue that blockholders would motivate company to increase disclosure in order to mitigate not only interest between shareholder and management but also among shareholders. Their study finds a positive relationship between ownership concentration and disclosure level. Therefore, the first hypothesis is:

 H1: Ownership by large shareholders is positively correlated with company disclosure level

Large firms tend to increase their disclosure level. Large firms will maintain their assets to prevent decrease or even loss due to improper policy or management frauds. Bradbury (1991) argues that a company with large assets but does not implement high disclosure level will suffer more potential loss than a company with small assets. Furthermore, Foster (1986); McKinnon and Dalimunthe (1993); Bradbury (1992); and Berger and Hann (2002) explain that a company with large assets will implement high disclosure policy to mitigate the agency problem between management and shareholders.

Singvhi (1971) argues that large firm will implement high disclosure policy because the advantage of easier access to get external financing and increasing the stock

liquidity. Meanwhile, Sengupta (1998) explains that large firms tend to disclose more because information about their assets is 'good news' to investors. Information on large assets will show that a company has a good reputation and ability to repay its loan or credit. As a result, the creditor will charge a lower cost of debt.

The positive impact of firm size to company disclosure is supported by Birt, Bilson, Smith and Whaley (2006) as well. Buzby (1975) also asserts that a company with large assets will have sufficient resources and information system to help the company in collecting and providing information. Based on previous studies, the second hypothesis is:

H 2: Level of assets has a positive relationship with company disclosure level

Dye (2001) argues that if disclosure is not mandatory, a company only provides favorable information to the stakeholders. The cost occurred due to disclosing unfavorable information is called proprietary cost (Verrecchia (2001)). Proprietary cost is a trade-off between incentive and disincentive resulting from implementing high disclosure policy. The incentive is to increase the stock price meanwhile the disincentive is a loss of market share (Verrecchia (2001)).

Verrecchia (2001) investigates the role of proprietary cost in order to explain why companies act reluctantly to disclose additional information (voluntary disclosure). Verrecchia (2001) argues that companies operate in a low-competitive environment has disincentive to reveal voluntary disclosure. They assume that voluntary disclosure will disclose too much information to their competitor and reduce their market share. Conversely, companies that operate in a highly competitive environment will have a greater incentive to disclose because the potential loss of market share is relatively lower than low competitive environment. Releasing additional information could be beneficial to the company because it could reduce asymmetric information between management and the shareholders (Hayes & Lundholm (1996); Harris (1998); Botosan and Stanford (2005), Harris (1998)). Therefore, the third hypothesis is:

H3: The level of competition is positively correlated with company disclosure level

III. RESEARCH METHODOLOGY

3.1. Variable Measurement

In measuring a company disclosure level, it is common to use a score or index that can be calculated based on disclosure items in a company annual report. In US and European countries there is a rating for disclosure level which is published by Association for Investment Management and Research (AIMR). This rating can be used as a reference to investors to evaluate adisclosure level of listed companies.

In addition to rating released by AIMR, several studies like Cerf (1961); Mautz and May (1978); Fith (1979); Nair and Frank (1980); Lee and Twedie (1981); Gray, Sweeney and Shaw (1984); Gray and Robertson (1989); and Cooke (1988, 1992) introduce several indexes as alternative measures of disclosure. A disclosure index can be used to measure the level of compliance to government or stock exchange regulation. This index could be used as an indicator of mandatory disclosure and/or voluntary disclosure. It is counted based on the explanation in the annual report regarding company financial status and its performance. All of information must be revealed, in qualitative or quantitative, in order to help stakeholders in making decision (Siegel and Shim (1994)).

Cerf (1961) employs a disclosure index that consists of several disclosure items. These items are constructed after studying investment decision-making process, by exploring how decisions are made by conducting some interview with security analysts and conducting some tests on reports produced by analysts. Another study, Cooke (1992) utilizes 165 disclosure items that include mandatory and voluntary disclosure items. His research constitutes further evidence on Shingvi and Desai (1971) empirical research.

Botosan (1997) employs disclosure quality with the use of an index calculated based on information provided in the annual report. Botosan (1997) demonstrates that annual report can be used to measure quality of disclosure. Lang and Lundholm (1993) in Botosan (1997) state that there is a positive relationship between annual report and other company's publications (the correlation coefficient is 0.62) and between annual report and AIMR disclosure rating (a correlation coefficient of 0.41). Thus, Botosan (1997) argues that disclosure on company annual report could be a good proxy of company disclosure.

Disclosure index developed by Botosan (1997) is classified into the following five categories: background information, summary of historical financial statistics, key non-financial statistics, projected information and management discussion and analysis. Each category has total score that is measured by using several disclosure items. The score depends on the level of information provided in annual report. In measuring each item, Botosan (1997) provides the list of disclosure items with explanation and guidance (anchor) to define the score so it is useful to minimize subjectivity in determining the score.

In contrast to US and Europe, Indonesia has no institution that provides disclosure index. Furthermore, most studies related to disclosure level in Indonesia employ Botosan Index (Tjakradinata (2000); Adhariani (2004); and Budiarti (2007)). As mentioned above, Botosan index could minimize subjectivity in measuring company disclosure.

In measuring disclosure level, it is necessary to understand the style and format of annual report of listed companies. In Indonesia, Badan Pengawas Pasar Modal (Bapepam) and Lembaga Keuangan as a regulator to monitor stock exchange in Indonesia has released a decree No: KEP-134/BL/2006 Regulation No X.K.6 that state there is obligation for publicly listed companies to publish an annual report. The decree also provides a guidance of the style and content of annual report that is mandatory to be informed to the public. According to that decree, companies have to explain significant changes compared to the last annual report.

The decree also requires certain information to be disclosed in the annual report, i.e., important financial summary, commissioner's report,[235] Board of Director (BOD) report, company profile, management discussion and analysis, report on corporate governance, responsibility of BOD on annual report, and audited financial report. Specifically on management discussion and analysis, a company has to explain the following information: review on operation of each segment of business, financial performance analysis, discussion and analysis on business condition, significant changes, impact to the company, prospect and achievement and also explanation about major accounting policies being used. The company can provide additional information

---

[235] Indonesian companies apply a two-tier board, i.e., the supervisory board or the board of commissioner and the management board or the board of directors.

(voluntary disclosure) as well such as information about company strengths (or other 'good news') which can be beneficial to the company. Measuring disclosure level can be performed by determining and evaluating disclosure items provided in the annual report (which has to comply with the regulation standard).

In this study, the level of disclosure is calculated based on the list of disclosure items and weighted according to weighted item based on study by Botosan (1997). The formula of total disclosure value is given below:

$$TSCORE_i = \sum_{i=1}^{5} SCORE_{ij}$$

Disclosure total (TSCORE) is total score for company j in category i to all category (category 1 to 5). This score then will be divided by the maximum score of disclosure level:

$$DISC_i = \sum_{i=1}^{5} \frac{TSCORE_{ij}}{\max(TSCORE_i)}$$

Ownership structure is proxied by the percentage of ownership by large shareholders (block holders). Large shareholder is defined as a shareholder who own more than 5% of outstanding shares. Higher percentage of large shareholders shows a more concentrated ownership.

The competition level reflects the competition among companies which belong in the same industry classification (SIC). To measure the competition level, we use Herfindahl Index (HI)[236]. The value of competition is 1 minus Herfindahl Index (1-H1) and has a range between 0 until 1. The value close to zero means that the competition is low meanwhile the value close to one means that the competition is high. To calculate HI for each industry based on SIC, the study used the formula:

---

[236] The other proxy for competition is Concentration Ratio (CR). It is called CR-4 or CR-8 which reflect the number of four or eight mean the number of biggest companies (Leuz (1999) and Harris (1998). This proxy is not used in this study due to not all industries have at least four public listed companies. This study uses Herfindahl Index because this index is commonly used in other research and also by US Department of Justice to investigate fraud of antitrust (Birt, Bilson, Smith and Walley (2006)). Besides Helfindahl Index is also well known Herfindahl-Hirschman Index (HHI) that has the same value with Herfindahl Index (HI) multiply by 10000. HHI has value 0 to 10000. If the value closes to 0, it shown perfect competition meanwhile if the value closes to 10000 means the market or industry is monopoly.

$$HI_J = \sum_{i+1}^{n_j} (\frac{R_{ij}}{Rj})^2$$

R_{ij} is a revenue of company i in industry j, n_j is a number of companies in industry j.

$$R_j \equiv \sum_{i=1}^{n_j} Rij$$

R_j is the revenue total of all companies in industry j.

3.2. Sample

To be included in the final sample, the observation has to meet the following criteria: 1) The companies are manufacturing listed companies; and 2) The company has an annual report in 2006. Furthermore, this study uses Standard Industry Code (SIC) to determine industry classification. This information is obtained from OSIRIS data base per April 1, 2008. On the other hand, we use one year annual report to measure company disclosure with the assumption that the format of annual report is constant over time and hence the annual report is a good proxy of overall company disclosure as well (Botosan, 1997).

3.3. Empirical Model

We employs Ordinary Least Squares Regression as shown below to investigate the influence of large shareholders, competition level and total assets to disclosure level.

DSCORE = βo + β1*O+ β2*C + β3*TA +

ε ....(1)

where

βo	=	Intercept
O	=	Large shareholder is defined as shareholder who own more than 5% of outstanding shares
C	=	Competition
TA	=	log(Total Aset)
ε	=	*error*

IV. EMPIRICAL RESULT

4.1 The Result of Sample Selection

The result of sample selection is shown in the table below:

Sample Data	Total	
	Company	**SIC**
Number of companies in manufacturing industries based on SIC (from OSIRIS)	107	24
Number of companies that is not reported 2006 annual report or the data is not available	6	1
Number of selected samples	101	23

Table 4.1
Summary of Sample Selection Procedure

4.2   Descriptive Statistic

The descriptive statistic on Table 4.2 shows that the average company disclosure level is 0.562408, meaning that companies disclose 56% disclosure items of Botosan Index. Based on the average disclosure level, 46 out of 101 companies have above average value. This result shows that the transparency level of manufacturing companies in the Indonesia Stock Exchange is relatively low. Furthermore, there is wide variation of disclosure level among manufacturing companies, i.e. between 0.228 and 0.9764. The relatively same result is shown by industry disclosure level (see Table 4.3). The average value of industry disclosure level is 54.6. % and 12 out of 23 industries has below average value.

The competition level in the industries (denoted by C and measured by using Herfindahl Index (1-H)) shows the average competition level is 0.582. There are 12 industries with value below mean HI industries. The lowest value is industry with SIC 262 (paper mills) with HI value 0.0043. Meanwhile the maximum HI value is industry with SIC 335 (rolling, drawing and extruding of nonferrous metals) with value of 0.08316.

As shown in Table 4.4, the industry with SIC 324 (Cement, Hydraulic) has the highest disclosure level (0.7614). This industry on average has large shareholder ownership (56.07 %) and large total assets (9.9021), which are higher compared to

average large shareholder ownership (38.24%) and average total asset (8.655) of all industries. Furthermore, the average value of competition for this industry (0.6155) is higher compared to average value of competition for all the industries (0.5196).

Table 4.2

Descriptive Statistic of Data Distribution for the Companies in 2006

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
Disc	101	.7481	.2283	.9764	.562408	.1478891	.022

TA	23	2.8500	7.0521	9.9021	8.655248	.6369608	.406
C	23	.8273	.0043	.8316	.519600	.2176460	.047

On the other hand, the industry with SIC 313 (steel works, blast furnaces and rolling and finishing) has the lowest disclosure level. This industry has the average ownership of large shareholder (25.9%) which is relatively lower than the average ownership of large shareholder in all industries (38.24%). The total assets of this industry

are 7.9741 and the competition is 0.4297. that are relatively lower than the average total assets (8.655) and competition (0.5196) of all industries.

Table 4.4

Data Distribution of the Industries in 2006

SIC	Average of Disc	Average of O (%)	Average of TA	Average of C	Companies Total
204	0.6689	42.30	9.0911	0.6036	4
208	0.6315	69.11	8.7039	0.6071	4
209	0.4472	27.66	8.7748	0.1306	5
211	0.5433	64.22	9.7421	0.5072	3
228	0.6066	35.93	7.8931	0.5749	6
229	0.5870	26.86	8.8506	0.7832	7
232	0.6378	18.16	8.9626	0.4305	3
243	0.6000	30.30	8.8146	0.6773	4
262	0.4725	61.04	7.8343	0.0043	2
267	0.5514	18.57	9.2034	0.6489	3
283	0.6424	60.09	8.7140	0.7165	9
284	0.4843	40.77	8.1103	0.1735	4
289	0.5121	30.32	8.5609	0.6971	9
301	0.4882	30.13	9.2254	0.3667	3
308	0.5173	30.38	8.3347	0.7712	9
314	0.4370	32.48	8.2989	0.5489	2
324	0.7614	56.07	9.9021	0.6155	3
325	0.5459	20.24	9.0305	0.3269	3
331	0.3307	25.99	7.9741	0.4297	2
335	0.6308	20.81	8.7574	0.8316	7
341	0.4016	33.75	8.2897	0.3578	2
349	0.4751	21.73	7.0521	0.4579	3
371	0.6040	82.68	8.9501	0.6899	4

Based on result of descriptive statistics above, we conclude that disclosure level tends to increase along with ownership of large shareholders, total assets and competition level.

4.3. Analysis of Correlation among Variables

The results of correlation tests are consistent with the expectation, i.e., total assets and competition correlate positively with disclosure level at significant level of 1 % while large shareholders ownership correlates positively with disclosure level at significant level 5 %.

Tabel 4.5
The Pearson Correlation Test among Variables

Correlations

		Disc	O	TA	C
Pearson Correlation	Disc	1.000	.200	.260	.292
	O	.200	1.000	.044	.007
	TA	.260	.044	1.000	.101
	C	.292	.007	.101	1.000
Sig. (1-tailed)	Disc	.	.023	.004	.002
	O	.023	.	.331	.471
	TA	.004	.331	.	.158
	C	.002	.471	.158	.

	TA	101	101	101	101
	C	101	101	101	101

4.4. Regression Analysis

OLS regression is conducted after validity check that assumption of OLS regression is fulfilled. As shown in table 4.6, the regression has R^2 30%, meaning that the internal factors (ownership of large shareholder and total asset) and the external factor (competition) can explain 30 % variation of company disclosure level.

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.549[a]	.302	.280	.1154597

a. Predictors: (Constant), TA, O, C

b. Dependent Variable: Disc

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	.090	.135		.670	.505	-.178	.359
	O	.110	.054	.188	2.033	.045	.003	.217
	TA	.037	.015	.225	2.422	.017	.007	.067
	C	.189	.065	.268	2.891	.005	.059	.319

a. Dependent Variable: Disc

The coefficient of ownership structure is 0.110 and significant level at 5 %. So, this study finds that there is a positive relationship between ownership of large shareholders and level disclosure. This finding supports the assertion that greater ownership of large shareholders will enforce management to implement high disclosure policy in order to assure management act in the best interest of shareholder.

This study finds that the coefficient of total asset is positive (2.422) and significant at the 5 % level (p-value = 0.017). Therefore, the result proves that larger asset will enforce firms to increase their disclosure level. This finding supports the argument that: 1) potential loss caused by agency problem is higher for company with large assets (Foster (1986); McKinnon and Dalimunthe (1993); Bradbury (1992); and Berger and Hann (2002)); 2) increasing transparency of large total assets will show company's good reputation. Furthermore, company will get easier access to external financing (Sengupta, 1998).

The coefficient of competition is positive (2.891) and significant at the 1 % level (0.005). Thus, higher competition encourages the company to increase their disclosure. This finding supports the argument that companies in a highly competitive environment will have a greater incentive to disclose because the potential loss of market share is relatively lower than low competitive environment. Releasing additional information is beneficial to the company because it could reduce asymmetric information between management and the shareholders (Hayes and Lundholm (1996); Harris (1998); Botosan and Stanford (2005), Harris (1998); Botosan and Stanford (2005)).

V. CONCLUSION AND IMPLICATION

This study shows that disclosure levels of listed companies in the Indonesia Stock Exchange are affected by: 1) internal factors: i.e., ownership of large shareholder and total assets; 2) external factor, i.e. competition. Using Botosan Index as a proxy of company disclosure and Herfindahl Index as a proxy of competition, the results show that ownership of large shareholders, total assets, and competition have a positive influence on level of disclosure. The implication of this study is that the government should play an active role to encourage favorable business competition so the high competition can motivate companies to implement high disclosure. Furthermore, regulator on stock exchange (Bapepam & LK) and the Indonesia Stock Exchange should improve the mechanism to increase disclosure level of public listed companies in Indonesia in order to create better fairness business environment and risk-protection for investors.

THE IMPACT OF SMOKING BAN *FATWA ON* INDONESIAN TOBACCO'S COMPANY: EVIDENCE FROM STOCK MARKET RETURN

Gatot Soepriyanto*, Paulina Santoso

Binus University

Abstract

The objective of this study is to assess the share price reactions to smoking ban *fatwa* on Indonesia tobacco's company. We expect that the smoking ban fatwa in the world's largest Muslim population will hit the tobaccos industry revenues, lower tobacco's company profit and eventually affect the share price of those firms. We use event study methodology and standard market model to calculate abnormal returns of the tobacco's firms related to the news of smoking ban *fatwa*. Our study failed to find a statistically significant effect of smoking ban *fatwa* on tobacco's firm stock market return. It suggests that the investors do not see the *fatwa* as a factor that may control the tobacco consumption in Indonesia – thus it may not affect the tobacco's firm revenues and profit in the future

Keywords: smoking ban *fatwa*, tobacco industry, event study.

1. INTRODUCTION

The purpose of this study is to examine the impact of smoking ban *fatwa* on share price of Indonesian tobacco's company. Given the recent introduction of the *fatwa,* the effect of such restriction is unknown. Understanding how the financial market will react to the restriction of this nature is important; as firms that are engaged in tobacco industry might find that the *fatwa* will hit their revenues, thus will lower their profit and eventually affects the future prospect of their business. The ulema's decision to ban smoking in public, children and pregnant woman has fueled the debate whether the decision will have an impact in the tobacco industry which provide work for millions workers.

The first argument is that the decision will affect the industry as most of Indonesia's populations are Muslims; hence it is most likely they will adhere to the *fatwa.* As a consequence it may hit the business (i.e. tobacco producer) that it could trigger a drop in cigarette output. The second argument is that the *fatwa* did not apply a blanket ban on smoking; it instead issued a fatwa placing more limited restrictions on tobacco

use. In addition, even though Indonesia is the largest Muslims country in the world, Indonesia has been known as a secular country where the *fatwa* is not legally binding for Muslims. Therefore one may argue that little effect will occur to the tobacco business.

Our study failed to find a statistically significant negative abnormal return as an effect of smoking ban *fatwa* on tobacco's firms. It provides evidence that the investors do not see *fatwa* as a factor that may control the tobacco consumption in Indonesia – thus it may not affect the tobacco's firm revenues and profit in the future. Additional test by comparing the abnormal returns of firms in tobacco industry and banking industry – as control group – provide a support our conclusion. We do not find a statistically significant difference between abnormal returns of firms in tobacco industry compare to firms in banking industry in the event date of smoking ban *fatwa* news.

The remainder of the study is organized as follows. A background to the smoking band *fatwa* issuance is provided in section 2. Development of hypotheses and literature review are discussed in Section 3, and Section 4 presents data selection. Section 5 illustrates the methodology of the study and Section 6 reports the results. Section 7 summarizes the study.

2. REGULATORY BACKGROUND

Smoking is widespread in Indonesia, with cigarettes among the cheapest in the world at around $2 a pack, Indonesia is the world's No. 5 tobacco market. Many Indonesians also have a strong cultural affinity with smoking, with pressure to hang out and smoke after celebrations for births or weddings in villages across the archipelago. Some cities in Indonesia, including Jakarta, have banned smoking in public places, but the rules are widely ignored. The US$8 billion tobacco industry in Indonesia plays an important economic role, with tax on cigarettes accounting for about 10 per cent of government income in the past, while the sectors provide millions of jobs.

In order to reduce tobacco consumption, the anti smoking campaigners had urged the government to ratify the World Health Organisation's Framework Convention on Tobacco Control. Indonesia, however, has been reluctant to sign up because of concerns about the impact on the economy despite the health risks from smoking. This issue has brought the attention of Majelis Ulama Indonesia (MUI) or Ulema Council - a top islamic body in the world's most populous Muslim. The council, established in 1975, has carved a key role for itself in Indonesia and its pronouncements on everything from Islamic banking to halal food can have a big influence on Southeast Asia's biggest economy.

The debate over smoking has revealed a split between those wanting to make it "haram," or not allowed, and others who favor a "makruh," a Arabic term whereby it would only be advised that smoking is bad and it is better to drop it. Some clerics also argued that there was no Islamic tenet that bans smoking. Finally, **on Sunday, January 25**, nearly 700 people, including Muslim clerics and theological experts, have gathered in West Sumatra for the National Edict Commission meeting, which could issue *fatwa* whether to apply a blanket ban on smoking for Muslims or place a more limited restriction on tobacco use. In the end, after a heated debate, the council said a decision could not be reached and only forbade smoking in public or smoking by council members of MUI, children and pregnant women. The fatwa is not legally binding for Muslims, who make up some 86.1 percent of Indonesia's 235 million population, but place pressure on Muslims to adhere to them and can influence government policy.

3. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

Prior studies related to the smoking ban policies around the world have been extensively examined, not only from health and environment perspective but also from economic view. The evidence on the impact of smoking ban on business is mix. A body

of literature finds that there is no significant effect of smoking ban on business. Bartosch and Pope (1999) and Alpert, Carpenter, Travers and Connolly (2007), for example, do not find significant effect of Massachusetts smoke-free workplace policies on restaurant business and several economic indicators. By analyzing 97 studies that made statement about economic impact of smoke-free policies - Scollo, Lal, Hyland and Glantz (2003) conclude that all of the best designed and independent studies report no impact of smoke-free restaurant and bar laws on sales and employment. Using Australia's cigarette and tobacco consumption product, real income and demographic effects as contextual factors, Bardsley and Olekalns (1999) also find a relatively minor impact of workplace smoking bans and anti-smoking advertising on cigarette and tobacco consumption.

The second body of literature has documented evidence on the negative impact of smoking ban on business. Adda, Berlinski and Machin (2007) for example, used a quasi-experimental research design that compared the sales and number of customers in public houses located in Scotland before and after the Scottish smoking ban was introduced, relative to a control group of establishments across the English border where no ban was imposed. They find suggests that the Scottish smoking ban had a negative economic impact on public houses, at least in the short run, due in part to a drop in the number of customers and sales. Using stock market return and event study as main methodology, Tomlin (2009) documents negative abnormal stock returns to portfolios of the hospitality industry firms examined upon the announcement of a proposed smoking ban. These results support the conclusion that a smoking ban lowered the aggregate market value of these firms.

In Indonesian context, ulema's decision to ban smoking in public, children and pregnant woman has also fueled the debate whether it will have an effect to the tobacco industry or not. The first argument is that the decision will affect the industry as most of

Indonesia's populations are Muslims; hence it is most likely they will adhere to the *fatwa.* As a consequence it may hit the business (i.e. tobacco producer) that it could trigger a drop in cigarette output. The second argument is that the *fatwa* did not apply a blanket ban on smoking; it instead issued a fatwa placing more limited restrictions on tobacco use. In addition, even though Indonesia is the largest Muslims country in the world, Indonesia has been known as a secular country where the *fatwa* is not legally binding for Muslims. Therefore one may argue that little effect will occur to the tobacco business.

Given the forward looking characteristics of capital markets, investors in stocks are expected to be among the first to react to the smoking bans *fatwa* that may has adverse effects on the revenues and profits of tobacco firms. It is expected that the market participants are able to assess the risk and uncertainty of future profitability of the tobacco firm due to smoking ban *fatwa.* Therefore, the first hypothesis for this study is (stated in alternative hypothesis):

H_1:   *The abnormal returns for firms in tobacco industry at the event window of smoking ban* fatwa *are negative*

Since the smoking ban *fatwa* is expected to have an effect on tobacco industry firm due to the characteristic of the industry, we expect that there is no similar reaction to the banking industry as a control group. Therefore, the second hypothesis for this study is (stated in alternative hypothesis):

H_2:   *There is a difference between the abnormal returns for firms in tobacco industry and banking industry at the event window of smoking ban* fatwa.

4. DATA

We have 2 sample categories: experiment and control sample. The share price data are obtained from Indonesian Stock Exchange (ISX) database. In order to be included in the experiment sample, we use the following sample selection category:

1. The firms are included in tobacco industry – the industry that most likely will be most affected by the smoking ban *fatwa;*

2. The firms' shares are actively traded during 200 days in estimation period and during event day period; and

3. The firms do not experience any confounding events such as earnings and dividend announcement during the observation period.

It brings us with experiment sample firms as listed in Table 1 below:

[INSERT TABLE 1 HERE]

The control samples are firms in banking industry. We choose banking industry as control sample based on the reason that the industry will not be affected by the smoking ban *fatwa* news. Additionally, the firms shares should actively traded during 200 days in estimation period and during event day period; those firms do not experience any confounding events such as earnings and dividend announcement during the observation period. Table 2 depicts the firm in banking industry that meet the above category.

[INSERT TABLE 2 HERE]

5. RESEARCH DESIGN AND METHODOLOGY

5.1 Empirical Model

5.1.1 The Standard Market Model

As the objective of this study is to investigate the market reaction upon the smoking ban *fatwa* news, the event study methodology is employed. This methodology allows us to measure the effect of a particular event on the share return of the firms. To

estimate the abnormal return for each day related to market reaction of smoking ban *fatwa news*, a standard market model is used (see Equation 1).

$$R_{it} = \alpha_i + \beta_i R_{mt} + \varepsilon_{it} \quad ^{237,\ 238}$$

(1)

Equation 1 is applied to estimate the OLS parameters, $\hat{\alpha}_i$ and $\hat{\beta}_i$. The estimation period used in this study covers 200 days prior to day -1. The abnormal returns surrounding each event are determined based on Equation 2.

$$AR_{it} = R_{it} - (\hat{\alpha}_i + \hat{\beta}_i R_{mt}) \quad ^{239}$$

(2)

In addition to a daily event window, a 3-day event window (-1 to +1), a 5-day event window (-2 to +2) and a 7-day event window (-3 to +3) are calculated. It is assumed that the length of the event window is enough to capture possible expectation or information leakage before the event, while it is not too long to face problems with confounding events falling within the event window. Cumulative abnormal returns (CAR$_{it}$) for each firm are computed by summing up the firm's abnormal return during the event window (Equation 3).

$$CAR_{it} = \frac{1}{N} \sum_{t=1}^{t=N} \varepsilon_{it} \quad ^{240}$$

(3)

---

[237] R_{it} and R_{mt} are calculated using the following equation: $R_{it} = (P_{it} - P_{it-1})/ P_t$, $R_{mt} = (M_t - M_{t-1}) / Mt$, where P_{it} is the share price of firm *i* at time *t*; P_{it-1} the share price of firm *i* at time *t-1*, M_t is the market index of at time *t*; M_{t-1} is the market index at time *t-1*

[238] In equation 1, R_{it} is the security return for firm *i* on day *t*, R_{mt} is the market return on BEI composite index (IHSG) on day *t*, α_i and β_i are the Ordinary Least Square (OLS) coefficients and ε_{it} is the disturbance term (residual)

[239] In equation 2, AR is the abnormal return for firm *i* on day t and $\hat{\alpha}_i$ and $\hat{\beta}_i$ are the OLS estimates of market model parameters for *firm i.*

[240] In equation 3, CAR_{it} is the cumulative abnormal return for firm *i* in time *t* and *N* is the number of days in the event widow.

6. EMPIRICAL RESULTS

6.1 Descriptive Statistics

6.1.1 Tobacco's Firm

Table 3 reports descriptive statistics for abnormal returns for the 4 experiment sample firms. Panel A, B, C and D show the descriptive statistics for daily abnormal return *(AR)*, 3-day, 5-day and 7-day cumulative abnormal returns *(CAR)* surrounding the events.

[INSERT TABLE 3 HERE]

Panel A in Table 3 shows that the daily *AR* (day -1 to day +1) from for January 27 event window are positive except for the day 0, which is the first trading day after smoking ban *fatwa* news[241]. In day 0, it shows that the *AR* is -0.00535 (negative) while in day -1 and +1 are 0.01267 and 0.00955, respectively. As illustrated in Panel B, the *AR* also became positive when the returns were accumulated for 3 days except for day 0 to day +2 where the *AR* is -0.00006. Moreover, we find that the *AR,* remained positive when returns were accumulated for 5 days and 7 days as depicted in Panel C and D respectively.

6.1.2 Control Firms

Table 4 reports descriptive statistics for abnormal returns of the control firms from banking industry. Panel A, B, C and D show the descriptive statistics for daily abnormal return *(AR)*, 3-day, 5-day and 7-day cumulative abnormal returns *(CAR)* surrounding the events.

---

[241] The smoking ban *fatwa* was issued on Sunday, January 25. The trading day started on Tuesday, January 27, since Monday, January 26 was a Chinese New Year public holiday.

[INSERT TABLE 4 HERE]

In general, it is interesting to see that the share price reaction in banking during the event date were moving into opposite direction compare to the share price movement in tobacco industry. Panel A in Table 4 shows that the daily *AR* (day -1 to day +1) from for January 27 event window are negative except for the day 0. In day 0, it shows that the *AR* is 0.00120 (positive) while in day -1 and +1 are -0.03147 and -0.01456, respectively. As illustrated in Panel B, the *AR* also became negative when the returns were accumulated for 3 days. Finally, we find that the *AR,* remained negative when returns were accumulated for 5 days and 7 days as depicted in Panel C and D respectively.

6.2 Empirical Results

Table 5 reports the abnormal return and cumulative abnormal return surrounding the event date. The result shows the mean coefficient for daily AR for the news related to the smoking ban *fatwa* is negative. Meanwhile, the 3-day, 5-day and 7-day CAR is positive.

[INSERT TABLE 5 HERE]

The empirical results of daily, three-day, five-day and seven-day abnormal returns for 4 tobacco firm provide mix evidence. The parametric test (*t*-test) for January 27, 2009 event window shows that AR is only significant at 15% level using one tailed test, with *t*-statistic (*p*-value) of -1.433 (0.13). However, the CAR_3, CAR_5 and CAR_7 are not significant with *t*-statistics (*p*-value) of 0.646 (0.25), 0.688 (025) and 1.327 (0.16), correspondingly. Hence, we only find little evidence to support on H_1 on which the market reacts negatively to smoking ban *fatwa* news.

We provide some explanations on why market does not react strongly to the smoking ban *fatwa* are (1) the equity investors believe that the smoking ban *fatwa* is not legally binding; hence it may not affect the tobacco industry significantly (2) the market believes that the smoking ban *fatwa* is not a blanket on smoking. The fatwa is basically not to ban smoking for Muslims, it instead issued a *fatwa* placing more limited restrictions on tobacco use, especially to the group of smoker who smoke in public, children and pregnant woman.

Consistent with the result in Table 5, our parametric test on abnormal return of tobacco firms and banking firms as control sample provide no support to H_2. In other words, there is no difference on abnormal return at the date of smoking ban *fatwa* – between firms in tobacco industry and banking industry. The result is shown in table 6 below.

[INSERT TABLE 6 HERE]

As illustrated in Table 6, The AR, CAR_3, CAR_5, and CAR_7 difference between firms in tobaccos industry and banking industry are not significant with *t*-statistics (*p*-value) of -0.115 (0.45), 0.648 (0.25) 0.594 (0.30) and 0.908 (0.19), correspondingly.

7. CONCLUSION

The objective of this study is to assess the share price reactions to smoking ban *fatwa* on Indonesia tobacco's company. We expect that the smoking ban fatwa in the world's largest Muslim population will hit the tobaccos industry revenues, lower tobacco's company profit and eventually affect the share price of those firms. Our study failed to find a statistically significant effect of smoking ban *fatwa* on tobacco's firm stock market return. It suggests that the investors do not see the *fatwa* as a factor that may control the

tobacco consumption in Indonesia – thus it may not affect the tobacco's firm revenues and profit in the future

We provide some explanations on why market does not react strongly to the smoking ban *fatwa* are (1) the equity investors believe that the smoking ban *fatwa* is not legally binding; hence it may not affect the tobacco industry significantly (2) the market believes that the smoking ban *fatwa* is not a blanket on smoking. The fatwa is basically not to ban smoking for Muslims, it instead issued a *fatwa* placing more limited restrictions on tobacco use, especially to the group of smoker who smoke in public, children and pregnant woman.

4.5 **Corporate Governance**

THE ROLE OF CORPORATE GOVERNANCE IN CONTROLLING RELATED PARTY TRANSACTION

Winda DamaiyantiHutapea and Sidharta Utama

University of Indonesia

Abstract

The objective of this study is to investigate whether Corporate Governance (CG) components (rights of shareholders, equitable treatment of shareholders, disclosure and tranparency, responsibilities of the board), proportion of ownership by majority shareholders, and financial leverage affect the probability of the occurence of related party transaction that a priori is expected to expropriate wealth of minority shareholders (RPTE). The study finds that the probability of the occurence of RPTE is reduced as a. board is more effective in performing its responsibility, b. the treatment of shareholders is more equitable, and c. the proportion of ownership by majority shareholders increases. However, the study finds that financial leverage as a measure of external monitoring does not affect the probability of the occurrence of RPTE.

Keywords: Related Party Transaction, Corporate Governance, Majority Shareholders, Financial Leverage, Expropriation

1. Introduction

Directors and internal corporate parties are responsible to conduct firm's affairs to maximize shareholder wealth. In some cases they arrange transactions with their families, majority shareholder, subsidiaries, or corporate affiliates. These transactions are called related party transaction (RPT). The definition of RPT in Indonesia, according to Pernyataan Standar Akuntansi Keuangan or PSAK (Indonesian Statement of Financial Accounting Standard) no 7 regarding RPT, is the same as the definition of RPT under International Accounting Standard (IAS) 24, i.e., "... *a transfer of resources, services, or obligations between related parties, regardless of whether a price is charged.*" (IAS 24, par. 9).

RPT can have a positive or negative impact on firm performance (McCahery and Vermeulen). Indeed, there are many examples of related party transactions that provide benefits for companies. For example, trade and foreign investment is often facilitated by inter-company financing transactions. Lower costs of capital and transaction costs provide a strong incentive for engaging in these transactions. However, related party transactions might not be undertaken at arm's length transactions and can be influenced by the relationship between the parties engaging in the transaction. Thus, there is a conflict of interest for some person in the company. For both controlling shareholders and insiders such as management, RPT can be the mechanism for expropriating wealth of non-controlling shareholders.

This point of view is supported by two opposing hypothesis stated by Gordon, Henry and Palia (2003). The conflict of interest hypothesis suggests that RPT is a transaction that a priori is to expropriate wealth from non-controlling shareholders. On the other hand, the efficient transaction hypothesis proposes that RPT efficiently fulfill underlying economic needs of the company. Since RPT may yield either benefits or costs to companies, it is important to empirically investigate some determinants that affect the probability of the occurrence of RPT that a priori to expropriate wealth from non-controlling shareholders (RPTE). The study proposes internal and external determinants: the internal determinants are corporate governance practice and ownership structure while the external determinant is the monitoring of creditors.

Corporate governance (CG) issues arise because of asymmetric information problems between principals and agents and self-interest behavior in the part of agents, resulting agents expropriating wealth from the principals. Examples of

principals-agents conflicts are conflicts between shareholders – managers, controlling shareholders – non-controlling shareholders, creditors – managers. CG as a company internal control mechanism should positively affect the efficiency and effectiveness of transactions undertaken by the company for the interest of the company. The *OECD Principles of Corporate Governance* suggested by OECD (2006) provides specific guidance for policymakers, regulators and market participants in improving the legal, institutional and regulatory framework that underpins corporate governance. These principles are:

1. The protection and facilitation of rights of shareholders and key ownership functions.

2. The equitable treatment of shareholders, including the opportunity to obtain effective redress for violation of their rights.

3. Recognizing the rights of stakeholders and active co-operation between corporations and stakeholders in creating wealth, jobs, and the sustainability of financially sound enterprises.

4. Timely and accurate disclosure and transparency on all material matters regarding the corporation.

5. The responsibilities of the board, including the strategic guidance of the company, the effective monitoring of management by the board, and the board's accountability to the company and the shareholders.

The study employs the first, second, fourth, and fifth principles as the proxy of CG. Principle three concerns with the role of stakeholders and thus is not related to protecting non-controlling shareholders from wealth expropriation; therefore, CG practice in connection with principle three is not included in the measure of CG in the

1397

study. On the other hand, the other four principles directly contribute to the protection of the non-controlling shareholders' wealth that could be affected by RPT.

The study provides the following three contributions to existing literature. First, the study employs samples that comprehensively consist of all types of corporate actions. Previous studies related to RPT in Indonesia cover only certain types of corporate actions. For example, Masuroh (2000) includes only mergers and acquisitions while Utama (2006) includes investment decisions. Further, our study separates this sample into RPT which a priori to expropriate and which are not, while other studies in Indonesia do not distinguish them.

Second, the study investigates whether the monitoring mechanism, internal and external, affects the probability of RPTE. The internal monitoring mechanism is CG practice while the external monitoring mechanism is the monitoring by creditors, proxied by the level of leverage. Because these two control mechanisms are set to assure that companies always maximize shareholder wealth, then the study expect these variables negatively affect the probability of RPTE.

Third, the study investigates the association of proportion of majority ownership with the probability of RPTE. Higher proportion of majority ownership makes it easier for the majority shareholder to engage in RPT. Because there are two opposing hypotheses about the impact of RPT on firm value, then for high majority ownership relative to low majority ownership, the study expects that the variable could affect the probability of RPTE either way, depending on which intention (efficiency or expropriation) that dominates.

Based on our empirical tests, we find the following major set of results. First, we find that the responsibility of the board negatively affects the probability of RPTE: the more effective and accountable the board in performing its duties, the less likely is the probability of RPT that a priori expropriate to occur. We also find that equitable treatment of shareholders negatively affects the probability of RPTE: the more equitable a firm in handling its shareholders, the less likely is the probability of RPT that a priori expropriate to occur. Second, this study also finds that proportion of majority ownership negatively affects the probability of RPT that a priori expropriate occur. This finding means that higher proportion of majority ownership results in a less likelihood of a firm to conduct RPT that a priori expropriate. Third, we find that leverage does not affect the probability of RPTE, so it can be concluded that external monitoring in Indonesia from creditors are not yet effective in reducing the probability of RPT that a priori expropriate wealth of minority shareholders.

The remainder of the paper proceeds as follows: Section 2 describes about the nature and type of RPT. In section 3 we summarize reporting requirement and regulation for RPT in Indonesia. The research design of this study is described in section 4 while the analysis and result are presented in section 5. Finally, section 7 provides conclusion.

2. The Nature and Type of Related Party Transaction (RPT)

RPT is a transaction that could be a priori to expropriate and could benefiting the minority shareholders. The study by Gordon, Henry, and Palia (2003) state two hypotheses about the nature of RPT. The first hypothesis is the conflict of interest hypothesis, stating that RPT is transaction that a priori to expropriate the minority

shareholders. Generally this RPT occurs on a firm that have a weak corporate governance machanism, and this firm usually have lower adjusted stock return. The opinion that RPT represents a conflict of interest is consistent with agency issues similar to those considered by Berle and Means (1932) and Jensen and Meckling (1976) about agency problem between manager and shareholders, and between majority and minority shareholders. The second hypothesis is efficient transaction hypothesis, which states that RPT efficiently could fulfill economic needs of a company (decreasing transaction cost). For example, giving compensation and fringe benefits for directors, because the directors have skill that useful for a firm.

Moreover, Ryngaert and Thomas (2007) state that though RPT can be abused to expropriate wealth, it also has some benefits, such as a contract with related party could provide rapid activity coordination and feedback and could overcome financial distress that a firm might have (e.g. by providing loan with a lower rate).

Consistent with argument that RPT could expropriate and benefiting the minority shareholders, Cheung, Rau and Stouraitis (2006) investigate the relationship between RPT and excess return during corporate action announcements and classify RPT into three categories. First, transactions that are a priori likely to result in expropriation of a listed firm's minority shareholders. These involve acquisitions of assets by the listed company from connected parties, asset sales by the listed firm to connected parties, sales of equity stakes in the listed company to connected parties, trading relationships between the listed firm and connected parties, and direct cash payments or loan guarantees from the listed firm to a connected party. Second, transactions likely to benefit the listed firm's minority shareholders, such as cash receipts by the listed company and transactions between the listed firm and its subsidiaries. Third, transactions that could have strategic rationales and perhaps are

not expropriation, such as takeover offers in which the connected party is another publicly listed or foreign company and formation of joint ventures, acquisitions of joint venture stakes from the remaining partners, and sales of joint venture stakes to the remaining partners. In the latter two cases, the connected party is the joint venture partner in its capacity as subsidiary shareholder. Their study finds that excess return in connected transactions are negative, consistent with the conflict of interest hypothesis.

3. Regulation and Disclosure Requirement for RPT in Indonesia

The following provides brief description regarding regulation on RPT in Indonesia, concluded from Utama (2008). The new Corporation Law (Undang Undang No. 40 2007) states that the Supervisory Board (SB) and the Board of Directors (BOD) shall perform their duties for the best interest of the company. Further, it also requires that the decision regarding RPT is made by parties that are involved with the transaction. There is no such requirement in the former corporation law. In addition, the Capital Market Law, which is further detailed in Badan Pengawas Pasar Modal - Lembaga Keuangan or Bapepam-LK Rule[242], requires certain transactions containing conflict of interest have to be approved by independent or minority shareholders. According to the Corporation Law, shareholders with cumulative 10% voting rights may ask for General Shareholders Meeting to express their concerns or to ask certain information/ questions. Shareholders may also file lawsuit against a company, BOD, or SB if they suffer loss as a result of negligence/misconduct by the company/BOD/BOC. Based on the existing laws and rules, especially after the enactment of the new corporation law, in general rules and regulation concerning RPT in Indonesia are relatively adequate.

---

[242] Bapepam-LK is the Indonesian Capital Market and Financial Institutions Supervisory Body.

Enforcing and implementing the laws and the rules are quite a challenge. The Corporation Law is just issued in August 2007, thus the enforcement and implementation of the Law remain to be seen. Further, with regard to Bapepam-LK's requirement of independent shareholders' approval for certain RPT, in practice only few RPTs (about 10 transactions per year during 2001 – 2007) obtain approval from minority shareholders. Thus, before 2007, the majority of RPT were unchecked by parties independent to the transaction, except if a firm voluntarily establishes such policy. Even though shareholders may file a lawsuit against a company/BOD/BOC, in practice it is difficult to do, possibly due to requirement of having at least 10% voting shares and/or due to the lengthy and inefficient judicial process.

The following explains the disclosure requirement regarding PRT for public companies in Indonesia. Public companies have to disclose their RPTs in the financial statements semi-annually in accordance with the Indonesian Accounting Standard and Bapepam Rule VIII.G.7. The Bapepam disclosure requirement is quite detail, e.g., disclosing the amount of assets, liabilities, sales, and expenses arising from RPT, disclosing the parties involved in RPT and their relationship with a firm for transactions above USD 100,000, and disclosing that the price and term of transactions are in accordance with arms' length transactions. Conflict of interest transactions requiring approval of independent shareholders also have to be disclosed in detail to the public while other conflict of interest transactions have to be reported to Bapepam-LK. Information that should be disclosed are:

- Explanation about the transaction: transaction value, related parties, and the nature of the conflict of interest.
- Report from independent party about the transaction.

- Confirmation about the transaction relative to the same transaction which does not contain conflict of interest.

- Statement from SB and BOD that all material information is being disclosed truthfully.

- Report from an expert or independent consultant, if it is required by Bapepam LK.

In addition to PSAK and Bapepam-LK rules about RPT, public firms are also required to disclose material information about events that could affect stock price or investors decision, not more than two days after the events appear (Bapepam LK X. K. 1 rules). The events include RPT and others like merger/acquisition, stock split/dividend, significant new product/innovations, significant changes on management, etc. Bapepam IX. E. 2 rule about material transactions requires that if a firm plans to conduct material transaction, then it has to be announced to public, not more than 28 days before shareholders meeting that will approve or refute that plan.

From the above explanation, our study concludes that before the enactment of the new corporation law in 2007, regulations regarding control mechanism to prevent abusive RPT are relatively weak since approval process other than from independent shareholders is not regulated. The disclosure requirement in financial statements, however, is relatively adequate since firms have to provide detail information regarding RPT. Disclosure requirement regarding material transactions (including RPT) is also adequate since companies have to publish detail information regarding the transaction.

4. Hypothesis and Research Design

4.1 Hypothesis

In this study we employ a logistic regression to investigate the effect of CG practice, proportion of majority ownership, and financial leverage on the probability of RPT that a priori to expropriate occur. The dependent variable of this study is a dummy variable of RPT that taking a value of one if the RPT is a priori to expropriate, and else zero.

The monitoring mechanism that we employ to investigate their impact on the probability of RPTE is CG components (as internal monitoring mechanism) and financial leverage (as external monitoring mechanism). We utilize the following CG components: rights of shareholders and key ownership functions, equitable treatment of shareholders, disclosure and transparency, and the responsibilities of the board and examine whether these components could reduce the probability of RPTE. Gordon (2003) investigates the relationship between RPT and CG mechanism (like board characteristics, CEO par performance sensitivity, and external monitoring) and finds that weaker CG mechanism being associated with more dollar amount RPT. Moreover, a study by Kohlbeck and Mayhew (2004) find that board of director's independency (i.e., strong CG) is associated with lower amount of RPT, and if RPT occurs, this transaction tends to be transparently publicized. Consistent with their views and findings, we hypothesize that better practice of CG associates with lower occurrence of RPTE.

We apply the same logic of the influence of CG practice to financial leverage, i.e., if external monitoring is high, then the probability of RPT that a priori to expropriate will be low. Gordon et al. (2003) make use of financial leverage as a proxy for external monitoring, i.e., higher financial leverage positively associates with more intensive external monitoring. An external institution (e.g., a bank) that provides loan to a

company will monitor activities of the firm, and it will refute something (such as abusive RPT) that could decrease the firm's value. Consistent with the expectation, their study finds that higher leverage associates with lower occurrence of RPT. Kohlbeck and Mayhew (2004) also use financial leverage as a proxy for external monitoring of a firm, applying the same argument as Gordon (2003). However, they find no relationship between leverage and the probability of RPT that a priori to expropriate occur. Based on Gordon et al (2003) argument, we hypothesize that higher financial leverage reduces the likelihood of RPTE.

Capulong et al. (2000) state that there are two possible impact of concentrated ownership. First, the majority shareholder could play monitoring role against management, or it could be that the majority shareholder use his or her ownership to conduct RPT. Thus, if the ownership on the firm is concentrated, then it would be easier for firm to conduct RPT, including abusive RPT. However, higher proportion of majority of ownership may also trigger more oversight from the regulator that is aware of higher likelihood of conducting RPT for firms with more concentrated ownership. In addition, higher ownership implies that majority shareholders' share of loss due to expropriation is also higher, making it less likely for them to conduct abusive RPT. Further, because RPT has two conflicting impact (it could be employed to expropriate or to provide benefit), then we make no prediction with regard to the effect of proportion of majority shareholders' ownership on the probability of RPT that a priori to expropriate.

4.2 Empirical Model

The following two models are employed to test the hypothesis:

Dummy $RPT_{mt} = \gamma_0 + \gamma_1 RiS + \gamma_2 EtS + \gamma_3 DT + \gamma_4 ResB + \gamma_5 PROP + \gamma_6 LEV + \gamma_7 SIZE$

Dummy RPTmt = $\delta_0 + \delta_1 TotCG + \delta_5 PROP + \delta_3 LEV + \delta_4 SIZE$

Where:

Dummy RPT$_{mt}$ = value 1 if RPT is a priori to expropriate, else zero,

RiS   = Rights of shareholders,

EtS   = Equitable treatment of shareholders,

DT   = Disclosure and transparency,

ResB   = Responsibility of the board,

PROP   = Majority shareholders ownership,

LEV   = Financial leverage,

SIZE   = Market capitalization,

TotCG   = total CG scores.

In the second model, we employ Total CG which comprises of the four principles of CG. Size is utilized as a control variable.

4.3. Sample Selection and Data Collection

Announcements on corporate action are used to collect RPT sample based on the seven types of corporate announcements: General Meeting of Shareholders (GMS), Results of GMS, Merger and Acquisition, Issuance of Shares, Advertisement of Summary of Prospectus, Material Transactions, Takeover Offer. These announcements usually state that the parties with whom firms conducting transaction are their subsidiaries, shareholders, affiliated firms, parties who have conflict of interest, and management. If on the announcement there is no information about the relationship, then we explore this relationship in the firm's notes to financial statements. Our initial samples of RPT are 216 samples. Because the same transaction could be announced in a different corporate action, then we treat

them as one unit sample. We also eliminate sample based on data availability. Our final samples of RPT are 163 samples.

This RPT sample is classified based on three classification categories of Cheung et al (2006). However, in this study, we put the third category into the second category, which is RPT that could benefit the minority shareholders. Table 1 provides a description of the sample composition. Sample of RPT that a priori to expropriate minority shareholder is 102 unit sample and sample of RPT that could benefit the minority shareholders is 61 unit sample. The majority RPTs are with subsidiaries which in most cases are not subject to independent shareholders' approval.

Total	**163**

5.2. Variable Measurement and Data Collection

Components corporate governance score, including rights of shareholders and key ownership functions, the equitable treatment of shareholders, disclosure and transparency, and the responsibilities of the board, are collected from Indonesian Institute for Corporate Directorship (IICD) that provides scores for CG components and total CG. The scores are based on an instrument of 117 items on which the rating for each item (poor, fair, and good) is based on public information disclosed by a firm (e.g., Annual Report, Financial Statements, Website, Corporate announcements, etc). Total CG score is obtained by adding all components' scores adjusted with their weight. The weight for each CG component: Rights of Shareholders (RIS) 20%, Equitable Treatment of Shareholders (ETS) 15%, Disclosure and Transparency (DT) 25%, and Responsibility of Board (RESB) 25% of total CG scores. We employ year 2005 scores as scores for year 2006 and 2007 due to availability of data.

We collect data for majority ownership proportion which is the largest ownership of the firm from information on notes of financial statement about ownership structure. Due to data availability, we do not calculate Cash-Flow Right and Control Right of the controlling shareholder. We calculate leverage using formula total debt divided by total debt plus total equity. Because we use leverage as a proxy of external monitoring, then the liabilities included on the leverage calculation are loans from banks, financial institutions, and other institutions that could monitor the firm. We exclude liabilities from related parties. Liabilities and equity data are collected from Balance Sheet. Size is measured by log of market capitalization (number of outstanding shares multiplied by security price) at the end of year. Data for security

1408

price and outstanding shares are collected from Bursa Efek Indonesia (BEI) or the Indonesian Stock Exchange.

5. Empirical Result and Analysis

5.1 Statistical Analysis

Table 2 provides statistics descriptive of variables employed by the study. Mean scores for RIS and RESB are 51.74% and 54.46%, suggesting that on average, in Indonesia protection of rights of shareholders is not yet adequate while the board is not yet effective in performing its responsibilities and accountability. Similarly, the average score of 68.1% for DT implies that there are rooms for improving the disclosure and transparency in Indonesia. Surprisingly, ETS appears to be well performed since the mean score of this component is 83.07%. However, examining the items under this component reveals that disclosures of some items are mandatory by Bapepam-LK and thus the scores for most firms are good. Further, only very few firms are sanctioned by Bapepam-LK in connection with violating rules related to ETS. On average, majority shareholders' ownership of the firms in Indonesia is 49.42%, meaning that ownership structure of listed firms is quite concentrated. The average financial leverage in Indonesia is quite high, with mean value of 41.33%.

Table 3 provides the pearson correlation analysis among variables. As expected, correlations among CG components are all significantly positive. Firm size also is positively correlated with all CG components except Rights of Shareholders. Thus, larger firms tend to be governed better than small firms. ETS and REB have negative relationship with dummy RPT, supporting the hypothesis, although only ETS that is statistically significant. Other CG components (RIS and DT) have positive relationships with the probability of RPT that a priori to expropriate occur but they are significant. Relationship between majority ownership and dummy RPT is negative and significant on level 5% while Leverage has a positive relationship with dummy RPT but not significant.

5.2 Regression Result

In the first model, we use CG components as proxies of internal monitoring, and the results can be seen in Table 5.

Table 5
Regression of Determinants Affecting Probability of RPTE

Dependent Variable: Dummy RPTmt					
Method: ML – Binary Logit (Quadratic hill climbing)					
Sample: 1 – 163					
Variable	Coefficient	Std. Error	z - Statistic	Prob.	VIF
RIS	0.231129	1.010041	0.228831	0.4095	1.618445
ETS	-3.535646	3.039755	-1.163135	0.1224	1.608769
DT	2.975157	2.287771	1.300461	0.0967	1.966186
RESB	-2.388398	1.769147	-1.350028	0.0885	1.730433
PROP	-1.122747	0.770095	-1.457933	0.1449	1.044129
LEV	1.200784	1.269641	0.945767	0.1722	1.041111
SIZE	-0.084824	0.090161	-0.940806	0.3468	1.521063
C	5.013984	2.912212	1.721710	0.0851	
McFadden R-squared	0.062918				
LR Statistic	13.56144				
Prob (LR statistic)	0.059555				

We find that RESB is significantly negative affecting the probability of RPTE at 90% confidence level. This finding confirms the hypothesis that the more responsible and accountable the board is then the lower is the probability occurrence of RPT that a priori to expropriate. Thus, responsible and accountable board will control and manage potential conflict of interest between a firm and management, directors or controlling shareholders. As expected, the coefficient for Equitable Treatment of Shareholders (ETS) is negative, but it is only marginally significant at 85% confidence level. Protection of shareholders rights (RIS) does not affect the probability of RPTE. The possible reason

for this insignificant result is that this principle concerns with shareholders rights in general, including controlling shareholders right, while monitoring of RPT primarily is to protect the rights of non-controlling shareholders. Contrary to the expectation, Disclosure and Transparency (DT) is significantly positive affecting the probability of RPT that a priori to expropriate occur, meaning that the more firms disclose their activities then the higher probability that the firm will engage the RPT that a priori to expropriate. The reason for this opposite finding might be that if RPT is a priori to expropriate, then the firm will be required to disclose more detailed about the RPT that they're engage. As shown in Table 1, RPTs that involve cash received, subsidiaries relation, and joint venture are those a priori to benefit a company, while these types of transactions that require less disclosure requirement.

Proportion of Majority Ownership (PROP) marginally has a negative influence on the probability of RPTE. The result implies that firms with higher ownership of controlling shareholders tend to engage in more beneficial RPT. On the other hand, Financial Leverage (LEV) does not significantly affect the probability of RPTE. Thus, in Indonesia, monitoring role from external parties is not yet effective in reducing the probability of RPT a priori to expropriate to occur.

In the second model we use Total CG as the proxy for internal monitoring and the results are shown in Table 6.

Table 6
Regression Total CG

Dependent Variable: Dummy RPTmt				
Method: ML – Binary Logit (Quadratic hill climbing)				
Sample: 1 – 163				
Variable	Coefficient	Std. Error	z – Statistic	Prob.
TOTAL CG	-2.021187	3.463304	-0.583601	0.27975
PROP	-1.482867	0.749420	-1.978685	0.0479
LEV	1.068480	1.209749	0.883224	0.18855
SIZE	-0.049142	0.087342	-0.562637	0.5737
C	3.253544	2.128624	1.528473	0.1264
McFadden R-squared	0.031200			
LR Statistic	6.724789			
Prob (LR statistic)	0.151167			

The second regression shows that TOTAL CG has no relation with the probability of RPTE. This finding confirms our expectation that to examine the influence of CG practice to the probability of RPTE, we must employ more specific components of CG practice. The finding for Proportion of Majority Ownership (PROP) is consistent with the previous regression, i.e., this variable is significantly negative affecting the probability of RPTE. Thus, more concentrated ownership does not necessarily mean that the majority shareholder will engage in RPT that a priori to expropriate the minority shareholders. The results for Financial Leverage and Size are not significant, consistent with the first regression.

The correlation analysis in Table 3 shows that the CG components are correlated to each other. To investigate the impact of each component without taking into account other components, next we regress these variables independently. The result were shown on table 7 below.

Table 7. Regression Results with CG Components Run Separately

Variable	Dummy RPT$_{mt}$			
RIS	0.239203 (0.3678)			
ETS		-4.706522 (0.0345)		
DT			1.503110 (0.2203)	
RESB				-1.083681 (0.2269)
PROP	-1.332771 (0.0389)	-1.311229 (0.0416)	-1.392671 (0.03185)	-1.441447 (0.0268)
LEV	1.323385 (0.1456)	1.212428 (0.1632)	1.035162 (0.1966)	1.010196 (0.2023)
SIZE	-0.088542 (0.2274)	-0.048019 (0.5162)	-0.120315 (0.1936)	-0.052585 (0.5087)
C	2.916726 (0.1676)	5.928005 (0.0267)	3.073507 (0.1494)	2.862002 (0.1663)
McFadden R-squared	0.043647	0.047158	0.032426	0.032223
LR Statistic	9.407810	10.16452	6.989102	6.945399
Prob (LR statistic)	0.051676	0.037746	0.136465	0.138802

When regressed separately, the findings are that CG components i.e., RIS, DT, and RESB are not significantly affecting the probability of RPTE. However, ETS is significantly and negatively affecting the probability of RPTE. This result supports the hypothesis that more equitable treatment of shareholders reduces the probability of wealth expropriation through RPT.

6. Conclusion

RPT can be employed to benefit a firm or to expropriate wealth of minority shareholders. We investigate determinants that could affect the type of RPT. The determinants are

internal and external monitoring mechanism as well as ownership by majority shareholders.

We find that a. a responsible and accountable board and b. more equitable treatment of shareholders could reduce the probability of RPT a priori being used to expropriate wealth of minority shareholders. Protection of shareholders rights does not have any influence on the type of RPT conducted while contrary to expectation, higher disclosure level associates with more RPT that a priori is to expropriate. The reason for this finding might be that if RPT is a priori to expropriate, then firms are required to provide more disclosure about the RPT that they're engage. Further, we document that CG practice as a whole does not affect the probability of RPT a priori being employed to expropriate. This finding implies that to examine the influence of CG practice to the probability of an a priori abusive RPT, researcher must employ more specific components of CG practice.

For external monitoring role for RPT we find that Financial Leverage does not significantly affect the probability of the occurrence of RPT a priori to expropriate. Therefore, in Indonesia, monitoring role from external parties is not yet effective in reducing the probability of RPT a priori to expropriate to occur. Finally we find that proportion of majority ownership reduces the possibility of an a priori abusive RPT. The result implies that firms with higher ownership of controlling shareholders tend to engage in more beneficial RPT. Their higher stakes at the company may reduce their incentive to engage in activities (such as RPT) that cause loss to the company.

THE INFLUENCE OF BOARD AND OWNERSHIP STRUCTURE ON PAY PERFORMANCE BASED AND NON-PAY PERFORMANCE BASED COMPANIES IN MALAYSIA

Basariah Salim and Wan Nordin Wan Hussin*

Abstract: We examine the influence of board and ownership structure on pay performance based and non-pay performance based of 158 companies listed on Bursa Malaysia for years 2003 to 2005. The results reveal that there is a significant difference of mean between companies which assert that their pay is linked to performance or otherwise. Among the variables are institutional shareholder, board score, and remuneration score, return on asset, return on performance, total asset and total debt. Furthermore, this study finds that adoption of pay-for performance as recommended by the Code is influence by ownership structure in particular the percentage of managerial ownership, local institutional ownership and foreign ownership. On the aspect board characteristics, remuneration score seems to show a strong influence on the adoption while board score is insignificant.

Introduction

Executive remuneration has become one of the most significant issues in contemporary corporate governance (Hill, 2006)[243]. Central to the debate is whether an exorbitant pay to executive directors is justified given the economic performance of the company involved. Some shareholders are of the opinion that executive directors are

---

[243] This issue has been long criticized and one of the topics that caught the attention of business magazines and alike in-developed countries especially US (Jensen and Murphy, 2004). Besides, Dalton and Dalton (2005) note that up to this date, this is one of the favorite topics being studied in corporate governance discipline. Murphy (1999) claimed that CEO remuneration research has grown even faster than CEO paychecks, skyrocketing from one to two papers per year prior to 1985 to 60 papers in 1995. In addition, Barkema and Gomez-Mejia (1998) and Gomez-Mejia and Wiseman (1997) assert that this issue has been studied 70 years ago and is still debated till today due to the mixed result of the relationship. They claim that a total of more than 300 studies on remuneration have been accumulated during the years.

*Email of correspondence author: Basa1189@uum.edu.my

overpaid compared to their contributions to the companies and excessive remuneration ultimately comes out of the shareholders' pocket. The perception that directors are excessively paid is also shared by the Malaysian public particularly the shareholders. Latest news and cases highlighted in Malaysian business magazines continues to attract attention on the issue of excessive pay[244].

The absence of strong link between pay and performance as evidenced by previous studies (i.e. Jensen and Murphy, 1990) indicated that the incentive mechanism (i.e. remuneration) on its own does not effective in aligning the interest of shareholders and executives. It is difficult to deny the importance of incentive mechanism in motivating and retaining talented executives or terminating bad executives. Thus, in ensuring that incentive mechanism really works as what is expected by shareholders, agency theorists suggested on integration of incentive mechanism and other governance mechanisms such as board of director and ownership structure. However, to what extent can the shareholders rely on the board particularly the remuneration committee to act on their behalf? The situation is worst when the executives who are family members sit on the remuneration committee.

Recent developments in corporate governance particularly executive remuneration have heightened the need to study this issue comprehensively and

---

[244] Transmile Group, the air cargo carrier, attracted attention in the early part of 2007 when its external auditor Deloitte & Touche blew the whistle after discovering irregularities in prior years' audited financial statements, involving unsubstantiated sales of more than RM600 million from 2004 to 2006. Subsequently, Transmile Group restated its financial statements from a profit of RM158 million to a loss of RM126 million for the year ended December 2006. In July and November 2007, its former CEO, CFO and two non-executive directors were charged in court with abetting the company in providing misleading financial statements. At the AGM held in September 2007, more than two third of the shareholders voted against the payment of director fees for 2006 totalling RM145, 000. The non-executive Chairman of Transmile Group, who is an ex-Transport Minister, resigned shortly before the said AGM. He joined the board of Transmile Group in 2004 when the Kuok Group emerged as a new controlling shareholder.

systematically. Furthermore, Denis and McConnell (2003) claim that for many countries in the world there is only limited empirical evidence regarding issues related to the effectiveness of boards of directors and of the compensation plans, they put in place; for some there is no evidence at all. These are useful avenue for further research. In addition, boards of directors and executive remuneration cannot be viewed in isolation. The interrelationship between board composition, executive compensation, and other corporate governance mechanisms remains a fruitful area for research worldwide.

In this context, Malaysia provides a unique setting in exploring the issues of executive remuneration and corporate governance. Following the introduction of the voluntary Malaysian Code on Corporate Governance (thereafter is referred as the Code) in 2000, companies listed on Bursa Malaysia are required to make public the Statement of Corporate Governance incorporating disclosure on directors' remuneration. The Code emphasizes the following principles on directors' remuneration. First, in the case of executive directors, remuneration should be structured so as to link rewards to corporate and individual performance. Second, companies should establish a formal and transparent procedure for developing policy on executive remuneration and for fixing the remuneration packages of individual directors. And third, company's annual report should contain details of the remuneration of each director. Under best practices in corporate governance, the Code recommends companies to establish a remuneration committee consisting of wholly or mainly of non-executive directors. The committee will monitor, supervise and advice the

board's decision regarding executive remuneration. The committee is allowed to get an advice from consultant relating to executive directors' remuneration and recommend to the board an appropriate remuneration for the executive directors. Hence, specifically, this study attempts to examine the influence of board and ownership structure on companies which assert that their pay is based on performance as compared to companies which are non-pay performance based.

Incentive pay

Incentive pay or pay-for-performance has long been used in aligning the interest of shareholder and manager. The pay-for-performance model is based on agency theory which works on the basis of how to structure the contractual relation (including remuneration incentives) between the principal and agent to provide appropriate incentives for the agent to make choices which will maximize the principal's welfare, given that uncertainty and imperfect monitoring exist (Jensen and Meckling, 1976). In this relationship, shareholder expects the executive to put their greatest effort to maximize firm value, which in turn increases the shareholder's wealth. In doing so, the executive in return also expects rewards, which is worth their effort. Thus, based on that argument, agency theory posits that aligning remuneration and performance is the optimum solution in satisfying the interest of the principal and agent. Further to the point, number of researchers (e.g., Gibbon and Murphy, 1990; Jensen and Murphy, 1990a and Gregg et al., 1993) suggest that reward for the agent is dependent on a variable that the principal is interested in, such as shareholders' returns. The shareholders' returns depend largely on the performance of the company under the

agent or executive's management. The above explanation provides rationale for linking the executive remuneration and company performance.

Board Structure

The important of good corporate governance in monitoring the optimal contract between shareholder and manager has long being raised by Jensen and Meckling (1976). They argue that wages by itself does not necessarily promote decision-making that enhances value for shareholders. They further argue that agency cost could be minimized by means of a variety of governance structures, which reduce the scope for managerial discretion. Among the elements of structure are incentive, board of director and ownership collectively known as internal mechanism. Company is considered as a better govern company if the company has a large shareholders, split role of chairman and CEO, low CEO tenure, small board sizes, and boards composed with majority of outside directors Jensen (1993), Core et al. (1999) and Bertrand and Mullainathan (2001). Here, particularly the board of director functions as an information system those stockholders within large corporations could use to monitor the opportunism of top executives. Information systems inform the principal about what the agent is actually doing that they are likely to restrain agent opportunism as the agent becomes conscious that he or she cannot mislead the principal.

In relation to above suggestions, Fama and Jensen (1983a) propose that decision management (initiation of decisions and implementation of ratified

decisions) and decision control (ratification and monitoring of decisions) should be separated and diffused across agents. They suggest three devices for separating decision management and decision control. In brief, the devices are decision hierarchies, functions of board of directors and incentive structures that encourages mutual monitoring among decision agents. They also suggest that within the context of agency theory, employment contracts are important means by which the principal and/or their representatives, non-executive directors can control the activities of the agents.

However, there are arguments that perceived board as does not acting at arm's length in selecting the compensation arrangement that maximizes shareholder value (Bebchuk et al. 2002 & 2004). The managerial power proponents argue that managers influence the appointment of independent directors, which in many cases enables them to block the appointment of directors who are likely to try to bargain with the managers at arm's length. Second, once appointed, independent directors are influence by board dynamics that make it difficult for them to deal with managers in a truly arm's length way, especially if other directors have no interest in confronting the managers over their pay. Finally, even if directors were otherwise inclined to challenge managers on the issue of executive compensation, they would likely have neither the financial incentive nor sufficient information to do so.

The functions of board as what being raised and recommended by Jensen and Meckling (1976) and Fama and Jensen (1983a) has been formalized in 1992 with

the introduction of Cadbury Report in UK (Mallin, 2004). Many countries including Malaysia follow suits the implementation of the report recommendations. The Code clearly highlights on the important of having an effective and efficient board in monitoring the activities of managers in running the company. The Code focuses on board responsibilities, composition and structure in enhancing the board effectiveness and efficiency. In addition to that, the Code specifically emphasizes on director remuneration and the establishment of remuneration committee in handling matters related to director remuneration. Jensen and Murphy (2004) propose a number of recommendations particularly on the roles and functions of remuneration committee in pay-setting process. Among the recommendation are remuneration committees must take full control of the remuneration process, policies and practices, the committees should employ their own professional contracting agents when hiring new top-level managers. With the issuance of the Code, board of director is expected to be more efficient and effective in monitoring the executives particularly in the issue of executive remuneration which might reflect whether the executive being rewards based on their performance as expected by the shareholder.

Ownership Structure

In addition to board effectiveness, ownership structure is also important in aligning the interest of shareholders and executives from an agency theory perspective (Jensen and Meckling, 1976; Fama and Jensen, 1983a; Jensen and

Murphy, 1990b and Hart, 1995). Agency theorists (Jensen and Meckling, 1976; Fama and Jensen, 1983a; and Jensen and Murphy, 1990b) argue that the provision of ownership rights reduces the incentive for agents' adverse selection and moral hazard since it makes their compensation dependent on their performance. They further argue that stock ownership by management in particular could reduce agency problems. As their stakes rise, managers pay a larger share of agency costs and, therefore, are less likely to expropriate wealth from other stockholders. Moreover, as the owner-executive's portion of the equity decreases, his incentive to devote significant effort to creative activities such as searching out new profitable ventures falls. He may in fact avoid such ventures simply because it requires too much trouble or effort on his part to manage or to learn about new technologies. Avoidance of these personal costs and the anxieties that go with them also represent a source of on-the-job utility to him and it can result in the value of the firm being substantially lower than it otherwise could be. Their argument is evidence by numbers of studies below.

Numbers of studies in US (Lambert et al., 1993; Core et al., 1999 and Brick et al., 2006) find that CEO compensation is lower when the CEO's ownership is higher. Similarly, study in UK by Ozkan (2007b) and Australia by Chalmers et al. (2006) also show that level of CEO pay is negatively associated to percentage of share own by the CEO. On the other aspect, Mehran (1995) on US data reveals that companies with higher percentage shares held by inside use less equity-based remuneration. However, there are studies in US show that

managers did entrench from shareholder when they hold a significant share in the company (Holderness and Sheehan, 1988; Zingales, 1995; Wan, 2004 and Stammerjohan 2004).

For the last few years, there is a growing literature that looks at the association between managerial ownership and remuneration in countries with high family ownership. Firth et al. (1999), using Hong Kong data, show that family group of companies are associated with lower compensation level. Another study on Hong Kong data by Cheng and Firth (2005) also finds that director's ownership moderate top management remuneration. Both studies suggested that this might be due to the lesser need of direct cash remuneration since the directors receive their rewards by means of dividends and capital appreciation.

Further to the discussion, Hart (1995) suggests that one way to improve corporate governance is by having a large shareholder. The large shareholder who might turn out to be the controlling shareholder is important as a mechanism in mitigating agency problem. Large or controlling shareholder could be institutions, individual/families, states or other corporations either financial or non-financial (Denis and McConnell, 2003 and Claessens et al., 1999a&b). Hart (1995) further argues that, in the case where a large shareholder owns less than 100% of the company, agency problems may be reduced, but they are not limited. First, a large shareholder will still underperform monitoring and intervention activities since he does not receive 100% of the gains. Second, a large

1426

shareholder may use his (voting) power to improve his own position at the expense of other shareholders. Finally, the large shareholder may simply become management, i.e. he may run the company himself. In addition, Alchian and Demsetz (1972) argue that controlling shareholder is important since the information asymmetry between controlling shareholders and managers may be reduced since controlling shareholders are likely to be actively engaged on the board of directors.

Numbers of studies evidence that institutional shareholder plays an importance role in a family concentrated ownership as well by dispersing ownership and control of the family in a company (Ozkan,2007b; Cheng and Firth, 2005; Khan et al., 2005; Hartzell and Starks, 2003 and Firth et al., 1999)). Their results suggest that the institutional serve a monitoring role in mitigating the agency problem between shareholders and executives. In addition, Core et al*.,* 1999 and Cordeiro and Veliyath, 2003) show a negative effect of block holders holding more than 5% of the outstanding shares with remuneration. In the case of Malaysia, this study expects that ownership structure in particular the managerial ownership might influence the pay-performance relationship. This is because significant portion of Malaysian companies as other East Asian countries are control by family (Claessens et al., 2000a&b).

Sample and data

The executive remuneration, board characteristics and ownership data are taken from the annual reports of the selected Bursa Malaysia listed companies for years 2003 to 2005. The 2003-2005 periods is chosen because the disclosures as required under the MCCG are effective for annual reports after June 2001. As at January 2006, slightly over 1,000 companies were listed on Bursa Malaysia comprising 646 on Main Board, 269 on Second Board and 110 on MESDAQ[245]. This study excludes MESDAQ, PN4[246] and PN17[247] companies. MESDAQ companies are excluded since their issued and paid-up capital is considered small compared to companies on Main and Second Boards[248]. In addition, PN4 and PN17 companies are excluded due to their adverse financial conditions.

Out of the 876 remaining companies, a further 409 companies are eliminated due to changes of financial year end, de-listing, incomplete annual

---

[245] The MESDAQ market was created in March, 2002 as a unique market with a separate identity from the Bursa Malaysia Main and Second Boards, specifically for the capital-raising needs of technology and high-growth potential companies. The minimum paid up capital is RM2 million for technology and non-technology companies, and a minimum of RM20 million for technology incubator companies.

[246] PN4 companies are companies which failed to meet the criteria set out under the Bursa Malaysia's "Practice Note No. 04/2001" as follows:

   v.   The company failed to report the deficit in its combined shareholders funds;
   vi.   Receivers or Managers have been appointed to manage the asset of the relevant company / its subsidiaries properties / associate companies;
   vii. Auditors have given a "disclaimer opinion" regarding the companies outlook in the company's latest accounts;
   viii. A special manager has been appointed as provided for under the Danaharta Nasional Berhad Management Act 1998.

[247]PN17 companies are PN4 companies which are being restructured and get into trouble again and the situation is not rectified.

[248] Issued and paid-up capital for Main Board and Second Board must have a minimum of RM60 million and RM40 million respectively.

reports for the three consecutive years 2003 to 2005, difficulties in assessing the annual reports online, and anomalous data.   The sample of 476 remaining companies is further reduced if there is unclear or no separation between executive and non-executive remuneration in the annual report. This segregation is important since this study focuses on the executive remuneration where the bulk of total directors pay goes to the executive directors[249]. Taking this into consideration, 372 companies are used as a sampling frame for this study. Due to the intensive and time consuming nature of hand collecting the executive remuneration and corporate governance data, 200 companies are chosen out of the 372 companies. Due to unavailability of data from Datastream or conflicting data between Datastream and annual reports, the final sample is reduced to 158 companies.

Finding and Discussion

Sample Characteristics

A number of 158 companies from Bursa Malaysia had been used as a sample of this study. Table 1 below shows a breakdown of 158 companies according to their board category and sector classification.   About 76% or 120 out of 158 companies are from Main Board and the remaining which is about 24% or 38 companies is from Second Board of Bursa Malaysia. The sample is dominated by Main Board companies due to

---

[249] Non-executive director remuneration which basically comes from fee is also taken during data collection process.   Our data show that on average, 90% of director remuneration is from executive directors and about 10% from non-executive directors.

their large population compared to Second Board companies[250]. Furthermore, the companies are divided into several sectors such as construction and properties, consumer product, industrial product, plantation, trading and other (finance, infrastructure, mining and technology) as classified by Bursa Malaysia (The Star, December 21, 2005). Table 1 also shows that sample of this study can be considered as well distributed within industries. Out of the total 158 companies, 46 or 29.11% of them are from the industrial product which is the largest sector for the sample. The second largest sector is construction and properties which comprises 32 representing 20.25% of the total sample of companies. This is followed by consumer product and trading sector (27 companies or 17.09% for both sectors). Further, it is followed by plantation sector which around 16 companies or 10.13%. The remaining companies are finance, infrastructure, mining and technology which are grouped under other category.

Table 1: Breakdown of companies by board category and sector

Sector	Board Category		Total Number of Companies	Percentage
	Main	Second		
Industrial Product	24	22	46	29.11
Construction/Properties	29	3	32	20.25
Consumer Product	22	5	27	17.09
Trading	23	4	27	17.09
Plantation	15	1	16	10.13
Other*	7	3	10	6.33
Total	120	38	158	100.00

*Other include finance, infrastructure, and mining and technology sectors

---

[250] As at January 2006, there are about 1,025 companies listed on the Bursa Malaysia; 646 on Main Board; 269 on Second Board and 110 on MESDAQ.

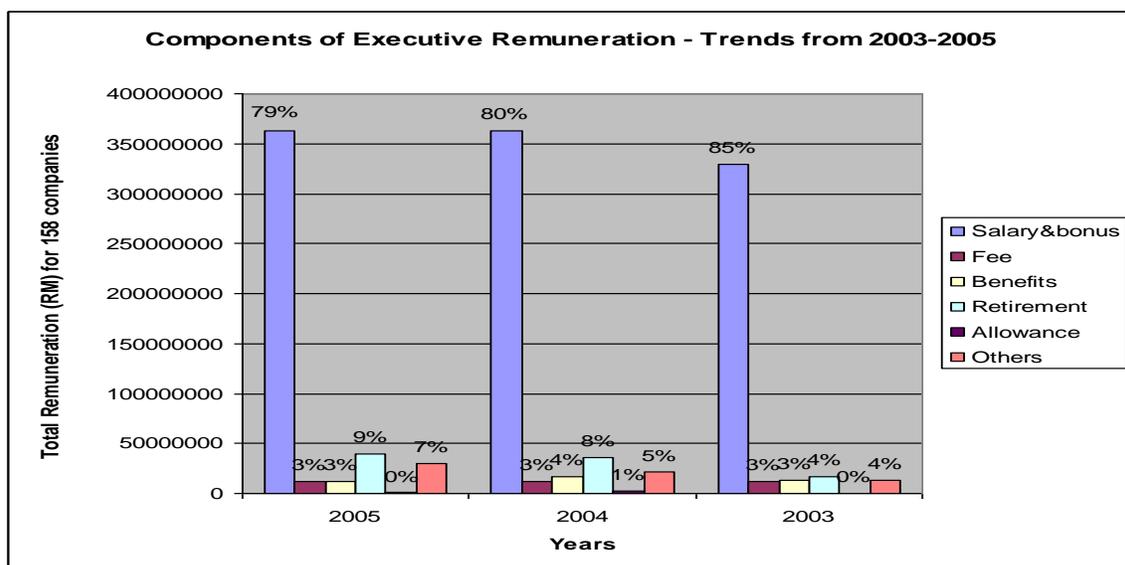
Executive Remuneration in Malaysia

This study collects total cash executive remuneration data from 158 companies of 2003 to 2005 annual reports[251]. The data provides a better understanding on the nature and trend of executive remuneration in Malaysia. Among the useful findings are the components of executive remuneration, trend of the components for the three years of study and remuneration level for the executive director. Figure 1 illustrates that component of executive remuneration in Malaysia consist of salary and bonus, fee (i.e. attendance fee for board meeting), benefit in kinds (i.e. car and medical insurance), retirement (i.e. pension, Employee Provident Fund (EPF) and define contribution plan), allowance and others (i.e. ex-gratia, retirement benefit, performance incentive and commission). These components are very much similar to the world-wide practices (Murpy, 1999 and Conyon, 2006). Figure 1 clearly indicates that salary and bonus is the main component of executive remuneration in Malaysia. In addition, the finding also depicts that there is a huge gap of pay between the components.

---

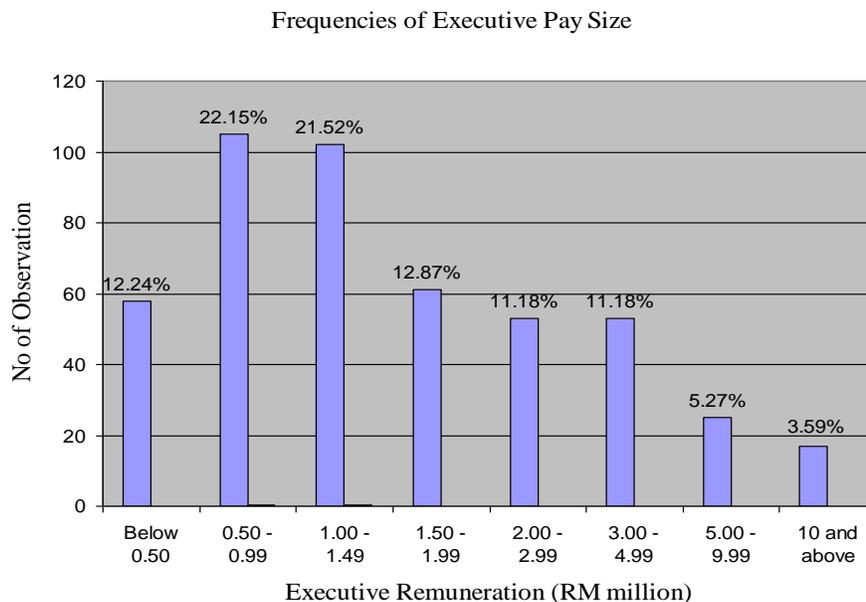
[251] Numbers of survey have been conducted concerning director remuneration in Malaysia; however, none of the survey specifically explores the nature and trend of executive remuneration in Malaysia. For example, annual survey by Malaysian Business and TheEdge focus on the highest paid director in Malaysia (including of executive and non-executive director). Whilst, survey that conducted by Uitm and MSWG (2007) focus on the level of compliance with the corporate governance principles and best practices on directors' remuneration. Meanwhile, PricewaterhouseCoopers which conducted a yearly survey focus on board remuneration & practices in relation to board effectiveness [(PricewaterhouseCoopers (2005, 2001)]. Hence, as far as this study concern, this is a first study that comprehensively compiles remuneration data primarily on executive director. At the beginning, this study tries to focus on CEO pay only as what being studied in other countries such as US, UK and Hong Kong. However, this study discovers that only few companies disclosed an individual director remuneration including the executive director. Based on data gathered, this study reports that only 14% out of 474 firm years or about 7 companies disclosed individual director remuneration (Table 2). This finding is consistent with Standard and Poor (2005) survey. They report that only 15% out of 100 companies disclosed the exact remuneration received by each executive and non-executive director. Therefore, concerning the constraint of data unavailability on CEO pay, this study focuses on executive remuneration.

Figure 1 below shows the trends in each of the components of executive remuneration from 2003 to 2005. It is quite clear that salary and bonus component had been slowly decreased from 2003 to 2005 although in a small percentage. The salary and bonus component percentages of 2003, 2004 and 2005 are 85%, 80% and 79% respectively. Furthermore, the figure also shows that the retirement and others components are increased from 2003 to 2005 although relatively in a small percentage. On the other hand, fee and benefits appear to be static over the periods. This finding seems to suggest that Malaysia companies are trying to shift from rewarding their executive based on fixed salary to other alternative. Apparently, this finding also implies that retirement and others components is increasing from year to year for although in a small momentum.

Figure 1: Components of Executive Remuneration – Trends from 2003 to 2005


Besides components and trends, this study also explores the level of executive remuneration in Malaysia. Figure 2 illustrates the frequencies of executive pay size for the sample. The figure explicates that majority of Malaysian executive director being compensated in the range of RM50,000.00 to RM1,500,000.00 (43.67%). Furthermore, 12.87% receives between RM1,500,000.00 to below RM2,000,000.00. About 22.36% receives in the range of RM2,000,000.00 to below RM5,000,000.00. Moreover, the figure also shows that only about 8.86% being compensated over than RM5,000,000.00. However, the figure also reveals that 12.24% obtains below than RM50,000.00. In addition, this study discovers that a lot of companies disclosed information on director remuneration in corporate governance statement at company level whilst information disclosed in notes to account in the financial statements is at group level.

Figure 2: Frequencies of Executive Pay Size

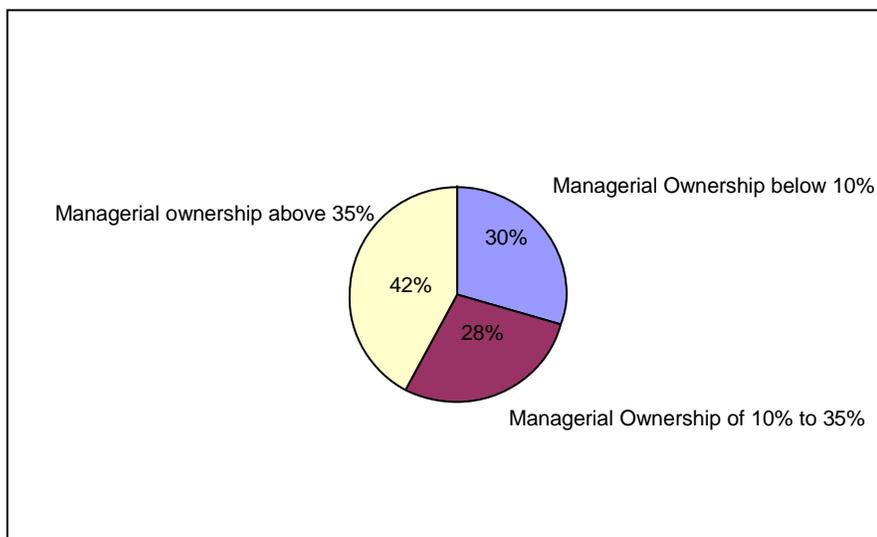
Frequencies of Executive Pay Size


Based on the executive remuneration information above, this study can confidently claim that executive director is being remunerated based on fixed salary rather than performance based (i.e. bonus). This can be evidenced by referring to Figure 1 which depicted that salary and bonus as the most important component of remuneration for executive director[252]. In addition, the gap of pay between salary and bonus component with other components is huge. Besides, this study also reveals that on average Malaysian executive director has being paid in the range of RM50,000.00 to RM1,500,000.00 per year. Moreover, only about 10% firm-years companies receive more than RM5,000,000.00.

Ownership Structure

474 firm- years have been classified according to the largest ownership group (10% cut-off point). Figure 3 depicts that 65% of 474 firm- years belong to managerial ownership which representing the largest shareholder in this study. Furthermore, the figure shows that 14% of the 474 firm- years, which is the second largest shareholder is belong to local institutional shareholders. It is then followed by foreign investors which are around 10% of the total shares. Nevertheless, non-executive directors also have significant amount of shares which is around 9% from the total shares. In addition, Figure 4 shows that about 30% of the firm-years have managerial ownership less than 10%, whereas about

---

[252] With regard to share option (figure is not disclosed), this study reports that out of 474 firm-years, 45% or 217 granted share option to their executive director while 55% or 257 do not grant an option to their executives. This finding support a survey by PricewaterhouseCoopers survey (2005) that 40% out of 105 companies granted share option to their executive directors.


28% of the firm-years have managerial ownership between 10% to 35%. Slightly more than 40% of our firm-years have managerial ownership above 35%.

Based on evidence shown in Figures 3, this study concludes that large number of Malaysian companies is owned by the executive directors and their family members. Even so, non-executive directors, local institutions and foreign investors are also the significant shareholders in some Malaysian companies as well. Findings of this study are consistent with other studies in Malaysia on ownership structures. For example, Abdul Samad (2002) finds the means for the largest shareholder and the five largest shareholders to be about 30% and 60% respectively. His finding is support by Haniffa and Hudaib (2006), where they report the mean shareholdings of the single largest shareholder and the five largest shareholders are 31% and 62% respectively.

Total		474	100

Figure 4:   Breakdown of Sample by Level of Managerial Ownership

Board and Remuneration Matters

Table 2 shows a descriptive statistic for thirty seven attributes of board and remuneration for a three years period of 2003 to 2005. Part A consist of 22

attributes show the mean, maximum, minimum and standard deviation for board matters. It is followed by Part B with another 15 attributes of remuneration matters. Board matters concentrate on composition, structure, function/activity and training of board member.   Part A of Table 2 shows that on average companies have eight members on their board for the observation years of 2003 to 2005. The maximum number is 15 persons while the minimum number is 4 persons. This finding is consistent with a survey by Standard and Poor (2005) and Haniffa and Hudaib (2006) for companies in Malaysia. Standard and Poor (2005) reports of 9 members whilst Haniffa and Hudaib (2006) reports of 8 members. In addition, this finding is in line with a suggestion by Lipton and Lorch (1992), where to be an effective board; the board size should be between 8 and 9 members. With regard to directors' independency, the descriptive statistic of Part A shows that about 60% of companies had more than one-third of independent director on board.   This statistic imply that more than half of Malaysian companies have successfully follow the recommendation of The Code by having more than one-third of independent director on board. In addition the statistic results show that about 12% of companies had independent directors more than one-half of the board members and only about 5% companies had independent directors more than two-third of the board members.   However, although not tabulated in Table 2, this study also figures out that about 11% (54 observations) had less than one-third of independent directors on board.

Table 2 evidences that on average, 80% of observations do separate the role of chairman and CEO of their companies. This finding is consistent with Haniffa and Hudaib (2006) where they report around 74% for the entire period of 1996 to 2000. They also claim that there is an increasing trend on role duality. They report that role duality has increased from 17% in 1996 to 30% in 2000. This finding is quite similar to the finding of Standard and Poor (2005), where, they report that about 94% companies separate the role. Further study on this attribute reveals that

only about 67% of companies in fact separated the role of chairman and CEO of their companies. This observable fact is due to the family relationship among the board members. There are companies where the father is the chairman whilst the son or the son in law is the CEO of the company (e.g. CheeWah Berhad, YTL Corporation Berhad, MTD Capital Berhad). The Table also discloses that only 16% of observations allow the board members to have an access to company senior management. Statistic on accessing to company senior management does imply that companies still prevent board members from getting firsthand information directly from senior management.

Statistic of Table 2 shows that on average 5 board meetings had been held for a year. The maximum board meeting is 18 times (Public Bank Berhad) whilst the minimum is 1 time (Lysaght Berhad) a year. Further to that, this study also compiles data on the frequency of board meeting which being divided into four categories. The statistic shows that almost 70% of observations held meeting at least 4 times a year as recommends by The Code on best practices. In addition, 18% of the boards met more than 6 times a year, 6% for more than 8 times and 1% above 12 times. On the other hand, although not tabulated in Table 2, this study also discovers that at least 9 observations (2%) held meeting less than 4 times a year. Furthermore, the Table

1438

confirms that almost all of the companies disclose aggregate board attendance and attendance of individual director. Attendance at board meetings is one of the indicators of a director's contribution to the company although it does not show whether a director actually contributes actively to board discussions.

With regard to training, 86% of directors had attended a mandatory training program as required by The Listing. Moreover, 28% of the observations had an orientation program for new director and about 15% incorporated business and corporate governance practices in their orientation program. Overall, the statistic clarifies that the mean of board score is a bit reduced from 2003 to 2004 (6.82 to 6.70), however, notably rose from 2004 to 2005 (6.70 to 7.42).

Remuneration Matters

There are two aspects focus by remuneration matters. First, it is relating to the formation, composition, meeting and attendance and functions or duties of remuneration committee. Second, it is concerning to the remuneration elements such as using market comparison or consultant in determining remuneration, link pay to either individual or corporate performance, preventing executive director in determining their own pay, long term incentives, compliance with RM50,000.00 band, disclosure of individual pay and components of pay.

Part B of Table 2 depicts that out of 474 observations, 88% (n=420) had a remuneration committee. Based on 420 observations, 70% of the remuneration committee had majority independent member and just about 13% had all independent member. In addition to that, 61% admit that their remuneration committee is chaired by independent member.   Meanwhile, on the meeting aspect, only 38% disclose their remuneration committee's meeting and roughly 17% disclose their attendance in remuneration committee meeting in their annual report.   With regard to remuneration committee function, 80% acknowledge that their remuneration committee recommends remuneration framework to the board. However, only 23% reports that their remuneration committee reviews all aspect of the remuneration. Statistical results on formation and remuneration committee independency seem to advocate that Malaysian companies have a convincing corporate governance structure particularly on remuneration committee as recommended by The Code and international corporate governance best practices.

Further, Part B of Table 2 reveals that on average 33% of observations (n=474) had a possibility of using market comparison or consultant in determining executive remuneration.   The statistic also exhibits that 61% link executive director remuneration to individual or company performance. Additionally, 55% asserts that their executive director is prevented from determining their own remuneration.   Besides, about 45% state that their executive director remuneration including of long term incentives and on average, 82% claim that

they comply with the RM50,000.00 bands. However, the statistic also makes clear that only 14% disclose of individual director remuneration. On the other hand, 81% state that they disclose remuneration components which analyzed by salaries, bonuses, option and long term incentives. Furthermore, the statistic shows a steady increase for remuneration score from 2003 to 2005 although in small magnitude. The remuneration score means are 7.11, 7.15 and 7.23 respectively.

Performance-Based Pay and Non-Performance-Based Pay Companies

This study split the sample into two groups which are performance-based pay and non-performance based pay. The former consists of companies which claim that their executive pay is linked to performance as disclosed in their corporate governance statement. Meanwhile the latter group consists of companies which do not make such assertion or are silent on the linkage of executive pay to performance in their corporate governance statement.

Classification of Performance-Based Pay and Non-Performance-Based Pay Companies

Table 3 below shows a classification of companies which associated with performance-based pay and non-performance based pay for the 3 years of study. The table reveals that 95 (60%) out of 158 companies disclosed that their executive remuneration is linked to performance/ company contribution for the 3 consecutive years of study as shown by classification 1. However, classification 2, show that 55 (35%) companies do not disclosed whether their executive remuneration is linked to performance/ company contribution for the 3 consecutive years of study as well. Additionally, classification 3, 4, 5 and 6 show that there are cases where companies are inconsistent in disclosing information in corporate governance report whether their executive remuneration is linked to performance/ company contribution or not. Appendix 1 illustrates an example of

data extraction of the performance-based pay and non-performance based pay companies.

Table 3: Classification of Performance Based and Non-Performance Based Pay Companies

Note; 1 for Performance-Based Pay, 0 for Non-Performance-Based Pay

Descriptive Statistics of Performance Based Pay and non-Performance Based Pay Companies.

Table 4 shows that out of 474 firm-years, 297 or 63% are categorized under performance-based pay and 177 or 27% firm-years belong to non-performance-based pay. We, compare the characteristics of the two groups. Table 4 reveals that the average pay for performance and non-performance based are RM2, 290,047.00 and RM3, 405, 120.00 respectively. Meanwhile, the highest level of executive pay for performance-based pay company is RM18, 940, 000. On the other hand, the highest level of executive pay for non-performance-based pay company is about RM78, 788, 000. The lowest level of executive pay for performance-based pay company is RM48, 000, as compared to RM32, 500 for the non-performance-based pay company. However, there is no significant

difference of mean of executive remuneration for both groups. Above result for executive remuneration seems to suggest that level of executive pay is not different either the companies assert that they link pay to performance or otherwise.

Further, Table 4 shows that mean share ownership by inside directors and local institutional shareholders for performance-based pay companies are 29 percent and 14 percent, slightly higher than the corresponding figures for non-performance based pay companies 26 percent and 9 percent for inside director ownership and local institutional shareholders ownership respectively. The average mean of foreign ownership are 7 percent and 6 percent for performance and non-performance based company. Among the three types of ownership, only institutional shareholder show a significant difference of mean which is around 0.04. T-test result of ownership structure as shown in Table 4 implies that ownership of institutional shareholder is higher in performance based companies as compared to non-performance based companies.

In addition, Table 4 shows that mean of board score is slightly higher in performance based as compared to non-performance based companies. The means are 7.10 and 6.77 respectively and the mean is significantly difference at 0.33. In addition, the maximum board score for performance based companies is 14 points while 13 for non-performance based companies. Similarly, the table also reports a remarkable different of mean between performance based pay

1445

company (7.06) and non-performance based pay company (5.67). The mean is significantly difference at 1.39. T-test result for board and remuneration score imply that companies which link pay to performance tend to adopt the Code recommendation regarding having an effective and efficient board and good remuneration practices as compared to non-performance based companies.

Additionally, Table 4 shows that mean of return on stock (RET), return on asset (ROA) and return on equity (ROE) are notably higher for performance based companies rather than non-performance based companies. The means are 0.11, 0.08, 0.09 and 0.04, 0.05 and 0.01 respectively. The means of ROA and ROE for performance based pay companies are considerately significant if compared to non-performance based pay companies. The different mean of ROA is 0.03 while for ROE is 0.08. However, mean for RET is insignificantly different. The results for ROA and ROE suggest that companies which link pay to performance perform better than companies which do not link their pay to performance. Also, the table report that mean for total asset and total debt are significantly different for performance based and non-performance based companies.

PB (Performance based), NPB (Non-performance based)

Factors Determining the Adoption of Pay-for-performance

Table 5 and 6 below shows logistic result of factors that influence the adoption of pay-for-performance by companies as recommended by the Code. Table 6 shows that only remuneration score is significant at 1% levels while the other factors are insignificant for 2003. However, as for 2004 and 2005, percentage of managerial ownership, percentage of local institutional ownership and remuneration score show a significant influence on the adoption of pay-for-performance. The results seem to suggest that higher percentage of managerial ownership and local institutional ownership affect the adoption of pay-for-performance. Similarly, the results also specify that higher remuneration score do affect the pay-for-performance. On the hand, the result is insignificant for

1447

board score. This result indicates that board plays no part in aligning the pay to performance as expected by agency theorists and the Code.   In addition, result of table 6 affirms the influence of percentage of managerial ownership, percentage of local institutional ownership and remuneration score on the adoption of pay-for-performance.

Conclusion

Results of this study show that executive director is largely being remunerated based on fixed salary rather than other components of pay. In addition, on average Malaysian executive director has being paid in the range of RM50,000.00 to RM1,500,000.00 per year. Only about 10% firm-years companies receive more than RM5,000,000.00 per year. Further, this finding also reveals that Malaysia companies are trying to shift from rewarding their executive based on fixed salary to other alternative although in small percentage. With regard of ownership, this study finds that large number of Malaysian companies is owned by the executive directors and their family members. Even so, non-executive directors, local institutions and foreign investors are also the significant shareholders in some Malaysian companies as well. Findings of this study are consistent with other studies in Malaysia on ownership structures

(Abdul Samad, 2002 and Haniffa and Hudaib, 2006). Meanwhile, overall results for board matters which related to composition, structure, function/activity and training seem to reflect that Malaysian companies put an effort to follow the Code recommendations. However, on the aspect of remuneration matters, the results indicate that Malaysian companies are still lacking in adopting of the Code for both aspect of remuneration. There still a room for improvement in particular remuneration committee independency, meeting and attendance and remuneration practices.

Interestingly, this finding reveals that there is a significant difference of mean between companies which assert that their pay is linked to performance or otherwise. Among the variables are institutional shareholder, board score, and remuneration score, return on asset, return on performance, total asset and total debt. Furthermore, this study finds that adoption of pay-for performance as recommended by the Code is influence by ownership structure in particular the percentage of managerial ownership, local institutional ownership and foreign ownership. On the aspect of corporate governance, remuneration score seems to show a strong influence on the adoption while board score is insignificant. Above findings brings to fore urgent need for the shareholders and authority in encouraging company to follow the Code's recommendation in particular on the aspect of remuneration structure and practices.

IMPACT OF ACCOUNTING REFORMS, CG COMPLIANCE REPORTING AND DISCLOSURE INTENSITY ON VALUE RELEVANCE OF ACCOUNTING NUMBERS IN ISE

Mine Aksu, Sabancı University
Can Simga Mugan, *Middle East Technical University*
Ayse Tansel Cetin *Gebze Institute of Technology*

Abstract

In this study, we first investigate the intertemporal association between accounting numbers and stock prices in the ISE-100 firms during the 992-2006 period by using an empirical specification of Ohlson (1995). Second, we explore how this association is affected by a series of recent voluntary and mandatory accounting and corporate governance reforms. We specifically explore the impact of the Uniform Accounting System (1994), the voluntary (mandatory) adoption of IFRS (inflation accounting) during 2003-2004, the mandatory adoption of IFRS in 2005, and the CG Principles Compliance Reporting, required since 2004. Finally, we investigate the impact of disclosure intensity on value relevance by updating and utilizing a proprietary Transparency and Disclosure Index calculated for 52 ISE firms for the years 2003-2005. We believe that these reforms and best practices will mitigate the most important agency problem in many emerging markets (EMs) -the expropriation of minority shareholders by concentrated ownership- and thus are expected to enhance the value relevance of accounting information, and thereby capital flow to EMs.

THE EFFECTS OF TRANSPARENCY AND DISCLOSURE ON FIRM PERFORMANCE: THE CASE OF SET 100 THAILAND

Suchada Jiamsagul[253]

ABSTRACT

There is limited evidence to support the performance effects of corporate governance in Thailand. Also, many participants in the stock markets also cast doubt on the ways to measure corporate governance. This study chooses transparency and disclosure as a proxy of corporate governance. The main purpose of this study is to test whether transparency and disclosure affect performance of SET100 firms after controlling for block and director ownerships, financial leverage, firm risk, and financial industry dummy. Also, this study aims to identify the variables of S&P:T&D which are related to firm performance. The performance variables are constructed by one accounting based measure (ROA) and two market based measures (Tobin's Q and Stock Return). The sample consists of 100 financial and non-financial firms of SET 100 index announced in year 2005. Their total market value of equity is about eighty percent of listed firms of SET. The results show that accounting policy review and accounting policy details are positively related to ROA, Tobin's Q, and Stock Return. Also, there is a negative relationship between information on auditors and return of common stocks.

1. Introduction

Responding to the efficient international allocation of capital, the Stock Exchange of Thailand (SET) has actively promoted corporate governance principles. Transparency and disclosure is one of corporate governance mechanisms. It is an important factor to build market confidence and encourage more stable, long-term international investment flows.

This study is motivated from the importance of transparency and disclosure for Thailand's economic development. Furthermore, there is little public empirical evidence to suggest the way to measure transparency and disclosure and to show the relationships between transparency and disclosure and firm performance.

Transparency and disclosure has effects on firm performance since it is the mechanism which is intended to increase the monitoring of management's actions and reduce the information risk borne by the shareholder. Better-transparency and disclosure firms should have a higher operating performance by minimizing the chance of having managers engage in opportunistic behavior. Also since investors perceive well-transparency firms as less risky, they expect a lower expected rate of return. This leads to higher firm value. In addition, if investors perceive that transparency and disclosure is useful, there should be a positive relationship between transparency and disclosure and stock return.

This study looks at the performance effects of transparency and disclosure on SET 100 firms in Thailand by using data from 2004. I investigate whether transparency and disclosure affects three performance measures: ROA, Tobin's Q and Stock Return. Transparency and disclosure variables, following the S&P:T&D scoring system, are measured by twelve subcategories of transparency and disclosure. In addition to explain the performance effect of transparency and disclosure, this study aims to find out which variables of S&P: transparency and disclosure are related to firm performance.

As above explanation, the research question is *whether transparency and disclosure affects firm performance?*

The rest of this paper will be organized into five parts. Literature review part gives theoretical background and prior studies of the relationship between corporate governance and firm performance. Then research hypotheses are conceptually developed and prepared for the empirical tests. The next part provides research methodology, including data and data sources, research model and variable measurements. Empirical result part presents the results and analyses. The final part shows the contribution and the conclusion.

2. Literature Review

The perspectives of agency theory are used to explain the need for corporate governance to improve firm performance. Corporate governance mechanisms such as transparency and disclosure are designed to cope with agency problems and information asymmetry. Hart (1995) indicates that corporate governance mechanisms are necessary if agency problems exist and contracts are incomplete. Klappers and Love (2004) also provide evidence that there are associations between corporate governance mechanisms and either the extent of the asymmetric information or contracting imperfections that firms face. Furthermore, firms with better corporate governance mechanism have higher firm performance.

Prior researchers assess corporate governance in terms of the relationship between ownership concentrations and firm performance. For example, Wiwattanakantang (2001) investigates the effects of controlling shareholders on corporate performance. Using Thai non-financial firms in 1996, the author shows that the presence of controlling shareholders is associated with higher performance measured by the return on assets and the sale-asset ratio.

Rather than considering outside ownership, Dhnadirek and Tang (2003) examine the relationship between managerial ownership and firm performance by using 41 firms in the financial industry during 1994-1996. The authors find that the concentration of managerial ownership beyond 25 percent has a negative association on firm performance.

There are several papers studying the effect of board of directors on firm performance. For example, Connelly and Limpaphayom (2004) also examine the relationship between board of directors and firm performance among life insurance companies. They conclude that outside directors can still be beneficial even for firms with limited managerial discretion such as these life insurance firms.

Furthermore, Sukcharoensin (2003) provides essays on the relationship between corporate governance and firm performance. The author finds that for firms with high ownership structure, the board composition has a lower impact on firm performance measured by Tobin's Q and return on assets. The results from simultaneous regressions indicate that independent structure of the board and audit committee does not enhance firm performance. In contrast, better firm performance leads to a more independent audit committee.

Recently, researchers have paid attention to corporate governance rating. For example, Nittayagasetwat and Nittayagasetwat (2006) investigate the relationship between a firm's stock return and corporate governance rating announcement. Due to data unavailability, the authors use only 11 listed companies that are rated in the top quartile of corporate rating by the Thai Rating and Information Service Co., Ltd. With the event study methodology, the research shows that there is no significant abnormal performance around the announcement of corporate governance rating. The authors suggest that good corporate governance may be of little concern to the investors.

3. Research Hypotheses

Based on the OECD framework, disclosure and transparency is a vital component of the corporate governance framework. Beekes and Brown (2005) also provide evidence that firms with better corporate governance quality make more informative disclosures. Their findings show that better-governed firms make more price-sensitive disclosure and have a larger following of analysts. Also, analyst consensus forecasts for these firms are less biased

and more accurate. In addition, value-relevant information of these firms is more timely in the sense that price discovery is faster.

Recently, the transparency and disclosure score criteria of Standard and Poor have been used as a measure of corporate governance. For example, Patel et al. (2002) use Standard and Poor's score datasets for 354 firms in 19 emerging markets over three years ending 2000. They show that price to book equity ratio is positively correlated with transparency and disclosure scores.

Cheng, Collins and Huang (2003) argue that strong S&P:T&D reduces the firm's cost of equity measured by market beta. Also, it leads to increased risk-adjusted abnormal returns and earnings response coefficients around the release of the S&P scores. With the S&P:T&D database of S&P 500 firms, Chen, Chung, Lee and Liao (2005) find that companies with poor disclosure and transparency have larger economic costs of equity liquidity.

Some researchers have used Standard and Poor's transparency and disclosure measurement criteria to gauge information disclosure in their country. For example, Chiang (2005) provides evidence on the relationship between S&P:T&D scores and operating performance of high tech companies listed in Taiwan. The study shows that scores for financial transparency and information disclosure are the highest among three categories. Also, only this component of transparency and disclosure has a positive significance for firm performance.

This study intends to test the effects of transparency and disclosure on firm performance. I expect a relationship between transparency and disclosure, and firm performance for two reasons. First, the higher transparency and disclosure of the company's business can reduce the asymmetry of information between shareholders and managers. Second, transparency and disclosure serves to keep management in check. In order to test whether transparency and disclosure affects firm performance, the study measures

transparency and disclosure by using twelve subcategories of S&P:T&D criteria (see appendix A). The research hypotheses are as following.

H1: Transparency and disclosure in the transparency of ownership (OWN_TRAN) is related to firm performance.

H2: Transparency and disclosure in the concentration of ownership (OWN_CONC) is related to firm performance.

H3: Transparency and disclosure in the voting and shareholder meeting procedure (OWN_VOTE) is related to firm performance.

H4: Transparency and disclosure in the business focus (FIN_BUSF) is related to firm performance.

H5: Transparency and disclosure in accounting policy review (FIN_ACPR) is related to firm performance.

H6: Transparency and disclosure in accounting policy details (FIN_ACPD) is related to firm performance.

H7: Transparency and disclosure in related party structure and transactions (FIN_RELAT) is related to firm performance.

H8: Transparency and disclosure in information on auditors (FIN_AUDIT) is related to firm performance.

H9: Transparency and disclosure in board structure and composition (BOARD_STRUC) is related to firm performance.

H10: Transparency and disclosure in the role of board (BOARD_ROLE) is related to firm performance.

H11: Transparency and disclosure in directors training and composition (BOARD_TRAIN) is related to firm performance.

H12: Transparency and disclosure in compensation and evaluation of executive (EXE_EVAL) is related to firm performance.

Table 1 lists the measurement and predicted signs of transparency and disclosure variables.

Table1: Measurement and predicted signs of twelve variables of transparency and disclosure.

Variables	Abbreviation	Measurement	Predicted Sign
Twelve sub-categories of transparency and disclosure			
1. Transparency of ownership	OWNR_TRAN	11 Questions of S&P:T&D Scoring System	+
2. Concentration of ownership	OWN_CONC	8 Questions of S&P:T&D Scoring System	+
3. Voting and shareholder meeting procedure	OWN_VOTE	9 Questions of S&P:T&D Scoring System	+
4. Business focus	FIN_BUSF	15 Questions of S&P:T&D Scoring System	+
5. Accounting policy review	FIN_ACPR	9 Questions of S&P:T&D Scoring System	+
6. Accounting policy details	FIN_ACPD	3 Questions of S&P:T&D Scoring System	+
7. Related party structure and transactions	FIN_RELAT	4 Questions of S&P:T&D Scoring System	+
8. Information on auditors	FIN_AUDIT	4 Questions of S&P:T&D Scoring System	+
9. Board structure and composition	BOARD_STRUC	8 Questions of S&P:T&D Scoring System	+
10. Role of the board	BOARD_ROLE	12 Questions of S&P:T&D Scoring System	+
11. Directors training and compensation	BOARD_TRAIN	6 Questions of S&P:T&D Scoring System	+
12. Compensation and evaluation of executive	EXE_EVAL	9 Questions of S&P:T&D Scoring System	+

4. Methodology and Data

4.1 Data and data source

Data of this study include both financial firms and non-financial firms, which are reported by either one of the two announcements of SET 100 index[254] of year 2005. Due to imperfectly overlapping of SET 100 firms, I have 108 observations. After that, I exclude REHABCO firms and firms which the fiscal year ending is not December. I finally have 103 observations which represent nearly eighty percent of the market capitalization of Thai listed firms. The data consist of firms in seven industries (see Table 2):

Table 2: Data classification by Industries

Name of industry	Number of firms
Agro & Food Industry	4
Property and Construction Industry	34
Industrials Industry	5
Resource Industry	11
Service Industry	11
Technology Industry	14
Finance Industry	24

Source: List of securities in the SET100 index during May 3, 2005 to June 30, 2005 and during July 1, 2005 to December 31, 2005.

---

[254] Being part of the index, these companies are likely to be of the greatest interest to individual and institutional investors, particularly international investors. Furthermore, these companies are expected to practice relatively higher standards of corporate governance compared to other listed Thai companies and so can be role models of corporate governance for others.

The data in above table are from the SET. More detailed data are from SETSMART database, the annual registration statements[255] (Form56-1), annual corporate reports, and the database of DATASTREAM INTERNATIONAL. The data regarding transparency and disclosure; and ownership structure are from Form 56-1. Annual corporate reports provide additional data where there are gaps in data from SETSMART and Form 56-1. Finally, financial data are from the databases of SETSMART and DATASTREAM INTERNATIONAL.

4.2 Measurement of Firm Performance

As noted in Brown and Caylor (2004), all performance measures are imperfect. Since measurement errors in performance indicators are not perfectly correlated, researchers should examine several performance measures rather than drawing conclusions from only one of them. In this paper, I collect data on three measures of firm performance as dependent variables, based on both accounting and market measures similar to other accounting and finance studies (e.g. Klein, 1998; Wiwattanakantang, 2001)

For two reasons, I prefer to use future performances rather than contemporary performances as dependent variables. First, corporate governance requires more time before its effects on firm performance is reflected. Many of the corporate governance papers link corporate governance variables to future firm performance (e.g. Core et al., 1999, Ertugrul and Hedge, 2005). Second, in order to address the endogeneity problem which is a typical problem in estimating the relationship between performance and corporate governance, a lag variable will be used.

---

[255] The Office of the Securities and Exchange Commission (SEC) requires all companies listed on the Stock Exchange of Thailand to fill in the annual registration statement (Form 56-1). They need to clarify accurate and clear information for investors to understand the operation, significant change of the corporation and possible risks.

Return on Assets (ROA) is based on earnings before interest and tax expenses divided by book value of total assets. Return on assets (ROA) measures firm performance in terms of firm's profitability prior to the effect of financing. By separating the financing effects from the operating effects, the ROA provides a cleaner measure of the true profitability of these assets.

For firms in non finance industry[256]:

$$ROA_{2005} = \frac{EBIT_{2005}}{(TA_{2005}+TA_{2004})/2}$$

For firms in finance industry[257]:

$$ROA_{2005} = \frac{EBT_{2005}}{(TA_{2005}+TA_{2004})/2}$$

Where:

EBIT	=	Earnings before interest expenses and tax expenses as of December, 31 2005.
EBT	=	Earnings before tax expenses as of December, 31 2005.
TA	=	Total assets as of December, 31 2005 and 2004.

[256]In case of non-financial firms, I use earnings before interest expenses and tax expenses as a numerator of ROA, since I intend to measure the performance with the viewpoint of operating decision rather than financing decision.

[257] In case of financial business in which interest revenues and expenses is main part of business, I use earnings after interest expense but before tax expense as numerator of ROA.

Tobin's Q is the ratio of the market value of a firm's assets to the book value of its assets. Usually, Tobin's Q is a performance measure in terms of investment opportunity. Tobin's Q is greater than one when the market value of a firm exceeds its book value. This implies that investors are willing to pay a premium over the value of the firm's assets. There is an anticipation of good future prospects under the present management.

$$\text{Tobin's } Q_{2005} = \frac{(MVE + PS + DEBT)_{2005}}{(TA_{2005} + TA_{2004})/2}$$

Where:

MVE = Market value of equity as of December, 31 2005. It is calculated from the fiscal year-end closing price of stock multiplied by the common shares outstanding.

PS = Preferred stock as of December, 31 2005. It is the net number of preferred shares at year-end multiplied by the stated value per share as presented in the balance sheet;

DEBT = Total liability as of December, 31 2005

TA = Total assets as of December, 31 2005 and 2004

In this study, stock return is a performance measure in terms of a return rate of common stocks. The relationships between stock returns and corporate governance can identify how investors perceive the usefulness of corporate governance. This paper does not use an abnormal return which is more appropriated for event study. I prefer to use raw return because it is more suitable if the study focuses on the association between corporate governance variables and future performance. Also prior study indicates that many of

1469

common methods used to calculate long run abnormal stock returns are conceptually flawed and/or lead to biased test statistics (Barber and Lyon, 1997).

I use the monthly return index [258] (RI) from the database of DATASTREAM INTERNATIONAL in computing stock returns.

$$SR^{259}_{2005} = (RI_{2005} - RI_{2004}) / RI_{2004}$$

Where:

RI = Monthly returns indexed as of December 31, 2005 and 2004.

4.3 Research Model

The following model is used for testing the relationship between twelve subcategories of transparency and disclosure and firm performance. With multiple regression analyses, the assumptions of ordinary least squares must be tested prior to conducting the hypotheses. First, the mean of the residual is zero. Second, the variance of residuals is constant (homoscedasticity). Third, multicollinearity problem does not exist. Finally, the error term is normally distributed.

---

[258] The RI demonstrates a theoretical growth in value of a share held over a specific period, assuming that dividends are reinvested to purchase additional units of equity at the closing price applicable on the ex-dividend date. The calculation ignores tax and reinvestment charges.

[259] Stock return is calculated by:

$$RI_t = RI_{t-1} * ((P_t + D_t)/P_{t-1})$$

Then, $RI_t / RI_{t-1} = (P_t + D_t)/P_{t-1}$

Add (-1) into both sides of equations

$(RI_t / RI_{t-1}) - 1 = ((P_t + D_t)/P_{t-1}) - 1$

$(RI_t - RI_{t-1}) / RI_{t-1} = (P_t + D_t - P_{t-1})/P_{t-1}$

$(RI_t - RI_{t-1}) / RI_{t-1} = $ Stock Return$_t$

Where:
P_t = price on ex-date
P_{t-1} = price on previous date
D_t = dividend payment associated with ex-date t

Model:

Performance $_{it+1}$ = β_0+β_1OWN_TRAN $_{it}$ +β_2 OWN_CONC $_{it}$+β_3OWN_VOTE $_{it}$

$\qquad$ + β_4 FIN_BUSF $_{it}$ + β_5 FIN_ACPR $_{it}$ + β_6 FIN_ACPD $_{it}$

$\qquad$ +β_7FIN_RELAT $_{it}$ + β_8FIN_AUDIT $_{it}$+β_9 BOARD_STRUC $_{it}$

$\qquad$ +β_{10}BOARD_ROLE$_{it}$+β_{11}BOARD_TRAIN$_{it}$+β_{12}EXE_EVAL$_{it}$

$\qquad$ +β_{13}C_BLOCK$_{it}$+β_{14}C_DOWN $_{it}$+β_{15} C_LEV $_{it}$ +β_{16} C_RISK $_{it}$

$\qquad$ +β_{17} FD $_{it}$ +ε $_{it}$

Performance variables consist of ROA, Log Q[260] and SR. Details of twelve variables of transparency and disclosure are shown in Table 1. Based on prior studies, five control variables are used to avoid spurious correlation. They are block ownership (C_BLOCK), director ownership (C_DOWN), financial leverage (C_LEV), firm risk (RISK) and the dummy variable of financial industry (FD).

Blockholders can be seen as controllers of agency problems. Because of their large shareholdings, they have a strong incentive to monitor managerial behavior. The variable of block ownership is defined as shareholders holding more than 5% of the shares. However, Block ownership does not include shares held by Thai NVDR Co., Ltd., Stock Exchange of Thailand, Thai Trust Fund Management Co., Ltd., and Thailand Securities Depository Co., Ltd.

Director ownership is defined as the percentage of common shares held by directors on the board of directors. The greater the percentage of share equity owned by insiders, the more likely they will make decision consistent with maximizing shareholder wealth, since that will maximize their own wealth.

Following earlier studies such as Anderson and Reeb (2004), Ertugrul and Hegde (2005), and Beiner et al. (2006), standard deviation of stock returns is used to control for firm

---

[260] To stabilize the variance of the residual and to make a normal distribution of the residual, Tobin's Q (Q) is transformed to Log Tobin's Q (Log Q).

risk. It captures the overall risk. Financial leverage is measured by total debt to total equity. Financial leverage can increase a firm's value by curbing agency problems.

5. Empirical Results

5.1 Descriptive statistics and Partial correlations

Descriptive statistics for the entire sample of all firms are presented in Table 3. The sample[261] consists of 100 observations under the SET100 Criteria. Panel A of the table shows that the average ROA, Tobin's Q and Stock return are 8.676, 1.422 and -0.048 respectively.

Panel B presents that the twelve subcategories of transparency and disclosure also have 10, 7, 6, 11, 5, 3, 4, 4, 5, 9, 5, 7 questions[262] respectively. The results also show that the subcategory of transparency of ownership (OWN_TRAN), the subcategory of voting and shareholder meeting procedure (OWN_VOTE), the subcategory of accounting policy review (FIN_ACPR), and subcategory of accounting policy details (FIN_ACPD) have positive signs and skew to the right. This suggests that most firms in SET100 are less transparent on transparency of ownership, voting and shareholder meeting procedures, accounting policy reviews and accounting policy details.

With respect to control variables on panel C, there is a large difference in the sample. The proportion of block holding (C_BLOCK) ranges from 0% to 98.9%. Also the maximum and average of the proportion of board of director shareholding (C_DOWN) are 63.5% and

---

[261] I exclude 3 firms which have higher firm performance but lower transparency and disclosure scores

[262] Question numbers of 11, 20, 21, 28, 35, 36, 45, 49, 52, 75, 89, 97, and 98 are excluded since all firms get zero from these questions. Question number of 12, 30, 32, 47, 64, 65, 66, 74, and 76 are excluded since all firms get one point from each question (see more detail in appendix A).

10.9%. In addition, the debt to equity ratio (C_LEV) ranges from 0.02 to 29.42. Also, the average and maximum standard deviation of stock returns (C_RISK) are 0.192 and 2.193.

Table 4 shows the descriptive statistics for 76 non-financial firms and 24 financial firms. This table shows the coefficient of variation[263] (CV) to measure the dispersion of non-financial firms and those of financial firms. Overall, I find that the dispersion numbers of financial firms and non-financial firms are not much different. Also, the mean values of transparency and disclosure are quite close between the two groups. However the mean value of ROA of financial firms (3.436) is lower than those of non-financial firms (10.331). Also, financial firms have much higher debt to equity ratio than non-financial firms (6.679 and 2.552).

This study uses the analyses of partial correlations[264] to detect a multi-collinearity problem in regression analysis models. Multi-collinearity is a problem of the high degree of linear correlation among explanatory variables in a regression model. When the multi-collinearity problem exists, the estimated coefficient tends to be less precise. Also, it is difficult to separate the effects of predictors on the dependent variable. The results in Table 5 show that there are seven pairs of partial correlations; however, their correlation coefficients are less than 0.5. Overall, the analyses of correlation show that there should be no serious multi-collinearity on the following analysis of regressions.[265]

---

[263] The coefficient of variation (CV) is a measure of dispersion of a probability distribution. CV is defined as the ratio of the standard deviation to the mean.

[264] Partial correlation is the correlation of two variables while controlling for other variables. In other words, partial correlation is a method used to describe the relationship between two variables whilst taking away the effects of other variables.

[265] In addition to partial correlation, this study also uses tolerance (TOL) and variance inflation factor (VIF) as indicators of multi-collinearity. Seen from regression results, VIF of all variables in the models do not exceed 3, TOL is not far from one.

Table 3: Descriptive Statistics (All firms)

Variables	N	Min	Max	Mean	SD	Skew
Panel A: Firm Performance						
ROA	100	-21.910	32.700	8.676	9.296	-0.066

Note: *, ** Significant at the 0.05, and 0.01 level respectively.

OWN_TRAN is transparency of ownership. OWN_CONC stands for concentration of ownership. OWN_VOTE stands for voting and shareholder meeting procedure. FIN_BUSF represents business focus. FIN_ACPR represents accounting policy review. FIN_ACPD stands for accounting policy details. FIN_RELAT is related party structure and transactions. FIN_ AUDIT represents information on auditors. BOARD_STRUC stands for board structure and composition. BOARD_ROLE is role of the board. BOARD_TRAIN represents directors training and compensation. EXE_EVAL is compensation and evaluation of executive. C_BLOCK is block ownership. C_DOWN represents director ownership. C_LEV stands for financial leverage.

5.2 Regression Analysis

In Table 6, the models of ROA, Log Q, and SR provide good of fit with adjusted R2 value of 33.5%, 15.8%, and 24.8%. Their significant levels are at 0.01 for ROA and SR, but at 0.05 for Log Q. The study shows that the coefficients of FIN_ACPR are positively significantly related with all three performance measures (ROA, Log Q and SR) at significant level of 0.10.

In addition, the coefficients of FIN_ACPD are positively significantly related to ROA and SR at a significant level of 0.05. FIN_ACPD is also positively related to Log Q at a significant level of 0.10. The results show that firms with higher transparency and disclosure on accounting policy review and accounting policy detail have higher firm performance in all three aspects of firm performance: operating performance, firm value, and rate of return on common stocks.

However, the coefficient of FIN_AUDIT is significantly negatively associated with stock returns at the significant level of 0.10. This shows that the more transparency and disclosure on auditors' information, the less value of stock returns. This does not meet the expectation that firms with higher transparency and disclosure have higher firm performance. In addition, the coefficients of FIN_AUDIT are not significant related to ROA and Log Q.

Regarding to control variables, the results show that the coefficients of block ownership (C_BLOCK) and director ownership (C_DOWN) are positively related to Log Q at the significant level of 0.05. This suggests that firms with high concentration of ownership either block ownership or director ownership have higher firm value. In addition, financial leverage (C_LEV) is negatively related to ROA at the significant level of 0.05, but positively related to SR at the significant level of 0.01. This means firms with higher debt to equity ratio have lower return on assets but higher rate of return on

common stock. Finally, there is a negative relationship between firm risk (C_RISK) and

ROA and SR at the significant level of 0.01. This means that firms with lower risk have

higher returns on assets and return on common stock.

6. Conclusion

Corporate governance principles have been actively promoted in Thailand. However, there is limited evidence to support the effects of corporate governance on firm performance in Thailand. Moreover, many participants in the stock markets also cast doubt on the ways to evaluate corporate governance. These reasons motivate this study.

Based on OECD framework and prior studies, transparency and disclosure is a vital component of the corporate governance. The purpose of this study is to test whether transparency and disclosure affects firm performance of SET100 firms after controlling for block and director ownerships, financial leverage, firm risk, and financial industry dummy. The performance variables are constructed by one accounting based measure (Return on Assets) and two market based measures (Tobin's Q, and Stock Returns). Transparency and disclosure variables are measured by twelve subcategories of S&P:T&D scoring systems.

The sample consists of 100 financial and non-financial firms of SET100 index announced in year 2005. SET 100 firms are chosen since they are expected to practice relatively higher standards of corporate governance relative to other listed firms. They also can be role models of corporate governance for other firms. Moreover, their total market value of equity is about eighty percent of SET.

1479

The results show that accounting policy review and accounting policy details are significantly positively related to ROA, Log Q and SR. However, information on auditors is negatively related to stock return. I believe that the reliability and timelines of accounting policy which are related to the frequency of financial reports as well as the discussion of accounting policy and procedures should improve the ability to make decision both inside and outside the organization. Unsurprisingly, firms have higher transparency and disclosure in accounting policy review and details have higher operating performance, firm value and return of common stocks. However, the negative reaction of information on auditors may be explained by that investors believe that non-audit services might compromise an auditor's independence and result in reduced quality of financial statements.

Regarding control variables, the evidence shows that a higher concentration of blockholders positively affects a firm's value. With better capability to monitor their investments, blockholders can improve firm performance. Further evidence also indicates that firms with higher director's ownership have higher firm value. The reason is that the greater the percentage of shares held by insiders, the more likely they will make decision based on the benefit of shareholders.

The coefficient of financial leverage shows that there is a positive association between debt to equity ratios and stock returns. This can be explained that investors perceive that firms can earn a greater rate of return than the cost of interest. However, debt to equity is negatively related to returns on assets. This might be because financial firms are included in the sample. Debt to equity of financial firms is quite high (6.26), thus interest on principal seems to add cost to firms.

For risks related to firms in SET 100, firms in the SET100 index have lower risks, but higher operating performance and higher rate of returns on common stocks. This

1480

could be explained by characteristics of SET100 firms. These firms are widely accepted as well governed firms compared to other firms. Usually, investors perceive these firms as having lower agency costs and more highly efficient operations.

In sum, this study provides evidence on the relationships between transparency and disclosure and firm performance of the SET 100 Thailand. Referring to the results, I would like to inform listed firms about the importance of transparency and disclosure on their performance. Furthermore, the findings would suggest to local and international regulators which part of transparency and disclosure could be used as a meaningful objective monitoring and enforcement tool. Knowing the importance of financial transparency and disclosure will inspire firms to improve the quality of their financial statements. The extension of this research might stream to other set of measurement of disclosure quantity such as the Globe and Mail, Report on Business (ROB) or the disclosure and transparency scores developed by the Institute of Directors Association of Thailand (IOD).

S&P: Transparency and Disclosure Scoring System

1. Transparency of Ownership (OWN_TRAN)

1. Provide a description of share classes? (1)

2. Provide a review of shareholders by type? (1)

3. Provide the number of issued and authorized ordinary shares? (1)

4. Provide the number of authorized but non-issued ordinary shares? (1)

5. Provide the par value of issued and authorized ordinary shares? (1)

6. Provide the par value of authorized but non-issued ordinary shares? (1)

7. Provide the number of issued and authorized of preferred, non-voting, and other classes? (1)

8. Provide the number of authorized but non-issued shares of preferred, non-voting, and other classes? (1)

9. Provide the par value of issued and authorized of preferred, non-voting, and other classes? (1)

10. Provide the par value of authorized but non-issued shares of preferred, non-voting, and other classes? (1)

11. Does the company disclose the voting rights for each class of shares? (1)

2. Concentration of Ownership (OWN_CONC)

12. Top 1 shareholder(s) disclosed? (1)

13. Top 3 shareholders disclosed? (1)

14. Top 5 shareholders disclosed? (1)

15. Top 10 shareholders disclosed? (1)

16. Shareholders owning more than 10 percent are disclosed? (1)

17. Shareholders owning more than 5 percent are disclosed? (1)

18. Shareholders owning more than 3 percent are disclosed? (1)

19. Does the company disclose percentage of cross-ownership? (1)

3. Voting and Shareholder Meeting Procedures (OWN_VOTE)

20. Is there a calendar of important shareholder dates? (1)

21. Review of shareholder meetings (could be minutes)? (1)

22. Describe procedure for proposals at shareholder meetings? (1)

23. How shareholders convene an extraordinary general meeting? (1)

24. How shareholders nominate directors to board? (1)

25. Describe the process of putting inquiry to board? (1)

26. Does the annual report refer to or publish Corporate Governance Charter?

(1)

27. Does the annual report refer to or publish Code of Best Practice? (1)

28. Are the Articles of Association or Charter Articles of Incorporation published?

(1)

4. Business Focus (FIN_BUSF)

29. Is there a discussion of corporate strategy? (1)

30. Report details of the kind of business it is in? (1)

31. Does the company give an overview of trends in its industry? (1)

32. Report details of the products or services produced/provided? (1)

33. Provide a segment analysis, broken down by business line? (1)

34. Does the company disclose its market share for any or all of its businesses?

(1)

35. Does the company report basic earnings forecast of any kind? (1)

36. Does the company report basic earnings forecast of any kind in detail? (1)

37. Disclose output in physical terms? (1)

38. Does the company give an output forecast of any kind? (1)

39. Does the company give characteristics of assets employed? (1)

40. Does the company provide efficiency indicators (ROA, ROE, etc.)? (1)

41. Does the company provide any industry-specific ratios? (1)

42. Does the company disclose its plans for investment in the coming years? (1)

43. Does the company disclose details of its investment plans in the coming

years? (1)

5. Accounting Policy Review (FIN_ACPR)

44. Provide financial information on a quarterly basis? (1)

45. Does the company discuss its accounting policy? (1)

46. Does the company disclose accounting standards it uses for its accounts?

(1)

47. Does the company provide accounts according to the local accounting

standards? (1)

48. Does the company provide accounts in alternate internationally recognized

accounting methods? (1)

49. Does the company provide each of the balance sheets by internationally

recognized methods (1)?

50. Does the company provide each of the income statements by internationally

recognized methods? (1)

51. Does the company provide each of the cash-flow statements by

internationally

recognized methods? (1)

52. Does the company provide a reconciliation of its domestic accounts to

internationally recognized methods? (1)

6. Accounting Policy Details (FIN_ACPD)

53. Does the company disclose methods of asset valuation? (1)

54. Does the company disclose information on method of fixed assets depreciation? (1)

55. Does the company produce consolidated financial statements? (1)

7. Related Party Structure and Transactions (FIN_RELAT)

56. Provide a list of affiliates in which it holds a minority stake? (1)

57. Does the company disclose the ownership structure of affiliates? (1)

58. Is there a list/register of related party transactions? (1)

59. Is there a list/register of group transactions? (1)

8. Information on Auditors (FIN_AUDIT)

60. Does the company disclose the name of its auditing firm? (1)

61. Does the company reproduce the auditors' report? (1)

62. Disclose how much it pays in audit fees to the auditor? (1)

63. Disclose any non-audit fees paid to auditor? (1)

9. Board Structure and Composition (BOARD_STRUC)

64. Is there a chairman listed? (1)

65. Detail about the chairman (other than name/title)? (1)

66. Is there a list of board members (names)? (1)

67. Are there details about directors (other than name/title)? (1)

68. Details about current employment/position of directors provided? (1)

69. Are details about previous employment/positions provided? (1)

70. Disclose when each of the directors joined the board? (1)

71. Classifies directors as an executive or an outside director? (1)

10. Role of the Board (BOARD_ROLE)

72. Details about role of the board of directors at the company? (1)

73. Is there disclosed a list of matters reserved for the board? (1)

74. Is there a list of board committees? (1)

75. Review last board meeting (could be minutes)? (1)

76. Is there an audit committee? (1)

77. Disclosure of names on audit committee? (1)

78. Is there a remuneration/compensation committee? (1)

79. Names on remuneration/compensation committee? (1)

80. Is there a nomination committee? (1)

81. Disclosure of names on nomination committee? (1)

82. Other internal audit-function besides audit committee? (1)

83. Is there a strategy/investment/finance committee? (1)

11. Director Training and Compensation (BOARD_TRAIN)

84. Disclose whether they provide director training? (1)

85. Disclose the number of shares in the company held by directors? (1)

86. Discuss decision-making process of directors' pay? (1)

87. Are specifics of directors' salaries disclosed (numbers)? (1)

88. Form of directors' salaries disclosed (cash, shares, etc.)? (1)

89. Specifics disclosed on performance-related pay for directors? (1)

12. Executive Compensation and Evaluation (EXE_EVAL)

90. List of the senior managers (not on the board of directors)? (1)

91. Backgrounds of senior managers disclosed? (1)

92. Number of shares held by the senior managers disclosed? (1)

93. Disclose the number of shares held in other affiliated companies by managers? (1)

1488

94. Discuss the decision-making of managers' (not board) pay? (1)

95. Numbers of managers' (not on board) salaries disclosed? (1)

96. Form of managers' (not on board) salaries disclosed? (1)

97. Specifics disclosed on performance-related pay for managers? (1)

98. Details of the CEO's contract disclosed? (1)

RISK SIGNAL, FINANCIAL DERIVATIVES TRANSACTIONS AND THE INDONESIAN GAAP

HILDA ROSSIETA, PhD
The University of Indonesia

Abstract

Motivated by the accounting events of firm's default related to derivatives and other financial instruments transactions, this study is aimed to investigate the capability of accounting information to signal the risks associated with the use of financial derivatives for hedging. Hypothesis are developed based on the theory and empirical evidences of manager's motive to use derivatives for hedging (Berkman and Bradbury, 1968; Dune et al., 2003) as well as signaling theory of accounting information (Ball and Brown, 1968; Beaver and Dukes, 1972; Jensen and Meckling, 1976; Megginson, 1997). The hypotheses are formulated in the Ordinary Least Square model. The study uses SPSS version 14 as software to conduct the statistical tests. Non-bank and non-financial institutions firms with financial derivatives transactions listed in Indonesian Stock Exchange during 2001 to 2006 are chosen as the sample. Determinations of the time frame has considered the timing of introduction of revisions of accounting standard on derivatives and other financial instruments in Indonesia PSAK 50 "Financial Instruments: Presentations and Disclosures" which was published in 15 July 1998, as well as PSAK 55 "Financial Instruments: Recognition and Measurements" which was published in 21 September 1998.

Based on the sample selections procedure and the completeness of the data required by the model, 24 firms listed during 2001 – 2006 or equal to 66 firm-years observations were identified as the data to be tested. Empirical evidences suggests that Indonesian GAAP is capable of providing signal associated with: (i) fair value exposures related to manager's motive to reduce the cost of financial distress; (ii) cash flow exposures related to manager's motive to practice tax arbitrage as well as to overcome underinvestment problems; (iii) interest rate risks related to manager's motive to avoid the risk default due to limitations of debt covenants; (iv) forex risk related to manager's motive to control forex exposures caused by foreign operations as well as foreign sales.

n the future, to increase results generalizations, research should be conducted to be more inclusive, covering all the firms with and without financial derivatives. In addition, more specific enquiries should be conducted to check the capability of PSAK 50 and PSAK 55 in providing the risk signals related to the use of derivatives and other financial instruments.

I.   Introduction

The trace of derivatives in the context of corporate finance start in form of capital instruments, in particular are shares and debt securities. From the contractual perspectives, shares and debt securities has clear distinction in terms of financial cost (i.e., dividend for shares and interest for debt). In addition, from accounting earnings perspective, they have diverse implications on tax and financial performance. However, the difference from economic terms most likely to be less clear (Davies et al., 1994). This is due to development and growing complexity of capital instruments that characterized both equity and debt, such as redeemable preference shares (i.e., substantially it is resemble more as debt than equity), convertible bonds (i.e., closer to the nature of equity than debt, even before conversion occurred), or securities with its valued tied to debt value like Market Based Securities (MBS).

Rapid development and growing complexity create challenges for accounting profession to put balance judgment on competing considerations of substance over form when accounting for financial instruments. Previous studies (i.e., Beaver and Dukes, 1972; Ball and Brown, 1968) suggested that residual changes in stock prices were highly associated with residual changes in earnings. One interpretation is that accounting earnings are perceived to be the best approximation of economic value of the firm, in term of stock price. This means that the economic substance matter the most on the reporting earnings. However, the fact that fundamental distinction of capital instruments is rooted in legal form is more likely to cause fair judgment on economic substance more difficult for the accounting profession. The issues regarding economic substance versus legal form generate problems for accounting profession as well as accounting information to accommodate achievement of efficient contracting cost.

The expected role of accounting in the efficient agency contract seemed to be compromised when looking at inability of accounting information to immediately detect the existence of derivatives related financial scandals in the past (Winograd, et al, 1995). This relates to the potential use of financial derivatives to hedge the market risk, but at

the same time, could also be used for 'gambling' (i.e., engage in trading derivatives without any link to underlying assets/liabilities which expose the company to unlimited downside risk). Most importantly, unless manager provide sufficient disclosure regarding their intention, the financial market allows manager to switch between hedging and trading purpose to go unnoticed in the financial statements. Hence, the *'off-balance-sheet'* nature of financial derivatives instruments allow the financial risk to be concealed until the uncontrollable problem suddenly appeared.

Some major issues surrounding accounting and reporting for financial derivatives and other financial isntruments, among others, are:

i. Financial derivatives could be used for trading (i.e., profit seeking activities) or for hedging (i.e., to manage the financial risk exposure). The effect of hedging versus trading derivatives transactions is contradictory. Derivatives hedging stabilize earnings, while derivatives trading increase earning volatility.

ii. Financial derivatives need only small upfront investment, while the down-side risk could be unlimited. The unlimited down-side risk especially happen when there are no underlying assets associated with the financial derivatives transactions, as in the case of financial derivatives trading to gain profit. Therefore, disclosures regarding managements' intention to use derivative (i.e., for trading or hedging) is critical to increase transparency of risk exposures associated with financial derivative transactions. However, there is timing incompatibility between management intentions for using derivatives in on one hand, and financial reporting on the other hand. Management intentions could change easily anytime dependent upon the opportunity of market movement, while, in contrast, accounting information is reported periodically. Therefore, some argued that although management has good intention to report the transactions, yet, accounting information is naturally incapable of reporting risk exposure associated with derivatives transactions.

iii. Being a financial instruments, financial derivatives transaction involving fair value measurements. The accuracy of fair value measurements depends on the availability of market value, as well as frequency of trading activities in the '*arm's length transactions*' (i.e., investors' decisions to sell, buy or hold are purely based on rational considerations, free from conflict of interest or forces of any kinds). Fair value measurements become problematic during the financial market crisis such as occurred in the 2007. In such situation, most of the parties willing to sell and only a few willing to buy. This condition leads to unprecedented decreasing market value for almost all the traded financial instruments. To contain further damage, some regulators suspended trading activities, hoping for the market to regain confidence. Practicing fair value measurements in these circumstances needs benchmark other than the market,such as the quantitative models provided by management. However, accuracy and reliability of the model is often difficult to be assessed objectively. In the case where the model is absence, financial instruments are valued by their historical cost. This is problematic in the market that is severely distressed, in which historical cost is often higher than the distressed market value. To present historical cost bigger than market value is inconsistent with conservatism principles, where the lowest value between market and historical cost should be choose for the purpose of accounting report.

iv. Even in the normal market circumstances, where 'arm's length transactions' could be practiced, reporting unrealized gains and losses associated with fair value measurement of financial derivatives is also problematic. Although there is a clear distinction between reporting gains/losses due to trading (i.e., charged directly to current Profit and Loss Statements) and hedging activities (i.e., deferral accounting is acceptable), yet the ways deferral accounting should be practiced are still in disputes, including: (i) what are the criteria that differentiate hedging from trading, so that one is entitled to apply hedge accounting?; (ii) where should unrealized gains or loss be reported, in the balance sheet or in the comprehensive income? (iii) if they are to be reported in the balance sheet, should they be reported as parts of underlying

assets/liabilities, or should they be charged directly to the equity section? (iv) if they are to be reported in the balance sheet, are netting-off presentation (i.e., direct off-set between unrealized gains or loss originated from the hedge contract and underlying assets/liabilities) acceptable?; (v) how do de-recognized hedge positions?

Investigation of the financial Accounting Standard in Indonesia context would be quite interesting for the some reasons. Mainly, despite growing importance of derivatives and other financial instruments in the corporate finance practice in both global as well as national level, yet, financial default related to the use of financial derivatives continue to be happened. This leads to the major doubt regarding the capability of financial accounting information to provide signal regarding risks related to the use of financial derivatives.

Considering the contrasting effects of financial derivatives use for hedging and trading on one hand, and the role of accounting information used by managers to signals firm's performance on the other hand, this research is aimed to investigate the capability of accounting information to provide signal regarding risk associated with financial derivatives and other financial instruments in the context of Indonesian capital market. More specifically, this research would investigate whether the market could appreciate the use of financial derivatives for hedging purpose using accounting information prepared based on Indonesian GAAP.

II.   Theoretical Framework and Hypotheses Development

II.1.   Manager's Motives to Use Financial Derivatives for Hedging
Berkman and Bradbury (1996) argue that, risk management can add value to a firm when capital market is imperfect. This provides incentives for managers to practice risk management by using financial derivatives, aimed at increasing firm's performance. Accordingly, the managers' motives to use financial derivatives are to manage risk exposures, including interest rate risk, foreign exchange risk, credit risk, fair value risk and cash flow exposure. More specifically, the corporate (i.e., manager) motive to use derivative hedging are as follows:

1. To reduce the expected cost of financial distress (Mayer and Smith, 1982; Smith and Stulz, 1985) in which manager presumably use financial derivatives to manage fair value exposure, cash flow exposure and interest rate risk.

2. To practice tax arbitrage and reduce the expected tax charge (Mayers and Smith, 1982; Smith and Stultz, 1985) in which manager most likely to use financial derivatives to manage cash flow exposure.

3. To reduce agency cost associated with underinvestment problem (Mayers and Smith, 1987; Bessembinder, 1991) due to increased volatility of future cash flows or short-term liquidity constraints (Froot *et al*., 1993) in which manager presumably use financial derivatives to mitigate fair value exposure, cash flow exposure and interest rate risk.

4. To accommodate managerial self interest (i.e., to gain high and stable bonus) and risk aversion (i.e., to avoid debt covenant violation) as argued by Smith and Stultz (1985) as well as Dunne et al., (2003), in which manager most likel to use financial derivatives to manage fair value exposure and credit risk.

5. To overcome the short term liquidity constraint (Berkman and Bradbury, 1996), in which manager presumably use financial derivatives to manage cash flow exposure.

6. To manage foreign currency exposure (Berkman and Bradbury, 1996), in which manager most likely to use financial derivatives to manage foreign exchange risk.

The study of Berkman and Bradbury (1996) on all domestic and non financial services firms in New Zealand which held derivative financial instruments at the 1994 balance sheet date find that none of the sample firms used derivatives for speculative purposes. In addition, the study develops and test the hypotheses based on the theory of financial derivatives hedging explained above. Accordingly, the empirical evidence suggested that firms with financial derivatives have specific characteristics, such as: (i) tend to be larger; (ii) have higher leverage; (iii) less liquid; (iv) have greater dividend pay out; (v) have higher use of quasi-equity (i.e., convertible debt) in their capital structure; (vi) have

bigger tax losses carried forward; (vii) have higher long term growth prospects; and (viii) have higher involvement in overseas activities.

Other study done by Dunne et al. (2003) tested 210 listed firms in UK right after introduction of Financial Reporting Standard on Derivatives and Other Financial Instruments No. 13 (FRS 13) in 1998. Some results of Dune et el.'s study (2003) consistent with Berkman and Bradbury's (1996) findings on firm's characteristics, where firms which use financial derivatives for hedging are larger and have higher involvement in overseas activities. In addition, although supported by less strong predictors, the empirical findings suggest that firms use financial derivatives to reduce risk of financial distress and overcome the underinvestment problems.

II.2.   Signalling Theory

Signalling theory emanate from the context of agency theory, in which firm's ownership is separated from its management (Jensen and Meckling, 1976). Further, manager supposed to act as an agent for the benefit of owner who act as principals, by maximizing the firm's value. Such agency relationship incorporates several problems, among others: (i) agency costs; (ii) information asymmetry; (iii) moral hazards; and (iii) adverse selection.

Agent and principals as individuals have their own self-interest, which might be conflicting with others. Contracts between agent and principals are set to protect and bond interests of all the parties involved in the agency relationship. However, no one could make the perfect contract that could fully protect self-interest of the contracting parties involved. This leads to the practice of manager's moral hazard, in which managers try to maximize their self-interest (i.e., utility value) at the cost of firm's value (i.e., adverse selection). Manager's moral hazard to a great extent is due to the condition of information asymmetry favourable for manager who involve in daily operations of the firm. On the other hand, although principals own the firms, yet their access to

information is limted to the information provided by monitoring systems only. Although principals have set bonding contract and monitoring system to protect their self-interests, still, the probability of managers' adverse selection at the costs of principals' interests could never been fully eliminated (i.e., residual loss). For that reasons, agency costs are assumed to be consisted of three kinds of costs: (i) bonding cost; (ii) monitoring costs; and (iii) residual loss.

Due to the assumed condition of information asymmetry, potential investor of public companies use information provided by the monitoring system to asses firm's value. Accounting information provided in the financial statements is considered as one of the most prominent and reliable monitoring system. In the light of these circumstances, managers try to provide signal of firm's performance via financial statements, both directly (i.e., via narrative disclosures) and indirectly (i.e., via accounting numbers), so that firm's value would be more consistent with its performance.

Scott (2006) provide some empirical evidence from public companies in US suggesting that to maintain high equity positions, some managers purposely hold bad news and tend to disclose good news. In addition, high level of leverage often interpreted as signal for good performance, as only companies with good performance are capable of taking such a high leverage risk. Therefore, high-leverage firms are valued higher by investor compared to low-leverage firms (Megginson, 1997).

II.3.   Hypothesis Development

Based on the theory of corporate motive of financial derivatives use as well as signaling theory of accounting information, this study argue that when firms used financial derivatives in their business operations, the firms' performance is associated with factors that motivate managers to use financial derivatives. If financial derivatives are used for hedging purpose, then, firm's value is expected to be more stable. This leads to the following propositions:

Firm's performance is positively associated with manager's motive to use financial derivatives to mitigate fair value risk, cash flow risk, interest rate risk, credit risk and foreign exchange risk.

Firm's performance is defined as volatility of firm's value, assuming that general aim of derivatives use for hedging purpose is to mitigate risks, which resulting in increased stability of firm's value. More specifically, managers' motive to use financial derivatives is hypothesized as follows.

II.3.1. Managers' Motive to Reduce the Cost of Financial Distress.

Financially distressed firms have higher variance of firm's value hence tend to have higher cost of capital (Mayer and Smith, 1982; Smith and Stulz, 1985). To reduce the probability of financial distress (i.e., mitigating the fair value exposure, cash flow exposure and interest rate risk) firms use derivatives hedging aimed at lessening the variance of firm's value and reducing the cost of capital. Based on that argument, the first hypothesis suggested is as follows:

H_1 : Volatility of firm's value is positively associated with cost of capital

II.3.2. Manager's Motive to Reduce Income Tax

Under progressive tax rate, firms with high income volatility are having average tax higher than firms with stable income. For example, in the two consecutive years, due to different tax bracket, firms with loss of Rp. 1 billion,- in the first year and has a profit of Rp.1 billion,- in the second year would pay higher average tax compared to firms which has a profit of Rp.0.5 billion each year. Although cumulative income for these two different firms are equal (i.e., Rp. 1 billion in total), yet, the firm that having profit of Rp. 1 billion would pay higher tax due to the higher rate applied for higher level of income. Accordingly, firms are using financial derivatives hedging to smooth earnings and reduce average tax charge (i.e., mitigating cash flow risk exposure). Hence, progressive income

tax provides incentives for manager to practice tax arbitrage by using financial derivatives for hedging. Therefore, the second hypothesis is as follows:

H2 : Volatility of firm's value is negatively associated with tax arbitrage

II.3.3. Managers' Motive to Overcome Underinvestment Problems

As agent to shareholders, managers might forgo positive Net Present Value project if the gains accrue primarily to debt-holders (i.e., underinvestment problems). This circumstance provide incentives for managers to use derivatives to hedge cash flow exposures, so that the underinvestment problems could be overcome, but at the same time, could also increase the residual claim for shareholders in the future. Accordingly, the third hypothesis is as follows:

H3 : Volatility of firm's value is positively associated with the volatility of future cash flow

II.3.4. Manager's Motive to Mitigate Default-risk as well as Accommodate their Self-interest

If hedging could increase firm's value by reducing its variability, and managers' wealth is dependent on firm's value, then, managers have incentives to use financial derivatives hedging for default-risk aversion as well as to accommodate their economic self-interest. One of risk associated with firm's default is restriction in debt covenants. Accordingly, when firms violate the restriction, then most probably that firm's value would be deteriorated. In addition, as bonus level is often tied to earnings level, manager use financial derivatives to maintain high level of earning. Therefore, the fifth and seventh hypotheses are as follows:

H41 : Volatility of firm's value is positively associated with level of leverage

H$_{42}$: Volatility of firm's value is positively associated with earnings level

II.3.5. Manager's Motive to Overcome Short-term Liquidity Constraint

Manager could resolve conflict of interest between shareholders and debt-holders by implementing low dividend pay-out policy, so that plenty of funds available to pay the fixed claimholders, and the same time, maintaining sufficient liquidity as a means of financial buffers. Accordingly, firms have incentive to use financial derivatives to hedge cash flow risk exposure, maintain stable cash flow and overcome short term liquidity constraint. Based on this argument, the fourth hypothesis is as follows:

H$_5$: Volatility of firm's value is positively associated with short-term liquidity constraint

II.3.4. Manager's Motive to Hedge Foreign Exchange Exposure

Compared to others, firms with overseas operations have higher proportion of forex assets and liabilities relative to its equity, and also, they tend to have higher forex sales proportion. Therefore, they presumably have higher exposures to foreign exchange risk. Accordingly, these kinds of firms tend to use financial derivatives to hedge foreign exchange exposure. Therefore, hypothesis six is as follows:

H$_{61}$: Volatility of firm's value is negatively associated with the net open position between foreign assets and foreign liabilities.

H$_{62}$: Volatility of firm's value is positively associated with proportion of foreign sales

III. Research Methods and Methodology

III.1. Hypotheses Testing

The hypotheses would be tested using the Ordinary Least Square (OLS) regression method based on the following model:

$$Y_1 = a + b_1(X_1) + b_2(X_2) + b_3(X_3) + b_{41}(X_{41}) + b_{42}(X_{42}) + b_5(X_5) + b_{61}(X_{61}) + b_{62}(X_{62}) + \varepsilon,$$

Most of the variables used in the model are adopted from Berkman and Bradbury's study (1996), as defined as follows:

Y_1:   Firms performance (VOL), defined as annualized 30 day volatility of stock return (%)

X_1:   Cost of capital (STRESS), defined as interest expense to total debt ratio (%)

X_2:   Tax arbitrage (TARBIT), defined as ratio of earnings growth/tax growth (%)

X_3:   Volatility of future cash flow (UNINV) defined as ratio of working capital of year n to year n-1 (%)

X_{41}:   Restriction of debt covenant (DER) defined as debt to equity ratio (%)

X_{42}:   Manager's self-interest (MSINT) defined as Ln Earnings Before Interest and Tax/ EBIT

X_5:   Short term liquidity constraint (DIVPR) defined as dividend pay out ratio (%)

X_{61}:   Net open position between foreign assets and foreign liabilities (NFNOPEN) defined as ratio of net open position in foreign currency to total equity (%)

X_{62}:   Proportion of forex sales (FNSALES) defined as ratio of forex sales to total sales (%)

ε: error term

Statistical software SPSS version 14 is used to test the model. General hypothesis of the data is defined as $H_0: b \neq 0$ and $H_A = 0$.

The use of OLS method in hypotheses testing requires several assumptions to satisfy First, OLS assumes the data to be normally distributed. Second, there is no association among independent variables (i.e., no multicollinearity). Finally, the effect of variability of individual company has been addressed (i.e., random effect and fixed effect)

III.2. Sample Selection and Data Description

Non-probability sampling method (i.e., purposive sampling method) is applied to choose non-bank and non-financial institutions companies listed in Jakarta Stock Exchange predicted to be significantly involved in financial derivatives transactions. The observation covers 5 years period when the PSAK 50 (i.e., accounting standar "Financial Instruments: Presentations and Diclosures" published on 15 July 1998) and PSAK 55 (i.e., accounting standard "Financial Instruments: Recognition and Measerements" published on 21 September 1998) have been effective, which is from 2001 to 2006.

Examination of notes to financial statements on particular account predicted to be associated with risk exposures (i.e., financial assets, financial liabilities and sales) was conducted to identify firms predicted to be significantly involved in financial derivatives transactions. Further, the study assumes that risk exposures are sustained as the risks are associated with firms' business process. Hence, when the examination showed that firms disclose the use of financial derivatives on year 2006, it was assumed that the firms had been using the financial derivatives since year 2001. Based on the sample selection procedure, 73 (seventy three) companies listed during 2001 to 2006 were identified, resulting 438 firms-years pooled data available for observations before data cleaning. The research used Bloomberg database as data source. Descriptive statistic for the variables identified by the SPSS software is shown in the following table.

Table 1
Statistic Descriptive
Dependent and Independent Variable of the Identified Sample

	DEPN.VAR	INDEPENDENT VARIABLES							
	VOL30	STRESS	TABIT	UNINV	DER	MSINT	DIVPR	NFNOPEN	FNSALES

The table above shows that dependent variable VOL30 is highly dispersed, range from the minimum 4.96 to the maximum 219.74. Notably, the variance is quite high, which is 1,182.11, far above standard deviations of 34.38 and mean of 57.14. Most of the independent variable are highly skewed, except for MSINT and FNSALES, which are -1.38 and 0.6 consecutively. Correlations among variables in the model are presented in Table 2 below.

		STRESS1	FNSALES	NFNOPEN	VOL30	TABIT	UNINV	MSINT1	DIVPR	DER

	N									415

* One tailed-test - significant at 5% level

** One tailed test - significant at 1% level

The results of Pearson correlations statistical test above shows some significant correlations between dependent variable VOL30 with independent variables as follows: (i) positively correlated with tax arbitrage (TABIT) at 1% level, cosistent with H2; (ii) negatively correlated with earnings level (MSINT) at 5% level, consistent with H42; (iii) positively correlated with short term liquidity constraint (DIVPR) at 5% level, consistent

with H5; and (iv) positively correlated with the proportion of foreign sales (FNSALES) at 1% level, consistent with H62.

SPSS check the completeness of the variables included in the model, resulting 24 firms left or equal to 66 firm-years data to be tested in the model. Descriptive statistic for the data included in the model after cleaning the outlier data (i.e., 3 standard devitation) is presented in the table below.

Table 3
Statistic Descriptive
Dependent and Independent Variable of the Data Tested (N=66)

N=66	DEPN.VAR	INDEPENDENT VARIABLE							
	VOL30	STRESS	TABIT	UNINV	DER	MSINT	DIVPR	NFNOPEN	FNSALES
Mean	52.70	7.49	0.73	3.56	196.45	10.94	16.71	-31.50	43.39
Std. Dev.	28.62	6.94	3.52	26.43	722.93	3.25	16.58	183.85	34.60

Notably, Table 3 shows some differences of the central tendency statistics (i.e., the value of means and standard deviations) of the data included in the model compared to the original data previously presented in Table 1, most particularly for the data with high skewness level. Presumably, this relates to the data distribution included in the model, which is better normally distributed compared to the original data.

IV.   Empirical Results, Analysis and Interpretation

The results of OLS regression is presented in the Table 4 below

Table 4
The Results of OLS Regression
(Dependent Var.: VOL30)

Independent Variables	Standardized Coefficients	t	Sig.	Collinearity Statistics	
	Beta			Tolerance	VIF

*   Significant at 5% level
** Significicnat at 1% level

o   The variables included in the model are defined as follows: (i) VOL30: firms performance, defined as %`annualized volatility of stock return; (ii) STRESS: expected cost of financial distress, defined as % cost of debt; (iii) TABIT: tax arbitrage, defined as % of growth in net income to growth in inome tax; (iv) UNINV: volatility of future cash flow, defined as % of working capital of year n to year n-1; (v) DER: restriction of debt covenant, defined as % of debt to equity; (vi) manager self interest, defined as Ln earnings before interest and tax; (vii) DIVPR: short term liquidity constraint, defined as dividend pay out ratio (%) ; (viii) NFNOPEN: proportion of forex assets and liabilities, defined as % of net open position in foreign currency to total equity; (ix) proportion of forex sales, defined as % of forex sales to total sales.

o   The model is statistically significant at less than 1% level, with R-square is 48.83% and adjusted R-square is 41.65%

o   The results of Durbin-Watson test is 1.98 at less than 1% level, suggesting that no autocorrelation of the residuals. Hence, no indication of underestimation on the level of statistical significance.

o   The result of collinearity test suggests that no multicollinearity problems found in the model, in which Tolerance value is close to 1 and VIP value is less than 10

Empirical results presented in Table 4 suggest that for firms using financial derivatives instruments in Indonesian context, their volatility of market return is: (i) positively influenced by the cost of capital as stated in H1; (ii) negatively influenced by tax arbitrage as stated in H2; (iii) positively influenced by restriction of debt covenant as stated in H41; (iv) negatively influenced by the net open position of forex (v) positively influenced by the proportion of foreign sales, as stated in H62. Hence, test results of the data suggest that H3, H42 and H5 are rejected. Apparently, volatility of future cash-flow, earnings level and short-term liquidity constraint do not influence volatility of firm value.

As hypothesized, the empirical findings indicate that in Indonesia, firms (i.e., managers) use financial derivatives for the following purposes: (i) to reduce the probability of financial distress aimed at lessening variance of firm's value and reducing the cost of capital; (ii) to smooth earnings and reduce average tax charge; (iii) to reduce default-risk related to restriction of debt covenants; (iv) to reduce forex risks exposure associated with foreign operations and foreign sales. This means that under the current GAAP, accounting information has a capability to signal risk associated with: (i) fair value exposure related to the cost of capital; (ii) cash flow exposure related to tax arbitrage as well as underinvestment problems; (iii) interest rate risk related to limitations of debt covenants; (iv) forex risk related to foreign operations and foreign sales.

V.   Research Limitations and Suggestions for Future Research

The purposive sampling method in this study excludes firms without financial derivatives from the investigations. This relates to the assumptions of managers' motive which use financial derivatives to hedge certain types of risks. However, hedging could also be done naturally without using financial derivatives. Therefore, future research should investigate whether Indonesian GAAP could also capable of signal the risk for the firms that use natural hedging to mitigate the risks. This would involve inclusion of all non bank and non financial institutions listed firms as the sample. If financial derivatives are

preferred to natural hedging, then, it is expected that certain accounting measures used in this model for firms with financial derivatives would be significantly different to firms without financial derivatives.

In addition, future research should also investigate the capability of accounting standard that specifically addressed financial derivatives and other financial instruments (i.e., PSAK 50 "Financial Instruments: Presentation and Disclosures" and PSAK 55 "Financial Instruments: Recognition and Measurements") to signal the associated risks. This is important, considering the big effort conducted to improve accounting standard on derivatives and other financial instruments in the national as well as international level, besides the continuing failure of accounting information to signal firm's default associated with derivatives and other financial instruments. Currently, PSAK 50 and PSAK 55 have undergone some major revisions aimed to be more aligned with IAS 32 and IAS 39 of International Financial Reporting Standards. The revised versions were planned to be effective by the beginning of year 2009. However, due to recent global financial crisis, in which most of the capital markets were highly distressed, then, implementation of the revised version of PSAK 50 and PSAK 55 were delayed until the early 2010.

AUDIT COMMITTEE ATTRIBUTES, FINANCIAL DISTRESS AND THE QUALITY OF FINANCIAL REPORTING IN MALAYSIA

Wan Nordin Wan-Hussin & Noor Marini Haji-Abdullah
Universiti Utara Malaysia
November 2009

ABSTRACT

Audit committee effectiveness remains one of the significant themes in corporate governance debates. We examine the association between audit committee characteristics, financial distress and the quality of financial reporting. This study is one of the few studies that overcome the imprecision inherent in the abnormal accruals/earnings management models as a proxy of the financial reporting quality, by using a more direct measure of financial reporting quality. The evidence suggests that the desirable characteristics which the policy makers believe would enhance the effectiveness of the audit committee in carrying out its financial oversight responsibilities do not seem to yield the intended consequence. The significant finding on the association between financial distress and financial reporting quality reinforces the importance of including distress variable in future corporate transparency study.

JEL code: G32

Keywords: Audit committee, financial reporting quality, Malaysia

INTRODUCTION

In the wake of a series of highly publicized accounting scandals around the world (see, for example, Enron and Worldcom in the US, Parmalat, Ahold, Gescartera and BBVA in Europe and Transmile in Malaysia), the effectiveness of audit committee in monitoring the financial reporting process is one of the significant themes in corporate governance debates (Gendron & Bedard, 2006). These high profile governance failures have led to the introduction of significant corporate governance regulatory reforms, which focused on the structures of audit committee, to improve the quality of governance over financial reporting. For example, the Blue Ribbon Committee (1999) in the US recommends a minimum size of three audit committee members, the independence of the board members who serve on the audit committee, and financial expertise of the audit committee members [266]. The Sarbanes Oxley Act (2002) or SOX brings further improvements in the corporate governance environment with audit committees that are substantially more active and diligent and possessing greater expertise and power to fulfill its expanded responsibilities (Cohen, Krishnamoorthy, & Wright, 2009). SOX requires that all audit committee members be independent and that the company's annual report disclose whether a member of the audit committee is a financial expert (Engel, Hayes, & Wang, 2009). SOX also stipulates that audit committees appoint, compensate, and oversee the external auditor (Section 301).

---

[266] The Blue Ribbon Committee (BRC) was established by the National Association of Securities Dealers and New York Stock Exchange at the behest of Arthur Levitt, the then Chairman of the Securities and Exchange Commission (SEC). SEC subsequently adopted certain recommendations by the BRC with effect from Dec 15, 2000.

The situation in Malaysia with regards to audit committee is not much difference from the US. Since 1994, the Bursa Malaysia Listing Requirements have required a listed company to appoint an audit committee which meets the following requirements; (1) must be composed of not fewer than three members; (2) a majority of the audit committee must be independent directors; and (3) at least one member of the audit committee must be a member of the Malaysian Institute of Accountants (MIA) or possesses sufficient accounting experience and qualification, or deemed "financially literate" by the stock exchange.[267] In the 2007 enhancements to the voluntary Malaysian Code on Corporate Governance (2001), it is stipulated that all audit committee members to be non-executives and financially literate with at least one of them is a member of an accounting association or body.

Beasley, Carcello, Hermanson, & Neal (2009) note that the bulk of past studies which examine the efficacy of the audit committee attributes as proposed by the regulators mainly focused on the association between certain audit committee inputs (e.g. audit committee member independence, expertise and diligence) and financial reporting outputs. They conclude that these quantitative studies generally find that a more independent, expert and diligent audit committee is associated with higher quality financial reporting and auditing. However, the recent corporate governance disaster at Hollinger International Inc. despite having audit committee members who possess all the desirable attributes (financially literate, independence and meet frequently) and Enron

---

[267] The Bursa Malaysia Corporate Governance Guide (2009) defines a member of audit committee as financially literate if he/she has the ability to read and understand financial statements, ability to analyze financial statements and ask pertinent questions about the company's operations against internal controls and risk factors, and ability to understand and interpret the application of approved accounting standards (p. 56).

where "The audit committee followed all the rules – but it let the shareholders down" (Business Week, 2002, p. 28), triggers them to probe deeper into "Do audit committee appear to provide substantive oversight of financial reporting, or do they appear to be primarily ceremonial bodies designed to create legitimacy?" Through in-depth interviews with audit committee members, they reveal that audit committee practices contain a mixture of substantive monitoring of financial reporting and ceremonial practices, consistent with Cohen, Krishnamoorthy, & Wright (2002) who document that audit partners generally perceive "audit committees are ineffective and are not powerful enough to resolve contentious matters with management" (p. 586).

Another stream of emerging research focused on whether audit committee members who are independent in form are also independent in substance (Gendron & Bedard, 2006; Cohen et al., 2009). These studies reveal that senior management has significant role in board and audit committee appointment, and it is possible that management appoints passive, compliant audit committee members who satisfy regulatory requirements but provide minimal oversight over management's actions. This suggests that at least some changes in governance may have been more form than substance. We continue with this line of investigation and examine whether firms imbued with the prime features needed by audit committee members are associated with reliable financial reporting in Malaysia.

Previous Malaysian studies provide mixed results on the desirability of the audit committee attributes, as proposed by the regulators. For example,

Bradbury, Mak, & Tan (2006) and Mohd-Saleh, Mohd-Iskandar, & Rahmat (2007) document that independent audit committee enhances financial reporting quality, whereas Abdullah & Mohd-Nasir (2004) and Abdul-Rahman & Mohamed-Ali (2006) show otherwise. Ismail, Mohd-Iskandar, & Rahmat (2008) and Abdul-Rahman & Mohamed-Ali (2006) do not find any evidence to indicate that audit committee activeness and financial literacy significantly impact financial reporting quality. However, Ismail, Mohd-Iskandar, & Rahmat (2008) find that audit committee multiple directorship impacts corporate reporting quality.

Thus, to help inform policy makers on the efficacy of their regulatory reforms, this study investigates whether audit committee characteristics such as the size of audit committee, independence of audit committee, audit committee meeting frequency and attendance, financial literacy of audit committee and multiple directorships held by audit committee members in other public listed companies would affect the quality of financial reporting.

Malaysia provides another suitable setting to evaluate the efficacy of prescribing certain "best practices" for audit committee since all listed companies in Malaysia are required to include in their annual reports, a report on the profile, composition, frequency and attendance of meeting, terms of reference and summary of activities carried out by the audit committee and summary of internal audit activities. We indicate the quality of financial reporting as high when the company won the prestigious annual award given by the stock exchange, and low when the company was publicly reprimanded by the stock exchange for violating the Listing Requirements pertaining to mandatory corporate disclosures, or the company received disclaimer audit opinion because the auditors were

not able to ascertain the accuracy of the financial statements. In overseeing the financial reporting, the audit committee is responsible, among others, in assessing the appropriateness of management's selection of accounting policies and disclosures in compliance with approved accounting standards, ensuring timely submission of financial statements by management, reviewing significant or unusual transactions and accounting estimates and assessing whether the financial report presents a true and fair view of the company's financial position and performance and complies with regulatory requirements (Bursa Malaysia Corporate Governance Guide, 2009, para 2.2.2).

Thus, our study is one of the few studies that overcome the imprecision in using the earnings management models as a proxy of the financial reporting quality by using a more direct measure of financial reporting quality to provide further evidence on the effectiveness of audit committee. The main problem with the abnormal accrual models is the presence of measurement error in detecting whether earning management has or has not taken place (Dechow, Sloan, & Sweeney, 1995; Guay, Kothari, & Watts, 1996; McNicholls & Wilson, 1998; Dechow & Dichev, 2002).

In addition, following Rosner (2003) and Garcia-Lara, Garcia-Osma, & Neophytou (2009), we incorporate financial distress indicator in the financial reporting quality model. Most earnings management studies in the past may suffer from omitted variable bias by not including the distress variable. And given that the role of the audit committee chairperson is highlighted in the Malaysian Code on Corporate Governance (2007)[268], Bursa Malaysia Corporate Governance Guide (2009)[269] and the Malaysian

---

[268] Under the Code, the best practices in corporate governance include:
The chairman of the audit committee should engage on a continuous basis with senior management, such as the chairman, the chief executive officer, the finance director, the head of

Corporate Governance Index 2009 endorsed by Minority Shareholder Watchdog Group, we also include the background of the audit committee chairperson in terms of degree of independence, accounting financial expertise and multiple directorships in the robustness tests. An empirical study by Engel et al. (2009) shows that the quality of audit committee, proxied by the accounting financial expertise of the chairperson, is positively related to the level of audit committee compensation.

The findings show that audit committee size and financial distress influence the quality of financial reporting. The other audit committee attributes such as independence, board seats in other companies, frequency of and level of attendance at audit committee meeting and financial literacy are not significantly related to the quality of financial reporting. There is also no association between financial reporting quality and the audit committee chairman independence, financial literacy and multiple directorships. All in all, the evidence suggests that the desirable characteristics which the policy makers believe would enhance the effectiveness of the audit committee in carrying out its financial oversight responsibilities do not seem to yield the intended consequence.

The rest of the paper is organized as follows. The next section reviews the relevant studies and presents the research hypotheses. Then we describe the research method and discuss the results. The concluding section is devoted to the implication of

internal audit and the external auditors in order to be kept informed of matter affecting the company. Through the engagements, relevant issues affecting the company can be brought to the attention of the audit committee in a timely manner.
[269] The Guide emphasizes that a key element for a successful audit committee is a strong chair demonstrating depth of skills and capabilities. The audit committee chairman should assume, among others, the following responsibilities: planning and conducting meetings, overseeing reporting to the board, encouraging open discussion during meetings and developing and maintaining an active ongoing dialogue with senior management and both the internal and external auditors. The chair is also accountable for the agenda of the audit committee meeting and should not delegate it to management.

our study for investors, regulators and academics who are examining the audit committee oversight process.

PRIOR STUDIES AND HYPOTHESIS DEVELOPMENT

Agency theory suggests that shareholders require protection because management (agents) may not always act in the interests of the absentee owners (principals) (Jensen & Meckling, 1976; Fama & Jensen, 1983). To deal with this agency problem, the board assumes an oversight role that typically involves monitoring the Chief Executive Officer (CEO) and other top executives, approving the company's strategy, and monitoring the internal control over financial reporting. Given board diverse responsibilities, the board of directors delegates some of its oversight to the audit committee and other committees of the board.

The issue of audit committee's effectiveness in monitoring the financial reporting process was examined by, among others, Klein (2002), Felo, Krishnamurthy, & Solieri (2003), Xie, Davidson, & DaDalt (2003), Abbott et al. (2004), Bédard, Chtourou, & Courteau (2004), Persons (2005), Lin, Li, & Yang (2006), Qin (2007) and Archambeault, DeZoort, & Hermanson (2008). They examine the association between audit committee characteristics and incidence of fraud or restatements or extent of earnings management or disclosure quality. We summarize below the arguments that link audit committee characteristics and financial reporting quality and provide the empirical evidence on the relationship. In addition, we also discuss the financial reporting behavior among financially distressed firms to illustrate the need to include distress variable in study on financial reporting quality.

Size of Audit Committee

As mentioned earlier, the Bursa Malaysia Listing Requirements require a listed company to appoint audit committee from amongst its directors which must be composed of not fewer than three members. A larger audit committee may make it more likely that potential problems in the financial reporting process will be uncovered and resolved. This could arise if a larger committee size increases the resources available to the audit committee and improves the quality of oversight. Felo et al. (2003) document a positive relationship between financial reporting quality and audit committee size in a univariate analysis but this relationship does not hold in the multivariate analysis. In Malaysia, Ahmad-Zaluki & Wan-Hussin (2009) provide evidence that audit committee size is positively associated with the quality of financial information disclosure, proxied by the accuracy of IPO management earnings forecast. Based on the above, the following hypothesis is proposed:

> H1:   Larger audit committee size is associated with higher quality of financial
>   reporting.

Independence of Audit Committee

The role of audit committee is to safeguard an organization by its authority to question top management regarding the way financial reporting responsibilities are handled, as well as to make sure that corrective actions are taken. In a famous speech by Arthur Levitt entitled "The Numbers Game", the former Chairman of the Securities and

Exchange Commission remarked that "qualified, committed, independent and tough minded audit committees represent the most reliable guardians of the public interest".

The Listing Requirements of Bursa Malaysia stipulates that all listed companies to have audit committees comprising three members whom a majority shall be independent. The term independent in the Malaysian context refers to two crucial aspects, independence from management and independence from significant shareholder. The Revised Malaysian Code on Corporate Governance 2007 reinforces the desirability of audit committee independence by excluding executive directors from membership. Meanwhile, SOX requires firms to have audit committees comprised solely of independent directors, i.e. those not an affiliate of the firm and not accepting any compensation from the firm other than directors' fees.

Many studies have uncovered empirical regularities that audit committee independence enhances the quality of financial reporting. Klein (2002), Abbott et al. (2004), Bédard et al. (2004), Persons (2005) and Archambeault et al. (2008) show that audit committee independence reduce earnings management, or the likelihood of financial reporting restatement and financial reporting fraud. Krishnan (2005) finds that independent audit committees are significantly less likely to be associated with the incidence of internal control problems over financial reporting. These studies support the view that independent audit committees contribute positively to the financial reporting process, which motivate the following hypothesis:

H2: Higher percentage of independent directors in audit committee is associated with higher quality of financial reporting.

Audit Committee Meeting Frequency and Attendance

The National Committee on Fraudulent Financial Reporting, also known as Treadway Commission (1987), states that an audit committee, which intends to play a major role in oversight, would need to maintain a high level of activity. The audit committee should meet regularly, with due notice of issues to be discussed and should record its conclusions in discharging its duties and responsibilities. In the same vein, The Malaysian Code on Corporate Governance (2001) posits that audit committee which does not meet or meets only once is unlikely to be an effective financial monitor. The Revised Code (2007) advocates an increase in the frequency of meetings between the audit committee and the external auditor without the executive board members present to at least twice a year. This encourages a greater exchange of free and honest views and opinions between both parties.

The Guidelines for Audit Committees in the UK are particularly useful on the issue of timing of audit committee meetings. The number of meetings required in a year depends on the company's terms of reference and the extent of the complexity of the company's financial operations. The Guidelines state that the main meetings are often planned between the end of one year's audit and the

beginning of the next, before the issue of the **Interim Statements, after the** Interim Results and after the year end, but before the accounts are finalized.

Menon & Williams (1994) contend that the more often an audit committee meets, the more active it is being perceived, which leads to fewer financial reporting problems. Xie et al. (2003) and Vafeas (2005) document that when audit committee meets more frequently, discretionary accruals are lower and there is lower likelihood of firm reporting a small earnings increase, which indicates better financial reporting quality. Abbott et al. (2004) document that higher levels of committee activity (measured by holding a minimum of four meetings) are significantly related to a lower incidence of financial restatement. These studies provide evidence in support of the view that audit committees which meet more often are more effective in monitoring management and can potentially enhance the quality of financial reporting.

There are several dimensions that can be used to indicate audit committee activity such as meeting frequency, meeting duration and time allocation among different functions, meeting regularity, information exchange at the meetings, and whether executive directors are present at meetings and level of attendance of audit committee members. Due to archival data constraint, the two dimensions of activity that are examined in this study are frequency of audit committee meeting and the level of attendance of audit committee members. Based on the above discussion, two sub-hypotheses are formulated:

H3a: Higher frequency of audit committee meeting is associated with higher quality of financial reporting.

Besides regular meetings, the level of attendance of audit committee members can also be used to measure the activeness of audit committee members. Even though the frequency of meeting is high but if the attendance levels are poor this may impair the effectiveness of audit committee. It is posited that the higher the level of attendance of audit committee members, the more active and participative the audit committee is, therefore the better is the quality of financial reporting.

> *H3b: Higher level of attendance of audit committee members is associated with higher quality of financial reporting.*

Financial Expertise of Audit Committee

Audit committees are responsible for numerous duties that require a high degree of accounting sophistication such as understanding auditing issues and risks as well as the audit procedures proposed to address them, comprehending audit judgments and understand the substance of disagreement between management and external auditor, and evaluate judgmental accounting areas. DeZoort & Salterio (2001) show that audit committee members with previous experience and knowledge in financial reporting and audit are more likely to make expert judgments than those without. Xie et al. (2003), Abbott et al. (2004) and Bédard et al. (2004) document that audit committee financial expertise reduces financial restatements or constrain the propensity of managers to engage in **earnings management. DeFond, Hann, & Hu (2005) document that appointment of**

accounting financial experts generates positive stock market reaction, in line with market expectation that the audit committee members' financial sophistication are useful in executing their role as financial monitors. Krishnan (2005) and Zhang, Zhou, & Zhou (2007) find that firms are more likely to be identified with deficiencies in internal control over financial reporting, if their audit committees have less financial expertise. All in all, these studies suggest that financially knowledgeable audit committee members that possess accounting qualifications are more likely to prevent and detect material misstatements. Thus, the following hypothesis is proffered:

H4:   Higher percentage of audit committee members who are financial experts is associated with higher quality of financial reporting.

Audit Committee Members with Board Seats in Other Companies

Morck, Shleifer, & Vishny (1988) state that monitoring of top officers requires time and effort. As the additional directorships on other firms' board increase, demands on the individual board member's time decrease the amount available for the director to effectively fulfill monitoring responsibilities at a single firm. Shivdasani (1993) contends that multiple directorships hold by board members is a double edged sword. On one hand, it is important in terms of adding to the experience, but on the other hand, it can cause limitation of time and

commitment for board members to perform effectively. Persons (2005) finds that the likelihood of financial statements fraud is lower when audit committee members hold fewer directorships with other firms. Meanwhile, Song & Windram (2004) and Vafeas (2005) find that multiple outside directorships may not undermine audit committee effectiveness. One possible interpretation of this result is that under a certain limit, outside directorships enable directors to acquire specific experience from other companies. Given the inconclusive finding, the following hypothesis (non-directional) is proposed:

H5: The number of outside directorships per audit committee member affects the quality of financial reporting.

Financial Distress

For an entity experiencing financial distress, the quality of financial reporting is often proxied by the tenor of the relevant financial statement notes and of the liquidity section of the Management Discussions & Analysis (MD&A). Carcelo and Neal (2003) find that there is a significant positive relation between the percentage of affiliated directors on the audit committee and the optimism of both the financial statements notes and MD&A discussions for financially distressed entities. This evidence corroborates the finding by Jones (1996) that managers in financially distressed firms would prefer no disclosure or optimistic disclosure because they believed that disclosure of the going concern problems may adversely affect the entity's stock price. Similarly, Koch (2002) contends that management earnings forecast issued by distressed firms exhibit greater upward bias and

are viewed as less credible than similar forecasts made by non-distressed firms. Meanwhile, Holder-Webb & Cohen (2007) in their study of firms entering financial distress, find that the firms increase the disclosure quality of MD&A in the year of initial distress. However, sustained increases in the disclosure quality are limited to firms that subsequently recover from distress.

Apart from examining the MD&A, very limited studies have compared the accruals quality between financially distressed firms and non-distressed firms. Rosner (2003) shows that financially distressed firms are more likely to exhibit signs of material income increasing earnings manipulation than those of non-distressed firms. Likewise, Garcia-Lara et al. (2009) show that managers resort to both accrual manipulation and real activity manipulation in the years leading up to bankruptcy. Based on the above discussion that points to the low reliability of financial report emanates from financially distressed firm with propensity to camouflage its real performance, the following hypothesis is derived:

H6: Firm experiencing financial distress is associated with low financial reporting quality.

METHODOLOGY

According to Cohen, Krishnamoorthy, & Wright (2004) and Pomeroy & Thornton (2008), there is a lack of consensus on how to operationalize financial reporting quality. Dimensions of financial reporting quality that have been used by previous researchers include incidence of financial restatements and fraudulent financial reporting, weaknesses

in internal controls, and earnings quality using constructs such as earnings response coefficient and discretionary or abnormal accruals. Given that the public disclosure of financial restatements due to misrepresentation, fraudulent financial reporting and weaknesses in internal controls are rare in Malaysia, this study proxies the quality of financial reporting according to whether the company is a winner of the Stock Exchange Corporate Award (KLSE Award) or is meted disciplinary action by the KLSE for deficient corporate reporting, or is a recipient of disclaimer audit opinion.[270]

The KLSE Corporate Awards recognize listed companies which have shown exemplary corporate conduct in complying with the Listing Requirements. In addition, the Award recognizes public listed companies which have demonstrated high standards of corporate governance, disclosure and transparency coupled with proactive investor relations efforts. Importantly, these Awards also seek to promote international best practices by public listed companies. In February 2004 it was announced that 40 companies won the 2003 KLSE Corporate Awards, the last year the Awards were given since they were started in 1999, including four financial institutions. In this study, the winners of KLSE Awards, excluding financial institutions, are deemed to have good quality financial reporting (see Appendix 1).

On the other hand, companies which were fined and/or publicly reprimanded by the Stock Exchange for failure to comply with certain provisions in the Listing Requirements are considered to have poor financial reporting quality. In 2003, disciplinary actions were taken against 21 companies, and the natures of the offences of

---

[270] KLSE is the abbreviation for Kuala Lumpur Stock Exchange, which is now known as Bursa Malaysia.

each company are described in Appendix 2. These companies are considered to have low quality of financial reporting because they failed to comply with some of the qualitative characteristics of financial information such as timeliness and relevance. Another dimension of poor financial reporting quality used in this study is when the auditors are not able to express an opinion on whether the financial statements give a true and fair view. For financial year ended 2003, we identify 11 such companies (see Appendix 3). Thus, unlike previous studies, our research design which focuses on companies with extremely high and low financial reporting quality provides us with a more competent and powerful test to identify characteristics of audit committee that matters in enhancing financial reporting quality.

The study uses logistic regression analysis to test the hypotheses. Maddala (1991) states that logistic regression is appropriate where disproportionate sampling from two populations occurs. Studies on the effectiveness of audit committee that have used logistic regression include and Felo et al. (2003), Abbott et al. (2004), Song & Windram (2004), Lin et al. (2006), Pucheta-Martinez & De Fuentez (2007) and Archambeault et al. (2008). The regression is specified as follows:

$$\textit{Dependent Variable} = \alpha + \textstyle\sum\beta\,\textit{Audit Committee Attributes} + \pi\,\textit{Distress}$$

$$+ \textstyle\sum\mu\,\textit{Controls} + \varepsilon \tag{1}$$

If a non-finance company has been awarded the KLSE Awards, the dependent variable = 1. If a company has received a public reprimand (with

or without fines imposed) by the Stock Exchange or disclaimer audit opinion, the dependent variable = 0. The variables associated with audit committee attributes are defined as follows: *ACSIZE* denotes audit committee size, *ACIND* denotes the proportion of audit committee members who are independent directors, *ACLIT* denotes the proportion of audit committee members who are financial experts i.e. members of professional accounting bodies, *ACFREQ* denotes the number of audit committee meetings held during the year, *ACATT* denotes the percentage of members who attended the audit committee meetings during the year, *ACMULT* denotes the percentage of audit committee members with board seats in other listed companies, *ACCHINDLIT* is a dummy variable which takes the value of 1 if audit committee chairperson is both independent and a financial expert and 0 otherwise, *ACCHMULT* is a dummy variable which takes the value of 1 if audit committee chairperson has directorship in other listed companies and 0 otherwise, and *DISTRESS* is a dummy variable which takes the value of 1 if the Z-score is below 2.07 based on the widely used Altman (1993) distress model[271] and 0 otherwise. The control variables are BIG-3, which takes a value of 1 if the company is audited by Ernst and Young, KPMG or PricewaterhouseCoopers and 0 otherwise, ROA

---

[271] The Altman distress model is computed as follows:

$Z = 1.2*$(working capital/total assets)$ + 1.4*$(retained earnings/total assets)$ + 3.3*$(EBIT/total assets)$ + 0.6*$(market value of equity/total liabilities)$ + 1.0*$(net sales/total assets).

It is used in Malaysian studies by Nor and Chin (2002), Gul (2006) and Hasnan et al. (2009).

which is net income divided by total assets, and *FIRMSIZE* which is the natural log of total assets.

Our data sources are Bursa Malaysia website, and the annual reports of the respective companies for financial years ended 2002 and 2003. We used the annual reports ended 2002 for companies that won the 2003 KLSE Corporate Excellence Awards having financial year ending in October, November and December. We used the annual reports ended 2003 for all the remaining companies.

FINDINGS

Table 1 shows the sample partitioned by quality of financial reporting, type of auditor, distress indicator and the background of the audit committee chairperson. Out of 36 non-financial firms that won the KLSE Awards, 26 (or 73 percent) were audited by the Big-3 firms of Ernst and Young, KPMG or PricewaterhouseCoopers. On the other hand, out of the 32 firms that were reprimanded for violating the Listing Requirements or issued disclaimer audit opinion, 17 (or 53 percent) were audited by non Big-3. Almost two third of companies with good financial reporting quality do not have distress indicator, whereas 88 percent of companies with poor financial reporting quality have distress indicator.

About two-thirds of the sample firms have audit committee chairperson who is also directors in other listed companies. The instances of audit committee chairperson who is both independent and a financial expert are lower among the high quality financial reporting firms than the low financial reporting firms (22 percent vs. 34 percent). The

chi-square tests (not shown in Table 1) indicate there are associations between the quality of financial reporting and type of auditor and between the quality of financial reporting and distress indicator.

(Insert Table 1 here)

Table 2 shows the descriptive statistics of the sample partitioned by quality of financial reporting, either good or poor. Univariate analyses (*t-test*) showing comparison between poor financial reporting companies and good financial reporting companies are also shown for each of the variables of interest, and control variables. The average audit committee size for the full sample is 3.8. The average audit committee size for the good quality companies is slightly higher than the poor quality companies (4.1 vs. 3.5). All the companies in the sample have an audit committee with at least 3 members, which is in accordance with the Listing Requirements. On average, 73 percent of audit committee members are independent. All companies in the sample have audit committee where the majority is independent directors. The difference in means on audit committee independence between poor and good quality companies (0.69 vs. 0.76) is statistically significant. With regards to financial expertise of audit committee members, on average, one third of audit committee members is considered expert.

The average audit committee meeting frequency is the same for good and poor financial reporting companies at 4.75 times. Another way to measure the activeness of audit committee is to look at the audit committee meeting attendance. The level of

attendance is higher (although insignificant) for good quality companies than poor quality companies whereby on average 94 percent of members attended the audit committee meetings of high financial reporting quality companies, as compared to 91 percent for poor financial reporting quality companies.

On average, nearly 60 percent of audit committee members are also directors in other listed companies, with good financial reporting quality companies have higher multiple directorships among its audit committee members than their counterparts (64 percent vs. 56 percent), although the difference is not significant. High financial reporting quality companies also have higher *Z-score*, albeit insignificant, than low financial reporting quality companies. In terms of firm's performance, high financial reporting firms perform significantly better than low financial reporting firms, with their average *ROAs* at 5.3 percent and -40 percent respectively.

To summarize, the evidence from Tables 1 and 2 shows that firstly, the incidence of engaging Big-3 audit firm is significantly higher for good financial reporting companies than poor financial reporting companies, and secondly the audit committee size and audit committee independence for good financial reporting companies are significantly higher than poor financial reporting companies. More companies in the poor financial reporting quality category have distress indicator than their counterparts in the good financial reporting quality category, although the difference in the *Z-score* means between the two categories is not statistically significant. Poor financial reporting firms are also smaller and have lower return on assets than their counterparts.

(Insert Table 2 here)

1531

Table 3 shows the correlation analysis among the independent and control variables. Based on the correlation matrix, the correlation coefficients among the variables are all less than 0.6 except for the Spearman correlation between *DISTRESS* and *ROA* which is -0.62, which indicates that multicollinearity problem is not a cause for concern. This is further supported by the variance inflation factors of less than 2, when ordinary least square regressions are run for all the various models

(Insert Table 3 here)

Table 4 presents the regression results. In all the models the common variables are audit committee size, financial distress and the control variables. In Model 1, the additional audit committee attributes tested are the degree of independence and accounting financial expertise of audit committee members, In Model 2, we include the diligence of audit committee in terms of frequency of meeting and level of attendance at meetings, alongside with audit committee member with multiple directorships. In Model 3, we focus on the background of the audit committee chairperson. Based on the results, none of the audit committee attributes influence the quality of financial reporting, except for audit committee size in Model 2. Good financial reporting companies are more likely to have larger audit committee size than poor financial reporting companies. This is consistent with the evidence by Lin et al. (2006) who

show that a larger audit committee provides more oversight over the financial reporting process and reduces the probability of restating financial statements after their original filings with the SEC, but contrasts with the evidence from Felo et al. (2003), Abbott et al. (2004) and Bédard et al. (2004).

Our finding that independent audit committee is not associated with the quality of financial reporting is in contrast with previous Malaysian studies such as Abdullah and Mohd-Nasir (2004) and Abdul-Rahman and Mohamed-Ali (2006) that uses abnormal accruals as proxy for financial reporting quality. However, it is in tandem with Bradbury, Mak, & Tan (2006) and Mohd-Saleh, Mohd-Iskandar, & Rahmat (2007). Similar to previous Malaysian studies such as Ismail, Mohd-Iskandar, & Rahmat (2008) and Abdul-Rahman and Mohamed-Ali (2006), we do not find any evidence to indicate that audit committee activeness and financial literacy significantly impact financial reporting quality. We also find no association between audit committee multiple directorship and corporate reporting quality, which challenges previous finding by Ismail, Mohd-Iskandar, & Rahmat (2008).

Poor financial reporting companies are also more likely to have distress indicator consistent with the univarite results presented in Table 1 earlier. Consistent with Table 2, the results in Table 4 also indicate that larger and better performing firms are more likely to exhibit higher financial

reporting quality. Overall, there is very little support for hypotheses 1 to 6. Although the variables associated with the hypotheses are not statistically significant, the signs of the coefficients are in the predicted directions.

The accuracy of the model indicates that the percentage of correct classification is very high at above 85 percent. The Nagelkerke R squared also indicates that about 75 percent of all variation in the quality of financial reporting is explained by the models. Although not tabulated in Table 4, when we include all the hypothesized variables and the control variables, the results are qualitatively similar. The significant variables are *DISTRESS*, *ROA* and *FIRMSIZE*, whilst all of the audit committee attributes are insignificant.

(Insert Table 4 here)

CONCLUSION

Audit committee effectiveness remains one of the significant themes in corporate governance debates (Gendron and Bédard, 2006). The main objective of the study is to examine the relationships between audit committee characteristics and the quality of financial reporting. The characteristics of audit committee that are examined are size, independence, literacy, multiple directorships, level of activities which is proxied by meeting frequency and attendance, and background of the audit committee chairperson.

The evidence that firms with more members in the audit committee are more likely to have good quality financial reporting is in contrast with the evidence from

previous studies such as Felo et al. (2003), Abbott et al. (2004) and Bédard et al. (2004), but consistent with Lin et al. (2006). This suggests that larger audit committee makes it more likely that it can devote adequate time and effort to ensure that the information disclosed in the financial statements is accurate and timely and hence increase the quality of financial reporting.

This study also documents that financial distress is associated with the quality of financial reporting. This implies that previous studies that exclude financial distress in the financial reporting quality model may be misspecified,

Overall the findings can provide guidance to users of accounting information such as investors and regulators. For users, our findings serve as a reminder that audit committees may appear to comply with regulatory requirements on independence, financial expertise and minimum number of meetings, yet in actuality they serve only a ritualistic role with no substantive monitoring in the financial reporting process, in tandem with institutional theory (Cohen, Krishnamoorthy, & Wright, 2008). To help users make an informed decision on the quality of audit committee and to facilitate a sound assessment of "independence in substance", more qualitative disclosure is required on the activities of audit committee. For the regulators, the efficacy of prescribing certain "best practices" for audit committee remains an open question.

It is also fruitful for future research to consider moderating factors that may blunt the ability of audit committee members in promoting corporate transparency. An independent audit committee member's lack of seniority on the board may adversely affect his/her ability to scrutinize top management and raise concern over questionable accounting practices. Audit committee member who is appointed by the incumbent CEO

may face obstacles in becoming an effective financial monitor. One of the limitations of this study is the possibility of error in the archival measure of audit committee diligence. Audit committee compensation may be a better proxy for diligence than number of meetings and level of attendance at such meetings. We also ignore non accounting financial expertise when measuring the level of audit committee financial literacy.

APPENDIX 1
The recipients of KLSE Corporate Awards 2003

NO.	COMPANY NAME - MAIN BOARD	AWARDS' CATEGORY	SECTOR
1.	AIC Corporation Berhad	KLSE Corporate Excellence Awards 2003	
2.	British American Tobacco (Malaysia) Berhad	KLSE Corporate Sectoral Awards 2003	Consumer Products

chairman is both independent and a financial expert and 0 otherwise, *ACCHMULT* takes a value of 1 if audit committee chairman is also director(s) in other listed companies and 0 otherwise, *DISTRESS* takes the value of 1 if the Z-score is below 2.07 based on the widely used Altman (1993) distress model (see footnote 6), *BIG-3* takes a value of 1 if the company is audited by Ernst and Young, KPMG or PricewaterhouseCoopers and 0 otherwise, *ROA* is net income divided by total assets, and *FIRMSIZE* is the natural log of total assets.

5.2 Islamic Accounting, Banking and Finance

THE IMPACT OF *RUHIYAH* ASPECTS ON
THE ASSESSMENT OF FINANCIAL PERFORMANCE HEALTH ON BMTS IN RESIDENCY OF BANYUMAS, CENTRAL JAVA, INDONESIA

Muhammad Akhyar Adnan[(*)], International Islamic University Malaysia
Permata Ulfah, Sudirman State University Indonesia

Abstract

The aim of the research is to analyze the impact of ruhiyah aspects on financial performance in the health assessment of Baitul Maal [wa at]Tamweels (BMT) – the shariah micro financing units – in Residency of Banyumas, Central Java, Indonesia. *Four* ruhiyah *aspects were examined in the study, which include: vision-mission, social sensibility, sense of belonging, and application of Shariah principles.*

All (43) BMTs in Residency of Banyumas were initially targeted as respondents. However, after applying some criteria set up, only 27 units of them were selected to be samples of research. The primary data were collected by distributing the questionnaires; the secondary data were based on their annual reports.

The study found that four above mentioned aspects have simultaneously significant impacts on the financial performance. Each variable has also been found to have a significant effect individually.

In spite of the results above, the other finding that needs to be emphasized here is that the Shariah principles are rarely applied by the management of the BMTs. Simplicity, easiness, and risk minimizing, are the reasons often held by the management. It is obvious that the main principles on which BMTs were initially based are ignored.

Keywords: *BMT, shariah micro financing unit, ruhiyah aspects, financial performance, health levels, Indonesia.*

BACKGROUNDS

The World Conference of Islamic Countries, 21-27 April 1969, had a positive impact in fostering Islamic banks in many countries. After establishment of Islamic Development Bank

in 1975, more than 200 Islamic financial institutions have also been established and recorded about fifteen years after. They are speared not only in the countries where Muslims constitute the majority, but also in some countries where Muslims are minority [Adnan, 1996; Muallim, 2007]

In Indonesia, on the initiatives of the *Majlis Ulama Indonesia* (MUI) and some Muslim entrepreneurs, the first Islamic bank, Bank Muamalat Indonesia, was founded with reference to the *Undang-undang RI No. 7 Tahun 1992* (Banking Act No.7, 1992). In 1998, a revision of the Act was passed to be *Undang-undang RI No. 10* (Banking Act No. 10 on Revision of Banking Act No. 7). On this basis, the Shariah banking has been admitted legally to be a sub-system of the national banking system.

According to Banking Act No. 10, 1998 the bank industry in Indonesia is classified into two types. One is a general bank, and the other is a rural bank (*Bank Perkreditan Rakyat*, abbreviated as BPR). The same classification is also applied for the Shariah bank industry, with additional *shariah* terms added to the name of bank, such as Bank Shariah Mandiri (BSM) established in Jakarta and has many branches located throughout many other cities in the country, and BPR Shariah Dana Hidayatullah in Yogyakarta.

Beyond above classification, the unique micro Islamic financial institutions also exist in the country. They are called as the *Baitul Maal [wa at] Tamwils* [commonly abbreviated as BMT). Legally, most of them apply the cooperative entity forms, but operationally, they look like more [Shariah] banks in general. Ideally, the BMTs were founded mainly to serve social and local interests who have no access to the formal banking industry, and not merely aimed at profit generating entities like many other micro financial institutions [See: Adnan, 2003]. The term "Baitul Mal" or "a pool of third party's funds" means a place for everyone who cares of social surroundings to save his or her money.

According to *Pusat Inkubasi Bisnis dan Usaha Kecil* (Center for Incubation of Small-business and Enterprises – abbreviated as PINBUK), although there are more than 3000 BMTs at the end of 2005, a far more higher number than that of 1997 (1501 BMTs), owned only below Rp. 1 trillion of assets [Pinbuk, undated]. The growth of BMTs is not always encouraging. Some of them were collapsed. The failure is caused by, first, unskilled management [Adnan, 2003] which could be indicated by the high non-performing loan. Second is poor management supervision, in particular the fund management supervision. The situation is worsened by the lack of management's sense of belonging. However, some exceptions also exist. For example is the *BMT Ben Taqwa* in Central Java. It has been growing remarkably and controlling the assets of around thirty trillions rupiahs (Agustianto, 2008).

In the middle of flourishing conventional institutions, the trust is a crucial issue directly connected to BMTs. Indonesian Minister of Cooperation and Small and Medium Enterprises, Surya Dharma Ali, urges that the performance of BMTs needs to be improved, especially in term of Shariah concept application. Collateral should not be an absolute requirement in credit or financing proposal, but in reality, it is strictly required.

PINBUK defines that the health level of BMT is its performance and quality which are seen from important factors that directly impact on the development of BMT, both in a short term and long term. There are two main aspects of the level, *jasadiyah* (physical) and *ruhiyah* (spiritual) (PINBUK, undated).

The *Jasadiyah* aspects include the financial performance, institutional structure and management. The *Ruhiyah* aspects include the vision-mission, social sensibility, sense of belonging, and application of Shariah principles which must be complying with the *shar'iah* rules, based on the Holy Quran and Tradition or *ahadith*. Some studies might have been focused to the *jasadiyah* issues. However, very little studies (if any) have been conducted to look at the *ruhiyah* issues, particularly in the case of the BMT, or micro Islamic financial institutions. This is among the reasons why this research was done.

Research Problems

Three important questions are set to study this issue. They are as follows: First, are the *ruhiyah* aspects affect simultaneously on the BMTs financial performance (the *jasadiyah* aspect)? Second: are the *ruhiyah* aspects impacts partially the financial performance? And finally: Which is *ruhiyah* aspect (among the four that we have identified) that has the most significant impact on the financial performance?

Objectives

The objectives of this study are:

1. To know how significant the *ruhiyah* aspects impact simultaneously on the *jasadiyah* aspect (financial performance).
2. To know how significant the *ruhiyah* aspects impact partially on the *jasadiyah* aspect (financial performance).
3. To know which ruhiyah variable that has the most significant impact on the *jasadiyah* aspect (financial performance).

Contribution of the Research

Upon the completion of the research, it is expected that it would be contributing the following:

1. To provide the BMT's management a general overview of factors influencing the financial performance. The research findings can be expected as a supporting consideration in the effort of sustaining or even improving the BMT's performance.

2. To provide the management of BMTs the reliable information of variables in the research those are closely related to the financial performance.

3. To provide the management of BMT an alternative resource to which the management might refer in determining the most important variable influencing the performance.

Theoretical Framework and Hypothesis

Shariah banking is a banking system that promotes morality and ethics. Values adopted in its operation are based on the basic characteristic of Prophet Muhammad (pbuh), which includes the *siddiq (honesty), istiqomah (consistent), fathonah (smartness), amanah (trustworthiness),* and *tabligh (ability to deliver)* principles (See also: Adnan (2006) in Sulaiman, M. and Nik Nazli Nik Ahmad, 2008). In addition, the cooperation (*ta'awun*), profesionalism (*ri'ayah*), and responsibility (*mas'o-liyah*), are other values that must be observed, as also guided in both the Quran's verses and Ahadith.

There are five interconnected factors that should be concerned in building a healthy BMT; these include the owner and management, customers and local community, competitors, regulators and supervisions, and infrastructures (Sudarsono, 2007).

The roles of BMTs as supporting agents for small enterprises are influenced by their health levels. A healthy BMT is a trusted, safe, and beneficial one. A BMT with an *unhealthy* predicate indicates that there is something wrong, not only in term of management and institutionalism, but also in that of Shariah aspect.

A research conducted by team Kofesmeid (2000) discovers that financial performance of BMTs is strictly connected to human resources they employ. The human resource is the main crucial issue faced by most of BMTs researched. The same finding was resulted by the team BMT Center Dompet Dhuafa Republika's research. The later shows that bad financial condition is caused by poor management of BMTs.

There are two main aspects of health assessed, *jasadiyah* and *ruhiyah*. The first includes financial performance or the capability of BMTs in managing funds accurately and smartly to ensure sustaining operation and profit generating, both in a short term and long term. The second covers institutionalism, or, the readiness of BMTs to perform their operations from the perspective of the availability and quality of rules and mechanism in planning, implementation, advancement, supervision, human development, and so on, and management, or, the readiness of BMTs to perform day-to-day operations.

Ruhiyah value is everyone's awareness of his or her existence as a creation of Allah (*makhluq*), by which he or she must always be conscious of the presence of Allah in every breath by consistently obeying what He wants.

The *ruhiyah* aspects includes, *fisrt*: vision-mission; *second*: social sensibility; *third*: sense of belonging; *fourth*: application of Shariah principles.

Vision, according to David (2002), is a long term wish and desire, "*What do we want to become*". Vision-mission has important roles in achieving defined objectives. Mission is the objectives or reasons why an organization lives. It is statements on what and how to achieve the objectives (Hunger et al, 2002).

Social sensibility is how responsive founders, management, and all members of a BMT are in caring of the surroundings, especially, local Muslim community. It is a fundamental basis for sustaining growth of the BMT as it is directly related to reputation and trust (Pambudi, 2007).

Sense of belonging, according to Robbins (1988), is a condition where personnel take the side of his organization with all its objectives. In line with Robbins, Gibson and Ivancevich (1996) define the sense of belonging as one's commitment, partiality, and loyalty, to certain organizations.

The research analyzes financial performance of BMTs in Residency of Banyumas from the point of view of the *ruhiyah* aspects. Two points are emphasized here, *first*, is to describe the measurement of the performance in the health assessment of BMTs used PINBUK standard that is slightly different from Bank Indonesia (Central Bank) standard. *Second*, is to scrutinize the relation between the ruhiyah aspects of management and the financial performance of BMTs in Residency of Banyumas that consists of four districts.

Hypotheses

Three hypotheses are developed to be examined in the study. They are:

1. The *ruhiyah* aspects have a simultaneous impact on the *jasadiyah* aspect (i.e. financial performance)

2. The ruhiyah aspects have a partial impacts on the *jasadiyah* aspect (i.e. financial performance)

3. The variable of Vision-Mission have the most significant impact on the *jasadiyah* aspect (i.e. financial performance)

RESEARCH METHOD

Population and Samples

The population of the research is all BMTs located in the Residency of Banyumas, Central Java, Indonesia. The samples were determined by non-probabilistic *purposive sampling* or *judgment sampling* with the criterion of minimum 3 years of operation. There are 27 of 43 MBTs in Residency of Banyumas that comply with the criterion.

Data Type

The primary data are obtained from questionnaires distributed to respondents, which include the founders, management, and local leaders of where the BMT is located. The questionnaires were designed using the Likert scale with 5 alternative answers. The secondary data are financial statements of 2005-2006 and other related information obtained from the BMT management.

Variables

The independent variables are:

1. The vision-mission of the BMT with the proxy questions on what opinion the founders, management, and all staff members who have the important positions and roles of BMTs.

2. The social sensibility which is measured by the proxy questions on percentage of funds allocated for *qard al-hasan* as compared to total financing provided, distribution of below-1-million financing to members, how active the management and members are in contributing to BMTs, and frequency of social-religious activities held by BMTs.

3. The sense of belonging which is measured by the proxy questions on the readiness of the founders and management to provide their additional contribution if the rush happens, degree of presence of the members in activities held, and how they pay obligatory contribution timely.

4. The application of shariah principles with the proxy questions on how BMTs collect and channel money from and to peoples, how to determine profit-sharing ratios, when revenue-sharing can be taking place, and who bears responsibility when loss happens in *mudarabah* agreement.

The independent variables measurement is conducted by providing five alternative answers for each proposed question, ranging from: *strongly agree* (score: 5), *somewhat agree* (score: 4), *neither agree nor disagree* (score: 3), *somewhat disagree* (score: 2), and *strongly*

*disagre*e (score:1). The scores are then multiplied by the weight of each question. The health level of BMTs is the results of the multiplication. See Table 1. Health Level of BMTs below:

Table 1: Health Level of BMTs

No.	Scores	Predicates
1	3.50-4.00	*healthy*
2	2.50-3.49	*moderately healthy*
3	1.50-2.49	*slightly unhealthy*
4	<1.5	*unhealthy*

Dependent Variables

Dependent variables are the BMTs' financial performances reflected in obtained scores for each component of capitalization, productive assets, liquidity, efficiency, and rentability. The scores are then multiplied by the weight of each score resulting in the health level as above. See table below for further details.

Table 2: The Assessment of *jasadiyah* Aspects

(Financial Performance) of BMTs

Components	Ratios	Scores	Weights
Capitalization			
$\dfrac{Total\ Capital}{Third\ Party's\ Saving}$	<5% 5% - 15.9% 16% - 25% >25%	1 2 3 4	20%

b. $\dfrac{\textit{Profit}}{\textit{Total Capital}}$	<5% 5% - 15.9% 16% - 25% >25%	1 2 3 4	7%

Analysis

Validity and Reliability Tests

An instrument is said to have a high validity level if its components do not deviate from the instrument function. In this research, the validity test is conducted with the *product moment* correlation method. According to Iqbal (2002), the minimum requirement for a component to be regarded as valid if r_{count} is grater than r_{table}.

The validity test of 19 statements used in the research shows the r_{count} of 0.679-0.91, is greater than r_{table} (0.367). The statements are, thus, regarded as valid. The reliability test (to measure the reliability of the questionnaires) is conducted with the *alpha cronbach* (*r-alpha*) correlation method. A statement is regarded reliable if the resulted *r-alpha* coefficient is greater than 0.5.

The reliability test of the 19 statements results in 0.742-0.93 of *r-alpha*, which is greater than 0.5. The statements are, thus, regarded reliable and can be used as measurement tools.

Hypothesis Test

In the research, the hypotheses are tested with *Path Analysis*. The analysis is used as there are both direct and indirect causal relation trends in the models.

The simultaneous impact of the *ruhiyah aspects* on the *jasadiyah* aspects (financial performance) is tested with F-test. The impact is regarded as significant if F_{count} is greater than F_{table}. The partial impact of the *ruhiyah* aspects on the *jasadiyah* aspects is tested with t-test. If a resulted t_{count} of an aspect is greater than the corresponding t_{table}, the impact is regarded to be partially significant. Further, which aspect of the *ruhiyah* aspects that has the most significant impact on the *jasadiyah* aspect is determined by observing the *Path Analysis* co-efficient. The aspect with the greatest coefficient has the greatest impact.

RESULTS

Descriptive Statistic

The number of respondents of each BMT is five people, these include one of founders, one of management staff members, one of local leaders, and two of customers. The totals of 135 respondents were successfully contacted. They are distributed as follows:

Table 3: Descriptive Statistic of Respondents

No.	Characteristic		Respondents			
			Founders	Manage-ment	Local Leaders	Members/Customers

Ruhiyah Aspects of BMTs

The health of BMTs in the Residency of Banyumas, viewed from the *ruhiyah* aspects, is presented in the table below.

Table 4: The Health Level of BMTs Viewed from *Ruhiyah* Aspects

No.	BMTs	*Ruhiyah* Aspects			
		Vision-Mission	Social Sensibility	Sense of Belonging	Application of Shariah Principles
1	A	3.540	3.307	3.747	3.480
2	B	3.568	3.216	3.104	3.248
3	C	3.640	3.590	3.460	3.320
4	D	3.840	3.520	3.700	3.800
5	E	3.920	3.600	3.920	3.800
6	F	3.888	3.992	3.648	3.376
7	G	3.847	3.953	3.747	3.587
8	H	2.937	2.990	3.493	2.789
9	I	3.710	3.670	3.240	3.500
10	J	3.690	3.393	2.880	3.333
11	K	3.644	3.512	3.488	3.424
12	L	3.393	3.447	3.347	3.240
13	M	3.566	3.806	3.726	3.371
14	N	3.660	3.330	3.240	3.500
15	O	3.150	2.540	2.600	3.200
16	P	3.880	3.247	3.427	3.293
17	Q	3.840	3.120	3.840	3.760
18	R	3.472	2.496	3.184	2.704
19	S	3.250	3.050	3.440	3.300
20	T	3.560	3.624	3.728	3.072
21	U	3.667	2.920	3.147	2.947
22	V	3.048	3.120	2.592	2.944
23	W	2.920	3.040	2.720	2.912
24	X	3.155	2.965	2.990	2.950
25	Y	3.263	3.223	3.246	3.154
26	Z	3.153	3.007	3.067	2.960
27	AA	3.116	3.129	2.933	3.129

Maximum	3.920	3.992	3.920	3.800
Minimum	2.920	2.496	2.592	2.704
Average	3.493	3.289	3.320	3.263

The table above shows that the health level of Vision-Mission aspect of BMTs in Residency of Banyumas on average is *moderately healthy* with the point of 3.493. There is no BMT with less than 2.49. Since the minimum point is 2.920, this means that none of BMTs in Banyumas can be classified as *slightly unhealthy* or *unhealthy*. The table also shows that seventeen of them have a *healthy* category.

The Social Sensibility variable shows the same results with the average point of 3.289 (*moderately healthy*). No BMT with the level of *slightly unhealthy* or *unhealthy* is found. The *healthy* category is achieved by nine BMTs with the points greater than 3.5.

In regards to the third variable, that is the sense of belonging, there is again none of BMT is found to be classified as *slightly unhealthy* or *unhealthy*. As indicated by the figures in the table, eight of them can be categorized as healthy.

The application of Shariah Principles is the most important aspect as it is the spirit of BMTs that makes them different from other small or micro sized financial institutions. How to determine profit sharing ratios, who bears responsibility when loss happens, and what rules to obey in running the operation, are all based on the said principles. The results show that there is no BMT in the Residency of Banyumas that does not respect the principles. In terms of the application, average point of 3.263 (*moderately healthy*) is achieved by the BMTs. It means that they have great concerns to apply the Shariah laws. Six of them have, in fact, respected the laws very much as indicated by the points recorded that are greater than 3.5 (*healthy*).

Jasadiyah Aspects (Financial Performance) of BMTs

Based on the method described in Table 5, the assessment of *jasadiyah* aspects (financial performance) of BMTs, the health levels of the BMTs' financial performances are presented in the following table. The levels are obtained by adding up all the components' health levels.

Table 5: The health levels of The BMTs's Financial Performances

No.	BMTs	Capitali-zation	Productive Assets	Liquidity	Efficiency	Renta-bility	Sum	Health Levels
1	A	0.80	0.85	0.60	0.20	0.80	3.25	MH
2	B	0.80	0.80	0.60	0.25	0.53	2.98	MH
3	C	0.80	0.90	0.20	0.25	0.20	2.35	SUH

Notes: H=Healthy; MH=Moderately Healthy; SUH=Slightly Unhealthy; UH=Unhealthy

The table above clearly indicates that, there are only 17 of BMTs in Residency of Banyumas achieving *moderately healthy* levels, and none of them is categorized as *healthy*.

Path Analysis

The aim of this analysis is to understand the impacts of the *ruhiyah* aspects's health levels on the *jasadiyah* aspect (financial performance)'s health levels. The variables to be analyzed are pictured in the table below.

Table 6: The Variables Used in *Path Analysis*

| No. | BMTs | Health levels of *ruhiyah* aspects | | | | Financial performance |
		Vision-Mission	Social Sensibility	Sense of Belonging	Application of Shariah Principles	
1	A	3.54	3.31	3.75	3.48	3.25
2	B	3.57	3.22	3.10	3.25	2.98
3	C	3.64	3.59	3.46	3.32	2.35
4	D	3.84	3.52	3.70	3.80	2.83
5	E	3.92	3.60	3.92	3.80	2.70
6	F	3.89	3.99	3.65	3.38	1.45
7	G	3.85	3.95	3.75	3.59	2.82
8	H	2.94	2.99	3.49	2.79	2.35
9	I	3.71	3.67	3.24	3.50	1.51
10	J	3.69	3.39	2.88	3.33	3.00
11	K	3.64	3.51	3.49	3.42	2.71
12	L	3.39	3.45	3.35	3.24	1.90
13	M	3.57	3.81	3.73	3.37	2.42
14	N	3.66	3.33	3.24	3.50	1.92
15	O	3.15	2.54	2.60	3.20	2.35
16	P	3.88	3.25	3.43	3.29	2.47
17	Q	3.84	3.12	3.84	3.76	3.45
18	R	3.47	2.50	3.18	2.70	2.77
19	S	3.25	3.05	3.44	3.30	2.85
20	T	3.56	3.62	3.73	3.07	2.75
21	U	3.67	2.92	3.15	2.95	2.90
22	V	3.05	3.12	2.59	2.94	2.82
23	W	2.92	3.04	2.72	2.91	2.10
24	X	3.16	2.97	2.99	2.95	3.31
25	Y	3.26	3.22	3.25	3.15	2.77
26	Z	3.15	3.01	3.07	2.96	2.75
27	AA	3.12	3.13	2.93	3.13	3.00

The social research has always a degree of aptness in explaining a relationship between variables. The relationship will not be able to be regarded as absolute causality due to unexplained variables and uncertainties. How apt the *ruhiyah* aspects influence on the *jasadiyah* aspect is determined by R^2. The greater R^2, the more correct the relations. The table below shows the degree of aptness of the *ruhiyah* aspects have an influence over the *jasadiyah* aspect.

Table 7: The Matrix of The X (*ruhiyah* aspects)'s Impacts on The Y (*jasadiyah* Aspect)

Impacts	Aspects			
	Vision - Mission	Social Sensibility	Sense of Belonging	Shariah Principles
Direct	95.08	47.75	4.28	8.11
Indirect				
Vision-Mission		-40.87	-8.80	-19.42
Social Sensibility	-40.87		8.02	10.22
Sense of Belonging	-8.80	8.02		2.58
Shariah Principles	-19.42	10.22	2.58	
Sum of Impacts	25.99	25.12	6.08	1.49

The total sum of X's impacts on Y is: (25.98+25.12+6.08+1.49) or 58.68 percent (R^2). As it has been explained before, this indicates that from all variables that impact Y, X represent 58.68% of them. The remaining other variables hold 41.36%. The remaining are unexplained variables and uncertainties.

Hypothesis Tests

Simultaneous impact of the *ruhiyah* aspects on the *jasadiyah* aspect (financial performance) is tested with F-test with significance of 95% ($\alpha = 0.05$). The result shows that F_{count} is 5.3183, greater than F_{table} (2.73). It means all the *ruhiyah* aspects do simultaneously have a significant impact on the *jasadiyah* aspect.

Partial test of each *ruhiyah* aspect is conducted by t-test with significance of 95% ($\alpha = 0.05$), resulting in the outcome below.

Table 8: The Result of Partial t-test on each The *ruhiyah* Aspect

Variables	pYX$_i$	t_{count}
Vision-Mission (X_1)	-0,9751	-6,6632
Social Sensibility (X_2)	0,6910	5,19495
Sense of Belonging (X_3)	0,2069	1,74743

Shariah Principles (X₄)	0.2848	2,06929

Based on the table above, Vision-Mission's t_{count} is less than t_{abel}. Each of the other three variables has t_{count} greater than t_{table}. It means all the four variables have significant impacts respectively on the financial performance. By comparing each path coefficient of the variables, it is obvious that $(pYX_2, pYX_3, pYX_4 < pYX_1)$, meaning that Vision-Mission is the variable with the most significant impact on the financial performance.

The table also shows that Application of Shariah Principles is the variable with the smallest coefficient. It is in line with the evident that some or many BMTs used to operate the entity closer to the conventional principles than complying with the Shariah rules purely. This include the treatment of money as a traded commodity, rather than means of payment, treating the *mudarabah* savings and deposits accounts with monthly fixed interests that are relatively equal to that of conventional banks, whether consumers agree or do not agree with. These have been regarded as the simplest and easiest way as the customers do not fully understand yet the Shariah techniques the BMTs try to apply.

In term of credit channeling, the BMTs often face a dilemma. In one hand customers needs the mudarabah and *musharakah* financing with an agreement of both profit and loss sharing as emphasized by the Shariah rules, on the other hand the management has to carefully place client's funds in safe instruments with zero losses. The management merely offers the profit sharing schemas, and avoids the loss sharing schemes. This is among the reasons why most BMTs tend not to offer the *mudarabah* and *musharakah* products.

As a result, they devote their efforts mainly to seek profit, and set aside social and religious missions at which their institutions are initially aimed. The reasons are:

a. The Shariah principles are still relatively difficult to be applied in the operations when, at the same time, consumers need easy, express, simple, and satisfying services.
b. Consumers have not yet fully understand the sharing systems, while the management reluctantly socializes the matter due to their limited knowledge.

CONCLUSIONS

Based on previous data analysis, the following findings are offered:

1. All the *ruhiyah* aspects have *moderately healthy* levels with the points of 3.493, 3.289, 3.320, and 3.263, for Vision-Mission, Social Sensibility, Sense of Belonging, and Application of Shariah principles indicators respectively.
2. In term of financial performance, from all the selected BMTs, 17 of them (63%) have moderately *healthy* predicates with the average point of 2.921, 33% bear *slightly unhealthy* with the point of 2.152, and 1 BMT (4%) is classified as *unhealthy*.

1564

3. All the *ruhiyah* aspects have a simultaneous impact on the financial performance with F_{count} of 5.3183 greater than F_{table} (2.73).
4. Each of the *ruhiyah* aspects has a significant impact on the financial performance. This is concluded from the resulted Vision-Mission's t_{count} (-6.6632) which is less than $-t_{table}$ (-1.7), and the other three's those are greater than t_{table} (1.7).
5. Vision-Mission is the *ruhiyah* aspect that has the most significant impact on the financial performance with its path coefficient (25.98) greater than the other three's coefficient (Social Sensibility: 25.12; Sense of Belonging: 6.07; Application of Shariah Principles: 1.48)

IMPLICATION

In our view, the above findings might have some implications. Among other is that the imperative of ruhiyah aspects to be well understood, planned and implemented by those BMTs' management and staffs. The research has proven convincingly the strong relationship between the j*asadiyah* and *ruhiyah* aspects. The reality in many cases had shown that little, if any, of *ruhiyah* aspects have been into account. A failure of taking care of these aspects, undoubtedly shall affect the life of entities.

As discussed previously, the implementation of shariah principles is having the lowest score. It indicates the likelihood of disregarding the shariah principles on the operation of BMTs. Regardless the reason(s) held by BMTs management, this practice can no longer be tolerated. Failure to implement the shariah principles properly might affect the fundamental well-being of the BMT. In the medium or long run, the existence of BMT can be fading. The BMTs would be seen as indifferent to any conventional (riba based) micro credit entities. The basic objectives of the establishment BMT will never be able to be reached.

LIMITATIONS AND FURTHER RESEARCH SUGGESTIONS

Although we believe that the findings are important, yet we have to recognize the inherent limitations of this study. These include, first: the study area coverage. The research was conducted in Residency of Banyumas that consists of four districts. As we have informed previously, we cover only 27 BMTs out of three more thousand BMTs scattered in the country. Different results might be possibly obtained if the observations are expanded to other or larger areas. The validity of the conclusions is, thus, restricted merely to Residency of Banyumas.

Second, the financial ratios used in the research to measure the health level of BMTs are based on the standards issued by PINBUK that are slightly different from that of Bank Indonesia (the latter is designed to measure the health level of conventional banks). Thus, there are possibly variables other than used in the research that impact, too, on the financial performance of the BMTs. These variables have not been regarded yet in the study. Moreover, the financial statements periods only cover two consecutive years (2005 – 2006).

Due to these constraints, we strongly suggest that more rigorous study can be conducted to overcome the above limitations of the current study.

CONVERTING A CONVENTIONAL BROKERAGE HOUSE INTO AN ISLAMIC ONE
(AN APPLICATION TO THE TURKISH MARKET)

Sinan Okumuş, Marmara University

Abstract

Islamic Finance is gaining momentum worldwide not only with the wealth accumulation in Islamic societies along with the higher oil prices but also with its asset backed structure casting out excessive uncertainty. Islamic Banking activities has been carried out by Participation Banks for the last 25 years in Turkey, however other Islamic Finance institutions like Islamic brokerage and Islamic Insurance (Takaful) are quite new to Turkish market with the former introduced in 2007 and the latter is yet to be launched. This paper lays out the ground for the conversion principles of a conventional brokerage house into an Islam compliant brokerage house by benefiting from the experience of Inter Invest, the first Islamic brokerage house in Turkey.

I. INTRODUCTION

Islamic Finance has been recently attracting interest from both the researchers and the practitioners. Many researchers analyse Islamic Finance whether its principles can be an alternative to crises worn global finance system. And as for the practitioners, Islamic Finance is a rapidly growing finance field with the oil driven

wealth accumulation and high population growth among Muslim communities. The

industry's assets have grown 28 percent globally in 2008 after observing an annual

growth rate of 20 to 30 percent over the last ten years. However the industry growth

is expected to slow down in 2009 due to severe global crises[272].

Basically, Islamic finance relies upon trade and bans interest. Any transaction should

be based on assets like real estate and commodities. Excessive uncertainty and

leverage is not allowed thus avoids speculation. Both the assets and the transaction

structure should comply with the Islamic principles. The financial structures and

operations should be approved by the Shariah board (religious board) which is

consisted of at least three Islamic scholars[273].

There are however shortcomings of Islamic finance like the lack of uniform

interpretation and application of the Islamic principles and the shortage of the Islamic

financial products. The industry is working on generally accepted Islamic principals

through associations. As for the shortage of the Islamic financial products, the

number of the Islamic finance institutions is growing along with the volume of the

financial products. Also the governments across the world are tapping the Islamic

finance market with asset based debt products.

---

[272] Islamic Finance Industry Growth May Falter in 2009, Bloomberg May 7,2009

[273] The Economics of Islamic Finance and Securitization, Andreas A. Jobst, February 2007

Islamic Finance was first introduced in 1985 to Turkish finance market through Islamic banks (called as Participation Banks in Turkey)[274].Islamic banks has reached to 3.7% of the all banking assets, 4.7% of deposits[275], 4.9% of credits and 4.2% of capital within 24 years of operations[276].Participation banks channelled most of the collected deposits into credits more than the conventional banks due to the fact that there were no available asset based government debt complying the Islamic investment principles until 2009[277].

Islamic financial system is not only limited to banks, other conventional finance operations like brokerage, funds, insurance and the like can be carried out on Islamic principles. Yet these Islamic institutions are quite new but they have been growing with solid steps.

The following section of this paper explains the Islamic brokerage and the differing functions between the conventional and Islamic brokerage house both on the

---

[274] Albaraka Turk was the first Islamic bank to operate in Turkey.Currently there are 4 participation banks active.

[275] Islamic Banking has serious disadvantage over the conventional banking on the deposit side.The earliest deposit maturity is one month due to the Islamic operating nature of the Participation banks, while the conventional banks accepts overnight deposits and repurchase agreement.

[276] May,2009 Bulletin, Banking Regulation and Supervision Agency (BRSA)

[277] Turkish Treasury launched new bonds linked to income of several state agencies in January and April 2009. The participation banks showed large demand for their proprietary portfolios as well as their clients.

operational and business lines. The paper also aims to lay out the equity selection and investments criteria for mutual funds to operate in line with the Islamic principles.

II. ISLAMIC BROKERAGE

Brokerage houses act as intermediaries between the investors and the capital markets. Islamic brokerage houses are means for Islamic investors to invest their wealth ethically into assets complying with Islamic principles avoiding interest, manipulation & speculation, excessive uncertainty, leverage and detriment to third parties.

Mostly an investor is not in a position to know whether an investment is Islam-compliant or not. Islamic brokerage house provides information on the Islam compliancy of the investment in addition to financial advising and intermediary services.

Brokerage houses are extensively regulated and scrutinized by state or vocational organizations[278].Islam applies additional responsibilities on the brokerage houses in order to ensure ethical financial system. These additional responsibilities are like freedom from interest, excessive uncertainty, gambling, unearned income, price

---

[278] A Model of an Islamic Stockbrokerage Firm, Thomas D. Telner,
www.djindexes.com/mdsidx/downloads/tellner.pdf

control and manipulation, detriment to third parties and entitlement to transact at fair

prices and equal, adequate and accurate information.[279]

Islamic brokerage house carries out most of the functions of the conventional

brokerage houses. It provides investors advise on investments, brokerage on

securities and commodities, manages mutual funds, real estate funds, private equity

funds and discretionary portfolios. Additionally it provides corporate finance services

like IPO's and debt securitization. Islamic brokerage house differs from the

conventional brokerages in areas like margin trading, transaction of interest bearing

bonds, transaction of equities which are not fulfilling the Islamic investment criteria.

Islamic brokerage activities have gained momentum within the last ten years. Some

brokerage houses are solely offering Islamic brokerage while some of them offering

both conventional and Islamic brokerage services. The banking clients of the Islamic

banks constitute solid base for the Islamic brokerage houses to offer their services.

Potentially, the network among the Islamic brokerage houses around the world will

strengthen the growth of the industry to ensure the continuation of the success.

III. THE POTENTIAL OF ISLAMIC BROKERAGE IN TURKEY

A. Brokerage Business in Turkey

---

[279] Islamic Financial Services, Mohammed Obaidullah, Islamic Economics Research Center, March 2005

The number of the active brokerage houses is 88 as of March 2009 down from 99 in 2007. In the last four years the sector has gone through consolidation. International banks and investment banks acquired local firms in order to take place in developing Turkish capital markets[280].

A typical brokerage house in Turkey provides brokerage in equity, fixed income, derivatives and foreign securities to earn commission income. Net commission revenues constituted 55% of the brokerage firms' revenue which was 561 million USD in 2008. 74% of the commission income is derived from equities, 23% from derivatives with the remaining derived from fixed income and foreign securities.

In addition to brokerage services, the firms also provide corporate finance, asset management and other services to constitute 28% of the revenue. The rest of the income comes from the proprietary trading and interest income received from the clients.[281](Exhibit 1)

Exhibit 1: Breakdown of brokerage firms' revenues (2008/12)

---

[280] The Capital Market Board of Turkey has not been issuing new licenses such that the only entrance to Turkish brokerage industry is to acquire a brokerage firm.

[281] The Association of Capital Markets Intermediary Institutions of Turkey

When we evaluate the breakdown of the stock trading volumes (Exhibit 2) 28,4% of trading is realised by domestic sales department, 25,1% by international sales department, 14,9% by branches (total 185 branches), 13,1% by bank branches (5.664 bank branches), 9,3% through internet, 5,5% by proprietary trading and the remaining 3,6% by the other departments.

Exhibit 2: Breakdown of stock trading volumes by departments (2008/12)

Turkish brokerage industry is intensively dominated by the bank owned brokerage companies and the international investment banks.The former have the advantage of the broader distribution network through their branches, call center and internet banking and the latter have their own international network of investors and funds.However specialised islamic brokerage companies with islamic banking backing can built solid business in Turkey.

B. Islamic Banking in Turkey

Four Islamic banks (called as Participation Banks) are operative as of May 2009, constituting 3,7%[282] of the all banking assets. The annualised average growth of the sector has become 30,7% within the last seven years while it has been 19,3% for the

---

[282] May,2009 Bulletin, Banking Regulation and Supervision Agency (BRSA)

whole banking industry. There are 682.000 deposit accounts (participation accounts), 176,000 credit accounts and 758.000 credit cards with the Islamic banks.[283] Islamic banks totally have 540 branches and 11.074 employees as of first quarter of 2009.[284]

Islamic banks are important pillars of the Turkish banking system with their non interest and profit / loss sharing structures.

Islamic banks have long ignored the other Islamic finance institutions like brokerage and insurance. Since these banks already have client base and solid reputation of ethical and Islamic operations, any attempt to get in to the brokerage and insurance business has a high chance welcome by the Islamic investors.

Islamic banks are warming up with the equity markets with Asya Bank and Albaraka Turk shares started trading at Istanbul Stock Exchange in recent years. Saying that there might be more interest in providing brokerage services to their clients in the near future through either their brokerage house or some other independent Islamic brokerage firm.

IV. CONVERSION OF A CONVENTIONAL BROKERAGE HOUSE INTO ISLAMIC ONE

---

[283] Participation Banks within the Turkish Finance System, Osman Akyüz, 20 March 2009, The Participation Banks Association of Turkey

[284] The Participation Banks Association of Turkey

The Islamic board of the Unicorn Investment Bank (Bahrain based Islamic Investment Bank) requested the management of Inter Invest (Turkish Brokerage House) and its subsidiary Inter Asset Management in 2007 to convert the company activities to comply with the Islamic rules within a three year period, under the condition of substantial progress in each year.

Brokerage house functions can be divided as business units and operation units.

A. Conversion of Operation Units

Operation units of a typical brokerage company are order processing, cashiering, clearing, transfer, finance/accounting, administration, internal audit, compliance, risk management and IT.

As for the conversion of operation activities, two major areas were needed for change.

1. Proprietary Accounts: All proprietary accounts in bonds and money market instruments are liquidated and deposited into participation accounts held with Islamic Banks. Also the equities in the proprietary accounts are liquidated to invest into Islam compliant equities.

2. Collaterals Held with Istanbul Stock Exchange (ISE) Settlement and Custody Bank: The company had treasury bonds with Settlement and

Custody Bank as collateral. The bonds were replaced by letter of guaranty of Islamic banks.

B. Conversion of Business Units

Business units of a brokerage house are treasury (cash management and proprietary trading), sales /marketing (domestic and international), corporate finance, asset management and research.

I.   Treasury: Treasury department of a brokerage firm mainly functions in cash management of the firm, lend or borrow money in the money markets and trade treasury bonds on behalf of the firm. Therefore, treasury department is not allowed to lend or borrow money in the money markets and trade treasury bonds. Instead, the department uses deposit accounts held with Islamic banks and trade income indexed government bonds when it is possible.

II. Sales / Marketing: Margin trading accounts of clients were cancelled since it does not comply with Islamic principles. Derivatives and fixed income instruments trading of clients is also not permissible in a Islamic brokerage house.

The clients were able to trade in equities which fulfil the following Islamic principles[285].

Equity Selection Criteria-Business Lines

Companies dealing in alcohol, tobacco, pork-related products, conventional financial services, defence/weapons and entertainment businesses are excluded from the Islamicaly investable equity list.

Equity Selection Criteria-Financial Ratios

Companies whose;

-Total debt divided by trailing 12-month average market capitalization is 33% or more,

-Cash plus interest-bearing securities divide by trailing 12- month average market capitalization is 33% or more,

-accounts receivables divided by 12-month average market capitalization is 33% or more,

are also excluded from the investable equity list.

The list of Islam compliant stocks in Istanbul Stock Exchange (ISE) will be revised after each quarter financial results for amendments. Research

---

[285] According to the Islamic Board of Unicorn Investment Bank.

department is responsible for the update of the stocks in line with the Islamic board.

There were 81 stocks approved by Islamic guidelines with total market capitalization at 32.5 billion USD which was 31% of the ISE total).The floating market capitalization of these stocks was at 9.7 billion USD as of November 2008.

III. Corporate Finance: Corporate finance activities should also align with the Islamic guidelines as outlined above for equities. Securitization should be based on asset and the total structure should be approved by the Islamic board.

IV. Mutual Funds: There are basically two ways of transition of the existing mutual funds into Islamic funds.

1-Amendment of the equity funds' bylaws to comply with Islamic guidelines and the closure of the money market funds and fixed income funds since they do not comply with the Islamic principles due to the lack of asset backed, revenue sharing or profit/loss sharing securities available in the Turkish market.[286]

---

[286] Turkish Treasury recently launched new bonds indexed to income of several state agencies which

2- Merger of the existing funds to create an Islamic equity fund.

There are challenges to managing Islamic funds in Turkish capital markets. The fund should invest fully in equities all the time regardless of the market condition due to the lack of Islamic debt and money market products. Also the Turkish Capital Market Board Code (CMB) is restricting funds to deposit money into conventional or participation bank accounts. Investing fully in equities creates pressure on the fund returns thus limiting the success of the fund. Investing into commodities like gold also is not a solution to the problem due to commodity price fluctuations. Islamic funds in Turkey will be successful in Turkish market when there will be more of government and private sector Islamic debt available with liquidity in the secondary market.

V. CONCLUSION

In this paper, we tried to explain the application process of the first of a kind conversion of a conventional brokerage house into an Islamic brokerage house in Turkey. Islamic brokerage has not kept up pace along with the Islamic banking

---

comply with the Islamic investment criteria however the secondary market of the issues is not liquid. Mutual funds can not invest into illiquid securities due to uncertain redemption dates.

up until recently however, today it is generally accepted as complementary to the Islamic banking business.

Brokerage business has been going through consolidation in Turkey. In order to be successful in these growing market institutions has been looking for ways of specialization. Islamic brokerage offers high potential in parallel with rapidly growing Islamic banking both in Turkey and worldwide. The introduction of the Islamic insurance (takaful) in the near future will boost the Islamic asset management business.

However, there are challenges ahead for the Islamic brokerage in Turkey. Firstly, the lack of Islamic debt is a major obstacle for the industry's growth. We believe there will be more Islamic debt issues coming to the market in the near future in order to attract more of Islamic capital in to Turkey. Secondly, an independent Islamic brokerage house would be highly dependent to the distribution network of the existing Islamic banks in Turkey. Such a company should target to be active in international sales and corporate finance in case it will have distribution problems for brokerage and fund management businesses. Lastly, Islamic brokerage is not well known to investors. The industry should accelerate its efforts to promote Islamic brokerage.

WAQF ACCOUNTING AND THE CONSTRUCTION OF ACCOUNTABILITY

Hidayatul Ihsan[287],Padang State Polytechnic, Indonesia

Abstract

This paper aims to explore the major themes that constitute the basis of the discussion on accountability in *awqaf* institutions. In doing this, the theoretical underpinnings and the existing empirical investigations relating to *waqf* accounting and accountability are examined. Review on *waqf* studies indicates the common phenomenon i.e. the absence of accounting standards for *waqf.* Nevertheless, this phenomenon could be due to there is no clear consensus about accountability. Due to previous *waqf* studies did not capture the dynamic aspect of stakeholders, this study suggest Mitchell, Agle and Wood (MAW) model to explain the nature of *waqf* stakeholders. By combining MAW model with Hayes accountability, this paper comes up with the proposal regarding what kind information should be provided by *mutawalli* to various *waqf* stakeholders.

Keywords: *waqf* accounting, accountability, MAW model, Hayes accountability

1. Introduction

Perhaps, prior to the last decade there were not many academicians realized that *waqf* accounting deserved to be researched. *Waqf* (plural *awqaf*) subject was marginal and only attracted small number of students and researchers to investigate (Hoexter, 1998); hence it is not surprising why *waqf* literature, including *waqf* accounting was hardly found. The absent of *waqf* accounting might be due to some reasons, but among other things is probably because many academicians thought that there was nothing to do with accounting for *waqf*.

---

[287] Hidayatul Ihsan is a lecturer at accounting department, Padang State Polytechnic, Indonesia. He is currently pursuing his study at Ph.D program in the International Islamic University Malaysia (IIUM). He can be contacted through e-mail address : hidayatul_im2@yahoo.com

The way of *waqf* is simple (Rashid, 2008) hence accounting for *waqf* is regarded very basic besides it is not as complicated as accounting for Islamic banking and other Islamic financial institutions (Muhammad 2008). Clearly, the development of *waqf* institutions in the last decade is not as rapid as the development of Islamic banking. While Islamic banking has attracted many researchers and scholars to investigate, *waqf* issue was left behind (Ihsan and Shahul, 2007, Adnan, Maliah and Putri Nor Suad, 2007).

It has been witnessed in the last few years that the revitalization of *waqf* institution has been on agenda of Muslim communities around the world. Plenty international *waqf* conferences[288] which were held by Islamic Development Bank (IDB) through its subsidiary organ the Islamic Research and Training Institute (IRTI) indicates a growing interest and awareness in *waqf* institutions as one of the tools for community development (Cajee, 2008). Along with the revival of this historic institution, the attention to the call for *waqf* accounting had been emerged. The new and modern *waqf* management has put greater emphasize on the principles of accountability and transparency (Cajee, 2008). Thus, as part of good governance and best practices of *awqaf* institutions, accounting is believed can improve the accountability and transparency of the *mutawalli*[289] (Adnan et al., 2007). Besides, accounting

---

[288] Recently, there were a number of waqf conferences held by IRTI i.e. in Singapore (2007), Bangladesh (2007), South Africa (2007), Dubai (2008), Iran (2008) and some other countries.

[289] *Mutawalli* is *waqf* manager, sometimes also called *nazeer*

is a tool for *mutawalli* to discharge his accountability to many parties such as wāqif[290], *waqf*

board, government and community in large (Ihsan and Shahul, 2007).

Studies on accounting practices in *waqf* institutions indicate there is diversity with

regard to accounting and reporting of *waqf* (see Abdul Rahim et al., 1999; Siti Rokyah, 2005;

Hisham, 2006 and Ihsan, 2007). Ihsan (2007) believes that the phenomenon of dissimilarity

of accounting practices among *awqaf* institutions is due to the absence of accounting

standards for *waqf*. In addition, Ihsan found that the perception of *mutawalli* regarding

responsibility and accountability influence the way of *awqaf* institutions produce and

disseminate accounting information. This is an interesting finding when Cordery and Morley

(2005) also assert that the uncertainty over accounting practices in charitable sectors and

other not-for profit organizations is not only due to the absence of accounting standards but

also because the failure to establish a widely agreed definition of accountability for that

sector.

In the *awqaf* context, although Hisham (2006) and Ihsan (2007) agree that Shahul's

proposal of dual accountability is more appropriate for *waqf*, it requires further explanation as

to whether it can be implemented and measured. Indeed, defining accountability is essential

as it is deemed critical to regulatory functioning (Cordery and Morley, 2005). While Cutt and

---

[290] *Wāqif* is *waqf* founder

Murray (2000) state that accountability is a foundation of performance measurement, evaluation and reporting. Further, Lewis (2006) believes that accountability is a central theme in Islam since the accountability to Allāh and the community is paramount to a Muslim's faith. As asserted by Askary and Clarke (1997), the word hisab which is interrelated with account and accountable is repeated more then eight times in different verses in the Qur'an.

Therefore this paper aims to explore the major themes that constitute the basis of the discussion on accountability in *awqaf* institutions. In doing this, the theoretical underpinnings and the existing empirical investigations relating to *waqf* accounting and accountability are examined. To begin the discussion, the development of *waqf* studies in general will be highlighted. It will be followed by the review of studies on *waqf* accounting in the recent years. The discourse about accountability construction in *awqaf* is presented before the conclusion.

2. *Waqf* studies as the key driver towards *awqaf* revitalization

In Islam, *waqf* is one of the principle means to alleviate the poverty problem in the society besides *zakat* (compulsory charity) and *sadaqah* (optional charity). Kahf (2003) defines *waqf* as "…holding certain property and preserving it for the confined benefit of philanthropy and prohibiting any use or disposition of it outside its specific objective". *Waqf* can be an effective system for poverty alleviation by improving non-income aspect such as health,

education etc as well as increasing access to physical facilities, resources and employment (Sadeq, 2002). Therefore, *waqf* activities became part of Muslim's life in the past.

Ironically, in the last one or two decades the non-Muslim scholars had paid more attention to *waqf* study than Muslim scholars. It is evidenced by the inclusion of *waqf* subject into the M.A and B.A curricula in some universities which have specialization in Islamic history and culture (Hoexter, 1998). Some masters and PhD research on *waqf* were undertaken in western universities (see for example Deguilhem-Schoem, 1986; Christoffersen, 1997). Even the first international seminar on *waqf* which was held in Jerusalem in 1979 was organized by non-Muslim scholars.

At the mean time, *waqf* study in Muslim countries or majority Muslim population was not progressing very well. This is indicated by Rashid (2008) when he traced *waqf* literatures which had been produced during the last 30 years (from 1977 to 2007) in five countries i.e. India, Pakistan, Bangladesh, Malaysia, and Indonesia. The type of *waqf* materials being reviewed were books, published papers, PhD thesis, masters dissertations, newspapers/magazines, seminar proceedings, book reviews, reports and on-line materials. From his research Rashid found only 306 *waqf* materials had been produced during that time in the above-mentioned countries. Although this finding did not represent all Muslim countries, to some extent it implies that *waqf* literatures are still limited and hardly found. As a matter of

fact, publication could be one of the key drivers to ensure the success of revitalization (Cajee, 2007).

Actually the Islamic Development Bank had tried to promote the issue of *waqf* revitalization by sponsoring the international seminar on *waqf* in Jeddah, 1984. Unfortunately there was no subsequent conference after that for nearly twenty years. It was by the end of the twentieth century that the idea of *waqf* revival had become on the agenda of many Muslim countries (Cajee, 2008). There was awareness among Muslim societies that there is a call for promoting and advocating *waqf* matters through education, research, seminars and publication. Rashid (2008) was optimistic that the sign of *waqf* revival has been apparent all over Muslim countries.

The development of *waqf* literatures can be referred to Hoexter (1998) who divided it into three stages. In this paper, some studies will be mentioned by way of examples. The first step is considered as focusing on discovering the legal aspect of *waqf*. A study by Christoffersen (1997) is one of the examples of this stage whereby it provided framework and understanding of *waqf*. While the second stage focuses on socio economic impact of *waqf*, political influence on *waqf*, as well as the relationship between *waqf* and gender. Some instances for this stage are Sadeq (2002) who discussed the role of *waqf* in poverty alleviation; Pioppi (2004) who investigated the impact of political changes to the revival of

waqf in Egypt and Doumani (1998) who scrutinized how political economy shaped perception of family *waqf* in Syria. Moreover, Hoexter points out that the next stage is pertaining to comparison between *waqf* and other model of charity in different culture and the sociological and cultural conception of *waqf*. Studies by Bastani and Esmailabadi (2008) and Eslami (2008) which compared *awqaf* and trust in England are examples of this category. This division into stages might be somewhat artificial but Hoexter argues that it can show the trends and innovation on *waqf* study. In fact some studies which are categorized into first stage continue to be discussed recently. For instance, Kahf (2007a) reviewed the fiqh issues relating to *waqf* revival, though previously he has discussed this issue extensively (see for example Kahf, 1999). Kahf (2007a) argues that this issue still needs to discuss as there is a call for revising the classical Fiqh in order to promote *waqf* revitalization. There are indeed some new issues on *waqf* which were not highlighted by Hoexter such as the integration of *waqf* into Islamic financial institutions (Ahmed, 2007; Pirasteh and Abdolmaleki, 2007; Becic, 2007; Kholid, Hassan and Sukmana, 2007; to mention but few) and modern management of *waqf* institutions (for example Cajee, 2007; Ahmad Hidayat, 2007; Sadique, 2008 and Rashid, 2008). There is also a trend to conduct country case study for instance Deguilhem (2003) in Syria, Pioppi (2004) in Egypt, Abdel Mohsin (2005) in Sudan, Maina (2007) in Kenya, Shamsiah (2008) in Singapore and many others. Generally speaking, *waqf* literatures are

continuously increased along with the upsurge of interest in *awqaf* issues. This is positive improvement as Rashid (2008) points out that the publication of *waqf* literature is essential to help promoting *awqaf* revitalization in the entire Muslim society.

Some authors (for example Marsoof, 2004; Ihsan, Ayedh and Shahul, 2006; Cajee 2007, 2008) have asserted that the development of *waqf* in the future will greatly depend on the good governance of this institution. Therefore the attention to *waqf* accounting had just emerged as it is believed that accounting can improve the best practices in *waqf* institutions. The following section will specifically review the development of study on *waqf* accounting in the recent years.

3. The development of research on *waqf* accounting

The attention to study *waqf* accounting might be emerged recently, but accounting practice in *awqaf* institutions is not a new idea at all. Rather, it had been practiced extensively in managing cash *waqf* during the Ottoman Empire. This evidence was discovered by Yayla (2007) who examined the accounting practice in Sultan Suleyman *Waqf* of the Ottoman Empire. By scrutinizing Ottoman's achieve, he found that the book keeping process had been carried out at that time. Although the preparation of recording based on initiative and consciousness of *mutawalli*, it could prevent the malfunction and misuse of *waqf* asset.

Further more, Yayla discovered that accounting record was used to measure the performance of *waqf* by the Sultan's commissioners. This finding is supported by Toruman and Tuncsiper (2007) who have carried out a similar study i.e. accounting practices for cash *waqf* in the Ottomans. Toruman and Tuncsiper discovered the fact that accounting practice on *waqf* had been carried out from 1490 to 1928. It was single entry in nature, but it provided all information regarding cash *waqf* management such as annual income of properties, expenditures by day, month and year and information about the increment of *waqf* assets of the year. In short, these two studies have proven that accounting was used as a controlling devise for *waqf* management during the Ottoman Empire.

As a matter of fact, there is no extensive study on current practice of *waqf* accounting has been conducted. Literatures show that there are three main themes emerged concerning *waqf* accounting. Firstly, accounting for *waqf* is essential as a tool for better practice corporate governance of *waqf* institutions. Therefore, there is a call for setting up accounting and auditing standards for *awqaf* (see for example Marsoof, 2004; Adnan, 2005; Ihsan, Ayedh and Shahul, 2006; Cajee 2007, 2008; Pirasteh and Abdolmaleki, 2007; Rashid, 2007; Hasan, 2007). Secondly, accounting practices vary among *waqf* institutions; however the common phenomenon is the absence of accounting standards for *waqf* (Abdul Rahim et al., 1999; Siti Rokyah, 2005; Hisham, 2006 and Ihsan, 2007). Thirdly, due to *waqf* accounting

standards has not been established, it is necessary to learn the existing similar standard

such as Statement of Recommended Practice (SORP 2005) for charity or AAOIFI's

Statements of Financial Accounting to develop *waqf* accounting concepts and standards

(Ihsan and Shahul, 2007; and Adnan et al., 2007).

In the first category, accounting for *waqf* is perceived important to improve the

accountability and transparency of *waqf* institutions. Marsoof (2004) urges the improvement

in accounting procedures since it is one significant element for the betterment of *waqf*

institutions. This idea comes up from his study on *waqf* administration in Srilangka where he

found the management of *waqf* has not been optimized. Therefore, he suggested for

developing accounting procedures and standards for *waqf*. In line with Marsoof, Adnan

(2005) agrees to develop *waqf* accounting standards. He provides two alternative models of

waqf accounting where *waqf* can be seen as social organization or *waqf* is regarded as an

organization which tries to maximize its resources through investment activities. If *waqf* is

seen under the former assumption, thus, accounting for nonprofit organizations will be

sufficient to be adopted. However, if *waqf* is considered under the latest assumption,

accounting for commercial organizations can be adopted. While, Ihsan et al., (2006)

scrutinize the issues of transparency and accountability in *waqf* institutions among Muslim

countries. Based on review on previous studies, they found that there is lack of accountability

1593

and transparency in *waqf* assets management. There was also mismanagement by the *mutawalli* in administering *waqf*. By examining the proposal from the Charity Commission in the UK, they found four main ideas from the Charity Commission which considered can be applied for the improvement of *waqf* institutions, namely internal financial control, transparency and reporting, management of funds and code of Good Governance. Besides, there is a need concerning legal reformation of *waqf*, whereby the government of Muslim countries should consider re-evaluating *waqf* acts. Studies by Cajee 2007, 2008; Pirasteh and Abdolmaleki, 2007; Rashid, 2007; Hasan, 2007 did not specifically address to accounting issues, rather they aimed to review some factors which are believed could encourage the revival or *awqaf*. However, these authors are in the same view that accounting for *waqf* is needed as it is part of best practice and therefore can improve the revitalization process of *awqaf*.

The second theme is accounting practices vary among *awqaf* institutions. Actually this issue arises from the studies on *waqf* in Malaysia and Indonesia. A study by Abdul Rahim et al., (1999) was a preliminary one which explored the accounting as well as administration practices among State Islamic Religious Council (SIRC) in Malaysia. By reviewing *waqf* literature and conducting telephone interviews with the officers of selected SIRCs in Malaysia, this study discovered that there was no detailed information about *waqf* assets. In addition,

this study found that there was unsystematic management as well as lack of accounting

system for *waqf* assets, where no written procedure to record *waqf* financial transactions.

Abdul Rahim et al., perceive that this phenomenon occurred because there was no federal

authority to coordinate all *waqf* in Malaysia. Thus, for the improvement of *waqf* management,

Abdul Rahim et al., (1999) suggest the establishment of *waqf* department which will

coordinate *waqf* in Malaysia. In addition to management improvement, Abdul Rahim et al.,

also recommended the improvement of accounting procedures to ensure the internal control

of *waqf* administration.

A study by Siti Rokyah (2005) can be seen as the extension of the above study where

it examined the status of financial reports and determined the level of *waqf* disclosure by the

State Islamic Religious Councils (SIRCs) in Malaysia. Siti Rokyah also scrutinized financial

procedures adopted and the relationship between financial procedures and *waqf* accounting

practices. She found that SIRCs vary in terms of the status on producing the latest annual

report. Majority of SIRC had overdue and outdated financial reporting[291]. Besides, most of

SIRCs showed low level of disclosure in their annual report.

Another finding from this study showed that there was no specific guideline in

preparing and maintaining *waqf* report. Besides, majority of SIRCs did not provide separate

---

[291] Siti Rokyah had conducted her study in 2004, while she found that the latest annual reports produced by SIRCs were
majority for the year 2000 and 2001. The rest vary from 1994 to 1997.

account for *waqf*. Thus, no information could be found regarding general *waqf* and specific *waqf* assets. Therefore, Siti Rokyah (2005) comes up with the suggestion of having proper guideline of manual in maintaining *waqf* assets. Besides reporting guideline, Siti Rokyah also suggests the acquiring of experienced accountants, since they will be able to help SIRCs in maintaining *waqf* accounts and reporting.

Hisham (2006) undertook another study on *waqf* accounting based on case study in the Federal Territory SIRC Malaysia. Hisam claimed that his study was different with Siti Rokyah's where his study was exploratory and descriptive, while the former study was more quantitative in nature. Furthermore, Hisham's study aimed to get better understanding with regard to *waqf* administrative and management which focused on accounting practices whereas Siti Rokyah's focused on financial reporting practices. Hisham conducted this study by reviewing the accounting practices in the Federal Territory SIRC and comparing *waqf* accounting with Statement of Recommended Practices for charitable (SORP 2005) in the UK. He combined interviews, observations and document reviews in his study to collect data. From his study, Hisham found that there was some improvement of *waqf* accounting in terms of record-keeping at Federal Territory SIRC. However, there was still no specific financial statement for *waqf* as well as no separation between different types of *waqf* was made.

Therefore, for an improvement he suggested some accounting practices for *waqf* based on SORP 2005.

In order to get better understanding with regard to accounting and management of *waqf*, Ihsan (2007) undertook another case study in two Indonesian *waqf* institutions. Although to some extent this study replicated Hisham's study, it relied on more than one case. Hence, Ihsan believes that through a multiple case design he will be able to show the relevance or applicability of findings to other settings. In fact, this study was claimed as the first attempt that tried to scrutiny the accounting aspect of *waqf* in Indonesia.

Ihsan used various methods to collect data i.e. interview, document review and direct observations. In this study, Ihsan had chosen three sites to be investigated, namely, Dompet Dhuafa (DD), Badan Wakaf Universitas Islam Indonesia (BW UII) and Badan Wakaf Pondok Pesantren Modern Gontor while the last was refused to be scrutinized.

The main finding of this study shows that there is different character and achievement of *waqf* management and accounting in DD and BW UII. This study also gives evidence that the two *waqf* institutions are different in terms of public accountability and transparency. Ihsan believed that the phenomenon of dissimilarity of accounting practices between DD and BW UII is due to the absence of accounting standards for *waqf* in Indonesia. It is therefore,

1597

Ihsan recommended to set up accounting standards and code of good corporate governance for *waqf* as it can improve the accountability of *mutawalli* in managing *waqf*.

There is common phenomenon from the above review i.e. the absence of accounting standards for *waqf*. Thus, due to *waqf* accounting standards have not been established, Ihsan and Shahul (2007) opine it is necessary to learn the existing similar standard such as Statement of Recommended Practice (SORP 2005) for charity. Ihsan and Shahul take the view that the structure of SORP 2005 is sophisticated and could encourages the trustee of charity to be more accountable. They suggest developing *waqf* accounting standards based on SORP model with some modification. Adnan et al., (2007) agree with this idea. In addition to learn SORP 2005, Adnan et al., propose an idea to investigate AAOIFI's Statements of Financial Accounting to develop accounting conceptual framework and standards for *awqaf* institutions.

The above discussion gives insight that accounting for *waqf* is important for the improvement of *waqf* management. Some authors note that accounting is a means to discharge *mutawalli*'s accountability to many parties (Hisham, 2006; Ihsan and Shahul, 2007; Adnan et al., 2007). This is in line with Lewis (2006) who asserts that one of the objectives of accounting system is to discharge accountability. Nevertheless, the phenomenon of dissimilarity of *waqf* accounting could be due to the different understanding of accountability

by *mutawalli*. If there is no clear consensus about accountability, thus the means to deliver it will vary (Sinclair, 1995). To remedy this, there should be a widely agreed definition about accountability so the user's needs could be determined (Cordery and Baskerville, 2005). Cutt and Murray (2000) agree that defining accountability is essential as a basis of performance measurement, evaluation and reporting. In short, there is a desire to assert what accountability in *waqf* should be about. The following section will therefore discuss the construction of accountability in *awqaf* institutions. Some theoretical underpinning relating to accountability in non profit organizations and public sectors will be reviewed as the basis of discussion.

4. The theoretical framework of *waqf* accountability

4.1. Defining accountability

One could be pondered, why defining the meaning of accountability in *awqaf* is very important? Sinclair (1995) says that nobody will argue with the need for accountability, however, it has discipline-specific meanings whereby many parties such as auditors, political scientists, philosophers, have their own definition about accountability. In short, how to define accountability will depend on the ideologies, motifs, and languages. This discussion will not lead to the standardization of accountability concept in *awqaf*, but at least there should be a

widely agreed definition among academicians. It should be noted that the accountability discussed here is limited to *mutawalli* accountability as it is part of managerial issues.

In the charity context, Cordery and Morley (2005) proposed the charity accountability model as they assume that this sector has specific characteristic compared with business entity. In line with this, Cutt and Murray (2000) agree that accountability framework in non-profit organizations should be defined as these institutions have a broad range of constituencies. Likewise, *awqaf* is not only charitable and non-profit in nature, but also located in religious setting. It is therefore, defining accountability will be crucial as the basis of reporting and performance measurement.

In the new model of administrative reform, the accountability is heightened through managerial control (Sinclair 1995). Hence, from managerial perspective Sinclair defines accountability as the requirement to those with delegated authority to be answerable for producing outputs or the use of resources to achieve certain ends.

While, Cutt and Murray (2000) opine that the accountability is:"[t]he obligation to render an account for a responsibility that has been conferred". Furthermore, they believe that formal definition of accountability presumes the existence of at least two parties, one who allocates responsibility and one who accepts it with undertaking to report on, account for, the manner in which it has been discharged. Similar with above definition, Gray et al., (1997)

has summarized the definition of accountability as "[t]he duty to provide account of the actions for which one is held responsible.

The above definitions of accountability (hereafter is referred to as conventional accountability) seem appropriate for *awqaf* since *waqf* is exposed to managerial issues. Nevertheless, these definitions have some weaknesses and fail to demonstrate accountability in Islamic perspective for some reasons. Firstly, according to Al-Safi (1992) that man-made definition of accountability is aimed to establish a certain material status for the individual and community. Indeed, accountability in Islam (*taklif*) can be seen as everyone is accountable for their actions on the Day of Judgment.

Similarly, Haniffa (2001) takes the view that the ultimate accountability in Islam is to Allāh since all deeds will be counted in the hereafter. Haniffa's background is the following verse of the Holly Qur'an: "To Allāh belongs all that is in the heavens and on earth. Whether you show what is in your minds or conceal it, Allāh will call you to account for it" (Qur'an, Al-Baqarah 2:284).

The second reason why conventional accountability might not be appropriate is because in the western society, fulfilling accountability is regarded as nothing to do with religious matters. Lehman (2004) analyses that the current western societies have neglected the religious dimension in their social systems. While in Islam, rendering an account to

discharge accountability is identified as part of ibadah (servitude to Allāh) and *amal saleh*

(virtuous deeds) in attaining *al-Falah* (benefit for the people in this world and the hereafter

(Haniffa, 2001).

Due to the conventional accountability does not show accountability to Allāh, Shahul

(2000) therefore, comes up with the proposal of dual accountability where as Allāh's

khalifah,[292] human beings are being accountable for all resources entrusted; besides they

should fulfill any contract made among them. Shahul named it Islamic accountability. This

kind of accountability is most appropriate for *waqf* not only because the nature of *waqf* is

based on religious motivation but also it involves the interest of ummah (public). Hisham

(2006) and Ihsan (2007) agree the accountability of *mutawalli* can be seen as dual

accountability, although it needs further elaboration as to whether it can be manifested. The

manifestation of *waqf* accountability will be discussed in the following section.

4.2. The manifestation of *waqf* accountability

Before discussing how the manifestation of *waqf* accountability is, the proposed *waqf*

accountability by Hisham (2006) and Ihsan (2007) will be presented. These two studies are

chosen because as far as *waqf* study is concerned, there is no other study which discuss

---

[292] Khalifah : vicegerent

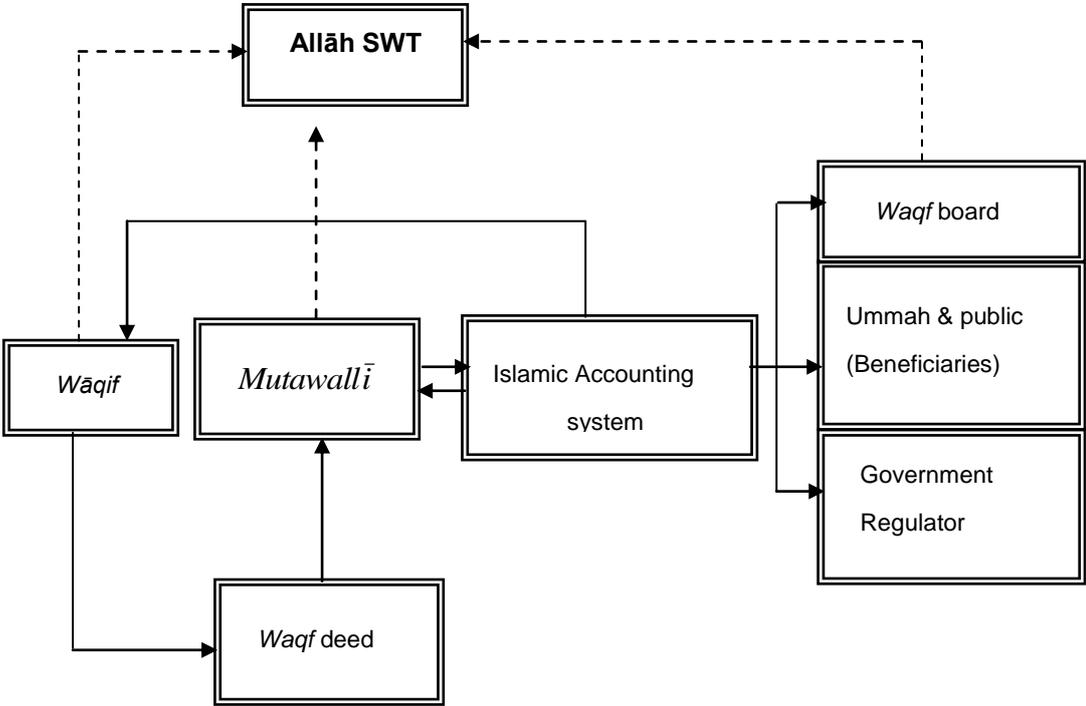
waqf accountability model. The *waqf* accountability model proposed either by Hisham (2006) or Ihsan (2007) are very much similar, although Ihsan claim that his is the extension of Hisham's work. Originally, this model was developed from Shahul's proposal of dual accountability (2000). The latest model of *waqf* accountability is presented below:


Figure 1.The *waqf* accountability Model (Source Ihsan: 2007)

Given the above definition of dual accountability in *waqf*, now there is a question to answer: how to discharge this accountability? Previously, it has been mentioned that *waqf* is a religious deed besides it is meant for public benefit. Therefore in the first place, all parties; *mutawalli*s, wāqif*, waqf* board and regulators should discharge their accountability to Allāh. This accountability is considered as the primary accountability (*hablun min Allāh*). In the

above figure, it is represented by dashed arrows which means transcendent, as it cannot be perceived through the senses.

Although this kind of accountability is transcendent, Shahul (2000) argues it can be made visible through the fulfillment of all Allāh's commands and avoidance of His prohibitions (which is guided by Qur'an and hadist). For instance, in managing *waqf* assets, *mutawalli* cannot violate shariah rules. At the same time, *mutawalli* should show his accountability in fulfilling *waqf* objective as wāqif whishes. Besides, *mutawalli* has to ensure that *waqf* will contribute to the betterment of Muslim society.

The metaphysical nature of accountability to Allāh does not imply that it has nothing to do with reporting. Cutt and Murray (2000) state that, in nature, accountability manifests itself as information through management information systems and associated methods of analysis and evaluation. It is true that all deeds are recorded by the Angels and account to Allāh (Al-Qu'ran Qaf 50:17-18). But the accountability to Allāh (*Hablun min Allāh*) is interrelated accountability to human beings (*hablun min An-nas*) (Hassan, 1995 as quoted by Abdul Rahim, 2003). Therefore, in this sense a clear reporting from *mutawalli* will enable the user to see how compliant he is to the shariah rules in managing *waqf* assets. This is in line with Cajee (2007) who proposes the idea of providing shariah advisory services in order to

ensure the shariah compliance of *waqf* management. For further development he suggests the call for shariah auditing to make sure the correct application of *waqf* assets.

In another place, *mutawalli* should be responsible to various stakeholders. Defining stakeholders for nonprofit organizations might be elusive as they involve many audiences. Hisham (2006) and Ihsan (2007) identify the stakeholders of *waqf* as wāqif, *waqf* board, regulator, beneficiaries, and community in large. The above-mentioned stakeholders are classified as major stakeholders by Cajee (2007). In addition he points out *waqf* stakeholders could be wider whereby it involves NGOs, politicians, business community, academics and Islamic Financial Services[293]. In short, *waqf* stakeholders are multilateral and dynamic.

With regard to the above *waqf* accountability, Ihsan (2007) explains that accountability to stakeholders could be discharged through Islamic accounting system. It means that *mutawalli* will provide report to wāqif, *waqf* board, beneficiaries and community. Hisham (2006) takes the same view with Ihsan. However, both Hisham (2006) and Ihsan (2007) did not explain what kind information should be provided by *mutawalli* besides to whom the priority should be given. It is important to identify the interest of different parties in the stakeholders group so *mutawalli* can provide relevant information to them. Cordery and

---

[293] There are two types of waqf i.e. waqf ahli (family waqf) and waqf khairi (public waqf), but the discussion here is limited to waqf khairi. The context of waqf stakeholders mentioned might not be appropriate for waqf ahli as it is only involved several people in certain family.

Morley (2005) recognize that the identification of stakeholder's interest will help improving accounting standards or such regulations.

In the widest sense, accountability is more than accounting, focusing on the information needs of users (Jones and Pendlebury, 1996 in Connoly and Hyndman, 2004). Therefore, with regard to information should be provided by *mutawalli*, it would be relevant to quote Hayes (as cited in Cordery and Morley, 2005) who classifies the types of accountability in the charity sectors to the stakeholders as follows:

- Fiscal accountability i.e. to make sure that the money has been spent as agreed and according to the appropriate rules

- Process accountability that is to ensure that proper procedures has been followed to provide value for money

- Program accountability i.e. to ensure that institution is effective in achieving its objective

- Accountability for priorities i.e. fulfilling user needs appropriately.

Since *waqf* has some similarities with charitable organization[294], we can adapt the above classification to determine what kind information should be provided by *mutawalli*. It should be noted that discharging accountability should consider both quantitative and qualitative

---

[294] The similarities are in terms of charitable activities and nonprofit organization

reporting (Cordery and Morley, 2005). Quantitative reporting can be in terms of financial performance of *waqf* institution, i.e. how much is the cost expensed or how much money is being invested to develop *waqf* assets. Whereas qualitative reporting is non-financial information which inform the users whether any objectives are achieved and how is the progress of *waqf* programs.

Further, we need to elaborate the issue concerning the urgency of stakeholder's demand on certain information. This discussion does not intend to argue that *mutawalli* should pay attention to all stakeholders; rather *mutawalli*s have to pay certain kinds of attention to certain kinds of stakeholders. It is predicted that all stakeholders of *awqaf* do not have the same power to pressure *mutawalli*. For instance, the beneficiaries of *waqf* will be difficult to push *mutawalli* to provide financial information, due to their lack of power to do so. Beneficiaries may have expectation on moral and honesty of *mutawalli*, but that alone, leave them as non-dominant stakeholders. However, regulator and *waqf* board most probably can impose their will to *mutawalli*. Nevertheless, if regulator acts as the beneficiaries, they will be more powerful to coerce *mutawalli*.

Actually the above description had been explained by Mitchell, Agle and Wood (1997) in their theory of stakeholder salience-the degree to which managers give priority to

competing stakeholder claims. The following section therefore will discuss the stakeholder

salience theory in its applicability to explain the multiple demands of *waqf* stakeholders.

4.3. Stakeholder salience and its application to *waqf* stakeholders

Mitchell et al., (1997) propose the qualitative classes of stakeholders which can be identified

by the following attributes: 1) stakeholder's power to influence firm, 2) the legitimacy of

stakeholder's relationship with the firm, 3) the urgency of the stakeholder's claim on the firm.

Based on the above attributes, Mitchell et al., (1997) propose seven types of stakeholders:

three possessing only one attribute, three possessing two attributes and one possessing all

three attributes. The rationale behind stakeholder salience theory is management has limited

time and resources to provide information to various stakeholders. Management therefore

has to focus on stakeholder's needs. The types of stakeholders based on Mitchell et al.,

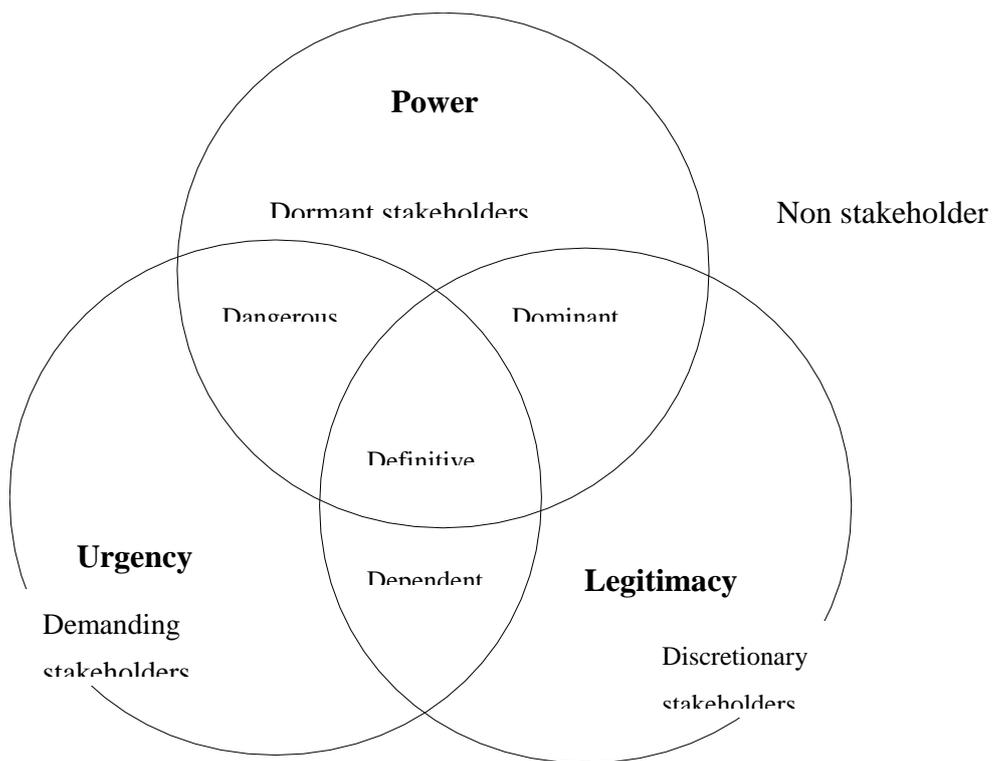
proposal (MAW) is presented in the following figure:


Figure 2: Stakeholder typology (Source: Mitchell, et al., 1997)

Mitchell et al., (1997) assume that the salience of particular stakeholders will be low if only

one tribute is present, moderate if two attributes are present and high if all attributes are

present. Based on the figure above, Mitchell et al., classify stakeholders into three general

classes. Firstly, latent stakeholders are those who possessing only one of the three attributes.

It includes dormant, discretionary and demanding stakeholders. Secondly, expectant

1609

stakeholders are those who are possessing two attributes and include dominant, dependent and dangerous stakeholders. Definitive stakeholders are those who possessing all three attributes. Lastly, those who possessing none of these attributes are considered as non stakeholder. We will elaborate how MAW model is applied in *awqaf* context. In this paper, the classification of *waqf* stakeholders is adapted from Cordery and Morley (2005)

The first category is latent stakeholders which include dormant, discretionary and demanding stakeholders. Dormant stakeholders are those who possessing power to impose their will to organization, but by not having a legitimate relationship or urgent claim. Normally, dormant stakeholders have little or no interaction with the organization. In the *waqf* context, the samples of member of this class are *waqf* board and government. While, those who possess the attribute of legitimacy are classified as discretionary stakeholders. The potential wāqif and donors are the instance for this category as they have no power to influence organization and no urgent claims. The third class in latent stakeholders is demanding stakeholders. Mitchell et al., (1997) explain that demanding stakeholders are those who are with urgent claims but having neither power nor legitimacy. They are considered as the "mosquitoes buzzing in the ears". The press is probably the sample to represent the member of this class.

When the latent stakeholders acquire another attribute, they will move to expectant stakeholders which classify under dominant, dependent and dangerous stakeholders. Dominant stakeholders possess both power and legitimacy. They have right to claim and have ability to act on this claim. Existing wāqif is the representative of dominant stakeholders. The stakeholders who have legitimate claims, but lack power is considered as dependent stakeholders as they depend upon others. The sample of dependent stakeholders is beneficiaries of *awqaf*. When stakeholders are characterized by urgency and power, they fall into dangerous category of stakeholders. Cordery and Morley (2005) give social justice lobbyist as the sample of member of this class. Although Mitchell et al., (1997) note that the notion of dangerous is somewhat uncomfortable, failure to identify dangerous stakeholders would result in missed opportunities to mitigate the potential danger.

When all three attributes is present in one group of stakeholders, they will be classified as definitive stakeholders. Perhaps, *mutawalli* and staff are in this category. It should be noted that this classification and example are not fixed. Baskerfille-Morley (2004) believes that the membership of one class could be adaptive and dynamic. This is in line with Mitchell et al., (1997) when they noted that any expectant stakeholder could become a definitive one by acquiring the missing attribute. An empirical work by Magness (2008)

supports the MAW model whereby stakeholders is not static, rather dynamic and can move

into another class of stakeholder.

Although MAW proposal was originally address to commercial entity, Cordery and

Morley (2005) had applied this model to charitable sectors. Similarly, in this paper we will

apply MAW proposal by combining it with Hayes proposal of accountability.

4.4. The combination of Hayes accountability and MAW model

Having discussed Hayes accountability and the salience of stakeholders based on Mitchell et

al., (1997) proposal; we are now turning into discussing how the two proposals could be

combined. Cordery and Morley (2005) have used both Hayes and MAW to explain charity

accountability. In the author's opinion, the use of Hayes and MAW is possible to explain

mutawalli accountability to *waqf* stakeholders. It does not mean to argue the previous

discussion regarding dual accountability. Rather it intends to make further explanation how

mutawalli accountability should be discharge to various parties. The following description will

illustrate the need of *waqf* stakeholder for certain information. It should be noted that the

membership of stakeholder in the class is not fixed, rather they can move and change

depend on situation and time

1612

As mentioned early, *mutawalli* and staff are considered as the definitive stakeholders. Keating and Frumklin (2003) point out that the growing interest in professionalization of non profit sectors has placed the staff in the centre of accountability equation. Therefore, as the definitive stakeholder, *mutawalli* and the staff will need all information pertaining to *waqf* administration. Information about fiscal, process, program and priorities will give a visibility to the resources, activities and achievements, thus enabling informed discussions and decisions for the *mutawalli*.

Although there is severe criticism about government intervention on *waqf*, almost all Muslim governments now involve in controlling *awqaf* management (Kahf, 2007b). As the dormant stakeholders, the government and regulatory body may require fiscal information (Keating and Frumklin, 2003). Lee (2004) opines that providing financial reporting to government has become compulsory for non profit organizations as part of their external accountability. This information will help *waqf* regulatory body in monitoring *awqaf* institutions.

In the charity context Cordery and Morley (2005) mention that donors will normally ask for financial information from the trustee. Similarly, the information about fiscal is also required by wāqif to assess the performance of *mutawalli* in managing *waqf*. However, in waqf context, financial per se is not enough. Mutawalli needs to inform wāqif whether he/she has fulfilled the objective of *waqf* as the wāqif whishes. Therefore, information about program

is also important for wāqif. This is in line with agency theory whereby reporting is needed for

contractual purposes (Cordery and Baskerville-Morley, 2005). The *Malikis* and others said

that the proprietary of *waqf* assets remain in wāqif (Kahf, 2007b). Hence, wāqifs have the

right to replace *mutawalli* if they think that *mutawalli*'s performance is not as expected. In

other words, wāqifs could be a definitive stakeholder if they consider it is "urgent" to do so.

While dangerous, demanding and discretionary stakeholders who are represented by

social justice lobbyist, press and potential wāqif respectively, might claim the information

about program i.e. how effective *waqf* in achieving the result intended. Keating and Frumklin

(2003) note that the stakeholders of non profit organizations normally need such program

reporting to make decision about their support and participation on the organizations in the

future. Other information such as financial, process and priority could be less relevant for

them. Most of charitable organizations stakeholder indeed perceive that non-financial

information is important in assessing output (Hyndman, 1990)

The last category but not least is beneficiaries who are categorized as dependent

stakeholders. They have lack of power (Cordery and Morley (2005); hence it is difficult for

them to coerce *mutawalli* to provide complete information for them. Their concern is more to

the fulfillment their interest on *waqf*.

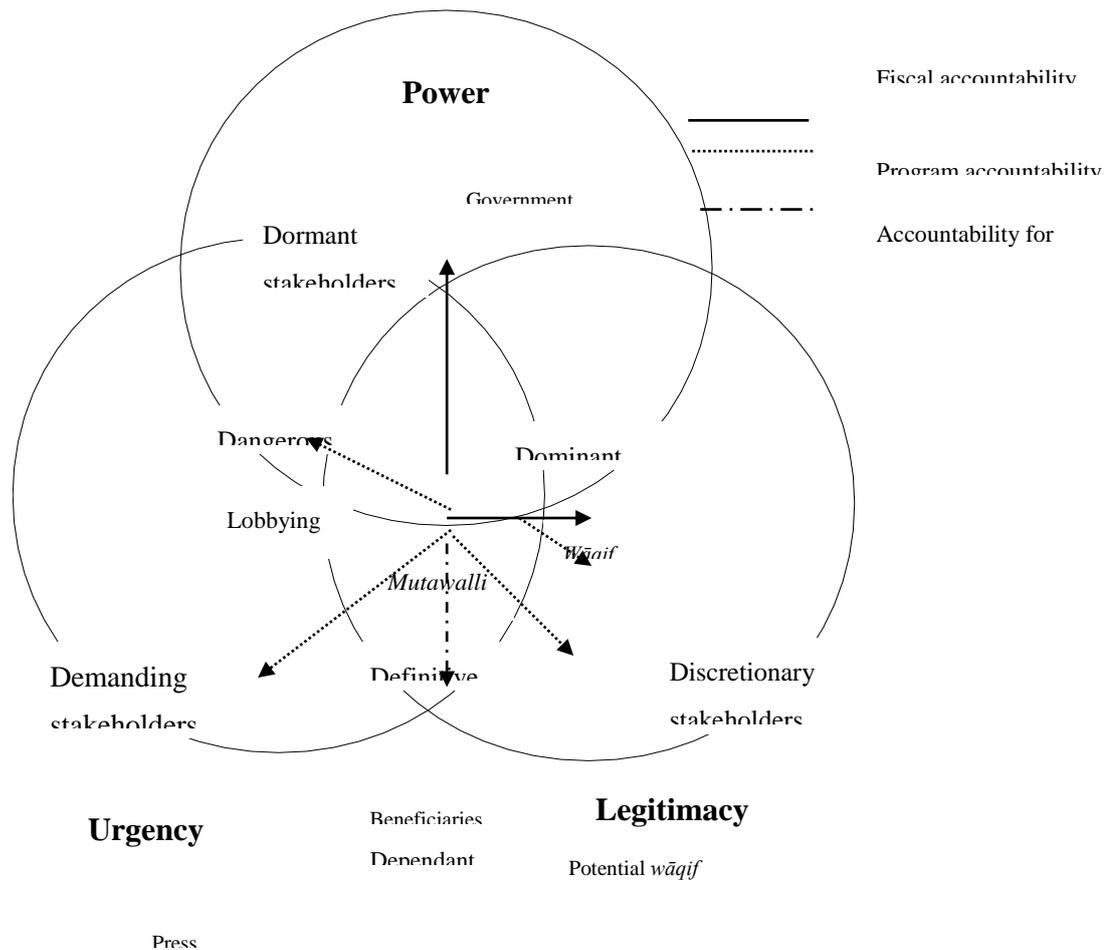
The above scenario can be drawn into the following figure:


Figure 3: Application of Hayes accountability to MAW model

The information about fiscal, program and process are discharged in formal manner. For instance, fiscal information is provided in the financial report; program information is reported in *mutawalli* report; while process will be informed through performance reporting. Whereas, information about priority can be more informal and unstructured compared to the former information. Yet, Cordery and Morley (2005) note that the informal and unstructured information are more likely to be provided in a culture with high levels of trust.

5. Concluding remarks

As earlier discussion demonstrates, the issue of *waqf* revitalization has been on agenda of Muslim communities. Along with this, the attention to *waqf* accounting had just emerged as it is believed that accounting can improve the best practices in *waqf* institutions. Review on *waqf* studies indicates the common phenomenon i.e. the absence of accounting standards for *waqf*. Nevertheless, the phenomenon of dissimilarity of *waqf* accounting could be due to there is no clear consensus about accountability, thus the means to deliver it will vary.

In this paper we agree that Islamic dual accountability is the most appropriate model to explain accountability in *awqaf* sectors. In the first place, *mutawalli* is accountable to Allāh SWT. This kind of accountability is transcendent in nature, yet it can be made visible through the fulfillment of all Allāh's commands and avoidance of His prohibitions. In another place, *mutawalli* should discharge his accountability to various parties such as wāqif, *waqf* board, government and beneficiaries. Due to previous *waqf* studies did not capture the dynamic aspect of stakeholders, this study suggest MAW model to explain the nature of stakeholders in the respective classes. By combining MAW model with Hayes accountability, this paper comes up with the proposal regarding what kind information should be provided by *mutawalli* to various *waqf* stakeholders.

This paper has some research implications. Firstly, it needs empirical evidence to justify the stakeholder salience in *waqf* context. Secondly, since this paper suggests adapting Hayes accountability, it requires further scrutiny to what extent *waqf* stakeholders need certain information. Scrutinizing stakeholder salience and identifying the user needs will help *mutawalli* in administering *awqaf* effectively. Lastly, perhaps cross-country study will enrich *waqf* literature as none of previous studies did comparative study. In addition, it will enable Muslim countries to learn each other in order to improve *waqf* administration.

5.3 Social and Environmental Accounting

SHOULD CORPORATE SOCIAL RESPONSIBILITY BECOME MANDATORY?

A VIEW FROM INDONESIAN INVESTOR

Gatot Soepriyanto, Binus University

Rudy Suryanto, Universitas Muhammadiyah Yogyakarta

Abstract

The obligation for Indonesian companies whose activities deal with or related to the management of natural resources to carry out corporate social responsibilities (CSR) program as stated in article 74 Law no 40, 2007 on Limited Corporation (PT) has sparked a wide debate. The proponents of this rule believe that such requirement is necessary given the low commitment of many companies in Indonesia in implementing CSR. The opponents, however, argue that such regulation will be perceived by investor as 'undisclosed tax burden'. Such regulatory background provides a unique setting to investigate whether equity investors in Indonesia Stock Exchange (BEI) has reacted to the information surrounding the event date related to the passage of mandatory CSR implementation bill. This research, examine whether the issue was used by investor in determining their decision. The cumulative abnormal returns in the event windows are used as a measurement to examine whether investor responded positively or negatively to the requirement. We present some evidence that on average, equity investor reacted positively to the news that related to the approval of mandatory CSR implementation bill. We also find that the investor reaction is determined by the size of firms, leverage, and by questioning the engagement of the firms with mining industry. This research supports the view that CSR is a value-enhancing investment that may increase firms' future value. The research outcome result is also relevant with prior studies which suggest that CSR implementation is beneficial to investors.

Keywords: *Event Studies, Corporate Social Responsibility, Mandatory CSR Implementation*

1. Introduction

In responding to perceived irresponsible conduct of some major companies in Indonesia toward environment [295], the Indonesian House of Representative (DPR) has endorsed the obligation for firms whose activities deal with or related to the management of natural resources to carry out a corporate social responsibility (CSR) program. This mandatory rule is enacted under article 74 of Law no. 1, 2007 on Limited Company (PT). Such obligation has sparked debate on whether it would beneficial to the companies. The proponents of this rule (e.g. the lawmakers and non government organisation) believe that such requirement is necessary given the low commitment of many companies in Indonesia in implementing CSR. Their argument is supported by some studies that found CSR programs are in line with company's objective to maximize shareholders' value (Stigson 2002). The opponents (e.g. business managers and CSR practitioner), however, argue that such regulation will be perceived by investor as 'undisclosed tax burden' and it may shift the focus of attention to the amount of spending, not the outcome of CSR program itself (Lingga 2007).

This study examines equity investor reactions to news related to the approval of mandatory CSR implementation bill and to assess whether shareholders consider the rule

---

[295] For instance severe environmental destruction and pollution of PT Inti Indo Rayon in North Sumatera, PT Newmont Minahasa Raya in Minahasa, and PT Lapindo Brantas in East Java.

as beneficial or damaging. Our analysis focuses on seven sub industries that are most likely to be affected by the passage of the bill (i.e. sub industries whose activities deal with or are related to the management of natural resources). These sub industries include: oil and gas, coal and metal, pulp, paper and timber, energy and plantation.

The purpose of this study is to measure market's (investors') reaction on the mandatory of CSR implementation rule for firms whose activities deal with or are related to the management of natural resources. Moreover, this study attempts to answer some fundamental issues surrounding CSR concept, which includes: (1) investor response to information related to CSR program (2) the value of CSR's regulation in the eyes of the investors (3) investors' willingness to have additional CSR cost.

We present some evidence, which shows that, on average, equity investors have reacted positively to the news related to the approval of mandatory CSR implementation bill. Our research's outcomes are relevant with prior studies, which suggest that CSR will help investor in two ways; firstly, it minimizes the exposed risk of the companies (Heugens 2007; Chih, Shen and Kang 2007; Sarre, Doig and Fiedler, 2001) thus it may enhance company's performance in the long run through increasing customer satisfaction (Luo 2006) Secondly, CSR is beneficial to maintain reputation and better relationship with other stakeholders

(Rowe 2007; Blake 2006). In summary, our result supports the view that CSR program will contribute positively to the firms' value.

This study is significant for a number of reasons. First, it sheds a light for further research on market reaction toward CSR issues. Such research will help to end controversy over management's responsibilities; whether they only focus on maximizing shareholder value, or they also have responsibility for the social and environment. Research shows that there is a consistently strong relationship between CSR implementation and share price performance. This will prove that there is no conflict between management's role in maximizing shareholders' value with them being responsible for social and environment. Second, our study will be a constructive idea for the regulators and policymakers in other countries to be used as an answer to the question whether CSR implementation best left regulated or otherwise.

The remainder of this paper is organised as follows; section 2 describes the regulatory background of mandatory CSR implementation bill, section 3 discusses hypothesis development, section 4 describes sample data, section 5 illustrates research methodology, section 6 discusses the empirical result and section 7 concludes.

2. Regulatory Background

Indonesia has already had a plenty of legislation governing environmental and social issues. The main problem is that the laws are scattered and separated, administered by different agencies and departments, which sometimes redundant and occasionally even contradictory. Clearly, some may argue that there is no need to create yet another set of laws in this area. The house, however, has another argument. They believe that such requirement is necessary to promote the implementation of CSR that eventually may reduce the numbers of environmental and social problems that lie between industry and community.

Despite strong protest from the business community, the provision requiring mandatory participation in CSR programs was retained, although it was modified to cover only companies in natural resource-based sectors rather than all sectors. The bill was finally approved on July 20, 2007 and became operative on August 16, 2007. Article 74 of the bill stipulates that all companies engaged in the exploitation of natural resources must conduct environmental and social responsibility programs that will be liable for sanctions if they fail to do so. The funds expended on CSR programs are to be considered as part of a company's annual operating costs, and so it can be set off against taxation liabilities. The bill also mandates the disclosure of activities related to environmental and social responsibility

programs in companies' annual reports. This stipulation has broad corporate support given

that disclosure is regarded as a "best practice" that has been required by the Capital Market

Supervisory Agency (BAPEPAM) since 2006 (Darwin and Guntensperger, 2007).

The mandatory requirement of CSR implementation program in Indonesia provides a

unique setting for researchers to investigate the investors' reaction upon firms' social and

environmental responsibility. The mandatory requirement is a response to irresponsible

conduct of some major companies in Indonesia toward social and environmental issues. We

examine one prominent CSR mandatory rule-related event. The event is expected to

influence the market reaction upon the effectiveness of mandatory CSR implementation bill.

We used the latest release of mandatory CSR implementation bill-related news in the

"Kompas" and "Bisnis Indonesia" as the two leading national and business newspapers in

Indonesia.

3. Hypotheses Development

3.1 Mandatory CSR Rule and Stock Market Reaction

The roles of government in imposing CSR practice diverge from one country to

another country. Bryane (2003) posits two arguments related to mandatory CSR and non

mandatory CSR regulation. First, an argument which consider role of government should be

limited. Since any regulation of CSR will only lead a company to meet minimum requirement

and may vanish competitive advantage of some companies which had previously performed

CSR. Second, an argument which believes that the guideline and moral campaign are not

sufficient, hence government should play more active role in promoting CSR. The first

argument is similar with neo liberalist's view of government role in economic and business

which mostly develop in countries like United Kingdom (UK) and United States (US) where

government role in imposing the CSR is limited only as catalyst or fine-tuning the process.

The second argument develops in countries like France and some Asian countries where

government play more active role by giving incentives for companies that perform CSR.

However, none of those countries above move further to make regulations that mandated

companies to have CSR program.

Neo classic economist suggests that managers' main objective is to make decisions

in maximizing shareholders' value (Friedman, 1970). This argument then challenged by

Freeman with his "stakeholder theory" which states that management can only maximize

shareholders' value by maintaining a good relationship with other stakeholders (Freeman,

2004). Support to stakeholder theory has been stronger recently since there is an increasing

pressure from other stakeholders (e.g. employees, local community and environmental

lobbyist) (Sundaram and Inkpen, 2004) for companies to be more accountable on environmental issues (Hines, 1991).

Furthermore, Gilkinson (1994) provides evidence that CSR programs "…can enhance relations with a variety of stakeholders, including shareholders, lenders, insurers, underwriters, suppliers, customers, environmental activists and employees". In addition, Elkington (1994) stated that firm now facing difficult challenge to work out new ways of co-operating with their suppliers, community and other stakeholders to maintain its sustainability and also its competitive advantage. Therefore, Elkington (1997) suggested the use of "triple bottom line' (financial, environmental and social) as alternative for financial criteria in measuring company performance.

In the more recent study, Stigson (2002), documents that more company adopt and implement CSR programs since they belief CSR is inline with company's objective. Mackey, Mackey and Marney (2007) document that CSR might enhance company performance in the long run in term of share price performance. They also assert that even though CSR program reduce the present value of firm's future cash flows, but it will not affect firm's shareholders' value. Meanwhile, Chih, Shen and Kang (2007) found that CSR has a correlation with lower earning management and Sarre, Doig and Fiedler (2001) document that CSR will reduce company's exposes risk. In relation with market reaction, Bird, Hall, Momente and Reggiani

1631

(2007) found that CSR programs is value-relevant, especially since CSR is related to environmental and employee-relations.

Based on our reviews on what prior studies have found, we formulate our hypotheses as follows:

H1:   *The stock market reaction toward firms whose activities are to deal with or are related to the management of natural resources during the event window of the mandatory rules on CSR implementation is positive.*

3.2 Determinants of Stock Market Reaction toward Mandatory CSR Rules

Besides providing evidence of the market reaction to mandatory CSR implementation law as measured by abnormal return, this research also attempts to explore the factors that are attributed to such stock movements. We speculate that market did not take the information related to CSR for granted, They will relate such information to the economic characteristic of each company such as its size, profitability and leverage. This research, therefore, also aims to investigate the economic determinants that drive the market reactions toward mandatory CSR implementation law. We document the following contextual factors that are associated with the magnitude of abnormal returns for mandatory CSR related event.

a. Size

Previous studies suggest that companies with bigger size tend to disclose more of CSR information. Bigger company will be more exposed to social and environmental risks, since the company will deal with many parties through its activities and products (Hackston & Milne, 1996). Bigger companies made themselves to be more politically visible (Belkoui & Karpik, 1989). Based on that argument, the mandatory CSR law will not affect the companies much as they have bigger size and the experience to perform and report information of CSR beforehand. Thus, it will increase the accuracy of market expectation and lower market surprise (Na'im & Rakhman, 2000). Smaller companies, on the other hand, do not have such experience and expertise or probably they have never conducted any CSR program before. Therefore, the second hypothesis for this study is:

H2: *In responding to mandatory CSR implementation bill, the stock market will react more positively to smaller firms whose activities are to deal with or are related to the management of natural resources.*

b. Profitability

The implication of CSR legislation may incur additional costs. Companies that have high profitability may not be affected much by such additional cost. The high profitability will supply companies flexibility to manage and report CSR programs (Hackston & Milne, 1996).

Therefore, more profitable firms are more likely to be able to afford implementing the CSR programs. As such, the third hypothesis in this study is:

H3:   *In response to mandatory CSR implementation bill, the stock market will react more positively to more profitable firms whose activities are to deal with or are related to the management of natural resources.*

c. Leverage

Leverage is used as a proxy for firm's risks . Mandatory CSR implementation law is claimed to provide benefit in the form of "social and environmental license" by maintaining a good relationship with other stakeholders (Freeman, 2004). As discussed in preceding section, more companies now implement CSR programs and report it in their annual report. Companies willing to invest in CSRbelieve CSR programs are inline with their business objectives (Stigson, 2002) and it may create long term sustainability in their business processes. When a firm creates long term sustainability in their business processes, it is expected that the risk of the firm will also reduce. Therefore, the fourth hypothesis in this study is:

H4:   *In response to mandatory CSR implementation bill, the stock market will react more positively to higher leverage firms whose activities are to   deal with or are related with   the management of natural resources.*

d. Industry

As stipulated by article 74, Law no 40/2007 on PT, the obligation to carry out CSR program is for Indonesian companies whose activities are related with the management of natural resources. As the mining firms are often associated with the exploitation of the natural resources that may cause a significant environmental damage, we would like to know specifically whether the firms experience more positive market reaction toward the mandatory of CSR implementation news. Therefore, the fifth hypothesis of this study is:

H5: *In responsing to the mandatory of CSR implementation bill, the stock market will react more positively to mining firms whose activities are related to the management of natural resources.*

4. Data

Table 1 shows the sample selection procedure. We started with 35 firms listed in Indonesia Stock Exchange (BEI) that are categorized as firms whose activities are dealing with or are

related with the management of natural resources. Then we filtered out 1 firm due to its

inactive share price movement, 9 firms for their insufficient share price data and 4 firms for

their confounding events. It limits our sample into 21 firms. Our share price data is obtained

from Indonesia Securities Market Directory (ISMD).

[INSERT TABLE 1 HERE]

Table 2 illustrates that the sample used in this study is distributed across 4 industries and 7

sub industries based on IDX industry classification. The sample constitutes 10 firms from

Mining industry (47%), 8 firms from Basic Material and Chemical industry (38%), 1 firm from

Infrastructure, Utility and Transportation industry (5%) and 2 firms from Agriculture industry

(10%).

[INSERT TABLE 2 HERE]

5. Research Design and Methodology

5.1 Empirical Model

5.1.1 The Standard Market Model

As the objective of this study is to investigate the market reaction upon the obligation

of CSR implementation prescribed by article 74 of Law no. 40, 2007, the Event Study

Methodology is employed. This methodology allows us to measure the effect of a particular

event on the share return of the firms. To estimate the abnormal return for each day related

to the likelihood of approval or rejection of mandatory CSR implementation law, a standard

market model is used (see Equation 1).

$$R_{it} = \alpha_i + \beta_i R_{mt} + \varepsilon_{it} \quad ^{296, \ 297} \tag{1}$$

Equation 1 is applied to estimate the OLS parameters, $\hat{\alpha}_i$ and $\hat{\beta}_i$. The estimation period

used in this study covers 200 days prior to day -1. The abnormal returns surrounding each

event are determined based on Equation 2.

$$AR_{it} = R_{it} - (\hat{\alpha}_i + \hat{\beta}_i R_{mt}) \quad ^{298} \tag{2}$$

In addition to a daily event window, a 3-day event window (-1 to +1) is calculated. It is

assumed that the length of the event window is enough to capture possible expectation or

---

[296] R_{it} and R_{mt} are calculated using the following equation: $R_{it} = (P_{it} - P_{it-1})/ P_t$, $R_{mt} = (M_t - M_{t-1}) / Mt$, where P_{it} is the share price of firm i at time t; P_{it-1} the share price of firm i at time $t-1$, M_t is the market index of at time t; M_{t-1} is the market index at time $t-1$

[297] In equation 1, R_{it} is the security return for firm i on day t, R_{mt} is the market return on BEI composite index (IHSG) on day t, α_i and β_i are the Ordinary Least Square (OLS) coefficients and ε_{it} is the disturbance term (residual)

[298] In equation 2, AR is the abnormal return for firm i on day t and $\hat{\alpha}_i$ and $\hat{\beta}_i$ are the OLS estimates of market model parameters for *firm i.*

information leakage before the event, while it is not too long to face problems with confounding events falling within the event window. Cumulative abnormal returns (CAR$_{it}$) for each firm is computed by summing up the firm's abnormal return during the event window (Equation 3).

$$CAR_{it} = \frac{1}{N}\sum_{t=1}^{t=N}\varepsilon_{it} \quad ^{299}$$

(3)

5.1.2 The Cross-Section Regression Model

To investigate the determinant of market reaction upon the obligation of CSR implementation as prescribed by article 74 of Law no. 40, 2007, a cross sectional analysis was employed. The cross sectional regression model was used to examine the relationship between stock price movements represented by abnormal return or cumulative abnormal returns (CAR) with the event window and the range of variables outlined in the hypothesis development section that were predicted to influence price reaction. The models used were as follows:

$$AR_{it} = \alpha_i + \beta_1 LOGTA + \beta_2 ROE + \beta_3 LEV + \beta_4 IND + \varepsilon_{it}$$
$$CAR_3 = \alpha_i + \beta_1 LOGTA + \beta_2 ROE + \beta_3 LEV + \beta_4 IND + \varepsilon_{it}$$

(4)

---

[299] In equation 3, CAR_{it} is the cumulative abnormal return for firm *i* in time *t* and *N* is the number of days in the event widow.

In the model above, the dependent variables are the abnormal return *(AR)* and *CAR*, while the independent variables are the firm's specific characteristics such as *LOGTA, ROE, LEV,* and *IND.* All statistical tests use White's (1980) consistent covariance estimator. Table 3 summaries the variable interests in this research, which are described below:

[INSERT TABLE 3 HERE]

a. LOGTA

The second hypothesis was tested with the estimated coefficient of *LOGTA. LOGTA* is the natural logarithm of the total assets of the firm. *LOGTA* is used as a proxy of a firm's size. The coefficient of *LOGTA* is expected to be negative.

b. ROE

The third hypothesis was tested with the estimated coefficient of *ROE. ROE* is a proxy variable for profitability of the firm. It is the state of financial health of the firm. *ROE* is calculated by dividing the firms' earnings after interest and tax by the shareholders equity. The coefficient of *ROE* is expected to be positive.

c. LEV

The fourth hypothesis was tested with the estimated coefficient of *LEV*. *LEV* is the level of leverage of the firm. *LEV* is used as a proxy for firm risk. It is measured by dividing the long term debt and total assets of the firm. The coefficient *LEV* is expected to be positive. d. IND

The fifth hypothesis was tested with the estimated coefficient of *IND*. *IND* is a dummy variable for type of firms in our sample. The dummy variable is coded 1 if the firm is a mining firm and 0 otherwise. The coefficient *IND* is expected to be positive.

6. Empirical Results

6.1 Descriptive Statistics

Table 4 reports descriptive statistics for abnormal returns and selected firm characteristics for the 21 sample firms. Panel A, B, and C show the descriptive statistics for daily abnormal return *(AR)* and 3-day cumulative abnormal returns *(CAR)* surrounding the events. Meanwhile, Panel C describes the descriptive statistics for several firms' characteristics.

[INSERT TABLE 4 HERE]

Panel A in Table 4 shows that the daily *AR* from day -1 to day +1 for July 20 event window (the approval of the PT bills that included mandatory CSR implementation) is positive.

1640

The *AR* also remained positive when the returns were accumulated for 3 days as illustrated in Panel B. We also find that there are more than 50% of the sample experienced positive abnormal return for both daily and cumulative abnormal returns. It suggests that the passage of mandatory CSR implementation law provides value-relevant information to investors, despite no test of significance has been conducted.

Panel C in table 4 depicts the characteristics of firms whose activities are related with the management of natural resources. In terms of size as shown by the *LOGTA* variable, firms in the sample are quite similar in size as indicated by mean (median) of sample *LOGTA* is 15.13 (15.06).. Moreover, Panel B in table 4 illustrates that the sample primarily consists of medium leverage firms as shown by *LEV* variable with mean (median) of 0.43 (0.36), which means that the firms in the sample have approximately 43% long term debt in proportion to its total equity. Furthermore, the sample consists of quite profitable firms as mean (median) of *ROE* variable is 0.21 (0.17).

6.2 Empirical Results

6.2.1 Mandatory CSR Rule and Stock Market Reaction

Table 5 reports the abnormal return and cumulative abnormal return surrounding the event date. As expected, the result shows the mean coefficient for daily *AR* and 3-day *CAR* for the news related to the approval of mandatory CSR implementation law is positive.

[INSERT TABLE 5 HERE]

The parametric test (*t*-test) for July 20 event window shows that *AR* is significant at 15% level and the CAR_3 are significant at 10% level using one tailed test, with *t*-statistic (*p*-value) of 1.25 (0.11) for *AR* and t-statistic (p-value) of 1.64 (0.06) for CAR_3. Hence, the findings lend support on H_1 on which the market reacts positively for the approval of mandatory CSR implementation bill news.

Some explanations on why market reacted positively to the regulation are (1) more CSR programs are conducted and reported by companies in mining and other natural-resource related companies might lower companies' expose risk (Sarre, Doig and Fielder, 2001), (2) some mining companies (high-profile industry) have undergone some CSR projects voluntarily, so they will have no problems when CSR becomes mandatory (3) the additional activities and reporting required by the law will increase the accuracy of market expectation, lower information asymmetry, and lower market surprise (Na'im & Rakhman, 2000).

6.2.2 Determinants of Stock Market Reaction toward Mandatory CSR Rules

Table 6 Panel A and B report the cross sectional regression results of daily Abnormal Return (*AR*) and the 3-day CAR (*CAR$_3$*) on independent variables. The test variables are *LOGTA* which are measured by the natural logarithm of the total assets of the firms. *ROE* represents the profitability of the firms measured by profitability; *LEV* represents riskiness of the firms, measured by the long term debt divided by the total assets; and *IND* represents for type of industry – whether mining firms or non mining firms, which is a dummy variable that is coded as 1 for mining firm and 0 otherwise.

In Panel A table 6, the results of the cross sectional regression with *AR* as dependent variable indicate that all tested variables move as predicted, with different level of significance. The coefficient of *LOGTA* is negative with t-statistic (p-value) of -1.35 (0.09) that is significant at 10% level using one tailed test. The coefficient of *LEV* is positive with t-statistic (p-value) of 2.08 (0.03) and significant at conventional level of 5% level using one tailed test. Meanwhile, the coefficient of *IND* is positive and significant with t-statistic (p-value) of 1.74 (0.05) and significant at 5% level using one tailed test. Finally, the coefficient of variable *ROE* is not significant with t-statistic (p-value) of -0.61 (0.273), suggesting that no profitability effect influence the variation in the abnormal return.

Panel B in table 6 shows the cross sectional regression results of CAR_3 on the firm's characteristics variables. The results suggest of the CAR_3 regression on all tested variables (*LOGTA, LEV,* and *IND)* move in the same manner as the results of regression, where *AR* is the dependent variable, without major different in the significance level except for *LOGTA*. The coefficient of *LOGTA* variable is still negative with higher t-statistic (p-value) of -2.31 (0.019) and significant at 5% level (one-tailed), while the coefficient of variable *LEV* is still positive with t-statistic (p-value) of 2.59 (0.011) and stays significant at 5% level (one tailed). Meanwhile, the coefficient of *IND* is still positive and significant with t-statistic (p-value) of 1.99 (0.033) and significant at 5% level using one tailed test. Finally, the coefficient of *ROE* became positive and insignificant with t-statistic of 0.53. Therefore, both for *AR* and CAR_3 cross sectional model, the results provide support that market used company's size, leverage and type of industry as determinant factors in responding to the mandatory requirement of CSR.

Concerning the empirical result on size, it is important to note that market reacts more positively in smaller firms, suggesting that market expect smaller firms to carry out CSR activities. In general, previous studies show that bigger firms have more CSR practice and disclosure. This result does not oppose that general views, but somewhat complete them. As market expects that bigger firms have already performed and disclosed CSR programs, such

regulation would not affect much. On the other hand, given the low practice and disclosure of

CSR in smaller firms, market view that such regulation will give smaller firms a pressure to

conduct and disclose CSR, which is valued by market.

The similar explanation is given to why market reacts more positively to higher

leverage firms. Previous studies show that higher leverage firms will disclose less CSR

information in their annual report, suggesting that higher leverage firms view CSR as an

expense that should be minimized. The legal requirement of CSR, therefore, will give

pressure to higher leveraged firms to also perform CSR. Hence, this result suggests that

market also expect higher leverage firms to perform CSR.

Regarding the finding on industry type, which is whether firms are in mining industry

or not, is significant as determinant factor. The law explicitly mentions companies in whose

deal with natural resources to perform CSR (e.g. mining firms), while also mentioning the

same obligation to companies whose related to the management of natural resource. The

last category is less clear therefore, market reaction to the companies in last category is less

strong than in first category.

Finally, we find that there is no significant association between market reaction and

profitability, suggesting that market view the consequence of the legal requirement of CSR is

not associated to company's profitability. This is interesting given the fact that mandatory

CSR implementation will incur additional compliance cost. We interpret this result as investor believes that the benefit of CSR practice will outweigh the cost. For example, some studies find that CSR cost may lower claims from community and NGO (Mackey, Mackey and Marney, 2007, Bird et al, 2007)

7. Conclusion

The purpose of this research is to examine the investor reaction to mandatory CSR implementation law in Indonesia as stipulated in article 74 of Law no. 40, 2007 on PT. Specifically, this study examines whether equity investor in a firm that deals with or is related with the management of natural resources view the news related with the obligation to carry out a social and environmental responsibility program, as a good news or otherwise. Furthermore, the hypothesis of this study expects a positive stock market reaction to the event that leads to approval of mandatory CSR implementation law.

Using event study methodology, this study has proven that stock market positively values the approval of mandatory CSR implementation law for firms that deal with or are related to the management of natural resources. It is measured by the positive abnormal return on the day of the announcement and around the day of the related event. It indicates that the equity investors view the mandatory implementation of CSR is a value-enhancing

investment that may result in future cash flow generation. Thereby, value of the shareholders will be maximized.

We also examine the contextual factors that are expected to explain the variation of abnormal returns based on firms' characteristics and contextual factors, such as the size, the profitability, the leverage level, and the firms' engagement in mining industry (or not). It is hypothesized that the abnormal return will be more positive for firms that are profitable, have high leverage, and are engaged in mining industry. It is also hypothesized that the abnormal return will be more positive to smaller firms. Using cross sectional regression analysis, the results of this study provide support for the hypothesis. Overall, this study provides evidence of the stock market reaction upon mandatory CSR implementation law in Indonesia. This study lends support on prior literature that CSR is regarded as future investment instead of additional tax burden.

Despite the evidence provided in this research, there are several limitations that should be taken into consideration. First, even though we have attempted to isolate the event from other confounding events such as earning and dividend announcement before running the model, it is difficult to isolate the CSR obligation news with many other events in the market, which are beyond scope and not necessarily covered in press news. Second, this study employs 21 sample firms considered to be affected by the CSR mandatory rules in

Indonesia, which is quite small, compared to other event study research in developed countries. However, as this study is based on Indonesian market which is considered as a developing capital market, the size of the sample is assumed to be sufficient to draw robust inferences. Nevertheless, study with larger data set would have provided better off perspective about the issue. Finally, relatively low significance of the empirical result may affect our interpretation. Nevertheless, as Indonesian equity market is considered as semi strong efficient market (Setiawan and Hartono, 2003), we believe that the result is assumed to be adequate to draw reasonable inferences.

For the future direction, there is a research opportunity to elaborate study on the economic determinants of the share price reactions toward the mandatory CSR implementation law news. It is also interesting to see the market reaction regarding the establishment of CSR related government regulation (PP).

Where *AR* is the abnormal return at day 0, *CAR$_3$* is the 3 days cumulative abnormal return at day -1 to day +1, *LOGTA* is the natural logarithm of total asset of the firms as a proxy for firms' size, *ROE* is the return on equity of the firms as a proxy of profitability, *LEV* is the leverage level of the firms, and *IND* is the Dummy Variable, which coded as 1 for mining firms and 0 for non-mining firms.

REVISITING THE RELATIONSHIP BETWEEN CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE FINANCIAL PERFORMANCE: KOREAN EVIDENCE

Jong-Seo Choi, Pusan National University
Young-Min Kwak, Pusan National University)

Abstract: In today's global economy, corporate social responsibility (CSR) is a core component of corporate strategy. However, previous literature provides mixed results on the relationship between corporate social responsibility and corporate financial performance (CFP). This study was motivated by the lack of consistent evidence and the relative paucity of researches devoted to this topic under Korean context. We investigate the empirical relation between the level of corporate social responsibility and corporate financial performance using a sample of 433 firm-years between 2006 and 2008. The level of corporate social responsibility was measured using equal-weighted CSR index as well as stakeholder-weighted CSR index suggested by Akpinar et al. (2008). The corporate financial performance was measured using both accounting and market-based measures.

  We have empirically shown that stakeholder-weighted CSR index, which takes into account the degree with which specific stakeholder groups are prioritized, can provide a positive impact upon corporate financial performance whereas equal-weighted CSR might not be able to provide such a thing. Furthermore, after controlling for factors affecting corporate market performance, hedge portfolio returns based on stakeholder-weighted index proved to be significantly positive, suggesting that this type of CSR index could serve as a signal for good management rewarded by the market. These results imply that it is important for firms to realize which aspects of social responsibility are more important to its primary stakeholders who set expectations of, experience and evaluate the firm's actions in order to keep balance between CSR efforts and corporate financial performance.

Key Words: corporate social responsibility, KEJI index, corporate financial performance, instrumental stakeholder theory, redundant resource theory, virtuous cycle

I. Introduction

  The primary goal of business entities has shifted from profit-orientation toward broader socially motivated perspectives over the recent years. In the past, due to the over-emphasis on the short-term profits, business community frequently had to confront criticisms and protests

raised by society at large. Today's corporations are well aware of the importance of keeping balance between social responsibility and the pursuit of financial goals to ensure their long-lasting survival and prosperity. As such, business organizations make efforts to enhance their corporate image as a way to improve long-term profitability. With the heightened recognition of corporate social responsibility (CSR) in society, corporate entities have continuously refined their strategies to meet diverse stakeholders' demands (Kaplan and Norton, 2001; Becker, Huselid and Ulrich, 2001).

In academic circles, extensive research efforts have been undertaken to assess the empirical association between CSR and corporate financial performance (CFP) under diverse geographical context. The results of previous studies, however, are largely indeterminate as to the direction of the association between the two constructs (Margolis and Walsh, 2003; McWilliams, Siegel, and Wright, 2006; Orlitzky, Schmidt, and Rynes, 2003). For example, according to 'good management theory' or 'instrumental stakeholder theory,' companies with superior social performance tend to perform better financially by attracting socially responsible consumers (Bagnoli and Watts, 2003), alleviating the threat of regulation (Lev et al., 2006), improving their reputation with consumers (Orlitzky et al., 2003) and soothing concerns from activists and non-governmental organizations (Baron, 2001).

Conversely, other researchers argued that trying to satisfy the conflicting objectives of different stakeholders might result in inefficient use of resources and eventual deterioration of financial performance and the costs incurred from socially responsible actions may put the firms at an economic disadvantage (Aupperle, Carroll, and Hatfield, 1985; Ullman, 1985). Still others argue that it is not possible to determine the relations between CSR and corporate financial performance since there are so many intervening variables which are hard to control (Fombrun and Shanley, 1990).

In Korea, two recent cases of west coast oil spill accident and a large-scale money laundering committed by one of the Korea's leading conglomerates provided a momentum for heated debates among public arena and a rise of public outcry for changing the old fashioned way of doing business and increased concern for environment and transparency in corporate governance structure. Also, with the Korea's first sustainability report being published in 2003, corporate social responsibility movements, in which labor union, NGOs, and governmental agencies alike participate, emerged as a major social agenda.

Moreover, it has been a recent trend that under the initiatives of institutional investors based in Europe and North America in particular, Socially Responsible Investment (SRI) movement rapidly spread throughout the global financial markets, which aimed at directing investments in socially responsible business that better met the public demands. The Korea Exchange (KRX) and Corporate Governance Service center (CGS) also followed suit by coming to an agreement to develop the Korean version of SRI index. When Korean SRI index is developed

and fully implemented, Korean capital market would become more favorable toward those companies which are perceived to be socially responsible. Foreign investors are expected to play leading roles in boosting such transitions to happen in Korean capital market. Korean companies in need of capital resources, being aware of the trend, would become more likely to exhibit socially responsible attitudes. It is a general understanding that public voices have vastly changed the corporate perception with regard to its involvement in the society. Corporations are expected to undertake an important role in devising corporate strategies designed to better meet the public demands under such circumstances.

  This research is mainly motivated by the mixed results of previous studies in relation to the empirical association between CSR and CFP and the lack of relevant researches in the Korea. Even though many Korean companies have reportedly been engaged in CSR activities across diverse social dimensions, most of previous Korean studies focused on environmental performance (Jang et al., 2009; Choi et al. 2008) or corporate donation activities (Park and Lee, 2002). Empirical research examining the association between multidimensional CSR index and CFP does not exist, due to the lack of adequate information on CSR performance available from publicly accessible data source. As such, to our knowledge, this study is one of the pioneering researches aiming at providing Korean evidence investigating the empirical association between multidimensional CSR and CFP. Specifically, this study seeks to explore the relation between CSR and CFP using KEJI[300] index which is developed by Citizens' Coalition for Economic Justice (CCEJ). CCEJ is one of Korea's leading NGOs, and it developed KEJI for the purpose of evaluating moral management and social responsibility[301] of Korea's leading corporations. The remainder of this paper is organized as follows: Section 2 reviews the previous literature and frames the testable hypotheses; section 3 introduces research design and section 4 provides the empirical results; section 5 summarizes the study's conclusions and limitations.

II. Literature Review and Hypotheses Development

2.1 Literature Review

---

[300] KEJI is an abbreviation for Korea Economic Justice Institute, which was established by CCEJ in 1990 for the purpose of conducting researches on socially equitable economic development and economic policies aiming at fair distribution of social wealth. KEJI has published KEJI index for leading Korean companies since 1991 and has awarded selected companies with the highest KEJI score on an annual basis.

[301] The Citizens' Coalition for Economic Justice (CCEJ) is a nationwide citizens' movement based in Korea, working for economic justice, environmental protection and democratic development since 1990.

Establishing a relation between CSR and CFP is important from a social responsibility perspective in that a positive relation tends to validate the credibility of the CSR measurements. Despite all the pleasant voices saying that CSR is a way to improve reputation among customers, employees, and shareholders (Lev, Petrovists, and Radhakrishnan, 2006) or provide legitimacy for their action (Berrone and Gomez-Mejia, 2006), more than thirty years of research in management literature exploring the link between CSR and corporate financial performance only provided mixed results (Margolis and Walsh, 2003; McWilliams, Siegel, and Wright, 2006; Orlitzky, Schmidt, and Rynes, 2003).

One stream of research showed that socially responsible firms would perform better financially by attracting socially responsible consumers (Bagnoli and Watts, 2003), alleviating the threat of regulation (Lev et al., 2006), improving their reputation with consumers (Orlitzky et al., 2003) and soothing concerns from activists and non-governmental organizations (Baron, 2001). On the other hand, there is another stream of research which argues that trying to satisfy conflicting objectives of different stakeholders might result in inefficient use of resources and might even deteriorate the financial performance (Aupperle, Carroll, and Hatfield, 1985) and costs incurred from socially responsible actions may put the firms at an economic disadvantage compared to others (Ullman, 1985). Other than those, there is also a third stream of research which concluded that it is hard to establish any relationship between CSR and CFP since there are so many intervening variables between the two constructs which are hard to control (Fombrun and Shanley, 1990).

Mixed results reported in the previous studies about the relationship between CSR and CFP may be attributed to the various ways corporate financial performance have been operationally defined (Carroll, 1991; Orlitzky et al., 2003), to the lack of appropriate statistical controls (Margolis and Walsh, 2003; Wood and Jones, 1995), and to the 'stakeholder misalignment' problem (Wood and Jones, 1995; Akpinar et al., 2008).

For example, Orlitzky et al. (2003) explore the relation between CSR and CFP using meta-analysis approach. They found that CSR appears to be less correlated with market-based financial performance indicators than accounting-based ones. McGuire et al. (1988) also classified the studies into groups and stated that there is a positive relationship between CSR and accounting based CFP measures, whereas mixed results have been reported in the studies where stock-based CFP measures are used. On the other hand, McWilliams and Siegel (2000) showed that once R&D investment is included in the equation, the positive relationship between CSR and CFP is not significant anymore. They argued that empirical studies about the relationship between CSR and CFP so far have ignored some intervening variables which are acknowledged to be important determinants of financial performance.

As another explanation for such mixed results in previous studies, Wood and Jones (1995) suggested so called 'stakeholder misalignment'–relating stakeholder specific variables to a set

of aggregated stakeholder variables ignoring many differences that exist between different stakeholder groups. They argued that future studies about CSR should take into account that a company should weight which sub-dimensions of social performance is perceived to be important by its stakeholders. In order to cope with such a 'stakeholder misalignment' problem, Lev et al. (2006) classify firms into two groups in accordance with the degree of sensitivity to consumer perceptions. First group consisted of firms belonging to industries where sensitivity to consumer perception is high (such as consumer goods and finance industries) and second group had firms operating in industries where sensitivity to consumer perception is low. They empirically showed that firms producing goods and services purchased by individual consumers are more likely to enhance revenue from having a reputation as a good corporate citizen than firms that produce goods and services for industrial or government use.

More recently, Akpinar et al. (2008) explored the relation between CSR and CFP using a new measure of CSR. They measured CSR with a stakeholder-weighted CSR index which aggregates CSR sub-dimensions indices after taking into account of stakeholder conflicts and their varying importance in different industries. They found a significantly positive association between CSR and CFP using a new stakeholder-weighted CSR index, whereas this link was not significant when equal-weighted CSR index was used as explanatory variable.

Among related Korean researches, Jang et al. (2009) conducted an integrated analysis of the interrelations among environmental performance, financial performance, and environmental disclosure after controlling for endogeneity by using two-stage least squares (2SLS) regression approach. They observed significantly positive relation between environmental performance and financial performance. Choi et al. (2008) applied simultaneous equation approach to explore the relations among corporate environmental disclosure, public initiatives, and firm characteristics. Han et al. (2002) studied the association among corporate philanthropic activities, corporate image, and corporate product image. They provided empirical evidence suggesting that corporate philanthropic activities alleviate direct or indirect cost by improving corporate image and corporate product image. Park and Lee (2002) explored the relation between corporate donation service/environmental protection activities and corporate financial performance of 295 Korean listed manufacturing firms. They found that corporate donation service tended to enhance corporate financial performance, whereas environmental protection aggravated it. These results imply that the effect of CSR varies with CSR sub-dimensions. Bae et al. (2008) explored the economic value of CSR disclosures using the event study methodology. They observed statistically significant abnormal returns on the event day and the day before announcement date and concluded that corporate social investments have positive economic value.

2.2 Hypotheses

  As discussed in literature review section, prior empirical researches on the relation between CSR and CFP have reported mixed results. A variety of causal mechanisms have been proposed in previous studies to account for the inconsistent findings (Orlitzky et al., 2003). In this paper, we particularly focus on the instrumental stakeholder theory and/or the good management theory (Alexander and Bucholz, 1978; Berman et al., 1999; Bowman and Haire, 1975; Margolis and Walsh, 2003; Waddock and Graves, 1997). Instrumental stakeholder theory shares the underlying logic with the good management theory, and they suggest a positive relationship between CSR and CFP. According to these theories, the satisfaction of various stakeholder groups is instrumental for improving organizational financial performance and high corporate social performance bolsters a firm's competitive advantage by weighing and addressing the claims of various constituents in a fair and rational manner (Jones 1995).

  In contrast to the typical primary interest groups in the past who used to focus on financial performance only, there has been a steady increase in the number and kind of stakeholder groups interested in broader corporate social performance (Shapiro, 1992). For example, Graves and Waddock (1994) and Teoh and Shiu (1990) both insisted that institutional investors are favorably inclined toward companies with better social performance when other factors are held constant and independent information on social performance is available. Bowman and Haire (1975) also discussed that stakeholders, stockholders and bondholders may regard CSR as indicating management skill. Alexander and Bucholz (1978) suggested that CSR makes firms an attractive investment since investors evaluate socially aware and concerned management as possessing the requisite skills to run a superior company. Similarly, Spicer (1978) found a positive association between stock price and corporate social performance and insisted that corporate social performance gives information about management competence. Along the same line, Waddock and Graves (1997) found a positive relationship between CSR and the quality of management, where quality of management is measured using the Fortune reputation survey rankings. According to above theories and previous studies, we predict that:

Research Hypothesis: There is a positive association between CSR and CFP.

  We also predict that the association between CSR and CFP would become more evident by taking the sub-dimensions of social responsibility that prioritize major stakeholders into proper perspective.

III. The Empirical Model and Variable Descriptions

3.1 The empirical model

We first propose following econometric model to test research hypothesis:

$$CFP_{it} = \beta_0 + \beta_2 CSRindex_{it} + \sum \beta_{jt} CONTROL_{tjt} + \varepsilon$$

Where, CFP = corporate financial performance
CSRindex = corporate social responsibility index
CONTROL = control variables

Above model is designed to investigate empirical association between CFP and CSR index on cross-sectional basis, particularly when the former is measured using firm level performance measures such as accounting and/or market based indicators. However, cross-sectional regression models are not likely to control intervening variables which are acknowledged to be major determinants of market performance. Thus, we employ Carhart's (1997) four factor market model in addition to the above cross-sectional regression model to see whether market-based financial performance incorporates corporate social performance as well. In order to use Carhart's four factor model, we rank firms according to their CSR index order and construct two portfolios by including firms from the first decile in the top portfolio and those from the tenth decile in the bottom portfolio. We then calculate the differences in the monthly returns between the top and bottom portfolios, which provide hedge portfolio return that can be earned by taking long position in the most socially responsible firms and short position in the least socially responsible counterparts.

We next reclassify the firms belonging to the top and bottom portfolios according to each of the four factors suggested by Carhart (1997) as major determinants of market return to obtain factor mimicking portfolios on a monthly basis. The return differences between the upper and lower halves of respective factor groups are used as dependent variables in the monthly time-series regression models to control for the effects of these factors. Our focus is placed on the intercept term of the four factor market model since it signals whether the CSR based hedge portfolio still earns positive returns after controlling for the four factors included in the model. The model to be estimated is as follows:

$$R_t = \alpha + \beta_1 RMRF_t + \beta_2 SMB_t + \beta_3 HML_t + \beta_4 Momentum_t + \varepsilon$$

Where, R_t = the monthly return difference between top and bottom portfolios
$RMRF_t$ = market risk premium factor mimicking portfolio return
SMB_t = size factor mimicking portfolio return
HML_t = growth factor mimicking portfolio return
$Momentum_t$ = momentum factor mimicking portfolio return

The alpha in this model represents the abnormal return on a zero-investment strategy that buys top portfolio and sells short bottom portfolio. If high CSR drives market-based financial performance, we would expect positive and significant alpha.

3.2 Variable Descriptions

3.2.1 Corporate Financial Performance

To examine the link between CSR and cross-sectional CFP, we use both accounting-based and market-based financial performance measures. As accounting-based financial performance measures, we use return on assets (ROA) and return on equity (ROE). We also choose Tobin's Q as market-based financial performance measures. We measure Tobin's Q using Chung and Pruitt (1994) definition.

- ROA = operating profit / total asset
- ROE = operating profit / owner's capital
- Tobin's Q = (market value of common stock + market value of preferred stock + book value of liabilities) / book value of total asset

3.2.2 Corporate Social Responsibility

A key research design issue in our study is to develop reliable proxies for corporate social responsibility. A few previous studies in Korea including Park and Lee (2002) and Jang et al. (2009) assessed CSR using KEJI index developed by CCEJ in order to evaluate the level of Korean firm's business ethics and social responsibility.[302] One of the distinctive features of

---

[302] Korea Economic Justice Institute (KEJI) index is the first comprehensive evaluation scheme for corporate business ethics and social responsibility developed and implemented in Korea, which is comparable to CEP index provided by Council of Economic Priorities in the US, Asahi Foundation index of Japan, and several other corporate ethics indices of European countries.

KEJI index is that it is a product of an independent rating service that focuses particularly on the evaluation of multidimensional corporate social performance. Overall KEJI index consists of seven indices corresponding to seven individual sub-dimensions (soundness, fairness, contribution to society, consumer protection, environmental performance, employee satisfaction, and contribution to economic development).[303] We develop two proxies using these data for each of our sample firm-years from 2006 to 2008.

- ■ Equal-weighted CSR index (EW)

The first proxy for CSR is defined as the simple sum-up scores of seven sub-dimension KEJI indices. This variable was used by Park and Lee (2002) who assessed corporate donation and environmental protection efforts in particular. The first proxy is measured for each firm-year as follows:

$$\text{Equal - weighted CSR index (EW)}_{\text{it}} = \sum_{k=1}^{7} x_{ijk}$$

Where, x_{ikt} = score for firm i, social dimension k, year t

This approach has a drawback in the sense that it assumes all sub-dimensions are equally important to all stakeholders. As discussed in the previous literature of instrumental stakeholder theory, firms need to attend to different stakeholders differently according to the various interests (Wood and Jones, 1995). Depending on the specific areas of social responsibility considered to be important by major stakeholders, the level of CSR is likely to be given different evaluations. Our first proxy for CSR suffers from the lack of a weighting scheme for the different dimensions of CSR, which is remedied by introducing weighted measures of CSR, as proposed by Akpinar et al. (2008).

---

[303] More specifically, soundness dimension comprises three items of soundness in stockholder composition, capital expenditures, and financing efforts. Fairness dimension consists of fair trade, economic concentration, transparency, and cooperation with suppliers. Contribution to society considers care for minority groups and donations. Consumer protection comprises protection of consumer sovereignty, product quality and promotion. Environmental protection covers environmental improvement efforts, environmental friendliness, and violation of regulation. Employee satisfaction consists of workplace safety, human resource investment, wage and welfare, labor-management relationship, and gender equality. Contribution to economy relates to R&D efforts and operating performance.

■ Stakeholder-weighted CSR index (SW)

In order to alleviate potential limitation inherent in our first proxy for CSR, the second proxy for CSR is adopted from Akpinar et al. (2008) and is defined as the stakeholder-weighted CSR index. Akpinar et al. (2008) argued that stakeholder-weighted CSR index (SW) is a new CSR measurement which reflects the relative importance of each stakeholder group based on the industry where individual firms belong to. In order to operationalize the second proxy for CSR, we first separate our sample firms into 9 industries according to firm level Korea Standard Industry Code (KSIC). After categorizing the sample firms into 9 industry groups for each year, KEJI index score for each of the seven dimensions is summed up to obtain an aggregate score of social performance for that particular industry-year. Then individual sums for each of the seven dimensions are divided by this overall sum to compute the weights for each of the seven dimensions for every industry-year. After having the weights for every industry-year, we have multiplied the raw KEJI index scores with associated weights to get the new stakeholder-weighted CSR index for every firm-year.

$$Weight_{jkt} = \frac{Average_{jkt}}{\sum_{k=1}^{7} Average_{jkt}}$$

$$Stakeholder - weighted CSR index (SW) = \sum x_{ijkt} \times Weight_{jkt}$$

Where, $Average_{jkt}$ = average score for industry j, for social dimension k, for year t

$Weight_{jkt}$ = weight for industry j, social dimension k, for year t

x_{ijkt} = score for firm i operating in industry j, social dimension k, year t

3.2.3 Control Variables

We use several control variables which is consistently shown to be related to the corporate financial performance. These control variables can broadly be broken down into two groups of firm characteristics and management preferences. Firm characteristics category includes size (Arlow and Gannon, 1982; Shin and Stulz, 2000), risk (McWilliams and Siegel, 2000) and sales growth (De, 1992). To control for the past corporate performance, we also lag sales growth by one year and include it as an additional control. We take logarithm of total assets to

measure firm size and define firm risk using long term debts divided by total asset. We include sales growth for year t using log of sales in year t divided by sales of year t-1. We also include lagged sales growth for year t, which is measured by sales of year t-1 divided by sales of year t-2.

Management preference variable includes R&D expenditures standardized by total assets (McWilliams and Siegel, 2000). Lastly, we also control for industry and year effects by including 8 industry as well as 2 year dummy variables to distinguish 9 industries and 3 years under coverage respectively.

- SIZE = Log (total asset)
- RISK = Long-term debt / total asset
- $Sales_t$ = log (Sales for year t / Sales for year t-1)
- $Sales_{t-1}$ = log (Sales for year t-1 / Sales for year t-2)
- R&D = R&D expenditures / total asset

3.2.4 Variables Used in Carhart's (1997) Four Factor Model

In Carhart's (1997) four factor model, R_t represents the monthly return difference between top and bottom portfolios. $RMRF_t$ is the month t market return minus the risk-free rate and terms SMB_t (small minus big), HML_t (high minus low), and $Momentum_t$ are the month t returns on zero-investment factor-mimicking portfolios designed to capture size, book-to-market, and momentum effects, respectively. Each of the factor-mimicking portfolios are measured by computing the differences in monthly returns between the upper and lower half of the firms rank-ordered according to each of the factors. Four factor market model is estimated using 36 monthly time-series returns.

IV. Empirical Results

4.1 sample selection

The sample of this study is drawn from companies listed on the Korea Exchange (KRX) for which KEJI index is available from KEJI annual brochures. These firms appeared in the list of firms selected by KEJI for scrutiny to determine annual Economic Justice Award winners.[304]

---

[304] KEJI is comparable to US CEP, and has awarded Economic Justice Prize based on KEJI index since 1991. The index was first introduced in 1991 and subsequently modified and refined in 1993. Representatives from

KEJI award winner selection procedure consists of both quantitative and qualitative evaluation processes. Quantitative evaluation is applied to Korean companies listed in the KRX on the basis of annual reports, news reports, and other information available from governmental authorities such as National Tax Service, Fair Trade Commission, and KRX, excluding those firms under serious financial trouble.[305] Qualitative evaluation is subsequently conducted by sending questionnaires to the overall top 10% and top 20% industry leaders to collect publicly unavailable information. KEJI discloses the scores of top 200 companies in its brochure with the names of 3 award winners on annual basis.

Consequently, our sample inevitably suffers from sample selection bias as it consists of those companies which scored relatively high in KEJI indexing procedure. To the extent that we rely on KEJI index, however, in order to measure corporate social performance or the level of social responsibilities accomplished by Korean sample firms, this bias is an inevitable cost. To our knowledge, there is no alternative reliable measure of CSR in Korea that can be compared to KEJI in its coverage, and measurement validity. Sample period covers three years from 2006 through 2008. KEJI has published KEJI index since 1991 and the list of selected firms is subject to changes from year to year. KEJI index data is used as a proxy for CRS score and financial data are retrieved from the TS-2000 database. The final sample includes 433 firm-years for the three-year period with adequate financial variables available in TS-2000. We classify sample firms into nine industries using firm level KSIC codes. Industrial distribution of sample firms is shown in Table 1.

[Insert Table 1]

4.2 Descriptive Statistics

Table 2 shows the descriptive statistics for the research variables. Mean (median) values of EW and SW variables are 422.1 (417.8) and 62.57 (61.87), respectively. The standard deviation values of EW and SW variables are relatively small, suggesting that our sample consists of relatively homogeneous group of firms, characterized by superior position based on KEJI index. To examine corporate financial performance we use two accounting-based measures (ROA, ROE) and one market-based measure (Tobin's Q). Averages of ROA and

---

academia, journalists, governmental authorities, labor union, NGOs, business community, and general public have interacted with the institute for the betterment of the indexing system.

[305] Criteria for exclusion include the followings: three consecutive years net losses, debt being larger than owners; equity, lower than 1.0 times interest rate, merger target, and newly listed companies whose financial data are unavailable.

ROE are about 7% and 1.6%, respectively. Also, mean of Tobin's Q is 0.79. The firm size measured by the natural logarithm of total assets (SIZE) is 12.81.

[Insert Table 2]

4.3 Correlation and Analysis of variance

Table 3 shows Pearson correlation coefficients between pairs of variables. Based on the significance level of 0.01, EW variable correlates strongly with ROA and ROE only, whereas SW variable correlates with all financial performance variables including Tobin's Q, in positive directions. SIZE is positively correlated to all CSR variables (both EW and SW), which is consistent with a commonly shared view that as firm size increases, corporate responsibility tends to increase as well.

[Insert Table 3]

As discussed in good management theory or instrumental stakeholder theory, we expect that companies with superior corporate social performance should have higher financial performance. Table 4 examines the mean difference among four different groups of CSR for corporate financial performance using a series of one-way ANOVA tests. In panel A, we used equal-weighted CSR index to rank the sample firms, whereas in panel B, we used stakeholder-weighted CSR index to rank them. Table 4 suggests that average of corporate financial performance for firms with high CSR index is well in excess of the corresponding average for firms with low CSR index, the difference among the four types of firms being statistically significant. This result implies that CSR and CFP are positively related.

[Insert Table 4]

4.4 Cross-sectional Regression Analysis

Results of cross-sectional regression analyses, where equal-weighted / stakeholder-weighted CSR indices along with control variables are used to explain variations in CFP are provided in Table 5. Under the heading of model 1, we report results of equal-weighted CSR regressions, whereas under model 2, we report the results from regressions using stakeholder-weighted CSR measures. All regressions use dummy variables to control for industry and year effects, whose results are not shown in the table for brevity. As noted in the table, the models are shown to possess significant explanatory powers based on the conventional significance level.

1667

In model 1, the estimated coefficients for equal-weighted CSR (EW) are positive but statistically insignificant, whereas in model 2, the estimated coefficients for stakeholder-weighted CSR (SW) are positive and statistically significant. In other words, CSR with which stakeholders are prioritized can provide a positive impact upon corporate financial performance whereas CSR without it might not be able to provide such a thing. This result also implies that it is important for firms to realize which aspects of social responsibility are more important to its primary stakeholders. Thus, we adopt research hypothesis proposed in this study only when CSR index reflects the relative importance of specific sub-dimensions evaluated by each stakeholder group.

[Insert Table 5]

4.5 Time-series Four Factor Model

However, above regression analysis is not likely to control intervening variables which are acknowledged to be important determinants of financial performance, especially when market-based financial performance is considered. As a circumvention of this problem, we employ Carhart's (1997) four factor model to assess whether market-based financial performance incorporates positive corporate social performance. Table 6 shows the results of estimating 4 factor model where dependent variable R_t is defined as the monthly return difference between top and bottom CSR portfolios. The alpha coefficient in this model captures the abnormal return on a zero-investment portfolio which buys top decile portfolio and sells short the bottom decile portfolio. We estimated two models using equal-weighted and stakeholder-weighted CSR indices respectively to rank the firm-years to form top and bottom portfolios.

As can be seen in Table 8, alpha is not significantly different from zero (t=1.47; p=0.195) when equal-weighted CSR index is used to rank the sample firms. In contrast, alpha is positive and significant (t=2.30; p=0.031) for the 4 factor model which uses stakeholder-weighted CSR index to rank the sample firms. According to this result, although market risk, size, book-to-market ratio and momentum factors explain considerable amount of differences between the returns of two extreme CSR portfolios, there is a significant 23.9 basis point per month difference (alpha=0.239) remaining unexplained by the style differences between two portfolios. Specifically, this implies that an investor can enjoy approximately 3% (0.239*12=2.868) abnormal returns per year by taking long position in the top 10% CSR portfolio and short position in the bottom 10% counterpart, even when the market risk, firm size, book-to-market ratio, and previous period returns are held comparable between the two. Again, these results suggest that CSR with which stakeholders are prioritized can provide a

1668

positive impact upon market-based corporate financial performance whereas CSR without it might not be able to provide such a thing, which are consistent with previous results of cross-sectional regression analyses.

[Insert Table 6]

4.6 Additional Analysis: 2SLS Approach

Similar to the good management theory, slack resources theory also argues a positive association between CSR and corporate financial performance. However, it proposes a different temporal ordering – namely, that corporate financial performance is directly associated with CSR (Ullmann, 1985; Waddock and Graves 1997). According to this theory, financially healthy firms can afford to engage in more CSR activities, which in turn, are likely to lead to further enhancement of financial performance, particularly when the CSR activities are properly directed toward stakeholder preferences. This necessitates the consideration of endogeneity induced by the bidirectional causal relations between CSR and corporate financial performance. If we want to consider good management theory as well as slack resources theory, we need to estimate the equations in such a way as to show that the two variables of CSR and corporate financial performance are related to each other reciprocally. In this sense, previous results based on single-equation regression models are likely to be biased, as they disregard potential endogeneity problem. We, therefore, conduct additional analysis to test the relation between CSR and corporate financial performance after controlling for endogeneity by employing two-stage least squares (2SLS) regression analysis based on the following simultaneous equation system:

Equation 1: $CSRindex_t = \beta_0 + \beta_1 CFP_t + \beta_2 SIZE_t + \varepsilon$

Equation 2: $CFP_t = \beta_0 + \beta_1 CSRindex_t + \beta_2 SIZE + \beta_3 Sales_{t-1} + \beta_4 Sales_t + \beta_5 RISK_t + \beta_6 R\&D_t + \varepsilon$

[Insert Table 7]

The results of 2SLS regression analysis are presented in Table 7. As can be seen in panel B of the table, only the estimated coefficients for stakeholder-weighted CSR (SW) are positive and statistically significant, which is consistent with the results before controlling for endogeneity as reported in previous section. Panel A also shows that high levels of financial performance provide the slack resources necessary to engage in CSR with which stakeholders

1669

are prioritized. In a nutshell, Table 7 shows that CSR index which takes stakeholders' priority into account can provide a positive impact upon corporate financial performance and high levels of financial performance in turn tend to motivate extended engagements in stakeholder-oriented CSR activities. These results support Waddock and Graves' (1997) argument in favor of a "virtuous cycle" between CSR and CFP.

4.7 Sensitivity Analysis

Finally, we conduct two analyses to check the robustness of the afore-mentioned results. First, for each CSR index presented in Table 4, we replicate the difference test across the four CSR groups using non-parametric Kruskal-Wallis test. This approach obtains qualitatively similar results with the comparable level of significance as those reported in the parametric ANOVA-tests.[306]

We next replicate the regression analyses for investigating the relation between each of CSR sub-dimensions and corporate financial performance and still find a significantly positive association between stakeholder-weighted CSR index and corporate financial performance, except for the two sub-dimensions of contribution for welfare service and consumer protection categories. Partial results of this analysis are provided in Table 8.

[Insert Table 8]

V. Conclusion

Previous empirical evidence provides mixed results on the relationship between CSR and CFP. Our study was motivated by the lack of consistent evidence on the one hand and the relative paucity of researches devoted to this topic under Korean context on the other. We investigated the relationship between CSR and CFP using a sample of Korean firms, for which both CSR related data and the financial data are available from relevant data sources at the same time. Owing to the requirement that credible measures of CSR score should be available, sample frame was restricted to the list of firms subject to annual evaluation and publication by KEJI of CCEJ, a leading Korean NGO with respect to the level of corporate social responsibility.

Major contribution of this study mainly derives from the improvement of research design over many previous studies. In particular, in order to alleviate 'stakeholder misalignment'

---

[306] The results are not shown in the table, but are available from authors upon request.

problem discussed in previous literature, we adopted a proxy for CSR, which is defined by taking stakeholders' priority into account to measure CSR score. Furthermore, because general cross-sectional regression model is not likely to control intervening variables which are acknowledged to be important determinants of market-based financial performance, we also employed Carhart's (1997) four factor time-series model. Finally, we conducted additional analysis of the bidirectional relation between CSR and CFP after controlling for potential endogeneity by using two-stage least squares regression analysis based on the simultaneous equation approach.

The results from a series of aforementioned analyses consistently suggest empirical evidence which corroborates that stakeholder-weighted CSR score has a positive impact on accounting-based as well as market-based financial performance measures, whereas this impact disappears when sub-dimensions valued by stakeholders are given equal weights. In other words, only CSR with which stakeholders are prioritized can provide a positive impact upon CFP. This result implies that it is important for firms to realize which aspects of social responsibility are more important to its primary stakeholders. We also show empirically that high levels of CFP tend to increase CSR with which stakeholders are prioritized, consummating a bilateral connection between the two constructs.

However, this study is not without its own limitations which need to be considered in future studies. Most of all, our study did not clearly address the concerns for sample selection bias because our sample is drawn from a population of firms selected by CCEJ, which are featured by larger size, and superior position in terms of financial performance as well as CSR. This limitation is inevitable however, as far as data availability on reliable CSR score in Korea is concerned. Also, although KEJI index is widely cited as presumably the most reliable measure of CSR currently available in Korea, it would not be totally free from rooms for future improvement.[307] Finally, this study was conducted using three most recent years time span which may not be long enough to generalize the results. Because of these limitations and some others, it is necessary to exercise caution to derive meaningful inferences from the results of this study. Future research is expected to extend the coverage of sample firms both by using augmented datasets on corporate social responsibility as well as by experimenting with alternative model specifications.

---

[307] Notwithstanding, we do not know of any other alternative option available in Korea. The validity of results of this study is restricted to KEJI sample in that sense. In an untabulated analysis, however, we found that the financial performance of KEJI sample tended to well exceed that of average listed firms in KRX, which partially complements the results of this study.

HOW DOES CORPORATE GOVERNANCE AFFECT THE DISCLOSURE PRACTICES OF ENVIRONMENTAL INFORMATION?

Yong-Ki Jung, Sun-Hwa Kim, and Won-Sin Kim
.   Chonnam National University.

ABSTRACT:

How the difference of governance structure affect the disclosure context and level of the corporate environmental information. It is specially a serious issue in the era of conservation of global environment. it is because that corporate governance and environmental performance are of great significance to corporations' external reporting, and it is believed that there are significant relationships between the two. This study investigates in a comprehensive manner the association between corporate governance and corporate EID, including the influence of an outside director.

Our findings show that outside directors and foreign ownership were both important indicators of environmental information disclosure (EID), and decisive indicators of the level of EID. These results may prove helpful in policy decision making for environmental disclosure and governance of the corporation or the government.

Key words: corporate governance; environmental information; voluntary disclosure

1. Introduction

With the advent of the concept of sustainable development, corporations are compelled to make decisions in a fashion that protects the environment. In accordance with this tendency, numerous stakeholders, including governments, banking institutions, shareholders, investors, suppliers, consumers, employees, community residents, and environmental organizations, are interested in the environmental impacts of business activities and require information regarding environmental performance (Jose & Lee, 2007; Cormier *et al.*, 2005; Burritt & Welch, 1997).   Amid growing public concern for the environment, environmental authorities around the world are beginning to unveil new disclosure requirements, coupled with effective enforcement protocols with regard to environmental issues facing corporations. In South Korea too, the Korean Securities Commission requires corporations to disclose their environmental information in audit report footnotes,[308] but it is not yet the forcible demand. For this reason, corporate environmental information disclosure (EID) is viewed as an opportunity for corporations to visibly demonstrate their commitment to environmental protection, and many corporations have eagerly seized upon this opportunity.

Corporate environmental and social reporting has been the subject of a great deal of academic research for more than two decades. Some of the principal research questions that have been tackled

---

[308] In South Korea, the Korean Securities Commission requires corporations to disclose their environmental information in the foot notes to audit reports, combining the Environmental criteria and policy, Safety and accident, Environmental investment, Resources and energy consumption, Byproducts and waste treatment.

thus far or are currently being investigated include: Can environmental and social disclosure practices be linked to attributes of economic performance (Lorraine *et al.*, 2004) or to factors such as size, industry membership, risk, market reaction, external influences, or firm reputation, and do these factors differ among countries (Freedman and Jaggi, 2005; Buhr and Freedman, 2001; Guthrie and Parker, 1990; Gamble, Hsu, Fekrat et al., 1996; Williams, 1999). As previously noted by Cooper (1998), previous studies have indicated inconsistent results owing to disregard of other influencing factors, such as social and cultural systems among various countries. Assuming that a relationship may exist (see Cooper, 1988), the literature has, thus far, really only explored three of these reasons: First, the majority of studies have failed to distinguish between mandatory (meaning that required by law or conditions of practice) and voluntary disclosure; Second, it is increasingly clear that environmental and social disclosure varies among various countries, and these practices originated in different social and cultural systems with different economic growth; Third, owing to the lack of a theoretical basis for environmental and social disclosure, previous investigations could not lead to the arrival of universal validity of outcomes.

We argue that the situational or cultural context of corporate governance significantly affects EID. To prove it, this study focuses on voluntary environmental disclosure and addresses corporate governance structure as a proxy for culture. Cultural factors contribute to systematic differences in situational factors and management characteristics among countries. Contextual differences become even more critical when one attempts to apply extant theories and findings in an international context (Wan and Hoskisson, 2003). Especially, the 1997 financial crisis in South Korea raised questions of corporate legitimacy and governance structures, as well as the relationship between the corporation and social contexts governing the functioning of entities. After the financial crisis, improved governance structures enhanced the transparency of management, and the improved governance structures affected disclosure policy, causing disclosure policy to become more closely associated with appropriate corporate values. Thus, improved governance may affect environmental information disclosure, making such disclosure an integral component of legitimate social responsibility. Third, this study uses legitimacy theory to assess the relationship between corporate governance and EID practices. Gray *et al.* (1995) and Hooghiemstra (2000) previously argued that most insights into environmental and social disclosure emanate from the use of these theoretical lenses, which posit that environmental disclosure is a method by which a firm's continued existence or operations can be justified to its various stakeholders. Additionally, issues of governance, including the legitimacy of corporate power, corporate accountability (Worthy and Neuschel, 1983), and environmental and social disclosure processes can be viewed as strategies targeted at closing a perceived legitimacy gap between management and stakeholders.

This study can make two major contributions to the current body of knowledge. First, we comprehensively investigated the association between corporate governance and corporate EID, including the influence of an outside director. By way of contrast to previous studies, we focused on the

proportion of the ownership structure (Brammer, 2006; Smith, 2005; Cormier *et al.*, 2005; Solomon and Darby, 2005; Rahaman *et al*, 2004). Second, we utilized a novel disclosure index developed to assess the amount and quality of EID in terms of disclosure content and format. The use of a disclosure index is considered to be effective in measuring the transparency of the resultant accounting information. Prior studies measured the quantitative or qualitative aspects of EID disclosure in the annual reports (Brammer and Pavelin, 2006; Cormier *et al*, 2005; Al-Tuwaaijri *et al*., 2004; Hackston and Mile, 1996). With such an approach, problems arise as the result of variations across companies and time in writing style and page and font sizes (Hackston and Mile, 1996).

This study is structured into seven sections. The second section provides a prior review and theoretical framework for this study. The third section discusses related studies and develops our hypotheses. The fourth section outlines the methods employed in this study. The fifth section presents our results. The sixth section presents a discussion and outlines the limitations of the study, and the final section contains our conclusions and recommendations for future research directions.

2. Prior Review and Theoretical Framework

2.1 Prior review

Extant studies of corporate social disclosure have pointed to an increasing tendency over time, both in terms of the number of companies making disclosures and in the extent of information being reported (Harte and Owen, 1991; Deegan and Gordon, 1996). Theories explaining social disclosure patterns include the following: 'social contracting theory', which suggests that companies have a social contract with society to demands of divergent interest groups by legitimizing their actions; 'accountability theory', which also extends social contracting theory and considers companies' compliance with the law; and finally, 'decision usefulness theory', which incorporates users other than investors (Tilt, 1994).

Recent conceptual contributions emphasize the role of voluntary social and environmental disclosures in maintaining the legitimacy of business organizations within a business and investment climate characterized by an increasing interest in social and environmental impacts of economic activity. Encompassing stakeholder theory and legitimacy theory, these sociopolitical approaches are 'set within a framework of assumptions about "political economy"' (Gray *et al.*, 1995a) and cast disclosure as a tool for influencing the perceptions and actions of social and political stakeholders. By establishing its legitimacy, a firm both lessens the regulatory burden that would otherwise constrain the execution of corporate strategy, and keeps away from the market the potential stigma associated with a reputation for environmental recklessness.

Employing a variety of theories, corporate environmental and social reporting has become the subject of a substantial quantity of academic research for more than two decades. The empirical

literature documents the variation across firms in environmental disclosure activism. It has been shown to vary considerably across companies, industries, and time (e.g. Brammer and Pavelin, 2006; Cormier *et al.*, 2005; Solomon and Darby, 2005; Smith *et al.*, 2005; Gao *et al.*, 2005; Al-Tuwaaijri *et al.*, 2004; Rahaman *et al.*, 2004; Newson and Deegan, 2002; Gray *et al.*, 2001; Gray *et al.*, 1995a; Hackston and Milne, 1996; Adams *et al.*, 1998; Patten, 1992). Some of the principal research questions that have been tackled regarding environmental and social disclosure practices are linked to attributes of economic performance or to factors including firm size, profitability, debt ratio, industry membership, visibility, ownership, environmental performance, and what motivates companies to make particular social and environmental disclosures. However, these results have not been consistent. First, the majority of studies have failed to distinguish between mandatory (meaning that required by law or a condition of practice) and voluntary disclosure. Second, it has become increasingly clear that environmental and social disclosure varies among various countries, and such results originate in differences among cultures and systems; and third, investigations into environmental and social disclosure lacking a theoretical basis have largely been disproven.

Therefore, this study focuses on voluntary environmental disclosure and governance structure (a proxy for cultural) via the establishment of legitimacy theory.

----- Insert Table 1 -----

2.2 Theoretical framework: organizational legitimacy

Legitimacy theory is defined as "a generalized perception or assumption that the actions of any entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman, 1995). The corporate or governmental entity, through its top management, seeks congruency between organizational actions and the values of its general and relevant public (Dowling and Pfeffer, 1975; Lindblom, 1994) or its stakeholders. Sethi (1979) argues that if an actual or potential disparity exists between organizational and social values, then organizational legitimacy will be jeopardized, thereby giving rise to a 'legitimacy gap'. In essence, seeking organizational legitimacy is deemed to be important in demonstrating social worthiness (Oliver, 1991), as well as demonstrating that the firm is in tune with societal concerns (Clarke and Gibson-Sweet, 1999) and values to help close any perceived legitimacy gaps.

Actions by corporate management to convince the wider society that the organization is socially responsible are a part of the process of legitimation (Gray *et al*, 1995a). Lindblom (1994) identified four broad legitimation strategies that firms may use to ensure organizational legitimacy: informing stakeholders about intended improvements in performance; seeking to change stakeholders' perceptions of an event; distracting attention away from an issue; and changing external expectations regarding its performance. Such legitimation strategies include gaining, maintaining, or repairing legitimacy (Suchman, 1995). Dowling and Pfeffer (1975) identified three modes of action that firms can undertake to enhance legitimacy: adapt output, goals, and methods of operation to conform to prevailing definitions of legitimacy; attempt via communication to alter the definition of social legitimacy to conform to present practices, output and values; and finally, attempt via communication to become identified with symbols, values or institutions which have a strong basis in social legitimacy. Gray *et al.* (1995a) linked the strategies suggested by Lindblom (1994) and the actions proposed by Dowling and Pfeffer (1975) within the framework of legitimacy theory. The adoption of an appreciation strategy

depends on how management feels it can most effectively close the legitimacy gap. When a legitimacy gap is discovered and recognized by senior management, the company must consider a response. One response is to ignore the gap, presumably on the basis that no adverse consequences will ensue. Alternatively, senior management responds by disclosing information that would be helpful in reducing the legitimacy gap. O'Dwyer (2002) suggests that the objective of companies in disclosing environmental and social information is to influence opinion: either in a defensive way to repair a perceived loss of legitimacy or in a proactive fashion, to be seen as having social conscience and enlightened self-interest.

Legitimacy theory is also the basis for our analysis, because it is difficult to separate the notion of legitimacy from the idea of crisis. The financial crisis in Korea in 1997 raised questions of corporate legitimacy and its governance structures and of the relationship between the corporation and the social context governing the functioning of entities. After enduring the financial crisis, and attempting via communication to become identified with symbols and values, the improved governance structure enhanced the transparency of management and accounting disclosure. As a consequence, it is expected that the improved governance structure may affect the environmental information disclosure to stakeholders, thereby reducing the legitimacy gap for CSR (corporate social responsibility).

3. Hypotheses Development

3.1 Research Framework

This study intended to verify the impact of corporate governance on the disclosure of environmental information, via legitimacy theory. This is important when discussing corporate environmental disclosure practices to consider the values, motives, and choices of those involved in policy formulation decision-making in the organization (Maclagan,1999). Hence, the consideration of corporate governance, including ownership structure and the constituents of boards that exist in an organization, is important because it is top management who oversees information disclosure in annual reports (Gibbins *et al.*, 1990).

The principal variables relevant to corporate governance are outside directors on board, management ownership, institutional ownership, and foreign ownership. The disclosure of environmental information is measured by environmental information disclosure (EID), and particularly by the level of EID. The research framework of this study is as follows:

<Research Framework>

3.2 Korean context

3.2.1 Board composition

The Securities and Exchange Act, Article 2, defines an independent director as a non-executive director who is qualified and elected in accordance with Articles 54-5 or 191-16 of the Securities and Exchange Act (Feb 1998, re-regulated on Nov 2000).

The requirements for listed companies are as follows:
(a) At least one independent director should be on the board, and the total number of independent directors should comprise at least one quarter of the board.
(b) For companies with assets in excess of two trillion Korean won, at least three independent directors should serve on the board, and the total number of independent directors should comprise at least half of the board.

The recommendations of the Korea Corporate Governance Service (KCGS) concerning boards of directors are as follows:
(a) The board of directors shall make the corporation's key management policy decisions and shall supervise the activities of the directors and management.
(b) The directors and the board shall perform their duties faithfully in the best interest of the corporation and its shareholders; they should also live up to their social responsibilities and consider the interests of various stakeholders.
(c) The board shall observe the related statutes and the articles of incorporation when performing its duties, and shall ensure that all members of the corporation also observe them. One of the functions of the board is to oversee the process of information disclosure.

3.3 Hypothesis Development

3.3.1 The proportion of outside directors on a board

The exercise of the environmental information disclosure process should be viewed as a strategy targeted at the closure of a perceived legitimacy gap between management and stakeholders (government, banking institutions, shareholders, investors, suppliers, consumers, employees, community residents and environmental organizations) via outside directors. Outside directors are seen as a check-and-balance mechanism, not only ensuring that companies act in the best interests of owners, but also other stakeholders, and also advising on the public presentation of the company's activities and performance; and providing 'additional windows on the world' (Tricker, 1984). The firms with a higher proportion of outside directors on the board are associated with higher levels of voluntary disclosure (Cheng and Courtenay, 2006). Furthermore, outside directors are likely to respond to concerns about honor and obligations, and would generally be more interested in satisfying the social responsibilities of the firm (Zahra and Stanton, 1998), as this may enhance their reputation and honor in society. They are likely to protect their reputation and to reduce the risk of litigation by providing more societal disclosure. More recently, stakeholders have become interested in the environmental impacts of business activities and information on performance (Jose and Lee, 2007; Cormier et al., 2005; Burritt and Welch, 1997). Environmental information disclosure (EID) is one important method of communicating with stakeholders. Thus, outside directors can put pressure on companies to engage in EID in ensuring congruence between organizational actions and societal values or organizational legitimacy. Therefore, boards dominated by outside directors are expected to have a greater influence on EID, as they are responsible for representing the interests of other stakeholders. Therefore, we hypothesize the following:

> **H1:** There is a positive association between the proportion of outside directors on corporate boards and the disclosure of environmental information.[309]

3.3.2 The percentage of management ownership

Preston *et al*. (1999) underlined the importance of this open communication between management and its stakeholders. Management is not directly accountable to these stakeholders; a firm's long-term existence is dependent upon its ability to legitimize its activities to the broader society. Corporate managers attempt to manage stakeholders' impressions with regard to its environmental performance, exercising environmental information disclosure (Neu *et al.*, 1998). Hence, it can be inferred that an implicit social contract exists between the organization and those who are affected by its operations (Brown and Deegan, 1998). An organization that wishes to continue its operations must ensure that it meets the terms of the social contract, even if these terms evolve over time. Failure by a firm to operate in a manner consistent with community, or public, expectations, may potentially lead to the demise of the firm (Deegan and Rankin, 1996). Relying on the organizational – environmental nexus, environmental disclosure can then be viewed as an attempt by managers to legitimize a firm's activities to its stakeholders (Walden and Schwartz, 1997). In South Korea, amid growing public concern for the environment, numerous stakeholders, including governments, banking sectors, shareholders, investors, suppliers, consumers, employees, community residents and environmental organizations, are increasing the disclosure pressure of environmental activities in the name of social responsibility. Additionally, as the response to investor action, environmental information disclosure affects corporate value (Kim and Youn, 2000). Korean management will tend to increase the practices of EID in order to improve the reputation and justify the firm's approaches to social responsibilities. Hence, we hypothesize as follows:

---

[309] Environmental information includes choice of EID(environmental information disclosure) and level of EID

H2: There is a positive association between the proportion of management ownership and the disclosure of environmental information.

3.3.3 The percentage of institutional ownership

The ownership structure of the company may expose legitimacy in corporate responsibility, communicating this to stakeholders. Institutional investors, in positions other than outside shareholders, may find it more difficult to obtain environmental management information than other managers. These investors will, therefore, exert greater pressure for increased disclosure. Rahaman *et al.* (2004), in a case study, reported that social and environmental disclosure efforts have provided explanations for corporate decisions to disclose information in annual reports at a Ghanaian public sector organization, the Volta River Authority (VRA). This study indicated that a major influence on environmental reporting is the constant pressure to comply with the requirements of funding agencies, such as the World Bank. Solomon and Darby (2005) detected an association between institutional ownership and social and ethical environmental disclosure in the UK, using data from interviews. The results of these studies showed that social and environmental disclosure was a response to the pressure of institutional investors. In the South Korean capital market, the 13% rate of institutional investors in 1997 has increased over time. Institutional investors who have increased investment in corporations have exercised CSR (corporate social responsibility), and they require more information to pursue this trend of social and environmental management activities. Therefore, we expect that institutional investors will pressure management to exercise EID. Hence, we hypothesize the following:

H3: A positive association exists between the proportion of institutional investors and the disclosure of environmental information.

3.3.4 The percentage of foreign ownership

Different shareholders may demand different disclosures and this demand is greater when the shareholders are foreigners, owing to the geographical separation between management and owners (Craswell and Taylor, 1992). If a large proportion of a firm's shareholders are foreign, it may prove more difficult for them to obtain information about the firm from alternative sources. These investors will, therefore, impose greater pressure on the corporation to disclose more. Most recently, social responsibility has been concerned with management activities, and environmental information disclosure became important in capital market. Along with it, foreign ownership will impose greater pressure to disclose more environmental information. However, Cormier *et al.* (2005) found a negative association between foreign ownership and environmental disclosure quality in large German companies. Unexpectedly, these results implied differences in ownership structures among countries. In the South Korean capital market, recently, foreign investors have occupied an important position. They tend to be more interested in the environmental impacts of business activities than are local investors, and require a substantial amount of information on environmental performance in order to

consider long-term investment. Therefore, we expect that foreign ownership will pressure management to exercise EID. We hypothesize the following:

H4: *A positive association exists between the proportion of foreign ownership and the disclosure of environmental information.*

4. Methods

4.1 Data and sample selection

Panel A of table 2 presents that the final sample for the analysis includes 656 firm-year observations from the KIS-VALUE database. The sample for this study was obtained from firms listed on the Korean Stock Exchange (KSE) from 2003 to 2006. We collected the environmental information data from the footnoted items of audit reports of the Retrieval and Transfer System (DART), which has archived electronic annual and quarterly reports of all the public companies in Korea since fiscal year 1998. Financial data and equity ownership were hand-collected from the KIS-VALUE database, provided by the Korea Listed Companies Association. The proportion of outside directors on corporate boards was hand-collected from the annual reports of the Retrieval and Transfer System (DART). Exclusion criteria for the sample were firms in the banking and finance industry, with missing information on board composition, with no ownership data for the period 2003 to 2006, and with missing, outlier, or insufficient financial data. Our sample ultimately included a total of 1,977 firm-year observations. The reason that financial industry corporations were excluded is that they are not typically involved in environmental problems; this was verified through prior studies and sampling surveys.

Panel B of table 2 shows the industry/year distribution of sample firms. Panel B of table 2 shows the industry/year distribution of sample firms across different industries, using two-digit Korean SIC codes. The number of disclosure firms differed among industries, but there were no differences in the numbers of disclosure firms in terms of year distribution.

----- Insert Table 2-----

4.2 Model Setting Procedure

This study was conducted in two stages. First, the authors identified those corporations that disclosed their environmental information in financial statements (audit reports) and assessed the impact of corporate governance using form 1. Second, the impact of corporate governance on the level of EID was evaluated for corporations that disclosed environmental information in financial statements (audit reports) using regression analysis form 2. The level of disclosure was assessed via a disclosure index that was developed for this study. The use of a disclosure index to assess the association

1689

between corporate governance and the level of disclosure is considered to be an important approach for evaluating the transparency and disclosure quality of corporate information. Chang *et al.* (2002) previously contended that the transparency of financial information is sustained when corporations provide relevant, timely, and accurate accounting information in an objective and easy-to-understand manner. Thus, the level of disclosure can be used as an indicator of the transparency of corporate information.

$$\text{DENINDI}_{it} = \alpha + \beta1\text{OUTDIR}_{it} + \beta2\text{CON}_{it} + \beta3\,\text{INS}_{it} + \beta4\,\text{FOR}_{it} + \beta5\,\text{LEV}_{it}$$
$$+ \beta6\,\text{ROA}_{it} + \beta7\text{IND}_{it} + \beta8\text{SIZE}_{it} + \varepsilon_{it} \text{-------------------------------------(1)}$$

$$\text{DISLEVEL,it} = \alpha + \beta1\text{OUTDIR}_{it} + \beta2\text{CON}_{it} + \beta3\,\text{INS}_{it} + \beta4\,\text{FOR}_{it} + \beta5\,\text{LEV}_{it}$$
$$+ \beta6\,\text{ROA}_{it} + \beta7\text{IND}_{it} + \beta8\text{SIZE}_{it} + \varepsilon_{it} \text{----------------------------------- (2)}$$

Where:
  Dependent Variables
 Disclosure = degree of various disclosure practices as below
       DENINDI (choice of EID) = a dummy variable with a value of 1 when a firm has EID practices in
                the foot notes of audit reports in Korea and a value of 0 otherwise
       DISLEVEL (level of EID) = score of disclosure on the five categories required for EID (score of
                disclosure index)
  Independent Variables
     OUTDIR = the proportion of outside directors on corporate boards
     CON = the percentage of equity ownership by control
     INS = the percentage of equity ownership by institutional investors
     FOR = the percentage of equity ownership by foreign investors
     LEV = firm leverage measures as the ratio of total liabilities to total assets
     ROA = return on assets as a measure of firms' performance
      IND = a dummy variable with a value of 1 when a firm belong to environmental expropriation
             industries and a value of 0 otherwise
      SIZE = the natural logarithm of total assets

    In both forms, the independent variables are all the same, but in this current study, the dependent variables differ from each other. The primary variables of interest are OUTDIR (the proportion of outside directors on corporate boards), CON (the percentage of equity ownership by control), INS (the percentage of equity ownership by institutional investors), and FOR (the percentage of equity ownership by foreign investors). The control variables are variables that were used in previous studies: LEV(Choi,1998; Brammer and Pavelin, 2006; Cormier *et al.*, 2005), ROA(Cowen *et*

al., 1987; Belkaoui and Karpik, 1989; Hackston and Milne, 1996; Bragdon and Marlin, 1972; Kim, 2000; Brammer and Pavelin, 2006; Jung and Kim, 2004), IND(Cowen *et al.*, 1987; Adams *et al.*, 1998; Freedman and Jaggi, 1988; Choi, 1998; Gao *et al.*, 2005; Newson and Deegan, 2002; Patten, 2002: Brammer and Pavelin, 2006), and SIZE(Cowen *et al.*, 1987; Belkaoui & Karpik, 1989; Adams *et al.*, 1995 and 1998; Hackston & Milne, 1996; Puxty,1986; Cooper,1998; Arnold,1990; Tinker *et al.*,1991; Choi, 1998; Patten, 2002; Jung & Kim, 2004; Cormier *et al.*, 2005; Brammer & Pavelin, 2006) have been found to be effective factors of EID. In connection with IND variable, the classification of the environmental expropriation industry and environmental non-expropriation industry applied the methods used in the Lee's study (2003). Lee's study classified the companies in the chemical, food, fiber, rubber, metal, oil refining, pulp and non-metal manufacturing industries into the environmental expropriation industry, and classified the companies in the sound, correspondence, automobile, transport equipment and building industries into the environmental non-expropriation industry.

The reason for constructing form 1 with a Logit Regression Analysis is to verify the influence of governance characteristics as a potential motive variable between the firms disclosing and non-disclosing the environmental information. In form 2, we intended to verify the effect of governance characteristic on the level of environmental disclosure with the measure of environmental disclosure indices and regression analysis.

4.3 Measurement of Disclosure Practices

In this study, DENINDI (choice of EID) was data disclosed in the foot notes of the audit reports of the DART system. DISLEVEL (level of EID) was the score calculated on the disclosure index. The disclosure index was utilized to determine the disclosure level.

To assess the level of EID, a disclosure index was commonly developed in many investigations and regression analysis was conducted. In addition to the use of a disclosure index, the level of disclosure can be analyzed quantitatively or qualitatively, including the number of pages, lines, words and the degree of quantification on disclosure content (Patten, 1992; Choi, 1998; Cowen et al., 1987; Trotman & Bradly, 1981; Wiseman, 1982), including the degree of category on disclosure content (Brammer and Pavelin, 2006; Cormier *et al.*, 2005; AI-Tuwaijri *et al.*, 2004). This study examined both the quantitative and qualitative aspects of disclosure for corporate environmental information. The disclosure index is more inclusive than those used by other studies, as it is capable of assessing the disclosure format as well. In form 3, the level of disclosure includes the content (DISCON) and format (DISFOR) on environmental information disclosure. With the subdivided form 3, the content includes the quality (DISQUALITY) and quantity (DISQUANTITY) on environmental information disclosure, as in form 4. Additionally, the format includes the degree of subdivision on five items of environmental information disclosure (ITEMDI), and the choice table presentation on numerable information (TABALFOR) as in form 4. The disclosure index was developed to assess the level of EID, and is presented in the Appendix. With regard to disclosure content, the amount and quality of EID was

measured on a 3-point scale. Disclosure format was assessed by determining whether information about each category was clearly presented separately and whether there was a table presenting enumerable data. The presence or absence of the separation of information on each category was indicated as 1 and 0, respectively. The presence or absence of a table presenting quantitative data was indicated as 1 and 0, respectively. The sum-score for each category ranged from 0 to 8 in terms of the five indices of environmental information. The total scores for five categories ranged from 0 to 40.

DISLEVEL = DISCON + DISFOR --- (3)

DISLEVEL = DISQUALITY + DISQUANITY + ITEMDI + TABALFOR ------------ (4)

5. Results

5.1 Descriptive Analysis

<Table 3> presents summary statistics on the choice and level of EID (DENINDI, DISLEVEL) and determinants of voluntary disclosure. The mean of the DENINDI in the total sample was 33.2%. This finding indicated that the firms disclosing environmental information represented 33.2% of the total sample, and these results indicated that firms take a negative attitude toward environmental information disclosure. The mean of the DISLEVEL in the disclosure sample was 6.985. The finding indicated that the firms had a low level of environmental information disclosure for total scores (40). The proportion of outside directors (OUTDIR) in the total sample and disclosure sample were 30.1% and 34.5%, respectively. The proportion of management ownership (CON) in the total sample and disclosure sample were 30.5% and 31.2%, respectively. The proportion of institutional investors (INS) in the total sample and disclosure sample were 8.3% and 8.4%, respectively. The proportion of foreign investors (FOR) in the total sample and disclosure sample were 7.1% and 9.7%, respectively.

----- Insert Table 3 -----

5.2 Correlation analysis

<Table 4> presents the Pearson Correlation Indices for dependent and independent variables among the test variables. In the total sample, the analysis indicated that companies with a higher proportion of outside directors (OUTDIR) were correlated significantly with the choice of EID (DENINDI). These results showed that outside directors pressured management to exercise EID, to present legitimacy regarding corporate social responsibility. Additionally, the analysis indicated that

companies with a higher proportion of foreign investors (FOR) were significantly correlated with the choice of EID(DENINDI). The results indicated that foreign investors pressured management to exercise EID.

In the disclosure sample, the analysis indicated that companies with a higher proportion of foreign investors (FOR) were correlated significantly with the level of EID(DISLEVEL). The results indicated that foreign investors pressured management to disclose transparent information regarding environmental management activities.

----- Insert Table 4 -----

5.3 Disclosure Practices

<Table 5> presents the statistics for the dependent variables on the form 1, 2. The choice of EID (DENINDI) and the level of EID (DISLEVEL) did not differ from year to year in the total sample and disclosure sample, respectively. These findings indicate that the practice of environmental information disclosure was not improved over the four-year study period, and the disclosure level of environmental information was not improved over the four-year study period.

----- Insert Table 5 -----

5.4 Logit Analysis

Our first test assessed the association between the choice of EID and governance. <Table 6> presents the coefficient estimates of form 1 in the total sample. Our primary interest lay in the coefficient estimates on outside directors (β_1), control ownership ($\beta2$), institutional ownership ($\beta3$), and foreign ownership ($\beta4$). In the total sample, the results of the tests of Hypotheses (choice of EID) 1 to 4 are reported in <Table 6 >. In the total sample, the results indicate a significant positive relationship at the 1% between the choice of EID (DENINDI) and the outside director (OUTDIR), in the predicted direction. The results indicated that outside directors pressured management to exercise EID to reduce the environmental risk (world trade, financing, employment, lawsuit, and penalty) in communication with stakeholders, while improving the reputation and justifying the firm's approaches to CSR (corporate social responsibility). Also, the results indicate a significant positive relationship at the 1% between the choice of EID and foreign investors (FOR), in the predicted direction. The results indicated that foreign investors pressured management to exercise EID. Unexpectedly, management ownership and institutional ownership did not choose to engage in EID. For control variables, the results indicate a significant positive relationship at the 1% between the choice of EID and Industry characteristics (IND), in the predicted direction. The results indicated that the activities of firms in industries were associated with particularly visible environmental issues. This result was consistent with the findings of previous studies (Cowen *et al.* 1987; Adams *et al.* 1995, 1998; Freedman and Jaggi, 1988; Choi, 1998; Newson and Deegan, 2002; Patten, 2002; Gao *et al.* 2005). Also, the results indicate a significant

positive relationship at the 1% between the choice of EID and firm size (SIZE), in the predicted direction. This result was consistent with the findings of previous studies(Cowen *et al.*, 1987; Belkaoui & Karpik, 1989; Adams *et al.*, 1995 and 1998; Hackston & Milne, 1996; Puxty,1986; Cooper,1998; Arnold,1990; Tinker *et al.*,1991; Choi, 1998; Patten, 2002; Jung & Kim, 2004, Cormier *et al.*, 2005; Brammer & Pavelin, 2006)

----- Insert Table 6 -----

5.5 Regression Analysis

Our second test assessed the association between the level of EID (DISLEVEL**)** and governance. <Table 7> presents the coefficient estimates of form 2. Our primary interest lay in the coefficient estimates on outside directors (β_1), control ownership ($\beta2$), institutional ownership ($\beta3$) and foreign ownership ($\beta4$). In the disclosure sample, the results of the tests of Hypotheses (level of EID) 1 to 4 are reported in <Table 7>. In the disclosure sample, the results indicate a significant positive relationship at the 5% level between the level of EID (DISLEVEL) and the outside director (OUTDIR), in the predicted direction. The results indicated that the outside director pressured management to disclose transparent environmental information in communication with stakeholders, thus improving the reputation and justifying the firm's approaches to (CSR) corporate social responsibility. Additionally, results indicate a significant positive relationship at the 5% level of EID (DISLEVEL) and foreign investor (FOR), in the predicted direction. The results indicated that foreign investors pressured management to disclose transparent environmental information. Unexpectedly, management ownership and institutional ownership did not affect the level of EID. For control variables, the results indicate a significant negative relationship at the 5% level between the level of EID (DISLEVEL) and firm leverage (LEV). The results indicated the corporations had low EID levels when the debt rate was high. Also, the results indicate a significant positive relationship at the 5% between the level of EID and firm size (SIZE), in the predicted direction.

----- Insert Table 7-----

6. Discussions and limitations

Previous papers that have analyzed the impact factors on environmental information disclosure and level have focused principally on industrial characteristics, audit firm, and corporate characteristics factors such as firm size, profitability, debt ratio, industry membership, risk, visibility, ownership, and environmental performance.

This study demonstrates that the majority of factors such as the proportion of outside directors on corporate boards, and the percentage of equity ownership by foreign investors have positive effects on the choice of environmental information disclosure. This implies that an outside director system has proven to be effective with regard to information disclosure policy, and that the trend of the rising percentage of foreign investors after capital liberalization served to increase the level of environmental information disclosure. Moreover, this also means that environmental information disclosure policy could be influenced by the efforts of governance structure improvement by the firm, as well as regulations and system reforms by the government. Therefore, it is necessary to accelerate the

governance structure improvement policy, and to more aggressively induce foreign investors' investments.

However, it is hard to conclude that our results constitute a universal phenomenon, in that the scope of this research is restricted to just 4 years after the enforcement of governance structure reform system in Korea. It is also restricted to industry characteristics (IND) and corporate financial characteristics (debt ratio, ROA) as influencing variables to the environmental information disclosure in establishing the control variables. Accordingly, our study did not fully consider diverse factors such as organizational characteristics, the effects of pressure groups, and environmental performance variables considered as possible factors in environmental information disclosure.

The environmental performance factor was not included in this research as with the previous researches. It is because that we could not find any consistent result and any unified criteria for the performance measure from the previous studies. In addition, we restricted to information disclosed in corporate financial statements for the measurement of EID and the level of EID. But we can readily observe a tendency toward greater disclosure and greater diversity of environmental information from the websites disclosing sustainability reports. Hence, it is also necessary to extend this study to more diverse corporate reports and website IR reports.

7. **Conclusions**

This study presents an examination of the relationship between corporate governance attributes and EID practices. This was conducted in two stages. First, the authors identified those corporations that disclosed their environmental information in financial statements (audit reports) and assessed the impacts of corporate governance. Our findings indicated a significant positive relationship between the choice of EID and outside directors. The results also indicated that the outside director pressured management to exercise EID in order to reduce the environmental risk in communication with stakeholders, thereby improving the firm's reputation and justifying the firm's approaches to social responsibility. Additionally, the results indicate a significant positive relationship between the choice of EID and foreign investors, in the predicted direction, and the results showed that foreign investors pressured management to exercise more disclosure on environmental information. Secondly, the impact of corporate governance on the level of EID was evaluated for corporations that disclosed environmental information in financial statements (audit reports). The level of EID was measured by a disclosure index that was developed for this study. The results indicated a significant positive relationship between the level of EID and the outside director, and this also indicated that the outside director pressured management to exercise more transparent information disclosure in communication with stakeholders. Also, our findings indicated the existence of a significant and positive relationship between the level of EID and foreign investors, and our results additionally demonstrated that foreign investors pressured management to disclose transparent environmental information to enhance corporate value.

From the findings of this study, we can conclude that improved corporate governance can enhance environmental information disclosure policy, and sometimes the transparency of disclosure. In Korea, through the effects of governance, these findings might prove helpful to the environmental policy decisions of companies and regulators. It seems desirable that similar studies be extended to the dimensions of comparative analysis among countries.

IND	0	1	.551	.497
SIZE	16.260	24.390	19.688	1.574

The variables are defined as follows:

Dependent Variables

- **DENINDI(choice of EID)** = a dummy variable with a value of 1 when a firm has EID practices in the foot notes of audit reports in Korea and a value of 0 otherwise
- **DISLEVEL(level of EID)** = score of disclosure on the five categories required for EID (score of disclosure index)

Explanatory Variables:

- **OUTDIR** = the proportion of outside directors on corporate boards
- **CON** = the percentage of equity ownership by management
- **INS** = the percentage of equity ownership by institutional investors
- **FOR** = the percentage of equity ownership by foreign investors
- **LEV** = firm leverage measures as the ratio of total liabilities to total assets
- **ROA (return on assets)** = return on assets as a measure of firms' performance
- **IND** = a dummy variable with a value of 1 when a firm belong to environmental expropriation industries and a value of 0 otherwise
- **SIZE** = the natural logarithm of total assets

Table 4. Correlation

TUNNELING, OVERLAPPING OWNER, AND INVESTOR PROTECTION: EVIDENCE FROM MERGER AND ACQUISITION IN ASIA[Ψ]

Mas'ud Machfoedz[#], Sumiyana[#], Ratna Candra Sari[*], and
Francisca Reni Retno Anggraini[&]

Abstract

Tunneling is to describe transfer resource out of the firm for benefit of their controlling shareholders. Better legal protection and stronger social norms improve minority shareholders' protection from expropriation. They consequently reduce the private benefits of controlling shareholders (La Porta, 1999). This study aims to investigate tunneling in the context merger and acquisition (M&A) and to examine whether tunneling occurs only in emerging markets with poor law enforcement or whether it also occurs in developed countries.

This study documents that managers are more likely to overpay target in merger and acquisition with high overlapped owner which have stakes in bidder and target firm. That overpayment, a transfer of wealth from owners of bidder's firm to overlapping owners, is a type of tunneling. This study concludes that tunneling occurs in nations not only with low investor protection, but also with high investor protection.

Key words: *tunneling, expropriation, merger & acquisition, investor protection*

INTRODUCTION

Weak corporate law and lack of enforcement mechanism raise fears of expropriation for minority shareholders around the world. These fears seem especially warranted in the presence of business group, a common organizational form in many developed and developing countries. The controlling shareholders have strong incentives to siphon resources out of the firm to increase their wealth (Johnson, et al. 2000). Tunneling is to describe the transfer resource out of the firm for the benefit of their controlling shareholders. Tunneling occurs when someone transfer wealth from company where he has low right of cash flow to another company where he has higher right of cash flow (Johnson, et al. 2000). If prevalent, tunneling may have serious consequences. It can hinder equity market growth and overall financial development. Illicit profit transfers may also reduce the transparency of the entire economy, cloud accounting numbers and complicate any inference about firm health. The purpose of this study is to investigate tunneling in the context of merger and acquisition (M&A) with emphasis on both sides of M&A, bidder and target companies.

We study merger and acquisition because managerial objective and corporate governance mechanisms play important roles when managers acquire other firms. For instance, tunneling could be a major motivation for some acquisition activities of affiliated firms. If a member firm within group has poor financial performance, the owner managers' solution would be to merge it with a more successful firm within the same group. If acquiring bad target maximized the aggregate value of the group despites overpayment, acquisitions are good news for controlling owner, even though they are bad news for the minority shareholders of the bidding firm.

Tunneling can take place in the form of outright theft or fraud or more subtle legal form, such as dilutive share issueances that discriminate minority shareholders and merger between affiliated firm to siphon resources out of the bidder or target. Figure 1 illustrates tunneling. Assumes that company B owns 35% votes (5% direct and 30% indirect votes) and 16 % cash flow right of bidder (through 5% direct ownership and 11% indirect ownership) and 100% vote and cash flow right of target (company K). If the overlap owner (B) through his control of the bidder overpay the target, the overlap owner will gain 100% of the overpayment while only paying 16% for it. Thus, there is transfer wealth from bidder company which overlap owner has low cash flow right to target company which overlap owner have higher cash flow right.

Figure 1 Ownership Structure

Previous study in Merger & Acquisition emphasizes on gain or loss in one side, bidder or target. Thompson et al. (1995) emphasize that ignoring a side to the M&A deal would lead to partial and incomplete understanding of the process and thus the outcomes. In particular, how corporate governance characteristics at both firms have interacted. Furtermore, how corporate governance characteristics affect the aggregate outcomes for the combined firm. To get further understanding of the M&A outcomes as well as the significant factors that affect M&A performance, the corporate governance characteristics of both firms should be considered.

Some studies on M&A have argued that the value creation or destruction in the M&A process should be examined conjointly for the acquiring and target firms (Seth, 1990). Traditionally acquiring and target firms are treated as owned by separate sets of owners that seek to maximize their shareholder wealth. In reality, however, the acquiring and target firms often have particularly same owners.

Figure 2. Overlapping Owner

Such overlapping owners that hold stock in both the acquiring and the target firm are more likely to be interested in the total gain from this transaction (Hansen and Lott, 1996; Easterbrook and Fischel, 1982). Contradictory to 'solo' investors, overlapping investors would be more concerned at maximizing their portfolio value, rather than maximizing the shares value of the acquiring firm.

In the context of mergers and acquisitions when shareholders of the acquiring firm are simultaneously owners of the target firm, they'll be more concerned with the total gain, or portfolio effect from this acquisition. Particularly, they will stand to gain from the transaction as shareholders of the target firm. Inversely, 'solo' shareholders that own stocks in the acquiring firm but not in the target firm will be concerned with the stock returns of the acquiring firm. Such heterogeneity of owners' interests could weaken the monitoring by principals, as well as the impact of such monitoring on agents. Thus, posing less restraint on managerial propensity engages in value destroying acquisitions.

The acquisition of LG Merchant Bank by LG Securities, both belong to the LG Group illustrates tunneling. LG merchant Bank was money-loosing entity. To recapitalize debt-ridden LG Merchant Bank, the LG Group announced that LG Securities, considered to be the most profitable firms in the group, would acquire LG Merchant Bank. The LG official said the merger reflects the LG Group's long term plan to foster the brokerage house into an investment bank and consolidate its financial operations (Korea Herald, 1999). In the other side, brokerage's trade union and minority shareholders of LG Securities opposed the merger, saying that it would impair the value of their share (Korea Herald, 1999). At the time of the merger announcement, the controlling family of the LG group held 18% of the outstanding shares in LG securities and 60% in LG Merchant Bank. This means that if controlling

family had overpaid for the acquisition by \$1, it would have lost 18 cents through LG securities but gained 60 cents through LG Merchant Bank. It would have been better off. However, other shareholders in LG Securities would have lost 82 cents.

Recent financial research has examined the importance of corporate ownership structure (La Porta et al., 1999) and legal origins (La Porta et al., 2000) on the private benefits of control and protection of minority shareholders. Better legal protection and stronger social norms improve minority shareholders' protection from expropriation and consequently reduce the private benefits of controlling shareholders. Johnson et al. (2000) argue that tunneling occurs not only in countries with effective law enforcement but also in contries whose capital market are still emerging. Therefore, the overall impact of differing corporate ownership structures and legal systems on the private benefits of control becomes an empirical question. Therefore, this paper also has additional objectives that examine whether tunneling occurs only in emerging markets with poor law enforcement or whether it also occurs in developed countries.

Bae et al. (2002) find that wealth is tunneled or transferred by subway to the majority shareholders within Korean Chaebol by means of mergers to bail out troubled group members. Bertrand et al. (2002) document tunneling within Indian pyramids. Facio and Stolin (2006) examine the hypothesis that acquisitions undertaken by group-affiliated firms disproportionately benefit the bidder's controlling shareholder. They use a novel methodological approach to compare the announcement-period change in the stock market wealth of the bidder's controlling shareholder with the change in wealth implied by that shareholder's (direct and/or indirect) stake in the bidder. They find no evidence that acquisitions are used to tunnel resources to other companies in the bidder's group to the controlling shareholder's advantage. Claessens et al. (1999) find a positive impact of diversification within industrial groups for their sample of East Asian companies, while in contrast Lins and Servaes (2002) show that diversifying mergers within industrial groups reduces the wealth of minority shareholders in their sample of firms from seven emerging markets.

Our approach to investigate tunneling different from Bertrand at al. (2000), Facio and Stolin (2006) and Bae et al. (2002). Bertrand explore evidence of tunneling by examining how various firm respond external shocks to their accounting measure of performance. Facio and Stolin (2006) and Bae et al. (2002) investigate how investor in the stock market react to acquisition event. Contradictory to formerly tunneling investigation, we distinguish merger where there is an owners of the bidder who

simultaneously owns bidder and target shares (overlapping *owners) and solo owners*, that own stock in the acquiring firm but not in the target. Tunneling occurs when there is tendency to overpay the target in merger with high overlap ownership rather than in merger with low overlap ownership.

While Bertrand et al. (2002) use setting Indian business group, Holmen and Knopf (2004) concern at Swedish merger, Facio and Stolin (2006) study at western European companies and Bae et al (2002) use Korean Business group. All of the studies focus in Asia companies. The Asian countries provide a useful setting for testing tunneling, because we can examine effectiveness of law enforcement to protect minority shareholders. Leuz (2003) has clustered countries based on investor protection variable. The first cluster is characterized by large stock markets, low ownership concentration, extensive outside right, high disclosure and strong legal enforcement. Asia countries that include in the first cluster are Singapore, Hongkong and Malaysia. The second and third cluster show markedly smaller stock markets, higher ownership concentration, weaker investor protection, lower disclosure levels and weaker enforcement. Taiwan and Japan are in the second cluster. The third cluster are Korea, Indonesia and Thailand. Comparison between those clusters will give better understanding, whether tunneling occurs only in country with weak legal enforcement or occurs in country with strong legal enforcement.

We believe that this study is useful to (1) identifies factors that introduce noise in the assessment of managers and allows them to pursue value-destroying deals. In particular, in the context of mergers and acquisitions, investors that have stock interests in both the acquiring and target firm will likely have different perspective on the proposed business combination than 'solo' investors of the acquiring firm. This research focuses on both side of M&A, bidder and target, to give complete understanding of the process and the outcome of M&A, (2) show the new method to measure tunneling that is different from all prior research, (3) explain about tunneling, one form of expropriation minority shareholders.

The remains of this study is organized as follows. First, this study discuss theoritical framework and hypothesis development. Second, this study develops research method and sequentially conjectures some conclusion in next section.

LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

M&A is a profoundly studied topic, recent meta-analysis by King et al. (2004) concludes that the factors impacting the financial performance of firms engaging in M&A remain largely unexplained.

Some studies on M&A have argued that the value created/destroyed in the M&A process should be examined conjointly for the acquiring and target firms (Seth, 1990). Traditionally acquiring and target firms are treated as owned by separate sets of owners that seek to maximize their shareholder value. In reality, however, the acquiring and target firms often have some of the same owners (see Figure 1). Such overlapping owners, owners that hold stock in both the acquiring and the target firms, are more likely to be interested in the total gain from the transaction (Hansen and Lott, 1996; Easterbrook and Fischel, 1982). Paradoxical to 'solo' investors, overlapping investors would be more concerned at maximizing their portfolio value, rather than maximizing their shares value of the acquiring firm.

The present study undertakes a different approach in identifying heterogeneous ownership interests by looking at two types of owners – (1) overlapping owners that hold stock of both the acquiring and the target firm, and (2) 'solo' (or non-overlapping) owners, that hold stock of the acquiring firm but not of the target. It also corrects for methodological problems, since Graebner & Eisenhardt (2004) emphasize that ignoring a side to the M&A deal would lead to partial and incomplete understanding of the process and thus the outcomes.

Furthermore, the M&A context represents an adversary setting, where the division of the value created or alternatively value destroyed is affected by the relative bargaining owner of the acquiring firm and the target, competitiveness of the market for acquisitions, presence of multiple bidders, and method of payment (Coff, 1993; Seth, 1990). Prior research recognizes that legitimate reasons for M&A activity exist, which could benefit the combined entities through realizing synergies from resources combination, increasing market power, tax savings, R&D, and marketing spillovers, or increasing efficiency (Saxton & Dollinger, 2004; Brush, 1996; Ranft & Lord, 2002; Sirower, 1997; Healy et al., 1992, Morck et al., 1988; Scherer, 1988). Given the adversarial nature of the M&A process, however, such benefits may be captured by the target firm. There is value to be created as a result of the combination, this "*value is being transferred.*" Therefore, looking at the losses and gains at the acquiring firm only may not be very informative about the overall value-creating effect of the deal.

Under the wealth transfer hypothesis, shareholders of the acquiring firm may lose their stocks value if management overpays for the target. In this case, however, the loss at the acquirer will be offset by a gain at the target firm, as the shareholders of the target will enjoy higher returns due to the value transferred or extracted from the bidder's shareholders. Furthermore, if overlapping owners influence the deal as Holland (1998) suggest, they are in a position to ensure that the overall effect from the deal

is beneficial for them. Thus, looking at the aggregate outcomes for both firms represents an important challenge for research. Particularly, M&A is a non-repeatable event–firms have only one shot to get it right, face considerable information asymmetries and cannot remedy their actions without incurring significant expenses (Reuer, 2005).

Weak corporate law and lack of law enforcement mechanism augments expropriations' fears for minority shareholders around the world. These fears seem especially warranted in the presence of business group, a common organizational form in many developed and developing countries. The controlling shareholder will want to tunnel or transfer with subway, profit across firms, moving them from firms where he has low cash flow right to firms where he has high cash flow right. Cash can be transferred in many ways: the firms can give each other high (or low) interest rate loans, manipulate transfer pricing or sell assets to each other at above or bellow market prices, dilutive share issues that discriminate against minority shareholders and merger between affiliated firm to siphon resources out of the bidder or target.

Tunneling comes in two forms. First, a controlling shareholder can simply transfer resources from the firm for his own benefit through self-dealing transactions. Such transactions include outright theft or fraud, which is illegal everywhere (though often goes undetected or unpunished), but also asset sales and contracts such as transfer pricing advantageous to the controlling shareholder, excessive executive compensation, loan guarantees, expropriation of corporate opportunities, and so on. Second, the controlling shareholders can increase their share of the firm without transferring any assets through dilutive share issues, minority freeze-outs, insider trading, creeping acquisitions, or other financial transactions that discriminate against minorities.

Bae et al. (2002) examine whether firms belonging to Korean business groups (chaebols) benefit from acquisitions that they make. In other words, such acquisitions provide a way for controlling shareholders to increase their wealth by increasing the value of other group firms (tunneling). They explore the nature of business groups in emerging markets and examine two competing views of them: the view of Khanna and Palepu (2000) that they add value to their member firms (the "value added view") and the view of Johnson et al. (2000) that they provide the controlling shareholders with an opportunity for wealth transfer from the firm for the benefit of the controlling shareholders (the "tunneling view"). To evaluate these competing views, they examine merger activity. They find that when a chaebol-affiliated firm makes an acquisition, its stock price on average falls. While minority

shareholders of a chaebol-affiliated firm making an acquisition lose, the controlling shareholder of that firm on average benefits because the acquisition enhances the value of other firms in the group. This evidence is consistent with the tunneling hypothesis.

Bertrand et al (2002) Find evidence that owners of business groups are often accused of expropriating minority shareholders by tunneling resources from firms where they have low cash flow rights to firms where they have high cash flow rights. Indian groups appear to tunnel by manipulating non operating components of profits (such as miscellaneous and nonrecurring items). In fact, there is no evidence of tunneling on operating profits alone. Rather, non operating losses and gains seem to be used to offset real profit shocks or transfer cash from other firms. Finally, they examine whether market prices incorporate tunneling. They find that high market-to-book firms are more sensitive to both their own shock and shocks to the other firms in their group. Firms whose *group* has a high market-to-book are also more sensitive to their own shock, but are not significantly more sensitive to the group's shock. This suggests that the stock market at least partly penalizes tunneling activities. They find a significant amount of tunneling, it mostly occurrs via non operating components of profit.

Holmen and Knopf (2004) investigate several companies in Sweden, and find limited evidence of shareholder expropriation. Swedish companies have a high degree of ownership separation from control through pyramids, dualclass shares, and cross-holdings. This increases the potential for private benefits of control. However, Swedish extralegal institutions are consistent with greater shareholder protection. Using data on Swedish mergers they find limited evidence of shareholder expropriation. Apparently, Swedish extralegal institutions offset the drawback of weak corporate governance.

Faccio and Stolin (2006) investigates the presence of unanticipated transfers of value in corporate acquisitions, using a pan-European sample. They broadly define expropriation as the disproportional sharing of gains (or losses) among different shareholders. They find that the wealth average of the controlling families does not increase proportionately to what is implied by the families' investment in the bidder. For the whole sample, the change in value implied by the bidder's abnormal return (i.e., the change in value that should take place in absence of expropriation) has average of -976.3 (thousand US$), while the actual change in wealth experienced by the bidder's controlling shareholder is -1,481.4. This result is clearly inconsistent with expropriation.

Overlapping owners are more concerned with the total gain from the transaction, rather than how the gain is allocated between the acquiring and target firm (Easterbrook and Fischel, 1982). Thus,

managers of acquiring firms with dominant overlapping ownership would be likely less constrained to overpay for the target firms. Although 'solo' owners interests are hurt by such overpayments, overlapping owners could extract benefits from the overpayment in their capacity as target firm's shareholders. Thus, contradictory to 'solo' owners, overlapping owners are likely less critical to management in instances when executives overpay for the target or pursue bigger deals. Under the wealth transfer hypothesis, shareholders of the acquiring firm may lose their stock values if management overpays for the target. However, the loss at the acquirer will be offset by a gain at the target firm, as the shareholders of the target will enjoy higher returns due to the value transferred or extracted from the bidder's shareholders. Furthermore, if overlapping owners influence the deal as Holland (1998) suggested, they are in a position to ensure that the overall effect from the deal is beneficial for them. Overpayment to target serves as transfer of wealth from other bidder shareholders to the overlap owner.

Hypothesis 1: Overlapping ownership will be positively related to the announced value of the deal.

Ignoring one side of M&A deal would lead to partial and incomplete understanding of the process and the outcome, we propose Hypothesis 2-3 that corporate governance on both firms (target and bidder) will reduce tunneling.

Hypothesis 2: Corporate governance at bidder's firm has negative effect on the announced value of deal, especially corporate governance at bidder's firm reduce overpayment.

Hypothesis 3: Corporate governance at target's firm has negative effect on the announced value of deal, especially corporate governance at target's firm reduce overpayment.

Recent research shows that legal protection of minority shareholders and creditors is an empirically significant determinant of financial development across countries (La Porta et al., 1997). Company law in civil-law countries is less protective of minority shareholders than that in common-law countries (La Porta et al., 1998). Courts in civil-law countries may tolerate more tunneling than courts in common law countries because of: (i) a narrower application of the duty of loyalty largely to transactions with no business purpose, (ii) a higher standard proof in conflict-of-interest situations, (iii)

a greater responsiveness to stakeholder interests, and (iv) a greater reliance on statutes rather than fairness when regulating self dealing transactions. In this paper, we focus specifically on the legal treatment of minority shareholders in different legal systems with respect to tunneling.

Hypothesis 4: Investor protection has negative relationship with the announced value of deal

Hypothesis 5: Investor protection has moderating effect on the relationship between overlapping owner and the announced value of deal.

RESEARCH METHOD

DATA SOURCE AND SAMPLE SELECTION

This research collects all merger and acquisitions from Zephyr database for the period 1999-2007. In addition, this study also documents ownership structure and financial statement obtain from osiris database.

HYPOTHESIS EXAMINATION

Hipothesis 1 – 5 would be examined by the following regression.

$$DV = \beta_1 + \beta_2 TotOv + \beta_3 CGbidder + \beta_4 CGtarget + \beta_5 IPbidder + \beta_6 IPtarget + \beta_7 control\ variables + \varepsilon$$

DV   : Deal value

TotOv   : Total Overlap Owner

CGbidder : Corporate Governance bidder's company

CGtarget : Corporate Governance target's company

IPbidder : Investor Protection bidder

IPtarget : Investor Protection target

VARIABLES DESCRIPTION

DEPENDENT VARIABLE:

1. Deal value

Deal value is the sum of payment from bidder for target company relative to firm value of target. We measure firm value with book value of target firm preceding of the deal. Book values are meaured by total assets.

INDEPENDENT VARIABLES:

1. Overlapping owner's percentage in the acquiring-target firm

In order to calculate a joint overlapping measure for both firms, percentages owned by overlapping owners in acquiring (target) firm were combined then scaled with the market value of acquiring (target) firm.

$$Jo\mathrm{int}\_Overlap = \frac{TB*MVB + TT*MVT}{MVB + MVT}$$

TB:	the percentage owned by overlapping owners in the acquiring firm was calculated as the sum of ownership stakes at acquiring firm of all owners that held stock at both the acquiring and the target preceding the announcement of the deal
MVB	market value of bidder company
TT	the percentage owned by overlapping owners in the target firms was calculated as the sum of ownership stakes at target firm of all owners that held stock at both the bidder firm and the target firm preceding announcement of the deal.
MVT	market value of target firm

2. Corporate Governance

Corporate governance was measured by indicator of firms' independency to signify the company degree of independence with regard to its shareholder. Brickley et al (1988) suggest that only owners that are independent from managerial influence will adequately monitor and likely to oppose the self-serving action of managers. Based on BvD's database independence indicators are noted as A, B, and C with further qualification as follows.

Indicator A	Company with no recorded shareholder with an ownership over 24.99% (either direct or total).This is further qualified as A+, A, or A-
Indicator B	Company with one or more shareholders with an ownership percentage over 24.99% and no recorded shareholder with an ownership percentage (direct or total) over 49.99%. The further qualifications of B+, B and B- are then assigned.
Indicator C	Company with a recorded shareholder with an ownership (direct or indirect) over 49.99%. The C indicator is also given to a company that has an ultimate owner identification.

The greater level of independency is the less power the overlap owner has to influence the deal to ensure that the overall effect from the deal is beneficial for them. The greater level of independency will reduce tunneling or overpayment to target.

3. Investor Protection

Based on all items below, countries were clustered into three levels of investor protections (Leuz, 2003). The parameter to measure level of investor protections are:

a. Outside Investor Right. Mechanisms in corporate law protect the rights of outside (minority) investors and attenuate agency problems between insider (controlling) owners and outside/minority owners. The outside investor rights variable is the anti-director rights index created by La Porta et al (1998). It is an aggregate measure of minority shareholder rights and ranges from zero to five.

b. Disclosure requirements. The disclosure index (DIS_REQ) measures the extent of disclosure requirement of information for securities issued by firms through a prospectus including information on the compensation of executives, shareholder ownership structure, inside ownership, unusual contracts, and related-party transactions.

c. Importance of equity market. The Importance of Equity Market is measured by the mean rank across three variables used in La Porta et al. (1998): (1) the ratio of the aggregate stock market capitalization held by minorities to gross national product, (2) the number of listed domestic firms relative to the population, and (3) the number of IPOs relative to the population. Each variable is ranked in such way, so that the higher scores indicate a greater importance of the stock market.

d. Legal enforcement. Legal enforcement is measured as the mean score across three legal variables used in La Porta et al (1998): (1) the efficiency of the judicial system, (2) an assessment of rule of law and (3) corruption index. All three variables were scaled from zero to ten.

CONTROL VARIABLES:

To control for variation in deal value, the regression model include control variables:

1. Performance

Firm performance was measured as return on assets (ROA) and Return on Shareholders (ROS), consistent with prior research (Haunschild, 1993; Sanders, 2001). *The greater performance value the greater deal value*

DATA ANALYSIS AND FINDINGS

Descriptive Statistics

This study obtains data from ZEPHYR and OSIRIS database. ZEPHYR database contains merger and acquisition data. OSIRIS database contains financial data from annual reports of publicly traded around the world. The final sample consists of 104 M&A deal with overlapping owner, across seven countries for fiscal years 2005-2007. Table 1 present descriptive statistics, including the means and standard deviation for all study variables. Mean of deal value relative to book value is 106.023 and its standard deviation is 258.427. Mean of deal value relative to book value in high overlap owners is 171.443, while in the low overlap owner is 49.94. It could be inferred that mean of deal value in high overlap owner is higher rather than in low overlap owner. It suggest that in high overlap owner's deal, the probability of overpayment to the target is higher than in low overlap owner's deal. More description of table 1. While, the others could be inferred with the same methods.

Table 1 Descriptive Statistics

Variables	Mean	Min.	Max.	Std. Dev.
DealValue/ Book Value	106.023	0.07	2309.64	258.427
Total Overlap Owner	7.0076	0.01	92.97	13.953
High Total Overlap Owner	171.4433	0.10	2309.6	358.59
Low Total Overlap Owner	49.94	0.07	417.05	90.82
CG Target	2.4554	0.00	5.00	2.095
CG Bidder	2.693	0.00	5.00	2.148
IP Target	2.177	1.00	3.00	2.00
IP Bidder	2.168	1.00	3.00	0.59
LnNet Income	10.28	6.80	14.76	1.813
Return on Shareholder	9.087	-232.90	51.61	38.38
Return on Asset	4.828	-52.95	28.65	10.88

Table 2 present institutional characteristics of each country based on Francis and Wang (2006). Malaysia, Hongkong and Singapore are in the first cluster characterized by large stock market, low ownership concentration, extensive outsider rights, high disclosure and strong legal enforcement. The

second and the third cluster are Japan,Taiwan, Korea, Indonesia. The second and the third cluster show markedly smaller stock market, higher ownership concentration, weaker investor protection, lower disclosure level, and weaker legal enforcement.

Table 2 Institutional characteristics of the sample by country

Countries	Outside Investor Right	Legal enforcement	Important Equity Market	disclosure Index	cluster (1:high, 3 low)
Korea	2	5.6	11.7	62	3
Japan	4	9.2	16.8	65	2
Malaysia	4	7.7	25.3	76	1
Taiwan	3	7.4	13.3	65	2
Indonesia	2	2.9	4.7	n.a.	3
Hongkong	5	8.9	28.8	69	1
Singapore	4	8.9	28.8	78	1

Hypothesis Examination

First of all, this study examines all hipothesis using equation model #. The results are presented in table 3. Tunneling is measured by overpayment for target firms. Consistent with hypothesis 1, overlapping ownership is positively related to the announced value of the deal. The announced value of the deal is positively affected by the number of overlapping owner (b =41,071; p<0,001). In the presence of heterogeneous ownership interests, managers are more likely to destroy deal value or overpay the target firm. Heterogeneity of owner's interest could weaken the monitoring by principals, thus pose less restraint on managerial propensity to engage in overpayment and approval of value destroying deals. Therefore, in the presence of heterogeneous ownership interests managers are more likely to engage in bigger M&A deals and more inclined to overpay the target. Therefore, the results are consistent with hypothesis 1.

Table 3 Test Results of Tunelling

	Coeeficient (t-value)
Constant	264.26
	(1.358)
Total Overlap Owner	41.071***
	(9.492)
Corporate Governance Target	43.945
	(0.890)
Corporate Governance Bidder	-123.857**
	(-2.199)

Investor Protection Target		-121.807
		(-1.125)
Investor Protection Bidder		63.357
		(.542)
Return on Shareholder		.021
		(.005)
Return on Asset		-2.451
		(-.244)
Net Income		-12.547
		(-.746)

Remarks: ***, **, * are significant at level 1%, 5%, and 10%. This table reports the estimated parameters in following regression: Deal = $\beta_1 + \beta_2$TotOverlap + β_3CG Bidder + β_4CG target + β_5Investor Protection Bidder + β_6 Investor Protection Target + $\beta_7$control variables + ε

The main effect of bidder's corporate governance are negative significant related to deal value with the coeficient of -123.857 and its t-value of -2.199. It means that the better bidder's corporate governance is, the lower overpayment to the target is. Hypothesis 2 is supported. Corporate governance of target's firm is not significant related to deal value. Hypothesis 3 is not supported. The result inferred that corporate governance at bidder company reduce tunneling more effectively, compared to corporate governance at target firm.

The main effect of investor protection variable both in countries of target's firm and bidder's firm are not significant. Hypotesis 4 is not supported. Since the main effects of investor protection variables were insignificant, we conduct additional test with splitted sample analysis. Investors protections of target was splitted. Based on level of investor protection, the sample was split on high and low investor protection and the analysis was performed separately for both sample using equation #. When applied to bidder in high investor protection countries, overlapping owners is significantly and positively related to deal value with coefficient of 10.005, and t-value probability less than 0.001. Furthermore, corporate governance of bidder company is remain negatively and significantly related to deal value (b=-38.203, p<0.005). IP has moderating effect, support H5. Similarly, when applied to bidder in low investor protection, overlapping owners is still significantly and positively related to deal value (b=58.609, p<0.10). This evidence supports Johnson et al (2000) that tunneling occurs not only in countries with effective law enforcement but also in countries whose capital market is emerging.

Table 4 Split Sample Analysis Based on Level of Investor Protection

	High Investor Protection	Low Investor Protection
Constant	147.63	-45.9
	(3.791)	(-0.564)
Total Overlap Owner	10.005*	58.609*

	(5.396)	(4.610)

	(-0.222)	(1.034)
Return on Asset	-.010	-52.608
	(-.005)	(-0.664)
Net Income	-8.578*	101.850
	(-2.107)	(1.043)

Remarks: ***, **, * are significants at level of 1%, 5%, and 10%. This table reports the estimated parameters in following regression: Deal = β_1 + β_2 TotOverlap + β_3 CG Bidder + β_4 CG target + β_5 Investor Protection Bidder + β_6 Investor Protection Target + β_7 control variables + ε

Sensitivity Test: Low vs High Overlap Ownership

Based on median values of overlapping owners, the sample was splitted into high and low overlap ownership and the analysis was performed for both samples. The median values of overlapping owners was 2.6. The high overlap owners category consists of deal M&A that had total overlap owners between 3.00%–92.97%, while the low overlap owners category consists of total overlap owners between 0.01% - 2.00%.

Table 5 Split Sample Analysis Based on Level of Total Overlap Owners

	High Overlap Owners	Low Overlap Owners
Constant	-539,214	272,805
	(-,916)	(4,026)
Total Overlap Owner	70,089*	-24,295
	(10,123)	(-1,604)
Corporate Governance Bidder	-71,352	-7,413
	(-,639)	(-,390)
Corporate Governance Target	29,807	-5,729
	(,353)	(-,481)
IP Bidder	-385,255	-46,887
	(-1,536)	(-1,116)
IP Target	-1,613	-12,543
	(-,005)	(-,403)
Return on Shareholder	-7,077	1,365
	(-,582)	(1,109)
Return on Asset	-5,526	-1,375
	(-,202)	(-,633)
Net Income	54,236	16,160
	(,982)	(-3,516)

Remarks: ***, **, * are significants at level of 1%, 5%, and 10%. This table reports the estimated parameters in following regression: Deal = β_1 + β_2TotOverlap + β_3CG Bidder + β_4CG target + β_5Investor Protection Bidder + β_6 Investor Protection Target + $\beta_7$control variables + ε

As expected, in the high overlap owners sample, total overlap owners are positively related to announced deal value with the coeficient of 70.089, and with probability less than 0.001. Investor protection and CG bidder were negatively related to announced deal value, but the effect is not significant. Surprisingly, however, for the low overlap owner sample the coefficient of the total overlap owners variable are negatively and insignificantly related to deal value, (b= -24,295 p>0,05). Overall results suggest that overlap owners have major control and influence in M&A deal value, especially when the overlap owners are high.

Findings

The literature has attempted to measure tunneling using different proxies. Berkman, Cole and Fu (2008) examine loan guarantes issued by Chinese firms to their controlling shareholders. Chen, Jian and Xu (2008) suggest that dividend policy may also be used to tunnel cash to controlling shareholders. Gao and King (2008) use the difference between accounts receivable and accounts payable to related parties as a proxy for tunneling and show that this measure is related to corporate governance characteristics. Jian and Wong (2003) show that Chinese firms belonging to business group use related party transactions with their parents (in particular trading goods and services) as a way of manipulating earnings. Bae, Kang and Kim (2002) find that the value of Korean firms affiliated with industrial groups declines when they are asked to bail out underperforming firms in the group through rescue mergers. Bertrand, Mehta and Mullainathan (2002) use earnings shock to measure tunneling. This study enrich tunneling measurement using overpayment in M&A transaction with high overlap owner.

Prior research only has focused on principal-principal problem and principal-agent problem. This study also demonstrate about agent-principal-principal relationship that weaken the corporate governance mechanism. The presence of overlapping owner in the context of merger and acquisition could deteriote the monitoring by principals. Conflicting interests of shareholders give opportunity for manager to make suboptimal MA deals.

	Traditional Agency Problem	Principal Principal Agency Problem	Principal Expropriation Problem
	Principal Agent Problem	P-P-A Problem	P- P problem
Principals (P)	Homogeneous Interest	Heterogenous Interest	Heterogenous interests
Agent	Self interest	Self interest	Acts in principals interest
Principal's Constrain on Managerial Discretion	Low	Low	High

This study evidences that heterogeneous interest among shareholders introduce noise assessment of manager to make decision about Merger and Acquisition. We find that in merger and acquisition with high overlap owner, which have stakes in bidder and target firm, manager are more likely to overpay target. That overpayment, a transfer of wealth from owners of bidder's firm to overlapping owners, is one form of tunneling.

Conclusion and Limitation

Heterogeneous interest among owners may deteriote constraint of manager performance and tamper managers' accountability. Managers may be less restrained in pursuing deal in order to increase their compensation or to enhance their reputation. Manager may take benefit personally through engagement of bigger deals. When principal have heterogeneous interest, manager of acquiring firms with high overlapping owners are less constrained to overpay the target firms.

Prior research only has focused on principal-principal problem and principal-agent problem. This study also demonstrate about agent-principal-principal relationship that weaken the corporate governance mechanism. The presence of overlapping owner in the context of merger and acquisition could deteriote the monitoring by principals. Conflicting interests of shareholders give opportunity for manager to make suboptimal MA deals.

This study evidences that heterogeneous interest among shareholders introduce noise assessment of manager to make decision about Merger and Acquisition. We find that in merger and acquisition with high overlap owner, which have stakes in bidder and target firm, manager are more likely to

overpay target. That overpayment, a transfer of wealth from owners of bidder's firm to overlapping owners, is one form of tunneling.

La Porta (1997) find that better investor protection and law enforcement improve minority shareholder's protection from expropriation and consequently reduce the private benefit of controlling shareholders. Courts in civil-law countries may tolerate accommodate more tunneling than courts in common-law countries because of: (i) a narrower application of the duty of loyalty largely to transactions with no business purpose, (ii) a higher standard proof in conflict-of-interest situations, (iii) a greater responsiveness to stakeholder interests, and (iv) a greater reliance on statutes rather than fairness when regulating self-dealing transactions. However, we conclude that tunneling occurs not only in economies with low investor protection (civil law) but also in economies with high investor protection (common law).

Two points are worth stressing. *First*, in recent years, the advanced civil-law countries, encouraged in past by a technology booming and in part by the flow of funds from foreign investors, have found it attractive to promote stock-market financing for new firms via legal reform. *Second*, for less-developed countries, including those that suffered from the Asian crisis, the failure of the legal system may be very costly precisely because they tolerate vast amounts of tunneling. Using legal reform to reduce tunneling is then a crucial element of promoting financial and economic development.

The limitations of this study are that this study focus only in M&A with overlapping owner, for future research, the sample should consist of MA with and without overlapping owners to make better inferences.

THE ASSOCIATION BETWEEN FINANCIAL CHARACTERISTICS AND CAPITAL MARKET REGULATORY NON-COMPLIANCE

Ainun Na'im , Universitas Gadjah Mada
Rida Prihatni, Universitas Negeri Jakarta

ABSTRACT

This study examines the association between financial characteristics and capital market regulatory non-compliance. The financial characteristics are measured using firm size, profitability, liquidity and financial distress. Capital market regulatory non-compliance is measured by non-compliances of firms on regulations about conflict of interest, market manipulation, disclosures, and timeliness on submission of financial statement. This issue is important for regulators for improving the capital market regulatory effectiveness, and for financial communities to look at the meaning of financial information.

Using 92 sample firm years (1992-2001), this research tests whether profitability, financial difficulties, liquidity, and firm size determine company non-compliance toward the regulation. The results provide a number of important points: descriptively and intuitively, complying firms have better financial positions than non-complying firms. B*inary logistics regression* analysis indicates that *current ratio* has significant effect, while profitability (Returns on Equity) has only marginally significant effect on non-compliance behavior. Other variables: firms size, financial distress (debt to equity ratio), and some profitability measures are not significant. We conclude that the result of this study is partially consistent with the previous studies, that financial positions of firms may drive non-compliance behaviors. This result is worth noting for regulators to scrutinize the non-complying firms and their financial performances.

Key Word: Non-compliance; capital market regulation; conflict of interest; market manipulation; disclosure; timeliness of financial statement; and financial characteristics.

1.Introduction

Effective capital market and accounting regulation are important for creating fair and efficient capital market (Beaver 1998). Effective capital market regulation means regulation which all the parties involved in the market comply with the regulation. This also means that the capital market has low cost of transaction. Thus, the efficiency of the capital market is important, as it is the effectiveness of the regulation. The effectiveness of the regulation is also important for implementing the principles of good corporate governance. This study intends to examine the compliance of the firms with regard to the regulation of capital market in Indonesia, the Law No.8/1995 about the capital market and the implementation rules of the laws.

The effectiveness of the regulation has invited public criticism due to a number of legal cases such as those relating to the lost of shares, the short selling, reporting, initial public offering (IPO), right issues, and insider trading. Those cases may indicate the weakness of monitoring and enforcement of the regulation from Indonesian Capital Market Supervisory Agency (known as Bapepam) and may indicate the weaknesses of either Jakarta Stock

Exchange (JSX) or Surabaya Stock Exchange (BES) in developing the capital market in Indonesia. Even though many achievements have been made in the initial development stage of the market such as those in the areas of infrastructure, legal foundation, human resources and market development, the effectiveness of the law and regulation of the market is still under scrutiny.

Signs for efforts to enforce the laws can be identified from a number of punishments and fines to non-complied firms. During year 2000, Bapepam had fined 131 firms for Rp10.284 billion for their non-compliance to the regulation. The regulator also issued sanctions to the firms in the form of written admonition, suspension of business licenses, and revoking of the business licenses.

Bapepam investigated and found infringement cases related to public company transparency, stock trading, and management of investment. In disclosure cases, a number of firms are found not complying to disclosure regulation that obliges them to disclose transactions that may consists of related parties and conflict of interest, urgent information for the public, financial statement presentation, and consistency of the use of fund (with that of planned) from the offering. In cases related to stock trading, the firms manipulate market through fake trading, while in cases related to investment management the firms misconduct the placement of fund in portfolio of securities. These infringements, the importance of legal compliance and market efficiency signify the needs to examine factors that influence the non-compliance behavior and the characteristics of the non-complying firms.

This study is to explore the relationship between the financial characteristics of the firms and the infringement of Bapepam's regulation. This research focuses on some types of infringements that frequently occurred in Indonesian capital market such as the violation on the information openness, conflict of interest transactions, financial reporting timeliness, fraud, and market manipulation. The analysis of financial characteristics of the firms is important due to two reasons: the extensive use of the financial information and the public perception that the financial information conveys other information about the firms. Financial characteristic is also important components in implementing the transparency principle in corporate governance. The financial characteristics are the structural variables (firm size and company ability to pay debt) and the performance based variables (liquidity and profitability).

This article is organized into five chapters. The next chapter discusses review of theories and development of hypotheses. Chapter three discusses the research method and chapter four explains the result and analysis. The last chapter provides conclusion, limitation and suggestion for future research.

2.Theoretical Background and Development of Hypothesis

Effective regulation is important for establishing good corporate governance of firms which eventually results in efficient capital market. Regulation of capital market and principles of good corporate governance have similarities in contents, since they have similarity in objectives.

Regulation of Information and the Quality of Governance

Corporate governance (GCG) is a system to organize and to control the company to create value added for all stakeholders. There are two aspects emphasized in this concept, first, the importance of shareholders right to get information accurately and timely; and second, the company's obligation to disclose financial information including firm performance, ownership, and stakeholders accurately and timely. There are also four major components of the principles and concepts of GCG: fairness, transparency, accountability, and responsibility. The four components are important because they can improve the quality of financial reporting (Beasly et al., 1996) and reduce the agency problems. Chtourou et al. (2001) contend that the application of the principles of GCG consistently can hinder falsifying activities that result in unreliable financial statement.

Issues of corporate governances are most relevant in public company setting, because there are huge potentials of agency problems in the setting. Regulators at national as well as international level such as International Organization of Securities Commissions (IOSCO) has been involved in the process of enforcement of the principles of good corporate governance. Each member of IOSCO, including Bapepam who become a member since 1992, hopes to give a contribution in improving the quality of compliance to the principles of good corporate governance.

Bapepam, the capital market supervisory agency in Indonesia, has been exerting their efforts and applying regulations to improve the implementation of principles of good corporate governance to capital market participants and members especially the public companies. to

corrective or repressive action. The release and applications of rules to contain fairness and transparency principles are preventive actions to assure that the principles are implemented. Bapepam also conducts corrective actions such as punishment for public companies which violate the regulation. Further, the punishment can be imposed to company leaders and managers individually or collectively.

An example of regulation issued by the Bapepam is Rule No. X.K.1 on Information Disclosure. The regulation states that every public effectively registered company should report the report to Bapepam and the public a decision or event that contain material information or that could possibly influence value of the stock or investor decision, as soon as possible no later than the end of the 2nd day after the decision or the event occur.

Theoretical framework that obliges management to disclose information about the condition of the firm is explained in agency theory. Jensen and Meckling (1976) state that agency relationship exists if there is one or more individuals which called principal authorize the other individual or organization, which called agent, to manage their wealth. The principal, then, will provide facilities to support the work of the agent. Principals also delegate to the agent authorities to make decision with regard to the business and the wealth of the principals. An institution of monitoring and control is mandatory to assure that management acts on the interest of principals, and for that reason a regulatory institution obliges publicly listed firms to file reports about their decisions and about the firm.

Fraud, Market Manipulation, and Conflict of Interest

Fraud, market manipulation, and conflict of interest are typical unethical and unlawful acts in business that benefit certain parties at the cost of others through unfair transaction. Regulation to prevent fraud, market manipulation, and conflict of interest transaction can be explained using agency theory. Agency relationship is a contract between principals and agents (Coase, 1937; Jensen and Meckling, 1976; and Fama and Jensen, 1983). The point from agency relationship is segregation between ownership (principal) and control (management). Principals have expectation that agents will provide a certain level of return for the money they invested.

Agency theory tries to answer the problems in agency relationship (Eisenhardt, 1989): information asymmetry and different risk preferences, with effective contracting and effective

regulation. Effective contracting and regulation facilitate principals and agents to reduce agency problems. Principal may prevent the conflict of interest by using a good incentive and monitoring system (Jensen and Meckling 1976). Agent can also spend a bonding cost at certain circumstances to assure that there is no action against the principal's interest, or to assure that principal would give compensation to a beneficial action. However, agents still have a possibility to make decisions that maximize their benefits. The value of money that equal to a reduction of principal's prosperity is also a cost for the agency relationship which usually called as a residual loss.

Effective contracting and regulation may stimulate other instruments to reduce agency problems and agency costs (Jensen and Meckling 1976): the work of market for managerial resources, the work of efficient capital market, and market for corporate control.[310] A manager could be fired and replaced if he or she does not perform. Market for managers can also close the opportunity for bad managers, either bad performers or bad attitudes. The work of efficient capital market can be used as measurement of manager's performance through the company stock price, while market for corporate control may threaten weak corporate management by acquisition. In summary, an effective regulation will prevent fraud, market manipulation, and conflict of interest transaction.

Contracts and regulation are made to make the relationship capable to explain the items of the tasks of the management in managing the fund from investor. Ideally, they should sign a detailed contract which capable to accommodate all possible situations in the future. However, uncertainties of the future obstruct the making of perfect contract. Considering this situation, investors ought to give residual controlling rights to management, which is, rights to make decisions on certain occasions which have not been accommodate by the contract. Manager has a discretionary right in managing investor's fund and managers could do an expropriation of the fund. Manager's residual control right provide opportunities for embezzlement, that eventually resulted in disadvantages for investors.

---

[310] Contract and regulation (laws) are similar in terms that both are agreed items by parties involved in the agreements. The difference is that contract is bound to limited signing parties while regulation is bound to the community members involved in transaction being regulated. Thus regulation is broader laws that contracts.

Expropriation could happen in many forms such as embezzling investor's fund, sell company's product to manager's company (an example of related party or conflict of interest) at lost, and selling other company's assets to manager's company. The worst form of expropriation is keeping the managerial position although there is lack or not enough competence (Shleifer dan Vishny, 1989). Jensen and Ruback (1983) contend that a fact of unqualified managers who defend their position is the most expensive agency problem.

Timely Submission of Financial Statement

Financial reporting is a medium of communication for company and interested parties or the stakeholders. It contains all information about the company especially company's economic resources and measurement of management achievement. The extent of benefit of financial reporting is determined one other things by the timeliness of financial reporting (Givoly and Palmon 1982, Schwartz and Soo 1996, and Na'im 2000). The benefit of the financial report decreases as the time passes (IAI 2002).

Timely financial reporting decreases the asymmetric information (Kim dan Verrechia 1994). The timeliness of financial reporting contributes to improve capital market efficiency, it is one of evaluation and pricing tools, one of information resources to prevent insider trading and to reduce leakage of information or rumor in stock market (Owusu and Ansah 2000). In Indonesia, the timely financial reporting is regulated in Law no. 8/1995 about Capital Market and Bapepam rule No.80/PM/1996 about Submission of Periodic Financial Reporting.

Compliance and Non-Compliance Hypotheses

Issues about compliance and non-compliances have been examined in social science especially in economics, psychology and sociology research. Compliance is personal, group or organizational behavior to do or not to do something in accordance with rules. Economics studies focus more on rational decision made by individuals to comply or not to comply considering the economic utility (Becker 1968). Psychology and sociology literature describe that compliance behavior is determined by internal and external factors (Tyler 1990a, 1990b). Internal factor is a will that emerges from nature of individuals, the strength of which would

influence their way of thinking and could control their behavior. External factor is strength from outside individuals which could influence their way of thinking and behavior.

Tyler (1990a, 1990b) also contends that there are two basic perspectives in sociology literature about law compliances: instrumental and normative perspective. Instrumental perspective assumes that an individual is entirely pushed by self interests and responses toward changes in tangible, incentive, and penalty that related to behavior. Normative perspective assumes that an individual is more oriented to moral values and against their personal interests.

Individual tends to obey law that they think it is in accordance and consistent with their internal norms. Normative commitment through morality means that an individual obeys the law because it is thought it is good, whereas normative commitment through legitimacy means that an individual obeys the law because the regulation that constructs the law has the right to control the behavior.

This study extends the sociological perspectives of compliance behavior by looking at the behaviors of firms in complying or not-complying the capital market regulation in Indonesia. We posit that financial conditions of the firms may drive the firms to comply or not to comply the regulations. Firms may tend to hide or to delay the release of information due to financial difficulties the firms face.

We try to explore the association of financial positions (i.e. total asset, total sales, financial distress, profitability, and liquidity) with behavior of the firms in complying or not complying to the capital market regulation (i.e. the rule of timeliness of financial reporting, information openness, conflict of interest transaction, and fraud and market manipulation). The reason behind this prediction is that management attempts to hinder financial difficulties by non-complying to the regulations. Another reason is that firms tend to comply with the regulation when they are in good financial positions, and when they have effective contracting so that they do not need to violate the laws. This research extends previous studies that focus on information regulation (disclosures and timeliness of financial reporting) to other regulation such as regulation against conflict of interest transaction and market manipulation. Thus, we hypothesize that larger firm size, lower debt to equity ratio, higher profitability, and higher liquidity are negatively associated with non-complying behavior of the firms.

3. Research Method

Sample and Data

The sample of this study is firms that do not comply to capital market regulation with regard to: fraud, market manipulation, information openness, conflict of interest transaction, timeliness of financial reporting (Bapepam rule no. kep-80/PM/1996). Specifically, the sample firms are selected based on the following criteria:

a. The firms are listed in Jakarta Stock Exchange.

b. The firms are fined due to their non-compliance to capital market rules by Bapepam for the periods of 1999-2001.

c. The non-complying firms are coded as dummy variable complying or not complying.

d. For comparison, we use randomly selected complying firms that have similarity in industry.

The data are collected from Bapepam's files and Indonesian Capital Market Directory of Jakarta Stock Exchange, and Centre of Capital Market Reference Faculty of Economics Gadjah Mada University.

Variable Definition and Measures

The dependent variable of the model used in this study is compliance or non-compliance behavior of the sample firms. Non-complying firms are identified based on the facts that the firms are being fined due to the non-compliance behavior. The complying firms are identified randomly from complying firms in similar industry. The variable is a dummy variable coded as 1 for non-complying and 0 otherwise.

The independent Variables used in this research are firm size, profitability, financial distress, liquidity. The profitability measures firms' ability to make returns, and these measures are used: return on investment (ROI), return on equity (ROE), and profit margin on sales. For the financial distress, this research uses debt to equity ratio (DER) as a proxy for levels of company's financial difficulty; liquidity is measured using current ratio; and firm size is measured based on total asset and total sales.

1738

Statistical Model to Test the Hypotheses

The data is analyzed using *Binary Logistics regression*, since the research has *dichotomous response model*. The logistic regression test uses *Backward Stepwise* method (*Conditional*) to filter for independent variables, that able the analysis to release unimportant variables one by one to find out the most significant variable. The logistic regression model is as follow:

$$C = \beta_0 + \beta_1 (ROI) + \beta_2 (ROE) + \beta_3 (PM) + \beta_4 (CR) + \beta_5 (TA) + \beta_5 (TS) + \beta_7 (DER) + \varepsilon$$
(1)

Where,
C: Dummy variable, complying (0) or not complying (1) the regulation,
ROI: Return on investment = net profit/total assets,
ROE: Return on Equity = net profit /equity,
PM: net profit margin ratio = net profit /sale,
CR: Current ratio = current assets/current liability,
DER: Debt to equity ratio = total liability/equity,
TA: Total assets,
TS: Total sales, and
ε: error.

4. Results and Discussion

Descriptive Statistic

Sample selection process results in 92 firms consisting of 46 of which are non-complying firms, and the others are complying firms. The non-complying firms and the types of non-compliances are listed in table 1. The number of firms with non-compliances to timeliness rule is the largest (25 firms), while firms with non-compliances on market manipulation is the least (3 firms). There are moderate numbers of firms who do not comply with the rules of conflict of interest (10 firms) and transparency (8 firms). Three non-complying firms do not have complete financial data, and thus, the final sample is 92 firms. Detailed list of the sample firms are presented in appendix.

Table 1. Non-complying Firms and Types of Non-compliances

Types of Regulation	Number of Firms
Conflict of interest transaction	10
Information openness	8
Financial statement timeliness	25
Market manipulation	3

.

Table 2 describes the comparisons between complying and non-complying firms. Means of total assets and total sales of non-complying firms are higher than complying firms. However, the complying firms are more profitable, more liquid, and have lower debt to equity ratio than the non-complying firms.

Analysis and Discussion

The results of logistic stepwise regression are presented in table 3. The full model indicates that return on total investment (ROI), return on equity (ROE), and profit margin (PM) have negative coefficients meaning that firms with lower ROE, ROI, and PM tend not to comply to the regulation than firms with higher ROE, ROI and PM. However, those coefficients are not significant. Liquidity (current ratio) is the only variable that has significant negative effect in the full model ($p=0.07$ for full model and $p = 0.03$ for reduced model).

Table 2. Comparison between Complying and Non-Complying Firms

	Non-Complying Firms (Mean & *Deviation Standard*)	Complying Firms (Mean & *Deviation Standard)*	Independent t-test & Level of *Significance*
Total Assets	3.500	1.100	8,805
	9.300	*1.200*	*0,004*
Total Sales	1.600	780	5,680
	4.732	*1.003*	*0,019*
ROI (%)	-2	10	0,452
	18,90	*33,60*	*0,503*
ROE (%)	-27	13	1,934

	124	*70*	*0,168*
PM	-1,102	0,008	4,945
	6,00463	*0,52713*	*0,029*
DER	0,54	0,92	8,574
	7,34175	*2,71443*	*0,004*
CR	0,98	12,07	3,854
	1,15	*69,95*	*0,053*

The reduced models (model 4, 5 and 6) indicate that in addition to liquidity, profitability (ROE) has significant effect at very marginal level (p = 0,10).

The other variables: size (total assets and total sales), financial distress (debt to equity ratio), and profit margin and return on investment do not have significant effects. The finding that liquidity is the only significant variable is interesting and indicates that it may have the most serious pressure to management, because the current ratio is the measure of the ability of management to fulfill its short term obligation, and the short term obligation has immediate effects to the business. It is different from profitability that can be measured using various measures, and in fact management may be evaluated using various different measures, including non-financial measures.

Compared to previous studies, the finding is relatively consistent with those of Naim (2000) that examined the effects of financial condition of the firms to information regulatory non-compliances, Schwartz and Soo (1996), and Givoly and Palmon (1982). Those studies conclude in general that firms tend to hide bad news, delay the information dissemination, and not complying the regulations. The effects of size, either measured using total assets and sales are consistently not significant. A note worth mentioned that there are also some inconsistencies in terms of the significant measures such as profitability, where this study found it is ROE which has significant effect, while in Na'im (2000), it is ROA; and that current ratio is examined and it is significant in this study while it was not included in the previous studies.

Table 3. The Results of *Binary Stepwise Logistics Regression*

	Total Asset	Total Sales	Current Ratio	D/E Ratio	Profit Margin	ROI	ROE
Mode I (Full):	0,664	-	-	-0,34	-0,21	-	-

Coefficient	0,253	0,609	0,374	0,523	0,877	0,433	0,547
Significance		0,295	0,073			0,778	0,246
Model 2:							
Coefficient	0,681	-0,633	-0,373	-0,035		-0,471	-0,559
Significance	0,234	0,264	0,073	0,515		0,760	0,238
Model 3:							
Coefficient	0,698	-0,649	-0,385	-0,037			-0,644
Significance	0,222	0,250	0,061	0,497			0,133
Model 4:							
Coefficient	0,688	-0,694	-0,401				-0,660
Significance	0,231	0,217	0,053				0,181
Model 5:							
Coefficient		-0,179	-0,442				-0,815
Significance		0,597	0,039				0,107
Model 6:							
Coefficient			-0,452				-0.810
Significance			0,035*				0,105

5. Conclusion and Limitation

This research is to examine the effects of financial conditions of publicly listed firms on their compliance and non-compliance toward capital market regulations. Four aspects of regulation are being examined: timeliness of the financial reporting, market manipulation, conflict of interests and transparency. Using 92 sample firms years (1992-2001), this research tests whether profitability, financial difficulties, liquidity, and firm size determine company non-compliance toward the regulation.

The results provide a number of important points: descriptively and intuitively, complying firms have better financial positions than non-complying firms. B*inary logistics regression* analysis indicates that *current ratio* has significant effect, while profitability (Returns on Equity) has only marginally significant effect on non-compliance behavior. Other variables: firms size, financial distress (debt to equity ratio), and some profitability measures are not significant. We conclude that the result of this study is partially consistent with the previous studies, that financial positions of firms may drive non-compliance behaviors. This result is worth noting for regulators to scrutinize the non-complying firms and their financial performances.

Limitation of the study rests on the size of sample firms and distribution of the sample among the different types of regulation. There are much more non-complying timeliness regulation firms group than the other non-complying groups. This study may be extended by increasing the sample size, and different measures of compliance and non-compliance firms. A case study approach may also provide a deeper analysis explaining why firms conduct non-compliance behaviors.

THE ROLE OF SELF-ACCOUNTING AND FINANCIAL CAPABILITY IN CONSUMER CREDIT DECISIONS

Umberto Filotto & Gianni Nicolini
University of Rome

Abstract

The role of financial capability in the consumers' financial behavior has been widely analyzed by the literature. The same happened for the relationship between debt and financial capability. The consensus about the benefits of an increase in the levels of financial literacy collides with a diversity of opinions on what the best solutions to increase financial capability. While methods based on traditional teaching may not be an effective solutions and they could not provide results in the short term, solutions oriented to support consumers in important financial decisions (requests for funding, choice of retirement solutions, etc..) may show greater effectiveness. Studies in literature have shown the tendency of subjects with high levels of financial capability to adopt a long term view and to upgrade their daily financial behavior with attitudes and practices related to self-finance (budget, financial check-up, saving for goals, etc.) The paper focuses on the relationship between financial capability and self-accounting practices, interpreting the latter as evidence of conduct financially aware. After a review of the literature designed to emphasize the role of self-accounting in the context of personal finance, a financial check-up based tool is proposed, pointing out how the financial accounts' schemes and logics (regular budget, estimates and forecasts checking targets) may find useful application in the context of personal finance.

Key-words: Self-Accounting, Financial Capability, Consumer Credit

Introduction

The relevance of financial capability is determined by the evolution of the market and by the ever increasing degree of financial innovation. The surge in the number of products and services and their articulation in a variety of customized solutions have simultaneously expanded the range of possible options but also the complexity of customer choices.
All agree that increase in the number of available financial solutions turns into a market improvement only if the customer is able to evaluate the distinguishing characteristics of each one, thus recognizing that most suitable for his or her needs; however several studies have shown that the level of knowledge in financial matters is generally low and, sometimes, it's not sufficient to formulate sound and responsible choices regarding saving, investment and borrowing.

There is vast awareness that a knowledge divide separates the supply and the demand side of the market; because this situation is not considered to be positive for several reasons[311], governments, supervisory authorities and private organizations have started

---

[311] A financial market where the consumers are unable to detect the differences between products is a market oriented to inefficiency and mispricing phenomena, and a consumer that

to study the alternatives available to rebalance the relationship between consumers and financial intermediaries. The diversity of opinions regarding the means of intervention and the target populations has led to the start of a multitude of projects and initiatives that differ in purpose, logic and duration. The choices that might seem more natural – the integration of financial capability courses into the scholastic curricula – does not seem to be totally effective[312] and it does ignore adults (the most active in financial terms) who, being no longer of school age, would excluded from such programs.

While it would be illogical to ignore a significant part of consumers, letting them to be guided in their personal financial choices only by their own experiences and beliefs, it must be also be considered that it is extremely expensive and complicated to engage in a comprehensive educational program considering also the limitations of time and motivation of the adult population. The assumption that adults should be asked to invest considerable portions of their free time to learn concepts which often do not even feel the need to acquire, highlights the limitations of a mass approach. More suited to the needs of adult consumers are those solutions that are provided in the proximity of specific financial decisions, focused on topics closely related to the object of choice. From this point of view, financial capability is not any more something generic and standardized (by the logic that "one size fit all") and becomes a diversified mode of action, oriented through the real consumers needs.

This paper focuses on consumer credit, by proposing a decision support tool aimed at those who are considering taking new financing. The goal of the tool is to focus consumers' attention on some critical choices of financing, with a highlight of the possible impact of a specific loan on the financial situation of the borrower.

In the first part we will focus on the contribution that the planning and control approach, typical of accounting, can provide to financial capability. Once the usability and adaptability of the accounting instruments is tested, the necessary adjustments required to avoid possible behavioral distortions, which occur in case consumers are asked to a self-made diagnosis, will be considered. The second part of the paper presents the tool structure and the estimation of its parameters through an analysis of the Italian market.

ACCOUNTING, SELF-ACCOUNTING AND FINANCIAL CAPABILITY

Financial capability becomes relevant, talking about consumer credit, when issues such as indebtedness and the equilibrium in consumer finances and his or her the capacity of repayment of debts are considered. There are several profiles that come into consideration when we analyse the level of consumer comprehension of the risks that come with a new debt. A first element of vulnerability in the consumer logic is "shortermism" (Lichtenstein, Fischhoff 1977). Consumers overweight benefit from the immediate possession of the purchased good, ignoring the effects that loan repayments will have on their future financial situation (Hilgert, Hogarth, Beverly 2003). A second

---

doesn't really understand a financial product could make wrong decisions that could affect his financial future.

[312] The adoption of financial capability courses by schools and universities is very expensive and seem to be uneffective in producing long-term knowledge improvements (Mandell 2006).

critical factor is the inability of consumers to evaluate the financial contract, as they concentrate on partial indicators such as the amount of the installment, while ignoring comprehensive measures such as total financial amount of debts or the APR. A third critical factor is the tendency of consumers to narrow framing. Assessments about the sustainability of funding should be based on a comprehensive view of the financial situation, rather than focussing on the analysis of the specific operation. Fragmentation, which follows a myopic view and partial equilibria of medium-to long-term risk, is a characteristic of consumer credit choices, as it happens with all the activities where the limited payment amount leads to focus on a small part of a wider financial balance. The consumer considers the single debt, forgetting about its effect on his or her global financial situation. A fourth element to be considered is the consumers' overconfidence. As Graser-Weber (2007) show, consumers tend to attribute to themselves the credit for financial successes, identifying exogenous factors to justify their losses. The trust in a full mastery in financial matters, based on previous financial experiences, is identified as the main cause of overconfidence, which exposes the consumer to take risks and make choices without having the full awareness of the consequences.

If the critical factors that expose consumers to a not-optimal financial behavior are different and suggest the need of a financial counseling activity, it is useful to analyze the contribution that accounting principles and solutions can provide on the matter.

Using accounting for financial capability purposes is motivated by the common goal of management and control of financial balances that firms and consumers share. Thaler (1999) emphasizes how individuals feel the need to "record, summarize, analyze, and report the results of financial transactions and other events, doing so with the same purposes of the organizations that use the managerial accounting". The desire to keep trace of where their money is going, and to keep spending under control can replicate the business world's own accounting practices.

Concerning the use of accounting principle Heath and Soll (1996) note that consumers tend to classify their expenditures into categories (food, transportation, entertainment, etc..) as well as companies gather their expenditure items into homogeneous groups. This mental classification is a preliminary work for an activity of planning and expenditure control, which, at the end, looks very similar to a budget approach. Shefrin and Thaler (1988) and Karlsson (1998) show that individuals classify assets into three mental accounts: current income, current assets, and future income, thus creating an accounting structure similar to a budget based on corporate balance sheet, income statement and budgets. Evidence of the differentiated approach is obtained by Karlsson (1998): he demonstrates the future expenses have a more negative impact on the decisiveness to buy when the payments based on current assets are preferred to current income ones.

While companies have to report their performance to a variety of stakeholders and are thus required to formalize the result of the accounting process in a document (the balance), the absence of such need allows the consumer to adopt a mental budget. Thaler (1993) defines mental accounting "as a collection of aggregation rules for what gets combined with what". For Hirst, Joyce and Schadelwald (1994) it's "a type of framing in which individuals are hypothesized to form accounts for the psychological benefits of cost and outcomes", while Kahneman and Tversky (1981) identify mental

account as "an outcome which frame specifies (i) the set of elementary outcomes that are evaluated jointly and the manner in which they are combined and (ii) a reference outcome that is considered neutral or normal". Similarly Gourville and Soaman (1998) and Prelec and Lowenstein (1998) define mental accounting as a cognitive form of bookkeeping that individuals practice to keep track of expenses and control consumption.

Different papers identify in mental accounting, in addition to a purpose of budgeting, a control instrument. Heath (1995) and Heath and Soll (1996) note that the mental budgeting is a tool for expenditure control. Cheema and Soman (2006) identify it as a self-regulatory mechanism or a self-control device, that prevent consumers "from doing what they want to do (eg, buy a car), forcing them instead to do What they think they should do (eg, save for retirement)".

The virtual nature of mental budget has important implications on the operational level, which potentially can affect its reliability. A first element of doubt for a mental budget adoption concerns the inner conflict of consumers who, faced with an expenditure constraint in self-imposed mental budget, want to make a purchase for larger amounts. Cheema and Soman (2006) have verified how consumers flexibly classify expenses, or construct accounts, to justify spending. This flexibility allows consumers to find loopholes and to circumvent the self-control imposed by mental accounts. The same conclusions are reached by Kunda (1990). The author states that "the biasing role of goals is thus constrained by one's ability to construct a justification for the desired conclusion: people will come to believe what they want to believe only to the extent that reason permits". The conclusion is that the virtual nature of mental budgeting helps to make it more malleable and, therefore, less credible and effective.

A second critical profile of mental budgeting concerns the classification of items which are not directly attributable to any of the known category (home, entertainment, food, etc..). The risk of misclassification can lead the consumer to exceed the limits imposed by budget, citing the possibility of splitting the cost across several categories.

A third critical factor in the use of mental budgeting is the narrow framing (Bonini, Rumina 1996, Moon, Keasy, Duxbury 1999). It refers to the tendency of consumers to consider buying and spending individually, without considering purchases made together, or relating to the same category. A typical example of narrow framing is the purchase of a good on sale. Being concentrated on the discounted price consumers tend to forget to pay adequate attention to the price of the other goods of the shopping-list; this leads to spend more than one would have done if he or she had compared the total expenditure with that of an alternative supplier.

The reliability of mental budgeting is also hampered by the tendency of consumers to react very differently to the same circumstances, however in different situations. For example, individuals who suddenly have access to significant financial assets (by inheritance, lottery winnings, etc.) tend to have different purchasing behavior than those who get the same amount via wise and planned investment activities (Hirst, Joyce and Schadelwald 1994). There are also evidences that the increase in spending in the first case is sometimes excessive even considering the new wealth (Moon, Keasy, Duxbury 1999).

The flexibility of mental accounting, especially compared to a written budget, is proved by Heat and Soll (1996), which recognize that the latter, being based to a higher degree of formalization, forces the consumer into a more rigorous approach thus preventing the breach of the financial limits of the budget. All these considerations strongly suggest the use of a written budget. The added value of writing a budget is also stressed by Thaler (1990), that explains the role of written budget in mitigating the consumers' tendency to prefer current consumption to the future one. It would also effectively generate a sense of guilt introducing a psychological cost that can inhibit the consumer from making unplanned purchases. Prelec and Lowenstein (1998) in analyzing the mental processes of consumers show that a written budget helps the consumer to rationalize choices. Similarly Sharif and Thaler (2006), emphasizing non-rational behavior in cases where the payment and use of the asset are not simultaneous, demonstrate the effectiveness accounting and of written budgets in reducing these phenomena. Finally, written budgets contribute in reducing consumers' shortermism, helping them to become aware of the of medium-long term effects connected with their current behavior (Wertenbroch 1998).

SUPPORTING CONSUMERS: A PROPOSAL

Accounting and self-accounting methods have been adopted to develop a tool designed to support consumers that are considering taking a loan. The goal is to define a model of self-assessment enabling consumers to determine the impact of a new loan on their financial situation. To be effective with adults, however, the tool has to overcome the abovementioned problems of traditional education. Because adults would allocate only a fraction of their time to learning financial matters only the financial knowledge that is needed has to be delivered and it has to be delivered when is needed, and the way it is acceptable and understandable by the user. This means complying to principles of relevancy, contingency and usability which require to answer properly to specific needs and to actual problems. Ergonomics is thus the underlying rule that mandates the way the tool is conceived and developed; ergonomic principles, referred to the educational contents, impose that the model is "tailor-made" and therefore finds its input in the form of the easily available and usable data on the consumer's financial flows. Regarding the form of the model, ergonomics require that the input information is known (or can be found) by the client, that they are clear and simple, avoiding the use of jargon (FSA 2004) and that attention is paid not to require an excessive amount of input information. Should the model require the consumer to find data that he or she does not possess (or that are difficult to obtain) would deprive it of its function as an information intermediary. Being simple and user friendly is necessary in order to reach consumers that lack basic financial knowledge, precisely those with the greatest need for counselling; economizing on the amount of input data required is considered necessary in order to minimize the abandonment of those who, lacking a strong motivation, might consider the opportunity-cost of using of the model as excessively high. For similar reasons, the output of the model must also respect its overall principles: it must be clear and immediately understandable.

As is the case for all forms of financial counselling (the provision of advice on savings, investments, insurance, etc), the elaboration of implicit information on customers seeking loan advice occurs on the basis of the know-how and ability of the counsellor in the area of problem-solving; it thus refers to long term financial budgeting,

and to estimations of the consumer's default risk. From the input data relative to the consumer's periodical cash flow, it is possible to obtain a tailor-made estimate of the consumer's level of risk and identify his specific financial habits (spending attitudes, tendency to borrow, saving habits, etc.). Data relative to a consumer's socio-demographic profile allows the estimation of the consumer's risk by means of a regression analysis based on the behaviours of a representative sample of consumers. The output of the two different analysis is a statement summarizing the possible effects that the new loan could have on the consumer's financial situation, highlighting the consequences that their current behaviour and choices could have on the future financial situation.

METHODOLOGY AND DATA

To create the model of self-assessment for consumer credit, two methods of analyses were used in combination. The first uses the logic of a financial budget to determine the net residual cash flow (NRCF) available to the consumer after having provided for his primary needs (food, clothing, housing, etc.), financial obligations (tax payments, repayment of current loans, etc.) and having satisfied any additional needs (free time, entertainment, etc.). Over a defined period of time, the NRCF is calculated as the difference between total monthly income (salary, investments returns, benefits, etc.) and the total of his expenses and financial costs. The NRCF is considered as a measure of the consumer's ability to reimburse new loans and as a measure of the consumer's ability to face any unexpected events that may negatively affect the family budget (such as a reduction in income or an increase in expenditures). Unemployment, divorce and invalidating illnesses (and/or those that require expensive medical care) are some of the events able that might cause the default of the consumer (Kempson, Atkinsons 2006). NRCF is standardised by considering it as a percentage of total income. Given that a low value of NCFR corresponds with a situation in which a larger part of the income is dedicated towards daily needs and the repayment of current debts, it can be argued that the lower the level of NRCF, the risk of default of the borrower becomes higher due to the consumer's limited capacity to cope with unexpected financial events. In order to simplify the information and make it more intuitive for the consumer, five classes of risk were defined (0-5) where lower values are associated to situations of less risk and higher values are associated with situations of greater risk. Table 1 presents the different classes of risk.

Table 1 – financial analyses of consumer cash flow and default risk

Class of risk	NRCF - Net Residual Cash Flow *(as percentage of total incomings)*
0	25%≤ NRCF
1	20%≤ NRCF <25%
2	15≤ NRCF <20%
3	10%≤ NRCF <15%
4	5%≤ NRCF < 10%
5	NRCF < 5%

Data relative to financial inflows and outflows represent the input by the consumer to the model. During the data entry, the consumer is guided by means of insertion grids. Inflows are classified as (1) net income from employment and other incomes (dividends, rents etc.), while the principal expense categories regard (1) housing costs (maintenance, energy and heating, furniture and electrical domestic goods), (2) tax, (3) food and drink, (4) clothing and shoes, (5) transport and communications (telephone, internet, fuel, car insurance, car maintenance costs, etc.), (6) leisure and education (books, music, pay-tv, cinema, theatre, sport, etc.), (7) other goods and services (medical expenses, care costs, etc). Next to these items the consumer is asked to indicate financial obligations relative to current debts (mortgage and other loan repayments) as well as the repayments of the new loans that the consumer is considering applying for.

Some data, such as those regarding spending habits which are tipically individual can only be supplied by the consumer. As to other expenses, estimations, based upon official statistical surveys, are available; these suggestions alleviate the burden of data entry for the consumer. The availability of such official data allowed their use in this study; however the same methodology can be applied in other countries once the quality of official statistics is (hopefully) comparable. The data source is the [Italian] National Institute of Statistics (ISTAT) which regularly runs enquiries on the purchasing habits of Italian[313] consumers in reference to food and drink, clothing and shoes, transport and communications, leisure, and other goods and services. The average level of national spending (ExAve) was modified in order to consider the impact of three important factors: geographic location (AreaEx$_a$), profession (JobEx$_b$) and the composition of the household (FamilyEx$_c$); these three factors, indeed, influence the level and the composition of family expenses. The average of the estimates on the division of the 'd-th' category of spending (e.g. food, clothing, etc.), whether for the 'b-th' job condition (JobQuote$_{b,d}$) or for the 'c-th' category - composition of the household (FamilyQuote$_{c,d}$), allowed to refine the estimations of the individual spending items. The estimate of the level of spending for the 'd-th' spending item (e.g. clothing, food, etc.) for a subject living in the 'a-th' region (Tuscany, Sicily, etc.) that holds the 'b-th' job (company director, manual labourer, etc.) and that shows the 'c-th' family composition (e.g. married with 2 children) was calculated in the following way.

$$EX_{a,b,c,d} = ExAve \times (1 + AreaEx_a) \times (1 + JobEx_b) \times (1 + FamilyEx_c) \times \left(\frac{JobQuote_{b,d} + FamilyQuote_{c,d}}{2} \right)$$

The parameters within vectors AreaEx, JobEx and FamilyEx indicate in which percentage the level of spending is different from the mean. Positive values indicate that subjects belonging to such categories show average levels of spending that are much greater, the higher the value of the parameter. Vice versa, negative values of the parameter indicate levels of spending that are lower than the average. The estimate of the parameters was obtained using the ISTAT tables on the division of Italian household spending on consumer goods.

The analysis of the NRCF was supported by a sample statistical analysis aimed at determining the default risk of individual consumers by comparing their socio-demographic-behavioural profiles with those of a reference population. The data analysed were made up of a sample of 206,334 observations relative to consumers that

---

[313] Istituto Nazionale di Statistica (ISTAT). 2006. Family consumptions – 2005

had previously applied for a loan in Italy during the period 2006-2007. The data were made available by Experian Italia that extracted and stratified the sample data in order to make it representative of the Italian consumer credit customers.

The sample was analysed by using a logistic regression model, at the basis of which the behaviour of the measure of default risk (R) was reproduced, starting with the constant α, through i regressors x_i, of which the estimation parameters were contained within vector β, and error term ε.

$$R = \alpha + \beta \mathbf{X} + \varepsilon$$

The independent variables of the model regard both the socio-demographic profile of the consumer and his financial behaviour. The first group of variables were age, gender, geographical region, job, living conditions, composition of the household and the number of dependent family members. The second group were the presence or the lack of loan applications in the previous six months, the number of current loans, the number of late payments in the last twelve months, the effective monthly amount of repayment of current loans and its weight as a percentage of net income.

The choice of variables was based on the results of previous studies on consumer financial behaviours. The tendency of consumers with lower incomes, higher percentages of the income devoted to the repayment of current loans, and with a number of late payments within the last twelve months to be more easily vulnerable to financial distress has been demonstrated in various studies (Barron, Elliehausen, and Staten 2000; Getter 2003). Where arrears in repayments are a direct evidence of the borrower's lack of financial resources and are followed a drift towards situations of financial distress, income and the repayments to income ratio are related to potential default as they make , the borrower less prepared to face unfavourable variations in his cash flow.

Including the number of applications for new loans in the previous six months is based on the assumption, confirmed by the literature (Elliehausen, Lundquist, Staten 2007), that a consumer in financial distress starts use new loans to reimburse older ones before declaring default. Living conditions are relevant since homeownership (compared to having to rent the home) means the borrower is not bound to pay rentals that could overload/stress the family budget. In addition to homeownership, marital status and age are the life cycle characteristics associated with the request for loans (Lansing, Maynes, and Kreinin 1957; Juster and Shay 1964; Aizcorbe, Kennickell, and Moore 2003).

The results of the regression analyses were traced back to five classes of risk where higher values correspond to greater levels of risk. The sum of the results obtained with the first method (the financial method) and those obtained from the regression model define the overall result of the model. When the first method showed a structural deficit in the family accounts, destined in the medium-long term to define situations of difficulty, the model attributes by default a final result equal to 10, corresponding to the highest level of risk. Indeed, if consumers regularly spend more than they earn, it is not necessary to analyse the other behavioural variables in order to reach the conclusion that they are destined to end up in financial distress in the medium-long term. In other

cases, the model expresses a rating obtained from the sum of the results of the first method (0-5) and those from the second (0-5). It therefore has a variation interval of 0-10, where higher values correspond to an equally high risk of financial difficulty.

Being expressed by a discrete number between zero and ten makes the results simple to communicate, interpret and immediately comprehensible. Because the same result can be obtained with different combinations of intermediate results (from the two methods) the output is enriched with comments differentiated according to the average results in order to highlight the different components of risk that emerge during the elaboration.

RESULTS

The estimate of the parameters required to calculate the individual items of expenditure associated to the individual socio-demographic profiles led to the identification of the following vectors: AreaEx, JobEx, FamilyEx; and matrices: JobQuote and FamilyQuote – the values of which are reported in the tables 2 to 6.

Table 2: parameters relative to geographic location used in the calculation of consumer spending levels (AreaEx)

AreaEx	Value
Piedmont	+2.71%
Valle d'Aosta	+11.19%
Lombardy	+22.91%
Trentino Alto-Adige	+24.63%
Veneto	+17.09%
Friuli Venezia Giulia	+1.81%

Table 6: the percent levels of spending per individual item and divided by family composition

FamilyQuote	Food and beverage	Clothing	Transport and Communications	Free time	Other goods and services
Single under 35 years old	23.52%	10.56%	31.52%	10.40%	24.00%
Single within 35-64 years old	28.18%	10.14%	28.52%	8.93%	24.23%
Single over 65 years old	50.57%	7.78%	15.79%	8.01%	17.85%
Couple without child (h.o.f. under 35 y.o.)	22.77%	11.78%	29.62%	9.24%	26.59%
Couple without child (h.o.f. within 35-64 y.o.)	27.82%	10.79%	30.52%	8.09%	22.77%
Couple without child (h.o.f. over 65 y.o.)	43.80%	8.00%	23.00%	7.80%	17.40%
Couple with 1 child	29.50%	10.86%	29.50%	9.56%	20.58%
Couple with 2 childs	29.66%	11.96%	28.26%	10.40%	19.72%
Couple with 3 or more childs	32.30%	12.00%	27.56%	11.26%	16.89%
Single with child	32.10%	11.09%	27.23%	10.42%	19.16%
Other conditions	34.39%	9.47%	29.24%	9.14%	17.77%

The heterogeneity of the consumer spending habits is highlighted by the percentage values of the first three parameters (geographic area, profession and family composition). The differences in the levels of spending in the various geographical areas can be, at

least partially, explained by the different level of prices in different regions; for example, the general level of prices in Sicily is clearly lower than that in Tuscany (AreaEx Sicily – 28.6%, AreaEx Tuscany +9.82%). The differences in the spending levels related to the professional position is explained by the differences in income; also, it is reasonable that spending levels are higher for larger families, and when the head of the household is in the working age bracket.

The steadiness in the demand for basic goods is verified in the data on the composition of expenditures. Indeed, it is reasonable that when financial resources are limited the proportion of expenditures destined for primary needs (e.g. food, etc) tends to increase at the detriment of non-essential spending (e.g. leisure).

The demographic characteristics and behaviours of the sample used for the regression logistics and the relative independent variables are presented in tables 7 and 8.

Table 7: Description of the qualitative and descriptive statistics of the dependent variables

		No	90.31%

Table 8: Description of the quantitative and descriptive statistics of the dependent variables

Indipendent variable	Description	Mean	SD
age	Age	44.20	13.39
cr_line	Number of active credit lines	1.429	1.36
late	Arrears in the last 12 months	0.756	2.329
people	Dependents relatives	0.926	1.472
debt_perc	Expenditures relative to the repayment of existing debts on total income	26.17%	78.39

The higher proportion of males (67.47%) in the sample population can be explained by their role within the family of decision makers on financial matters (FSA 2001); because of this, even when the loan is intended for the entire family, the principal borrower tends to be the male. The geographic distribution takes into account difference population densities, also connected to the presence of large cities (e.g. Rome and Milan). The composition of the sample regarding professions reflects both differences in the population numbers and different tendencies to use credit, justifying the strong prevalence of clerks (30.82%) and manual workers (44.25%). The data on repayment to income ratio shows high volatility within different categories, meaning a cross sectional use of credit.

The results from the logistic regression analysis carried out on the sample are reported in table 9.

The estimated model shows a "good fit" and is able to account for about 21% of total variance. The results indicate the variables most directly linked to consumer financial behaviour, rather than those relative to the socio-demographic profiles, that are more highly related to situations of financial distress. The number of current loans (0.2652) and the presence arrears in the last twelve months (0.3264) both show direct links to the risk of default, together with multiple loan applications in the last six months (1.0005). Thus, this study confirms the previous empirical evidence reported in the literature (Elliehausen, Lundquist, and Staten 2007). The opinion that individuals with low levels of homeownership have a definite riskier profile (those paying a rent 0.4059, in other conditions 0.3696) is justified by the higher expenditures that depress the NRCF and diminish consumer capacity to face unexpected financial problems. Significant differences are also shown by profession. The data show how manual workers, students and the unemployed are significantly much more exposed to the risk of financial distress than managers (-0.1193), clerks (-0.2295) and teachers (-0.4037). The large gap that separates married couples from the separated (0.3533) and divorced (0.3397) is highly consistent with prior research (Canner and Luckett 1991; Black and Morgan 1999; Fay, Hurst, and White 2002; Lane 1969; Stavins 2000).

CONCLUSIONS

The present study investigates the potential increase of the cognitive and decision making skills of consumers that are considering taking a new loan and are potentially exposed to financial distress risk. Thanks to the adoption of accounting methods, the tailor-made analysis of periodic cash flows, allows consumers to determine their own financial capacity and the "room" for additional finance. A logistic regression model applied to a reference sample is used to give the consumer a measure of his or her personal risk of financial distress; socio-demographic-behaviour profile is related to that risk. The final result is a decision making tool which combines the two models described

and, because of this, it is able to consider each individual own characteristics and to situate the judgement on financial sustainability.

As variables were chosen through an analysis of previous research, and results obtained in the empirical verifications are consistent with the latter, our model can be, indeed, considered robust; the low levels of data entry and the availability of the information requested facilitate the model's use even by those that do not have a high level of financial know-how. Similarly, the use of an assessment scale of 0-10, once more grants interpretational simplicity to the results.

On the conceptual level, the present study supports the idea that financial counselling can be provided also via non-human interfaces (such as web-based solutions) and that it can also broaden the effects of financial education thus strengthening consumer protection. Compared with education, counselling is better adapted to the needs of adult consumers who are difficult to reach with school-based educational programmes and who have a low availability to attend regular classes (expecially when compared with youngsters). The importance of addressing adults and not only students is amplified by the risks arising in a situation where levels of financial literacy are low, financial systems are increasingly complex and consumers tend to be autonomous in their decision making process.

The possibility for consumers to use the model repeatedly, modifying the input data (income, entertainment spending, the repayment rates of the loan the individual is requesting, etc.) turns the model into a tool for financial education in itself. Simulating different financial behaviours and having the possibility to check the effects that such behaviours would have upon the risk of incurring financial distress helps the consumer to improve his or her perception of risk and to quantify the advantages linked to more financially responsible behaviours.

From the theoretical perspective, the study supports the hypothesi that financial capability can be implemented by an accounting approach. The tool, as a formal budget, represents a step forward the mental budget approach analyzed by the literature.

5.5 Corporate Governance

CORPORATE GOVERNANCE & CORPORATE CITIZENSHIP
Müberra Yüksel, Kadir Has University

Abstract

Following Maignan as well as Matten & Crane, I have regarded corporate citizenship(CC) in a broad sense which emphasizes the role of a corporation in administering individual citizenship rights that distinguished it from corporate social responsibility(CSR). Such a definition reframes the citizenship by acknowledging that the corporation administers certain aspects of citizenship for other constituencies. These include traditional stakeholders, such as employees, customers, or shareholders, along with wider constituencies with no direct transactional relationship to the selected organization.

Corporate governance (CG) is based on principles of transparency, accountability, responsibility and fairness to stakeholders. The relationship between CC and CG along with corporate culture is questioned with a multi-stakeholder perspective in this paper.

Building upon prior studies on corporate culture and citizenship, I aim at showing the perception of employees in a developing country framework empirically. My assumption is that an effective human resource management that enables and cascades down corporate values and priorities is presumed to be a precondition for the alighnment of employees` attitudes with corporate codes of conduct. In other words, CC as well as CG need to start within workplace and then extend to marketplace and consequently to the community.

Keywords: Corporate Governance, Corporate Citizenship, Stakeholders, Accountability.

1. INTRODUCTION:

"If the confidence of public in the integrity of accountants' reports is shaken, their value is gone. To preserve the integrity of his reports, the accountant must insist upon absolute independence of judgment and action. The necessity of preserving this position of independence indicates certain standards of conduct."

(Arthur Andersen, 1932-cited in A. Toffler, 2003).

While corporate governance is an all embracing concept including strategy and performance of the organization along with managerial control, transparency and accountability, most research is about the visible tangible aspects. Effective business processes and strategies often result in higher business performance. Yet, competent behavior is the enabler that makes both strategy and process work. Effective performance demands appropriately effective behavior and priorities. In other words, effective

organizational change and corporate governance certainly requires effective change in corporate culture and values. That is rather difficult to do since understanding, observing patterns of behavior and measuring values are both challenging issues. Still, `good` corporate governance and corporate citizenship may only be achieved if strategic policies as well as processes at work are in line with the codes of conduct and values at work. Otherwise, improvements or implementations are either incomplete or unsustained due to misalignment of values of human resources, at managerial or non-managerial positions. For instance, without openness and transparency to stakeholders, meaningful constructive feedback, accountability or any kind of evaluation would not be possible.

Corporate scandals, like the alleged managerial greed and accounting indecency at Enron and Anderson, have forced corporate governance practices into the spotlight, illustrating the fundamental role they play in any economy. Yet, does corporate governance along with rights and duties converge or diverge among countries? The proponents of the globalization thesis argue that cross-national patterns of corporate governance will converge on either the Anglo-Saxon shareholder-centered model, or some hybrid between the conventional owner or shareholder model and stakeholder models typically found in the continental Europe (Crane & Matten, 2005).

The shareholder-centered model used in America includes more dispersed ownership, strong legal protection for shareholders and indifference to other stakeholders. The hybrid model combines features from both the shareholder and stakeholder models, defined by a less clear separation between dispersed ownership and managerial control. In other words, stakeholders have more influence over the operation of the company. Turkish corporations just like French companies are often criticized for a governance approach that involves an intricate network of public agencies, large firms and banks. Is globalization more about leveraging differences in an increasingly borderless world or is it about convergent codes of conduct. There is an important connection between corporate governance, the competitive strategy of firms and its sustainability (Bay & Küskü, 2006).

Recently, strategic human resource management includes both alignment with business strategy and performance as well as managerial role and internal marketing. Human Resource Management is portrayed in the role of reacting to a pre-conceived strategy. In other words, the human resources are selected, appraised, rewarded and developed only to produce performance which produces a set of 'needed role behaviours' with respect to corporate codes of conduct (Schuler and Jackson, 1987).

In this study I have explored the differences between organizational culture dimensions across different organizations at the corporate level along with the individual values and attitudes on corporate citizenship in one selected company at the individual employee level. After presenting the theoretical framework, an empirical analysis is made by employing two questionnaires. One is about corporate culture and the other is about corporate citizenship from HRM standpoint. The question whether there are any cultural differences between multinational versus local/ national organizations or not is inquired on the surface in the first comparative part. What are the significant gaps between the

values of "Turkish employees" and what is the role of HRM with respect to corporate citizenship are the main research questions in the case study. .

1.1 Organizational Culture

Organizational culture is "powerful, latent, and often unconscious set of forces that determine both individual and collective behavior that determine strategy, goals and modes of operating" (Cameron, 1999). People tend to interact with each other through their choices and decisions. If one can understand the pattern of decision making of the individuals and the organization, then the true goals of the organization can be made clear. This is a powerful concept for allowing organizations to become more effective. Prior research indicates that culture plays at least four important roles in organizations:

1. Culture forms a collective identity that helps its members associate themselves with their organization's policies and mission, and feel themselves a part of it
2. Organizational culture prescribes norms of acceptable and unacceptable behavior, making it clear for employees what they should say or do in a given situation
3. These norms help employees work together to meet customers' needs and respond to external pressures
4. Culture provides structure and control without relying on an authoritative management style that can lessen motivation and creativity. I will examine only Geert Hofstede 's constructs for the sake of brevity here. Hofstede conceived culture as a construct, which manifests itself in an organization as a result of the organization's location within a particular society. On the basis of an extensive analysis of 88,000 responses to a questionnaire survey of IBM employees in 66 countries, Hofstede argued that there are five discrete dimensions of culture:

- **Power Distance** focuses on the degree of equality, or inequality, between people in the country's society. A High Power Distance ranking indicates that inequalities of power and wealth have been allowed to grow within the society. These societies are more likely to follow a caste system that does not allow significant upward mobility of its citizens. A Low Power Distance ranking indicates the society de-emphasizes the differences between citizen's power and wealth.

- **Individualism** focuses on the degree the society reinforces individual or collective, achievement and interpersonal relationships. A High Individualism ranking indicates that individuality and individual rights are paramount within the society. Individuals in these societies may tend to form a larger number of looser relationships. A Low Individualism ranking typifies societies of a more collectivist nature with close ties between individuals.

- **Masculinity** focuses on the degree the society reinforces, or does not reinforce, the traditional masculine work role model of male achievement, control, and power. A High Masculinity ranking indicates the country experiences a high degree of gender differentiation. In these cultures, males dominate a significant portion of the society and power structure, with females being controlled by male domination. A Low Masculinity ranking indicates the country has a low level of differentiation and discrimination between genders.

- **Uncertainty Avoidance** focuses on the degree the society reinforces, or does not reinforce, uncertainty and ambiguity within the society. A High Uncertainty Avoidance ranking indicates the country has a high level of uncertainty and

ambiguity. This is reflected in a high concern for rules, regulations, controls, and issues with career security. A Low Uncertainty Avoidance ranking indicates the country has a low level of ambiguity and uncertainty. This is reflected in a society that more readily accepts change and takes more and greater risks (See the Annex1 for a schematic table of Hofstedte).

- **Long-Term Orientation** was added after conducting an additional international study using a survey instrument developed with Chinese employees and managers. Long-Term Orientation focuses on the degree the society embraces, or does not embrace, long-term devotion to traditional, forward thinking values. High Long-Term Orientation ranking indicates the country prescribes to the values of long-term commitments and respect for tradition. A Low Long-Term Orientation ranking indicates the country does not reinforce the concept of long-term, traditional orientation. In this culture, change can occur more rapidly as long-term traditions and commitments do not become impediments to change (Taylor, 2002).

1.2. Conceptual Framework For Corporate Citizenship and Corporate Reporting

"And does not ... the same hold for today's progressive computerization of our everyday lives in the course of which the subject is also more "mediatized" imperceptibly stripped of his power, under the false guise of its increase?"
-- Slavoj Zizek, 2005.

According to Zizek (2009: 15), market and social responsibility may be reunited for mutual benefit. As Thomas Friedman states bluntly: "Nobody has to be vile in order to do business; collaboration and participation of employees, dialogue with customers, respect for the environment, transparency of deals, are nowadays the key to success." Today`s capitalism thrives on reforms and charity. It cannot reproduce itself on its own. Sustainability of the system depends on social and environmental responsibility. However, maintaning the balance between freedoms and regulations, rights and responsibilities, free access and charged services, quality and quantity along with compliance and innovation are the fundamental issues (Zizek, 2009: 16-20).

After employees as the most significant internal stakeholder and the internal customer come consumers. Consumers are clearly one of the most important external stakeholders for any organization, since they are also the external customers. Further, without the support of customers of some sort, such as through the demand for or purchase of goods and services, most organizations would unlikely survive for very long. (Crane & Matten, 2004).Therefore the role of the external and internal customers in shaping the social and environmental impact of corporations become evermore critical. Employees' support of corporate citizenship is also important as Maignan & Ferrell (2001) point out. Moreover, corporate citizenship is likely to be acknowledged by businesses as a worthwhile investment if its activities clearly supported by consumers through their evaluation of purchasing alternatives. Based on a survey of managers (Maignan & Ferrell & Hult,1999) establish a positive relationship between proactive citizenship and customer loyalty. Dimensions of corporate citizenship and types of initiatives generate consumer awareness.

Because of the interdependence between corporate and consumer citizenship, businesses could learn about the most desirable means of communicating corporate citizenship from inside out-starting at the workplace. According to Maignan and Ferrell (2001) there are two dimensions of corporate citizenship communication: intensity and trust in the source – both of them are likely to influence consumers' evaluations of corporate citizenship and impact on his/her attitudes and behaviors. One could assume that up to a certain point, the more consumers are reminded of the corporate citizenship of a given firm, the more likely they are to integrate these initiatives in their purchasing decisions. However, when corporate citizenship is promoted heavily, consumers may perceive that it is mainly used as a promotional appeal, and may become suspicious about the intent of the firm.

This reasoning entails that consumer's trust in the source of the corporate citizenship communications is also likely to affect the relationship between evaluations of corporate citizenship and consumer behavior. Information regarding the activities undertaken by an organization to meet one or several of its social responsibilities may influence consumer decisions only if individuals judge this information as objective and trustworthy. According to Willmott (2003) corporate citizenship (as well as transparency and accountability, to a lesser extent, marketing communications activity) help to increase trust in the company. Lately, the impact of corporate citizenship is beginning to be regarded as community issues such as human rights and labor practices to health care and the environment. Corporations have started to organize their community and consumer involvement activities to attain the most strategic benefit and competitive advantage to the firm in the long term by leveraging on corporate citizenship.

Aras & Crowther (2009) have regarded corparate governance as the ultimate goal of sustainable excellence and found out that most firms at least complied with codes and CSR policies, if not with triple-bottom line and other actions tto be taken. In their theoretical model, the first five stages of development starting from window-dressing to sustainability reporting, they suggest that only internal stakeholder engagement is possible. For external stakeholder engagement and sustainability excellence, corporate governance with its four tenets (transparency, accountability, responsivenes and fairness) that balances rights with responsibilities have to be enhanced.

Aras & Crowther have employed content analysis of annual reports of 40 companies from ISE 100 and evaluated with a comprehensive checklist of sustainability measures on four themes on culture and employee, societal influence, environment and finance. They have found that all of them have emphasized sustainability and culture-employee more than societal influence and environment metrics. While the hypotheses investigating the relationship between company size and sustainability have been accepted, the relation between financial performance and sustainability has been rejected (Ibid, 2009). In the following section I will look into the workplace dimensions of corporate culture and citizenship rather than corporate governance since simultaneous development of all aspects and activities seem to be unlikely particularly within a developing country framework.

2. METHODOLOGY

Despite the fact that there is no single, commonly agreed definition, indicators and metrics of Corporate Citizenship (CC), in this study I tried to develop a tool based on the Maignan`s (2005) CC definition for the evaluation of corporate citizenship activities in the foreign companies. Combining corporate social responsibility and stakeholder management theory, Maignen defines it as the extent to which businesses assume the economic, legal, ethical and discretionary responsibilities imposed on them by their various stakeholders including employees, shareholders, business partners and suppliers, customers, competitors, public authorities and NGOs representing local communities, environment.

I have first conducted in-depth interviews with top and middle managers to determine the CC practices and codes of conduct. **Table 1** in the Appendix presents the 12 elements of CC as the sources of guidance and checklist used in the research. Some corporate citizenship elements are established from CSR indicators (Welford; 2005), some of them selected through consideration of many voluntary or regulatory international, regional or local standards, codes of conducts, initiatives, declarations and conventions which represent the source and further information about each element and they are provided in the second column.

By and large, elements of employee rights within the company's own operations are all commonly found as policies in the selected multinational firm. The policies about the protection of human rights within the company's own operations, prevention on child labor and forced labor in the workplace is found important, while policies on profit-sharing and share ownership schemes are not introduced in the host country yet. The interviewed managers mentioned policies on non-discrimination in the workplace and responsible recruitment practices and equal opportunities statements and implementation plans consisting equal pay and career prospects for women. Yet, the employees are predominantly male. The rate about working standards like statement on normal working hours, maximum overtime and fair wage structures is also clear. Staff development, in-house education and vocational training, lifelong learning, empowerment of employees, better information flow throughout the company is rather high.

When it comes to an examination of transparency and accountability there are written policies concerning e.g. human rights enforcement like forced child labor. Probing more on corporate governance demands another research. Although policies and procedures concerning codes of conduct (including bribery and corruption) along with core competencies of employees and relevant training programs are highlighted and training programs to promote corporate citizenship has commenced during orientation, still there seems to be some training needs still.

Most of the policies concerning employee rights including profit-sharing schemes are adequately implemented. Most of these policies are required by Turkish Labor Law. Still,

awareness of OECD Guidelines, ILO convention, EU Green Paper as sources of guiding principles was relatively higher than anticipated, probably due to the transformation process (See the Appendix for **Table 2**). How do economic, legal ,ethical and discretionary citizenship issues affect employee's overall evaluation of the company's CC is the major research question. Thus, I have attempted to examine whether the communication process of corporate citizenship is successful or not in this particular multinational company that have complied with the main checklists during our interview.

I have employed interviews for both checking corporate obligations, codes of conduct and core competencies in this selected multinational company. Then, I conducted a survey of 30 questions based on the issues delineated in table 3 below to analyze the citizenship behavior of employees and managers with a total response of 150. I have employed Friedman and Mann-Whitney-U tests to determine the gaps, if there are any and then I tried to see the relationships by Chi Square tests which may all be seen in **Table 4** of the annex. Except for some striking differences between managers and employees` attitudes, neither gaps nor relationships were surprising. The differences were mild and promotion based on fair performance criteria and participation of employees in decision-making are found to be significantly related to employee attitudes on both commitment and corporate citizenship.

TABLE 3: Organization & Employee Relations (Human Resource Management from a Stakeholder and Ethical Standpoint)

EMPLOYEE RIGHTS AS STAKEHOLDERS
Right to Freedom from Discrimination (e.g., equal opportunites, reverse discrimination)
Right to Privacy (e.g.,work-life balance, data protection and electronic privacy)
Right to Due Process (e.g., promotion, firing)
Right to Participation (e.g., decision process)
Right to Safe & Healthy Working Conditions
Right to Fair Wages (e.g., appropriate pay)
Right to Freedom of Conscience & Speech
Right to Work(e.g., fair treatment in the interview or job security)
EMPLOYEE DUTIES
Duty to Comply with the Labor Contract
Duty to Comply with the Law
Duty to respect the Employer's Property

In the comparative part of the research, I have employed another questionnaire on corporate culture. The survey questions provide information about the current organizational culture and a guiding framework within which to describe the present and plan for the future. The questionnaire is a 5 scale Likert format questionnaire and it has 100 questions.

The Sample:

Two different questionnaires have been used for measuring Corporate Culture and. Corporate Citizenship. The first survey was administered to 150 employees in five large-scale organizations that are selected by convenience sample. Five companies voluntarily participated in this research. Three out of these firms are multinational and the other two are Turkish companies. All of the firms are either a part of a big holding company or a part of a large conglomerate. The first sample consisted of 150 participating employees. About 30 people have been selected for each of the five companies as a representative random sample. Their age, and job type that they are working in are delineated below in the two pie charts:

The job type category has 17 clusters. In the table below, the participants' job types' clusters are given. There were five more clusters which did not match with any participants which were graduate trainee, call center operative, semi-skilled and routine work, non paid job / volunteer, and student. The gender distribution is rather skewed since 89% were male in the sample.

3. FINDINGS:

In the research, two companies were multinational and three of them were Turkish companies. One-way ANOVA technique is used for determining the differences corporate culture dimensions between multinational and Turkish companies.

P.S: (The reliability of all items is above .75)

The differences between multinational and Turkish companies based on the corporate culture dimensions are: the Concern for Results, Career Development and timely decision-making is Turkish companies. In addition to this, Decision-making in Turkish companies is higher than multinational companies. The descriptive statistics (means) also have shown that the corporate items are generally higher than the levels of individual values in Turkish employees.

4. CONCLUDING REMARKS:

"Many people know the price of things, few the value; for the price is about the visible cost and the value is about the intangibles that are hidden."
--Oscar Wilde.

By and large, those who oppose this universalistic approach and its application to developing countries often start from a point of describing the essential differences and assumptions between management in the West and in developing countries. These usually centre around essential cultural differences. Jaeger (1990) in drawing on Hofstede's (1980) work on cultural differences identifies the other cultures (of developing countries) as being characterised by high collectivism, high power distance, femininity, low uncertainty avoidance, and associative/contextual thinking. These are the binary opposites of cultures in developed countries against which management theories operate. Examples of these `biased` conceptual elements are:

–   a fatalistic approach to life. Hence goal setting, planning and budgeting are not valued and if carried out are hesitant and vague;

C			**Source of Guidance**
H	APPENDIX		International standards, codes
E	TABLE 2		of conducts , initiatives,

- a past time orientation. Hence planning is an extension of the past, decisions are based on precedent. Low premium on initiative;
- a 'being' orientation. Hence decisions based on emotions and feelings;
- autocratic authority relationships. Hence low risk taking, status not performance crucial in setting rewards.

This study has various limitations and calls for future studies. First, only corporate culture questionnaire is comparative the otheri\ is a case study. Second, the data are collected at one point in time and among five companies, which limit the causal inferences that one can draw. and generalizations that one may make. Future research might benefit by collecting comparative and longitudinal data. Despite the limitations, our study enhances our understanding of corporate culture and citizenship attitudes and behaviors.

Overall, the results suggest the importance of individual values and perceptions as well as pattern of interactions among colleagues along with casecaded codes of conduct at work. Additional research in this area seems critical to advancing our understanding of the relation between corporate governance, culture and citizenship behavior. I have just attempted to make a first cut assessment of the perceptions of employees on CC as the main internal stakeholder. The next step demands researchers to analyze the outcome of employee perceptions and attitudes on the company, its products and services along with customer perceptions. That way, the interactive relation between a company's reputation and stakeholders' perceptions about an organization's ability to enhance CC as a value creation and leverage for difference may be examined.

Similar to our findings, `the transferability debate` in strategic human resource management confirms that the employment relationships in developing countries will be subject to similar and perhaps exacerbated contradictory value shifts and cultural tendencies as are experienced in developed countries such as the gap between espoused human resource policies (usually based on Western norms of 'best practice') and actual practices is large. Hence, the employment relationship along with the human resource management displays a distinct 'dualism' - the formal contact on the one hand and the informal, culture infused, job behaviour on the other. Perhaps, we will reach a consensus on the basics of corporate governance when these two sides of the coin are aligned and integrated. As Zizek has suggested, new balances have to be found concerning dilemmas between freedom and regulation (effectiveness) , rights and responsibilities (equity) and ethics versus efficiency issues in the corporate market system.

THE IMPACT OF CORPORATE GOVERNANCE PRACTICES AND PERFORMANCE MEASUREMENT SYSTEMS ON FIRM VALUE IN EMERGING MARKETS
Elaine Yen Nee Oon,University of Malaya

Abstract

The central theme that undergirds this proposed research stems from the theoretical framework of a management control systems (MCS) operating as a package. Two forms of control will be examined in combination: administrative (corporate governance practices) and cybernetic (value-based performance measures); under the specific setting of listed companies from the emerging markets; namely Singapore, Malaysia, Indonesia, Philippines and Thailand. The purpose of this research is firstly, to investigate the influence of corporate governance mechanism on management's decision to undertake value-based performance measures. Secondly, it seeks to analyse this effect on firm value. In particular, this research will examine how firm value will be affected under two circumstances: when adhering to certain corporate governance practices and when value-based performance measures are being implemented. This research aims to contribute towards building a more coherent theory of management control systems as a package and to gain new insights as to how corporate governance and management accounting practices unfold differently across different countries, especially in less developed economies.

Table of Contents

Chapter 1: Introduction

1.1 Background and rationale of research

The last two decades have witnessed vast transformation in organizations worldwide, where intense competition and globalization of markets have forced organizations to re-define their strategies, structures and processes. This has led to increases in mergers and acquisition, and has encouraged organizations to secure competitive advantage through innovations in product, services, processes and information technologies.

The world of management accounting research has also changed as a consequence of the growth of international business, global competition, privatization, and deregulation. These changes have special implications especially for transitional economies such as Russia, China, Eastern Europe, Vietnam; and the newly industrialized or emerging economies such as India, Brazil, South Korea, Malaysia, Thailand, Philippines, Indonesia and Singapore[314]. These 'Less Developed Countries' (LDCs) are gaining increased attention from policy makers and academics across various discipline because of their growing dependence on globalization and international trade reforms. Accounting change is an essential component of market-based development policies promoted by international agencies. Of equal importance is the provision of relevant, timely and accurate internal management accounting information is equally important.

---

[314] Emerging economies are defined as "low-income, rapid-growth countries using economic liberalization as their primary engine of growth" (Hoskisson, Eden, Lau, & Wright, 2000), p.249. The International Finance Corporation (IFC 1999) identifies 51 rapid-growing developing countries as Asia, Latin America, Africa and the Middle-East as emerging economies. [See Hoskisson et al. (2000) for a list of emerging and transitional economies].

Management accounting assists executives in their efforts to improve the economic performance of the firm. However, it can be argued that the current continuous challenge is the alignment of 'local' business process with 'global' corporate strategies. Frequent failures have cast doubt on whether Western management accounting practices can be effective especially without adjustment to local circumstances. Thus there is a profound need to further the development of management accounting in these LDCs. Although work in this area is growing, it is still at its infancy. (Abdallah, 1992; Haldma & Lääts, 2002; Jusoh & Parnell, 2008; Williams & Seaman, 2002).

Many newly-industrialised or emerging economies such as Malaysia, Thailand and Korea have high technology-based manufacturing activities while in Singapore or Hong Kong, sophisticated financial and business services prevails. The traditional cost/management accounting system which evolved since the 1950s was mainly based on concepts of standard costing, flexible budgeting, Cost-Volume-Profit analysis, variance analysis and responsibility accounting (Ittner & Larcker, 2001; Jaruga & Ho, 2002). However, these traditional management accounting practices has been criticized as limiting a company's progress towards world-class manufacturing performance as the internal orientation of accounting information is too narrow for strategic decision making (Jaruga & Ho, 2002).

Most firms (except for large banks and large firms with foreign capital) in transitional and emerging economies are still rather conservative in using advanced and new 'value-based' management accounting methods such as

activity-based costing, the balanced scorecard, strategic accounting and control systems and economic value performance measures (Ittner & Larcker, 2001; Jaruga & Ho, 2002). Moreover, due to their unique environments, alternative approaches to Western management accounting methods are practiced in various emerging economies (Abdallah, 1992; Skousen & Yang, 1988). Therefore, firms in transitional and emerging economies have realized that they need effective management accounting techniques to provide management with relevant, timely and accurate information to improve the economic performance of the firm. However, there are scant findings published on the progress that firms in these economies have made toward this goal.

There have been several calls in the last few years for both theoretical and empirical contributions to the debate on how management accounting in transitional and emerging economies should develop in response to various globalization pressures and how management accounting can facilitate change (Hopper, Tsamenyi, Uddin, & Wickramasinghe, 2009). Despite this, the road to management accounting reform is rocky and long. Most transitional and emerging economies are still embarking on their management accounting reform process. Thus more studies on these economies can further shed light on the effective diffusion of management accounting practices under different social and economic systems. The first objective of this research is to fulfill this need by undertaking investigation of management accounting practices within the emerging markets.

Recently, there have also been numerous calls to investigate corporate governance within the context of management accounting literature (Bhimani, 2009) and corporate governance within emerging markets (Young, Peng, Ahlstrom, Bruton, & Jiang, 2008). Risk management and corporate governance issues are emerging concerns as evidence by their significant influence on public policy debates regarding the control of organisations. The notion of risk and corporate governance has extensively influenced and defined many aspects of organisational and managerial endeavours, including management accounting activities (Bhimani, 2009; Seal, 2006).

The Chartered Institute of Management Accountants (CIMA) (2005) also recognises the frictions between governance and value creation; and between conformance and performance when they coined the term "Enterprise Governance" to describe both corporate governance and business governance aspects of organizations. The enterprise governance framework note that '(T)here is a gulf between the corporate governance agenda and the "business success" literature and a framework is required to bring the two together' (IFAC 2004, p.9). CIMA clearly distinguishes the external and internal aspects of corporate governance where the external dimensions focuses on the role of boards and the internal dimensions on the value drivers. The framework emphasizes the need to balance the conformance and performance aspects of the business in order to generate long tern sustainable shareholder value.

As such it is inept to consider management control as being distinctly separate and independent from corporate governance concerns (Bhimani, 2009;

Malmi & Brown, 2008). The control process is in itself defined by the intent to monitor the degree and alignment between organizational activities and desirable managerial outcomes. Bhimani (2009) argue that it is crucial and essential for firms to make the deployment of utilization of controls that are regarded as effective, transparent and visible. He suggests that this makes management accounting, risk management and corporate governance increasingly intertwined and interdependent.

Calls for research in corporate governance within the emerging markets transpired from the realization of researchers that there is no single agency model that adequately depicts corporate governance in all national context (Rafael La Porta, Lopez-De-Silanes, Shleifer, & Vishny, 1997, 1998; Lubatkin, Lane, Collin, & Very, 2007; Young et al., 2008). In developed economies, because ownership and control are often separated and legal mechanisms protect owners' interests, the traditional principal-agent conflicts between owners (principal) and managers (agents) have received the majority of research in corporate governance (M. Jensen & Meckling, 1976; Young et al., 2008). However, in emerging economies, the institutional context makes the enforcement of agency contracts more costly and problematic (Wright, Filatotchev, Hoskisson, & Peng, 2005). This results in concentrated ownership, coupled with an absence of effective external governance mechanisms normally prevailing in emerging economies, give rise to more frequent conflicts between controlling shareholders and minority shareholders (Dharwadkar, George, & Brandes, 2000; Morck, Wolfenzon, & Yeung, 2005). This has led to the

development of a new perspective on corporate governance, which focuses on the conflicts between different sets of principals in the firm, known as the 'principal-principal' model of corporate governance, which centers on conflicts between the controlling and minority shareholders (Young et al., 2008). A comprehension of such relationships is indicative of the wider impacts of extra-organisational factors on internal control and governance structures that are common in emerging economies.

The relationships between management accounting, corporate governance and risk management have been addressed only to a minimum extent in the academic literature (Bhimani, 2009). Thus, the second objective of this research is to investigate corporate governance practices within the emerging markets. The purpose of this study is to investigate the relationship between corporate governance and management accounting practices within the emerging markets.

1.2   Theoretical Framework: Management Control Systems (MCS) as a package

The theoretical rationale for this research draws from the idea that management control systems operate as a package within organizations. The concept of organization having a control package is not new, having been introduced to the management accounting literature by early contingency theorists (Otley, 1980). Control refers to those practices intended to align individual's activities with organisational goals (Abernethy & Chua, 1996; Flamholtz, Das, & Tsui, 1985; Otley, 1980). A management control systems

(MCS) package is generally conceptualized as a collection or set of control and control systems (Malmi & Brown, 2008). Although the concept of MCS operating as a package has existed for over 3 decades, explicit research and theorizing on this phenomenon is still scarce.

Malmi and Brown (2008) suggest a number of reasons as to why studying MCS as a package is important. First, the functioning of outcomes of any new management control system element in any given organization is likely to be related to the functioning of an existing management control package. Thus, MCS do not operate in isolation. Past researchers have warned that studying MSC in isolation will lead to inaccurate conclusions because outcomes are likely to be related to the extent a new system is coupled to existing systems (Chenhall, 2003; Dent, 1990; Fisher, 1998).

Second, prior accounting research has substantially concentrated on studying recent developments in practice, including Activity Based Costing/Management, Balanced Scorecard, Value Based Measures/Management and Target Costing – aiming to explain their emergence, adoption, functioning and outcomes. However, much of this extant research focuses on only one system at a time, thereby largely ignoring the wider control context or package of which they are a part. Importantly, such omissions can obscure the derived conclusions on the functioning and associated benefits of such innovations.

Third, there is still limited understanding of the relative effectiveness of various forms of control. In particular, the question of how might these various

control (e.g. administrative, cybernetic, cultural) complement or substitute each other in a range of circumstances or not, remains an area warranted for further investigation.

Fourth, there is also a lack of understanding as to why and how various parts of a control package are used and emphasised in practice. The differences in emphasis in which they are contingent upon remain unanswered. More research focusing on accounting based (cybernetic) controls as a part of organizational control package is required to assist in developing a more coherent theory of management control systems. Such a theory would not only facilitate in explaining the causes and effects of individual controls and controls as a package, but also how control systems relate to each other, to firm activities and contingent factors. This proposed study aims to fill this gap.

This proposed study employs the conceptual typology of an MCS package adopted from Malmi & Brown (2008, p.291) as depicted in Figure 1 below:

Figure 1: Management Control Systems (MCS) Package

Cultural Controls					
Clans		Values		Symbols	
Planning		**Cybernetic Controls**			**Reward and compensation**
Long range Planning	Action Planning	Budgets	Financial Measurement Systems	Non-Financial Measurement Systems	Hybrid Measurement Systems
Administrative Controls					
Governance Structure		Organisation Structure		Policies and Procedures	

Source: (Malmi & Brown, 2008)

The motivation for this proposed study stems from the above conceptual typology of an MCS package as suggested by Malmi & Brown (2008). This

proposed study seeks to investigate the linkage and relationship between cybernetic control and administrative control (referring to Figure 1), within the emerging markets, namely 5 rapidly growing South East Asian countries: Singapore, Malaysia, Indonesia, Philippines and Thailand. The elements of cybernetic controls which will be examined are the financial and hybrid measurement systems which constitute what is termed 'value-based management', a widely recognized innovation of the 90s within the management accounting literature (Ittner & Larcker, 2001). Examples of financial performance measures are return on investment and economic value added (EVA). Hybrid performance measurement systems contain both financial and non-financial measures such as the Balanced Scorecard.

Under administrative controls, the element of governance structure will be examined. By combining the examination of both cybernetic and administrative control, this adheres to the suggestion of studying the phenomenon of MCS as a package in order to identify not only what is actually contained in a MCS package within the organization but also the potential linkages between systems which may reveal further missing and/or unnecessary elements. This will facilitate the building of a more coherent theory that will provide contribution to academics, practitioners and industry players in the business community.

Chapter 2: Statement of Problem and Research Questions

The idea of MCS operating as a package within specific settings motivates the following research problem for this study:

What is the effect on the value of companies from emerging markets when certain corporate governance practices are in place and when value-based performance measures (financial and hybrid) are implemented?

Consequently, this gives rise to the following research questions:

1) Does the corporate governance practices in countries from the emerging markets influence management to implement value-based performance measures (financial and hybrid)?

2) How does this impact the value of companies from the emerging markets?

2.1   Purpose of the research

The purpose of this research is firstly, to investigate the influence of corporate governance mechanism on managements' decision to undertake value-based performance measures (financial and hybrid). Secondly, it seeks to analyse this effect on firms' value. In particular, this study will examine how the firms' value will be affected under two circumstances: when adhering to certain corporate governance practices and when value-based measures (financial and hybrid) are being implemented by firms. Thirdly, this investigation will be conducted for a sample of firms from 5 emerging markets: Singapore, Malaysia, Indonesia, Philippines and Thailand, from the years 2000 to 2007, after the Asian financial crisis, but before the recent global financial meltdown that intensified

from 2008 onwards. This period was chosen because many of these countries from the emerging markets have gone through market liberalization after the Asian financial crisis.

Chapter 3: Literature Review and hypotheses development

3.1   Management Control System (MCS) as a package

According to Malmi and Brown (2008), the first hurdle to undertake the study of MCS as a package is defining what is meant by MCS. Numerous definitions and descriptions of MCS exists within the literature, some are different while others overlap (Abernethy & Chua, 1996; Anthony, 1965; Chenhall, 2003; Fisher, 1998; Flamholtz et al., 1985; Langfield-Smith, 1997; Merchant & Van der Stede, 2007; Ouchi, 1979). The lack of clarity, wide variation and inconsistencies in how MCS have been conceptualized has created a number of problems in MCS research in relation to the interpretation of research results and the design of MCS (Malmi & Brown, 2008; Zimmerman, 2001).

Zimmerman (2001) suggests that the distinction between decision making and control must be made, when determining what should constitute as MCS. This means that any accounting systems designed to support only decision-making at any level of the company, while leaving the use of those systems unmonitored should not be termed MCSs, but instead management accounting systems (MAS). However, those systems, practices, measures, rules and values and other activities put in place in order to direct employee behaviour should be called management controls. Consequently, any system or practice such as

balanced scorecard, governance structure or financial and non-financial performance measures can be categorized as a MCS (Malmi & Brown, 2008). Since in most organizations there are usually a number of MCS, the term 'package' is utilised[315]. As such, this proposed study conforms to the suggestion of Malmi & Brown (2008, p. 290) for the explicit definition of MCS, in which "management controls include all the devices and systems managers use to ensure that the behaviours and decisions of their employees are consistent with the organization's objectives and strategies but exclude pure decision-support system".

To date, MCS research has provided much information about the operation of many of the elements within MCS individually. However, currently very little is known about how these elements are actually configured as a package across organizations, although recent works by Sandelin (2008) and Kennedy and Widener (2008) have provided some insights on this phenomenon. Sandelin (2008) undertakes a case study to examine the operation of management control practices as a package in the context of a growth firm by focusing on cultural, personnel, action and results controls. He found that the form and functionality of an MCS package is influenced by internal consistency rather than contingent factors (Sandelin, 2008). Kennedy and Widener (2008) investigate the control framework that results from a lean manufacturing environment. They develop a theoretical framework that facilitates in

---

[315] Merchant and Van der Stede (2007) suggests that the collection of control mechanisms should be called an MCS.

understanding control choices, accounting practices and organizational structure, associated with lean manufacturing (Kennedy & Widener, 2008).

A review of the existing literature suggests that it remains unclear as to whether there are particular configurations that systematically exist in specific settings. In particular, do specific types of cybernetic controls generally exists with specific types of administrative or cultural controls? As the environments within which organization exists are in a state of constant change, which of all the elements in the MCS package are the ones which have to fit the best, and which are less essential for maintaining control and gaining superior performance (Malmi & Brown, 2008)? By taking a broader approach to study MCS as a package in emerging markets, this proposed research aims to provide some answers and clues to the open questions above.

Currently, there is also very little theory that enables researchers to establish the relationships between the elements in a control package (Chenhall, 2003; Malmi & Brown, 2008). How the elements within a MCS package relate to each other remains unanswered. This study aims to shed light on the obvious question of whether the effectiveness of each of the control system under examination is dependent on the existing configuration of the package. For example, misalignments between performance measures and the organizational structure or governance structure may result in ineffective control. By examining all or some of the elements in the package and the relationships between them, a better understanding of the effectiveness of individual elements will be achieved.

3.2   Value-based performance measures

According to Ittner & Larcker (2001), the value-based management (VBM) approach signifies the evolution of management accounting research and practice after more than 4 decades. This approach emphasizes on value creation for the firm through the identification, measurement and management of drivers of customer value, organizational innovation and shareholder returns. This results in the establishment of a diverse set of 'new' management accounting techniques directed at promoting value creation such as the development of balanced scorecards as indicators of economic success and economic value measures that are purported to better reflect shareholder returns.

Over the last decade, much has been written about value-based management. Most of the extant literature relates to VBM-metrics and its relationship with share price, a measure that contributes to the creation of shareholder value (Athanassakos, 2007; Biddle, Bowen, & Wallace, 1997; Stewart, 1991). Another substantial strand of research focuses on the implementation of VBM and its effects on company level (Lovata & Costigan, 2002; Ryan & Trahan, 1999, 2007; J.S. Wallace, 1997). A third strand of research highlights the assumed conflict between shareholder and stakeholder view of the firm (M. C. Jensen, 2002; J. S. Wallace, 2003). Lastly, the concept of how VBM is applied in practice has also begun to receive attention (Claes, 2006; Malmi & Ikäheimo, 2003).

From a management accounting perspective, the main issue is not whether the value-based performance measurements, such as economic value

measures, are more highly correlated with stock returns than traditional accounting measures, but whether its usage towards internal decision-making, performance measurement and compensation purposes improves organizational performance (Ittner & Larcker, 1998). A further related issue is whether the performance implications of the value-based performance measures depend upon how the measures are used within the organization, for example in capital budgeting, goal setting, investor communication, business planning, compensation and financial management purposes. As such, this study aims to investigate the performance of the organization upon adoption of value-based performance measures and also how these measures are used within the organization. This will be able to provide some direction as to the long-term benefits from the adoption of such value-based performance measures.

3.3   Corporate Governance within the emerging markets

There is a growing expectation that corporate boards should be overseeing the quality of internal management and the strategic decisions and pursuits of their companies (Abdullah, 2004; Agrawal & Knoeber, 1996). How far the characteristics of corporate boards influence management control has not been subjected to extensive research, particularly the differentiating effects of foreign versus domestic board membership has received only scant attention so far (Choi & Hasan, 2005; Gulamhussen & Guerreiro, 2009; Oxelheim & Randøy, 2003). Gulamhussen & Guerreiro (2009) studied the influence of foreign equity and board membership on corporate strategy and internal cost management of

domestic banks in Portugal. Foreign equity and board membership affect managerial choices and hence, as corporate governance mechanisms, influence the strategic decisions, pursuits and cost control outcomes. They call for future extension of their study to test their main hypotheses in other markets that have undergone some liberalization. In particular, in markets experiencing increasing globalization of foreign element of corporate governance will be a fruitful area for future research. As such, this proposed study responds to this call by investigation within the 5 emerging markets from South East Asia: Singapore, Malaysia, Indonesia, Philippines and Thailand.

3.4 Hypotheses

Based on the review of past literature above, this proposed study will investigate the relationship between corporate governance and value-based performance measures (new management accounting techniques or innovations) within the specific setting of emerging markets. The impact of this on firm value will be explored.

The following hypotheses is developed:

H1: Higher foreign shareholder's equity holdings will lead to adoption of value-based performance measures.

H2: Higher composition of foreign outside board membership will lead to adoption of value-based performance measures

H3: Firms with low insider (management) ownership will lead to adoption of value-based performance measures.

H4: Firms with higher institutional ownership will lead to adoption of value-based performance measures.

H5: Adoption of value-based performance measures will lead to higher firm performance.

H5: Higher foreign shareholder's equity will lead to higher firm performance

H6: Higher composition of foreign outside board membership will lead to higher firm performance

H7: Firms with higher insider (management) ownership will lead to higher firm performance

H8: Firms with a higher institutional ownership will lead to higher firm performance

Chapter 4: Methodology

To test the hypotheses in this research, a sample of firms listed on the stock exchanges of the 5 countries from the emerging markets (Singapore, Malaysia, Indonesia, Philippines and Thailand) will be collected from Datastream and Bloomberg. The firm value will be measured by Tobin's Q, similar to past studies (Agrawal & Knoeber, 1996; R. La Porta, Lopez-de-Silanes, Shleifer, & Vishny, 2002; Oxelheim & Randøy, 2003; Poletti Hughes, 2009).

Chapter 5: Conclusion – Implications and Significance of research

This PhD research will provide key implications and significance to practitioners, academics and industry players in the business community through the understanding of corporate governance practices in emerging markets and its influence on organisations' internal management decision-making and corporate strategy orientation. It will also shed light on how corporate governance mechanisms co-evolve with advanced management accounting techniques in emerging economies. Consequently, new insight will be gained on the progress of these emerging economies in light of global competition and advancement, relative to companies in developed markets, thereby contributing to the international business perspective.

Secondly, this research will uncover the characteristics of firms in emerging markets that are likely to adopt advanced performance measurement techniques. The role that foreign institutional investors play in emerging economies and their impact to the organizational performance will also be highlighted.

Finally, by taking a broader approach to study MCS as package, this will enable better theorizing of the actual impact of innovations, such as the value-based performance measures, and as a result, facilitate in developing better designs of MCS packages to benefit organisations worldwide.

Session 6.1: Financial Reporting

EQUITY RECOGNITION
Akihiro Noguchi, Nagoya University

ABSTRACT
It is important to note that the distinction between liabilities and equity is directly connected with the calculation of earnings. As income cannot result from an investment by or a distribution to an owner or from a change in the value of equity instrument, without a distinction between the claims of creditors and those of owners, measurement of income is not possible. To determine comprehensive income, not only the definition of equity but also recognition criteria and method of measurement have to be clarified. In this paper, to clarify the issues on equity recognitions, history of the accounting for stock subscription is explained, and then the accounting issues on equity recognition will be discussed from Japanese accounting environment.
                    Equity   Japan   Stock Subscriptions   Basic ownership approach

1. Introduction

It is important to note that the distinction between liabilities and equity is directly connected with the calculation of earnings. That relation between calculation of earnings and calculation of assets and liabilities or calculation of capital had been emphasized by Nakamura (1961) using following FIGURE. In the background for calculations of earnings and calculations of capital, there exist calculation of assets and liabilities.

FIGURE: Relation between calculation of earnings, capital, and assets and liabilities

Source: Nakamura (1961, p.13)

Currently, FASB and IASB are undertaking joint project *Financial Instruments with Characteristics of Equity* (formerly *Liabilities and Equity* project for FASB) [316]. It was

---

[316] For FASB Project Updates:
http://www.fasb.org/project/fi_with_characteristics_of_equity.shtml
for IASB Projects:
http://www.iasb.org/Current+Projects/IASB+Projects/Liabilities+and+Equity/Liabilities+an

written in Discussion Memorandum published by FASB in 1990 that the most obvious effect of the distinction between liabilities and equity is on the enterprise's financial position (FASB 1990, par.64). But at the same time it was also pointed out that income cannot result from an investment by or a distribution to an owner or from a change in the value of equity instrument, without a distinction between the claims of creditors and those of owners, measurement of income is not possible (FASB 1990, pars.66-67). In Agenda Paper 11A in Financial Instruments with Characteristics of Equity project, it is also written that liability and equity definitions are intended both to determine which things are potentially recognizable and which recognized things can affect comprehensive income (IASB 2009, par.9).

To determine comprehensive income, not only the definition of equity but also recognition criteria and method of measurement have to be clarified. The accounting treatment might be different, even with the same definition of equity, if the different recognition criteria or method of measurement is applied. And the accounting treatment might be same, even with different definition of equity, if the different recognition criteria or method of measurement is applied. In this paper, to clarify the issues on equity recognitions, history of the accounting for stock subscription is explained, and then discuss about the accounting issues on equity recognition using Japanese materials.

2 Accounting For Stock Subscriptions

Not only the definition of equity instrument, but also the recognition and the measurement of equity instrument affects when the increase in equity will be recorded. When the value of stock options were measured by intrinsic value on the grant date, as for ordinary stock options with exercise price set at the grant date market price, even if those stock options were considered as equity instrument, and considered they should be recognized from that date, they will not be recorded because their value will be measured as zero[317].

On the other hand, even if stock options are excluded from the definition of equity instrument, still it might result in recording increase in equity when they are granted, if equity recognition takes place in very early stage of issuing stock. So it is necessary to discuss about equity recognition principle. Even for a simple equity instrument, there will be several steps before formally issued; first it has to be authorized, next subscribed, and then contribution has to be made, and finally stock certificate issued[318].

In Japan, Company Law (formerly Commercial Code) specified the date when the capital stock will increase as a result of issuing stock, there was little room for debate. It is the date of dead line when contribution to the company has to be made[319]. As Japanese Company Law do not allow installment for making contribution to the company, if the subscribers fail to pay the amount, those subscription will be cancelled[320]. So in

d+equity.htm
[317] This was the situation before IFRS 2.
[318] Company Law Article 117 allows company to issue stock certificate. But, in January 2009, stock certificates of the listed companies in Japan were abolished by the Act on Transfer of Bonds, Shares, Etc. So, as for listed Japanese companies, they do not issue stock certificates any more and transfer of shares no longer requires stock certificates.
[319] Japanese Company Law, Article 209.
[320] Japanese Company Law, Article 208.

Japan, when stocks are issued, they are all fully paid. But before the amendment of Japanese Commercial Code[321] in 1950, it was allowed to issue stock without fully paid[322]. At the beginning of twentieth century, equity recognition could take place at the point of subscription[323].

It is necessary to analyze the critical event for equity recognition when stocks are issued on installments. At the beginning of twentieth century, it was debatable whether the increase in capital should be recognized when the stocks were subscribed or not. Hatfield (1916, pp.153-155) pointed out that the practice for uncalled subscriptions was not uniform in the USA[324], and in UK excluded from the balance sheet, but in France and Germany, they were generally shown as an asset.

IFRSs do not specify the presentation of share subscription account in the statement of financial positions. According to Epstein & Jermakowicz (2008), most share subscriptions are presented as deduction to shareholders' equity, but it is also explained that they are sometimes treated as an asset.

In the USA, Rule 5-02.30 of the Regulation S-X, it is required to show the dollar amount of common shares subscribed but unissued, and show subscriptions receivable as deduction. According to EITF 85-1, even if the notes are received for contribution, the predominant practice is to offset those notes and stock in the equity section[325]. Because the uncertainty remains high for subscriptions receivable, equity recognition is postponed until the payment is actually made.

In UK, "Called up share capital not paid" will be presented among assets, and "Called up share capital" will be the amount of equity recognized[326]. So in UK, "call" will be the critical event for equity recognition[327]. However, if those called up share capital are

---

[321] Japanese Commercial Code, Article 280-7 (1950 Amendment).

[322] Article 152 of Commercial Code established in 1890. See Ishikawa (2008).

[323] Dan (1914, pp.293-294) explains the accounting practice in UK, USA, and Japan, and supports that the stock subscription should be recognized as asset and the total amount of subscribed capital should be recorded.

[324] "Subscription to Stock" is included among assets in Bennett (1916, p.369). There seems to be two kinds of accounting practice existed, one of which were to record stock subscription as an asset, and the other to begin the record when the actual contribution was made. Those explanations about the accounting practice can be seen in Hatfield (1927, pp.174-179), Wildman & Powell (1928, pp.81-84), Sunley & Pinkerton (1931, pp.30, 33-34, 54-61). According to Couchman (1924, p.192), unpaid subscription maybe shown by the account "subscribers to capital stock" and deducted from the amount of stock subscribed in the balance sheet.

[325] However, in EITF 85-1, it is also stated that such notes may be recorded as an asset if collected in cash prior to issuance of the financial statements.

[326] The Large and Medium-sized Companies and Groups (Accounts and Reports) Regulations 2008 (http://www.opsi.gov.uk/si/si2008/uksi_20080410_en_1), Schedule 1 Companies Act Individual Accounts: Companies which are not Banking or Insurance Companies, Part 1 General Rules And Formats, Section B The Required Formats for Accounts, Balance sheet formats. However, the amount of allotted share capital and the amount of called up share capital which has been paid up must be shown separately.

[327] In the Format of the Balance Sheet in First Schedule for Companies Act in 1862, "3. If any Arrears of Calls, the Nature of the Arrear, and the Names of the Defaulters" was included among I. Capital.

actually paid in by the time the financial statements are published, there will be little difference between the US rule and the UK rule.

Most of the arguments against equity recognition at the subscription stage were those subscription receivables are not necessarily collectable. Even if they are called up, uncertainty of collecting the amount is so large that they should not be included among assets. But it could be argued in different way. As reporting entity has not received anything yet, from the view point of the reporting entity, until subscriber actually contributes something that the reporting entity could use, there is nothing to record at that time. If the latter reason is employed, in case of stock option, equity should be recognition when the service is received, not at the grant date.

3 FASB/IASB Project on Equity

FASB has been undertaking broad project on financial instruments since 1986. The Preliminary Views *Financial Instruments with Characteristics of Equity* has been issued as a part of the liabilities and equity project in November 2007. Based on the Memorandum of Understanding[328], IASB is undertaking Financial Instruments with Characteristics of Equity project and issued Discussion Paper in February 2008 that comprises Invitation to Comment and the FASB Preliminary Views document.

In Preliminary Views, the basic ownership approach is supported. Under the basic ownership approach, the most residual claim is classified as equity (par.16). By that definition, some perpetual instrument such as preferred stock will be classified as a liability (par.34), and derivatives on an issuer's basic ownership instruments such as a written call option on common stock will be classified as a liability (par.67).

In Preliminary Views, the ownership-settlement approach and Reassessed Expected Outcomes (ROE) approach are explained in appendix. The ownership-settlement approach classifies basic ownership instruments, other perpetual instruments, and indirect ownership instruments as equity (par. A1). The ROE approach uses an instrument's probability-weighted outcomes to separate and classify that instrument (B1).

In the Discussion Paper, summary and criticisms against IAS 32 are described, and compared with approaches in the FASB document.

According to the observer notes (Agenda paper 7) for Joint IASB/FASB meeting in October 2008, addition to the three approaches presented in the Preliminary Views, loss absorption approach, perpetual approach, participation approach (broad view of equity approach), IAS 32 (without modification), modified IAS 32, are discussed. And the Boards decided to begin future deliberations using the principles underlying the perpetual and basic ownership approaches[329].

4   Accounting Practice in Japan

(1) Listed Preferred Stocks

---

[328] Memorandum of Understanding between the FASB and the IASB, *A Roadmap for Convergence between IFRSs and US GAAP — 2006-2008*, 27 February 2006.

[329] IASB Observer Notes, Agenda paper 9, Financial Instruments with Characteristics of Equity: Developing a Classification Model. November 2008, par.1.

In Japanese practice, capital structure is simple and most of the company only issues common stocks. It is rare to find preferred stock listed and traded[330], but when they are listed, the amount will be material.

Shinkin Central Bank issues common shares (common investment securities) and preferred shares (preferred investment securities), but only the preferred shares are listed and traded among investors since December 2000. Preferred shares of Shinkin Central Bank have stated value[331] and preferred dividend is six percent of the stated value per year, but no voting rights at the general meeting. As Shinkin Central Bank serves as the central bank for shinkin banks[332], whose membership consists of all shinkin banks nationwide, and common shares of Shinkin Central Bank are held by those shinkin banks. According to the Annual Securities Report[333] of the Shinkin Central Bank submitted in 2008, the amount of common shares was two hundred billion yen and the amount of preferred shares was ninety one billion yen[334]. The capital surplus was one hundred and one billion yen and that total amount has been contributed from preferred shareholders.

ITO EN issued preferred stocks and they were listed at First Section of the Tokyo Stock Exchange in 2007. The amount of preferred dividend is twenty five per cent more than the amount of dividend for common stock. When no dividend is declared for common stock, the amount of dividend for preferred stock will be fifteen yen per share. According to the Annual Securities Report of the ITO EN submitted in 2008, the amount of common stocks and the amount of capital surplus from common stocks was about thirteen billion yen each. The amount of preferred stocks and the amount of capital surplus from preferred stocks was about twenty billion yen each. So ITO EN received more funds by issuing preferred stocks.

According to the basic ownership approach, preferred share or preferred stock will be classified as liability. But in case of the Shinkin Central Bank, only the preferred shares are traded at the stock market, so the investors in the market will be only preferred shareholders. If preferred shares are treated as liabilities, then accounting structure for calculation of earnings will not be for them, not for the investors in the market. Same thing can be said for preferred stockholders of ITO EN. Although nearly half of the

---

[330] Preferred stocks of Sakura Bank was listed in 1994 but delisted in 1997. Subsidiary Tracking Stock of Sony was listed in 2001 but delisted in 2005. Japanese banks issued preferred stock to receive financial support from the government after the financial crisis in late 1990s. Some companies issued preferred stocks as a result of debt equity swap. Although common stocks of those companies are listed, preferred stocks are not.

[331] Corporation established by Japanese Company Law do not have par value for their stocks. Because Shinkin Central Bank is established by Shinkin Bank Law (Cooperative Financial Institution Law) the shares of Shinkin Central Bank have stated value.

[332] Shinkin banks are cooperative financial institutions, and their membership is composed of local residents and small and medium-sized companies, but their functions are almost the same as those of commercial banks, and they also deal with many people who are not members (Shinkin Central Bank, *Annual Report* 2008, p.18).

[333] Official annual report submitted to the Financial Service Agency following the Financial Instruments and Exchange Act, Article 24.

[334] Although the total amount of common shares and preferred shares is disclosed, each amount of each class of shares is not disclosed on the balance sheet in Japan. So it is necessary to look for those figures in the other part (situation of the submitting company) of the Annual Securities Report.

capital was invested from preferred stockholders, if the basic ownership approach is adopted, they will be excluded from equity holders.

(2) Restricted Stock Type Stock Options

In Japan, employees received lump sum cash payment when they retire at the retirement age of the company[335]. Officer also received lump sum cash payment when they retire, just like employees. But situation is changing for officers. According to NIKKEI Newspaper (September 14, 2008, p.1), sixty per cent of listed companies in Japan have abolished those lump sum cash payment at the retirement for offices, and one third of them have introduced stock option plans to substitute it.

Among those stock options that substituted lump sum payment at the retirement of officer, some of them are restricted stock plans in substance. Early examples of restricted stock type stock option plans[336] can be found in Nikko Cordial Corporation in 2003. According to the *Annual Report* 2007 of Nikko Cordial Corporation[337], stock option plan resolved at the board meeting on June 26, 2003, and several plans resolved after that date, exercise price was set at one yen. As the stock price was over one thousand yen, one yen was only a nominal value. As for vesting conditions for stock option granted in 2003, "The earlier of the day a holder loses his or her position as a director of Nikko Cordial Group or June 30, 2022", which means it will be exercisable when he or she retires. In Japan, it is unlikely that he or she will serve as a director for more than nineteen years.

According to the *Operation Report* (proxy statement) in May 2003 of Nikko Cordial Corporation[338], stock compensation type stock option plan was introduced to make directors and executive officers to share not only the benefit of stock price increase but also the risk of stock price decrease with stockholders. At the same time, lump sum cash payment plan for directors and executive officers was abolished.

Income tax played an important role for producing that kind of compensation plan. If stock itself was granted and made it non transferable by the contract or junior stock with was granted, income tax would be imposed on the grant date. On the contrary, when stock option is granted without a consideration, even if it is not a qualified stock option[339], income tax will not be imposed until it is exercised.

---

[335] Part of the lump sum payment was substituted by pension plan by the company. In Japan, dual system of pension plan exists. One is run by the national government, and the other by the employer, or company.

[336] In the English version of *Annual Report* of Mitsubishi Corporation in 2005
 (http://www.mitsubishicorp.com/en/pdf/ir/library/ar/archives/ar2005.pdf)
simple English translation of Japanese "KABUSHIKI HOSHUGATA" stock option plan, "Stock Option for a Stock-Linked Compensation Plan" is used.

[337] Nikko Cordial Corporation merged with Citigroup Japan Holdings Ltd. to form Nikko Citi Holdings Inc. on May 1, 2008. (http://www.nikko.jp/GRP/index_e.html) PDF file of the annual report can be found at the following URL.
http://www.nikko.jp/ICSFiles/afieldfile/2007/09/26/07are_shiori.pdf

[338] *Operation Report* can be found in the Financial Report Service database NEXT YUHO KAKUMEI by Hitachi High Technologies Corporation.

[339] In case of qualified stock option, Japanese Income Tax Law postpones imposing tax until stock is sold by the grantee of the stock option (Act on Special Measures Concerning Taxation, Article 29).

Even if the basic ownership approach is adopted, according to the Preliminary Views, "Substance" will be taken into consideration and penny warrant will be treated as equity (pars.44-46). This is nothing but a proof that the difference between stock and warrant cannot be determined based on their legal form. What is the substance of stock has to be clarified.

And also it is not difficult to imagine that if the accounting for stock option and accounting for stock become different, that will provide an opportunity for creative accounting[340].

(3) Revenue Recognized from Stock Subscription Rights Transaction

Accounting for stock subscription rights affect financing activities of the company significantly. In 1994, in Japan, accounting treatment for debt issued with stock purchase warrants was changed to treat debt and stock purchase warrants separately in accounting[341]. Since then, very few Japanese companies issued debt issued with stock purchase warrants for financing purpose[342].

---

[340] Company cannot record profit or loss from the transaction of treasury stocks. But if stock purchase warrants are classified as liabilities, company can record profit or loss from the transaction of treasury warrants.

Before the amendment of the Japanese Commercial Code in 2001, purchase of treasury shares were prohibited except for the designated limited purposes by the Commercial Code or Special Laws in Japan. As the gain and loss from transaction of treasury shares was rare and was not material, it was treated as profit and loss. But the amendment changed that situation. The articles in the Commercial Code that required treating treasury shares as assets were amended. Transactions of treasury shares are no longer exceptional. The amount cannot be said as immaterial. It became possible and necessary to treat treasury share as deduction of capital by the accounting standard. So ASB Statement No.1 was issued in February 2002 so that Gain and loss from transaction of treasury shares can no longer reported in the income statement

ASB Statement No.5 "Accounting Standard for the Presentation of the Net Assets in the Balance Sheet" was issued in December 2005 and it changed the Capital section of the balance sheet to the Net Assets section. As the balance of outstanding stock options is included in the net assets section in the balance sheet, it might look that the accounting treatment is same as IFRS 2 or FAS 123 (R). However, that is not the case there. The difference is that when the stock option expires, even after vesting, the balance will be transferred to gain and reported in the income statement. Because the owner of stock option is not a shareholder, the contribution from the owner of stock option is not contribution from the shareholder. It is not included in shareholders' capital. Stock options are not presented among liabilities any more, but they are not presented within the shareholders' capital. As a result, when the stock option expires, not only the non vested ones but also for the vested ones, the balance of Stock Options account will be transferred to Gain from Stock Options Expired account and reported in the income statement.

[341] Japanese Institute of Certified Public Accountants issued a Report entitled "Accounting for debt issued with stock purchase warrants by the issuing company."

[342] See Noguchi (1998) for the effect on the choice of financial instruments. After the change in accounting treatments, most of the debts issued with stock purchase warrants were for stock based compensations. Because of the restriction of the Commercial Code, some companies chose to use stock purchase warrants issued with debt for stock

Before 1994, when the split accounting for debt issued with stock purchase warrants were introduced in Japan, there were more than ten cases of bonds issued with stock purchase warrants that their issue price exceeded their face value more than their total interest expense until maturity. For example, one company issued debt with stock purchase warrants at @101.60 yen. The interest rate was only 0.1% per year, and that debt was a four-year bond. So the total interest expense until maturity was only @0.40 yen, and the premium (treated as revenue) was @1.60 yen. Thus, the net of @1.20 yen resulted in the increase net income (Noguchi, 1998, p.336).

Similar case can be found in the other capital market. In UK, one company actually reported negative finance cost by following FRS 4 (Davies, Paterson and Wilson, 1997).

If conversion features are not treated separately in case of convertible debt, there will be following problems:

i) Consideration for conversion features will be allocated and offset interest expense that should have been recognized.

ii) When the stock price falls and becomes unlikely to be converted, if the company selects to redeem convertible debt, gain will be recognized. What's worse is that, in such kind of situation, company can select when to recognize that gain as long as the company can obtain enough fund to redeem convertible debt.

When conversion feature is not recognized separately, that will result in reporting the consideration for conversion feature as revenue. That means a part of the consideration for shares might be treated as revenue. In order to rule out split accounting for convertible debt, this problem has to be overcome.

Paton & Paton (1955, p.52) uses analogy that crediting income for lapsed stock option is on the same footing as crediting income for cash invested through an ordinary stock subscription and forfeited.

5 Summary

Definition, recognition, and measurement, all three aspects have to be take into consideration to figure out what would be the accounting treatment for financial instrument issued by the company.

In case of accounting for stock options before FAS 123R, it was the measurement which kept outstanding stock options off balanced. Even if the stocks are subscribed and issued, unpaid subscription will not be treated as equity. Increase in equity is generally recognized when contribution is made. In those cases, not the definition of equity, but measurement or recognition that prevented recording increase in equity in the balance sheet. If it is necessary to classify stock options or stock purchase warrants as equity, which can be done by modifying the recognition criteria even under the basic ownership approach.

The Preliminary Views of FASB supported the basic ownership approach. In this paper, three cases in Japan, (1) Listed Preferred Stocks, (2) Restricted Stock Type Stock Options, (3) Revenue Recognized from Stock Subscription Rights Transaction, were presented to show the defects of the basic ownership approach explained in the Preliminary Views.

---

option plans in substance.

Those cases are not necessarily unique to Japan. For example, similar problem of the basic ownership approach like (1) listed preferred stocks, has already been pointed out. According to the comment letter submitted to IASB, in case of European partnerships or cooperatives, the basic ownership approach would lead to a classification of interests of those organizations as liabilities[343]. In such kind of case, the basic ownership approach could lead to no equity presented on the financial statements.

As for the significance of (2), according to Towers Perrin Tokyo Office & Nikko Cordial Securities Inc (2009), by June 2009, 40% of listed companies in Japan have experienced granting stock options, and among 381 companies granted stock options last year, 150 companies granted restricted type stock options. So the restricted type stock option is one of the major forms of the stock options used in Japan.

Recognition of gain and loss from the transaction of stock subscription rights, stock options, or stock purchase warrants needs to be analyzed further. It might provide more room for creative accounting or real earnings management. But if they are measured at fair value and gain or loss are reported for the change in their fair value[344], it might provide useful information.

REPORTING FINANCIAL RATIOS IN ANNUAL REPORTS: VOLUNTARY DISCLOSURE PERSPECTIVE

Norhani Aripin, Greg Tower, Grantley Taylor
Curtin University of Technology

Abstract

This study examines the predictors of the extent of financial ratio disclosures within the 2007 annual reports of 300 Australian listed companies. Utilising agency theory as the theoretical framework, corporate governance, capital management initiatives, ownership concentration and firm size are hypothesised to be associated with the financial ratio disclosure patterns. A 43-item financial ratio disclosure index is developed and classified into five key sub-categories.

Overall, the extent of financial ratio disclosures is very low (5.3%) with more extensive disclosures within the sub-categories of Share Market Measure, Profitability and Capital Structure. A far lower Liquidity and Cash Flow ratio information is reported. Larger firms with more dispersed share ownership provided more extensive financial ratio information than the others. Further, profit-making firms and Big4 clients exhibit more extensive financial ratio disclosures. Resources firms presented significantly lower incidents of financial ratio than the Financials and Services sector. Corporate governance and capital management initiatives do not have predictive properties.

The findings of the research have important implications for understanding disclosure incentives as they relate to the extent of financial ratios disclosures within the annual reports of ASX listed firms.

Keywords: Financial ratios, voluntary disclosure, Australia

1.0 INTRODUCTION

This study offers a unique perspective of voluntary reporting, specifically on financial ratio disclosures in Australian companies' annual reports. The aim of this research is to investigate the factors that motivate firms to disclose financial ratio data to the stakeholders through their annual reports. A sample of 300 Australian listed companies is selected and 2007 annual reports are analysed.

Undeniably, there is an increasing interest in voluntary disclosure research recently (Brammer and Pavelin 2006; Chow and Wong-Boren 1987; Cooke 1989; Eng and Mak 2003; Guthrie *et al.* 2006; Healy and Palepu 2001; Hossain *et al.* 1994; Leung and Horwitz 2004; Meek *et al.* 1995; Botosan and Harris 2000). However, limited focus is

given to the financial ratio disclosures (Mitchell 2006; Watson *et al.* 2002; Gibson 1982; Gibson and Boyer 1980; Courtis 1996; Aripin *et al.* 2008; Horrigan 1965).

Using agency theory tenets, this study predicts that corporate governance, capital management activities, ownership concentration and firm characteristics influence the extent of financial ratio disclosures in the companies' annual reports. Bigger firms with stronger corporate governance structure, higher capital management initiatives and less concentrated ownership are expected to have more extensive financial ratio disclosures.

2.0   LITERATURE REVIEW

2.1   The Relevance of Financial Ratio Disclosure

A financial ratio is defined as a mathematical relation between two quantities (Subramanyam and Wild 2009). Financial ratio analysis is useful for several reasons: providing insights of the underlying firms' financial condition (Subramanyam and Wild 2009), a signalling tool (Mitchell 2006), accessing and comparing company's performance (Watson *et al.* 2002) and serving as an alternative to possible misleading influence of the absolute dollar figures (Courtis 1996). In addition, financial ratios are used in predictive studies (Altman 1968; Beaver 1966; Neophytou and Molinero 2004).

The disclosure of financial ratios in the annual reports is driven by several motives. First, the disclosures can enhance the understanding of stakeholders by providing them a quick and simple tool highlighting the firms' performance. Assessment of firm performance can be further enhanced if the ratio data is presented using graphs or tables (Courtis 1996) that depict changes over time. Secondly, communicating financial ratio information can provide users of financial statements with new information that is

not comprehensively presented in any single media (Watson *et al.* 2002). This information would be more meaningful for non-sophisticated users in evaluating and making informed investment decisions.

Further, some ratios are not possible to be calculated by readers because of the non-availability of inside information (Gibson 1982). Therefore, providing ratios such as account receivables turnover in the annual report could offer important insights of firms' financial health position to the readers. Alternatively, disclosure of financial ratios would efficiently reduce the time and cost of obtaining and processing information (Watson *et al.* 2002) elsewhere. Graham *et al.* (2005) suggests that among the reasons why companies choose to provide voluntary information is the reduction of the cost of capital and to provide important information to investors that is not included in the mandatory financial statements. Arguably, when company disclose financial ratio in the annual report, the management is communicating the importance of financial ratio information to be provided to the stakeholders. By providing such voluntary disclosure, managers must believe that the benefits outweigh its cost (Watson *et al.* 2002).

2.2 Theoretical Background and Hypotheses Development

This study employs agency theory to investigate the determinants of financial ratio disclosures in the companies' annual reports. It is argued that by disclosing voluntary information to users, the information asymmetry problem arising from conflicting agency relationship is reduced (Healy and Palepu 2001). Similarly, it is believed that corporate governance, capital management initiatives, ownership concentration and firm size will impact on financial ratio disclosure.

2.2.1   Corporate governance

Corporate governance may positively impact on the corporate reporting practices, including voluntary disclosures. (Barako *et al.* 2006; Bassett *et al.* 2007; Beasley *et al.* 2000; Beekes and Brown 2006; Chau and Gray 2002; Denis and McConnell 2003; Haniffa and Cooke 2002; Lakhal 2005; Taylor *et al.* 2008). Taylor *et al.* (2008), Barako's (2004) and Eng and Mak (2003) findings reveal that the presence corporate governance elements positively explain the level of voluntary disclosure in Australia, Kenya and Singapore respectively (also see Beekes and Brown 2006). These previous studies highlight the importance of corporate governance practices of the firms towards their financial reporting policy.

The requirement of ASX listed firms to disclose the extent to which they adhere to the best practice corporate governance principles and recommendations facilitates a comparison between a firm's corporate governance characteristics and financial ratio disclosures. Consistent with this rationale, it is expected that the extent of financial ratio information disclosed is positively related to the strength of corporate governance structure. Therefore, the following hypothesis is proposed:

> **H_1**: *The extent of financial ratio disclosures is positively associated with a stronger corporate governance structure.*

2.2.2   Capital Management Initiatives

In this study, core capital management initiatives include capital raising activities, takeover and merger activities, overseas cross-listings and the existence of international operations. Using agency theory, it is argued that firms engaging in such capital management initiatives provide more disclosure in order to reduce agency conflicts.

Frankel *et al.* (1995) concludes that financing firms have greater incentives to voluntarily disclose information than non-financing firms. Meek and Gray (1989) find that Continental European companies disclose more voluntary information due to pressure associated to the need to raise capital in the international capital market context. While Brennan (1999) reports greater disclosure of profit forecast during takeover bids for UK listed companies, Lang *et al.* (2006) suggests that cross-listed firms are facing different reporting incentives . This is consistent with Malone *et al.* (1993), who argues that firms with overseas operation are subject to additional reporting requirements by the foreign governments.

It is hypothesised that firms participating in these capital management initiatives will exhibit more extensive financial ratio disclosure because of the capital market scrutiny and pressure. It is argued that these firms need to provide more information to keep the investors and stakeholders more informed due to a larger group of investors (after raising new capital and merger), as well as a wider set of stakeholders (cross listings and foreign operations). Additionally, disclosure of financial ratio information is often event related. For instance, financial ratios may be disclosed to highlight the change in financial, operational or investment structure of the firm immediately following the aforementioned capital management events and activities. Therefore, it is expected:

H_2: The extent of financial ratio disclosures is positively associated with firms' capital management initiatives

2.2.3   Ownership concentration

Ownership structure is another possible mechanism that aligns the interests of shareholders and managers (Eng and Mak 2003; Haniffa and Cooke 2002; Chau and

Gray 2002; Hossain *et al.* 1994). Agency problems may be reduced in companies with a higher concentrated ownership structures. It is suggested that firms with higher concentration of ownership structure may disclose less information to shareholders. Chau and Gray (2002), Lakhal (2005), Oliveira *et al.* (2006) and Hossain *et al.* (1994) find a negative relationship between share ownership concentration and voluntary disclosures in a variety of countries including Hong Kong, Singapore, France, Portugal and Malaysia. The significant role of ownership concentration in influencing financial disclosure practices is clearly evident in previous studies worldwide. It is thus expected that ownership concentration influences the voluntary disclosure of financial ratio. This hypothesis is formally stated as:

H₃: The extent of financial ratio disclosures is negatively associated with higher ownership concentration.

2.2.4 Firm size

Consistent with prior literature, firm size is believed to influence the financial ratio disclosures practices of the firms. Many researchers (Hossain *et al.* 1994; Wallace *et al.* 1994; Chow and Wong-Boren 1987; Buzby 1975; Singhvi and Desai 1971) find a significant impact of firm size on the level of financial reporting of companies. Therefore, this factor is considered important in determining the extent of financial ratio disclosures.

According to Jensen and Meckling (1976) and Chow and Wong-Boren (1987), larger firms tend to have a higher proportion of outside capital and higher agency costs. On the other hand, Singhvi and Desai (1971) argue that larger firms tend to provide better quality disclosures because of the lower cost of accumulating detailed information and they are more likely to realise the possible benefits of better disclosure. Thus, by

voluntarily disclose additional information may mitigate agency conflicts. Using the same perspective, Watson *et al.* (2002); Barako *et al.* (2006) and Brammer and Pavelin (2006) also note that the larger the firm, the more likely they will make voluntary disclosures. Further evidence on firm size is provided by McNally *et al.* (1982); Singhvi and Desai (1971); Buzby (1975); Oliveira *et al.* (2006); Chau and Gray (2002) and Patelli and Prencipe (2007). Based on the studies done worldwide, it can be argued that firm size influence the voluntary financial reporting practices of companies. Thus, the impact of firm size is expected to be positively associated with the extent of financial ratio disclosures. The hypothesis designed to test this assertion is formally stated as:

H_4: *The extent of financial ratio disclosures is positively associated with firm size.*

In summary, four variables: corporate governance structure, capital management initiatives, ownership and firm size are hypothesised to be associated with the extent of financial ratio disclosure.

3.0   RESEARCH DESIGN

A sample of 300 Australian firms listed on Australian Stock Exchange (ASX) is selected with 75 companies stratified randomly selected from each of four main industry categories-Resources, Manufacturing, Services and Financials. The 2007 annual reports of sample firms are then analysed.

The dependent variable of this study is the Extent of Financial Ratio Disclosure (EFRD). EFRD is the proxy to measure the extensiveness of financial ratio disclosures in companies' annual reports. A disclosure index comprising 43-item of ratios most commonly discussed by seminal authors is developed. The ratios are then categorised into five major categories – *Share Market Measure* (SMM), *Profitability* (PROF), *Capital*

Structure (CS), *Liquidity* (LIQ) and *Cash Flow* (CF) ratios. Earning per share (EPS) is excluded since it is the sole financial ratio required to be disclosed by the AASB (AASB 2006). Each voluntarily item disclosed is scored as one (1) if present in the annual report for each company; otherwise zero (0). The EFRD scores is computed by summing up all items disclosed divided by maximum possible number of financial ratios that could be disclosed (43).

The strength of corporate governance structure is measured as a composite measure of thirteen key items recommended by the ASX Corporate Governance Council (2003). These thirteen items are aggregated and utilised by Taylor *et al.* (2008). These items incorporate the concept of independence of the chairman; duality; independence of directors on the board; audit committee characteristics; code of conduct; nomination policy; remuneration policy; risk management policy and written continuous disclosure policy (refer Appendix). A score of one (1) is allocated against each of the corporate governance items present; otherwise zero (0). A composite score comprising thirteen corporate governance items is then computed for each company.

Capital management initiatives comprise capital raising activities, takeover or merger activities, overseas listing and international operations. Thus, CM is a composite measure of these four items which relates to capital management activity of the company (refer Appendix). A score of one (1) is allocated against each of the capital management items present; otherwise zero (0). The composite score of CM is then computed for each company.

The ownership concentration (OC) score is measured as a total shareholding of Top 20 shareholders. OC is treated as a continuous variable by dividing number of shares owned by top twenty shareholders by the total number of shares issues. For this study, firm size is measured as natural log of total assets. As suggested by Hossain *et al.* (1994), natural logarithmic transformation reduces the skewness setoff the raw data.

Five control variables are employed: There are: Leverage (LEV) - Ratio of total debt to total assets; Non-audit fess (NAF) - Ratio of non-audit related fees to total audit fees; Industry (IND) - Dummy variable for four major categories of industry (Resources, Manufacturing, Services and Financials); Audit type (AUDTYPE) - Dichotomous variable for type of auditor (1 for Big4, 0 for Non-Big4) and Profit/ Loss firm (PLF) - (1 for profit firm and 0 for loss firm).

4.0   DESCRIPTIVE AND STATISTICAL ANALYSIS

4.1   Descriptive Statistics

As shown in Table 1, on average sample companies only disclose 5.3% of the 43 ratios investigated in this study. The maximum level of disclosure is 30.2%. Analysis on each major category reveals that the *Share Market Measure* scored the highest (9%), followed by *Capital Stru*cture and *Profitability* ratio with a mean of 7.9% and 7.4% respectively. However, the sample firms comm.

unicated less than 1% of *Liquidity* and *Cash Flow* ratios in their annual reports.

Table 1: Descriptive Statistics for EFRD

	Extent of financial ratio disclosure	Share Market Measure	Profitability	Capital Structure	Liquidity	Cash Flow
Mean (%)	5.3	9.0	7.4	7.9	0.9	0.2
Median (%)	2.3	9.1	0	0	0	0
SD (%)	5.6	9.6	10.8	12.5	4.6	1.7
Min. (%)	0	0	0	0	0	0
Max. (%)	30.2	36.4	55.6	57.1	42.9	22.2

Legend: SD is standard deviation; n=300.

Table 2 displays the percentage disclosure scores for each of the 43 ratios for the 300 Australian firms. The most reported ratios are 'Total Shareholder Return' (27%), 'Gearing' (26.7), 'Net Tangible Assets per Share' (25.7%), 'Return on Equities' (21.7%) and 'Dividend Payout' (20.7%). Further, 'Dividend Yield', 'Times Interest Earned' and 'EBITDA/Revenue' ratios were being disclosed between 15% to 18% of the sample firms. However, 11 out of 43 individual ratios are not communicated within the annual report by any companies.

Table 2: Extent of Financial Ratio Disclosures by Specific Ratio

Five Key Sub-categories (% disclosure score)	Specific ratio	% disclosure score
1. Share Market Measure (9.0%)	1.Total shareholder return (TSR)	27.0
	2.Net tangible assets per share (NTAB)	25.7
	3. Dividend payout	20.7
	4.Dividend yield	18.3
	5.Net assets per share (NAB)	3.7
	6.Market capitalisation	1.7
	7.Price-to-earnings (P/E)	1.0
	8.Earnings yield	1.0
	9.Price-to-book	0
	10.Book value per ordinary share	0
	11.Market-to-book ratio	0
2. Capital Structure (7.9%)	1.Gearing	26.7
	2.Times interest earned	15.3
	3.Total debt/equity	7.0
	4.Capitalisation ratio	2.7
	5.Equity ratio	2.0
	6.Liabilities/ Assets	1.3
	7.Long Term debt/equity	0
3. Profitability (7.4%)	1.Return on equities (ROE)	21.7
	2.EBITDA/ Revenue	15.0

	3.Gross profit margin	7.3
	4.Total expenses/revenue	7.0
	5.Return on assets (ROA)	5.3
	6.Net profit margin	5.0
	7.Pre-tax profit margin	4.0
	8.Return on sales	0.7
	9.Sales turnover	0.3
4. Liquidity (0.9%)	1.Current ratio	3.0
	2.Inventory turnover	1.0
	3.Quick ratio	0.7
	4.Days to sell inventory	0.7
	5.Accounts receivable turnover	0.3
	6.Collection period	0.3
	7.Payment period	0
5. Cash Flow (0.2%)	1.Operation index	1.0
	2.Cash flow adequacy	0.3
	3.Cash flow ratio	0.3
	4.Repayment long term borrowings	0
	5.Dividend payment	0
	6.Reinvestment	0
	7.Debt coverage	0
	8.Cash flow to revenue	0
	9.Cash flow return on assets	0
Overall EFRD		**5.3**

Legend: All 43 ratio percentages are calculated as the mean average of 300 sample companies. The five key sub-categories mean averages are also shown.

4.2   Univariate Analysis

Univariate tests are conducted to examine whether there is significant difference between the EFRD and the categorical variables. First, the t-test was conducted for profit-versus-loss firms. On average, the mean EFRD for profit firms is far higher than the loss firms at 7% versus 1.2% respectively, and the difference is statistically significant (p-value =0.000). This result implies that profit firms disclose more financial ratio information in the annual reports than loss firms (refer Table 3).

Table 3: T-test EFRD with Profit/ Loss Firms and Audit Firm Type

	N	Mean (%)	EFRD Mean Difference (%)	t-stats	Sig.
Profit/Loss firms					
Loss	88	1.2	-5.8	-12.657	0.000*
Profit	212	7.0			
Audit firm type					
Non-big4	108	2.4	-4.5	-8.473	0.000*
Big4	192	6.9			

Legend: *,**,*** Highly significant at the 0.01 level, Significant at the 0.05 level, Moderately significant at the 0.1 level respectively (2-tailed); EFRD is Extent of financial ratio disclosure; Big4 audit firms are KPMG Peat Marwick, Ernst & Young, Deloitte & Touche and PriceWaterhouse Coopers; Non-big4 audit firms are all others

A t-test is also performed for audit firm type (Big4-versus-NonBig4). Again, the mean EFRD is statistically different at 1% level if company is audited by the Big4 as compared to the Non-Big4 audit firms. Companies audited by Big4 audit firms reported significantly higher financial ratios in the annual reports with levels at about 7%.

Univariate analysis is carried out for each of five key EFRD sub-categories. Table 4 shows that the results for the profit/loss firms and audit firm type analysis are consistent across *Share Market Measure*, *Profitability* and *Capital Structure* sub-categories. Profit firms and firms audited by Big4 disclose significantly higher ratios within each of these three categories. However, the results differ for the *Liquidity* and *Cash Flow* ratio sub-categories.

Table 4: T-tests (Five Key Sub EFRD with Profit/ Loss Firms and Audit Firm Type)

Sub EFRD		N	Mean (%)	Mean Difference (%)	t-stat	Sig.
			Profit/Loss Firms			
Share Market	Loss	88	3.0	-8.5	-9.744	0.000*
Measure	Profit	212	11.5			
Profitability	Loss	88	1.0	-9.0	-9.911	0.000*

	Profit	212	10.0			
Capital Structure	Loss	88	1.1	-9.6	-8.755	0.000*
	Profit	212	10.7			
Liquidity	Loss	88	0.2	-0.9	-2.446	0.015**
	Profit	212	1.1			
Cash Flow	Loss	88	0.0	-0.3	-1.901	0.059***
	Profit	212	0.3			
Audit Firm Type						
Share Market Measure	Non- Big4	108	5.1	-6.1	-6.247	0.000*
	Big4	192	11.2			
Profitability	Non- Big4	108	2.7	-7.3	-7.223	0.000*
	Big4	192	10.0			
Capital Structure	Non- Big4	108	2.6	-8.3	-6.761	0.000*
	Big4	192	10.9			
Liquidity	Non- Big4	108	0.9	0.1	0.194	0.846
	Big4	192	0.8			
Cash Flow	Non- Big4	108	0.1	-0.1	-0.632	0.528
	Big4	192	0.2			

Legend: *,**,*** Highly significant at the 0.01 level, Significant at the 0.05 level, Moderately significant at the 0.1 level respectively (2-tailed); Sub EFRD is 5 key sub-categories of EFRD namely Share Market Measure ratio, Profitability ratio, Capital Structure ratio, Liquidity ratio and Cash Flow ratio; Big4 audit firms are KPMG Peat Marwick, Ernst & Young, Deloitte & Touche and PriceWaterhouse Coopers; Non-big4 audit firms are all others.

In addition, an ANOVA test was conducted to examine whether there is significant difference in financial ratio disclosures across the four major industry categories when dealing with financial ratio disclosures. Table 5 reports that Resources firms provided less extensive financial ratio information with a mean of 3.1%. The other three industries (Manufacturing, Services and Financials) communicate twice as many ratios[345]. This result confirms the findings of Mitchell (2006) in his study of Australian financial ratios using early 1990s data.

---

[345] Tukey HSD test confirms that Resources companies disclose significantly lower EFRD than Services and Financials firms.

Table 5: ANOVA EFRD with Four Industry Categories

	EFRD			
	N	**Mean (%)**	**F**	**Sig.**
Industry4			6.706	0.000*
Resources	75	3.1		
Manufacturing	75	5.1		
Services	75	6.1		
Financials	75	6.9		

Legend: *,**,*** Highly significant at the 0.01 level, Significant at the 0.05 level, Moderately significant at the 0.1 level respectively (2-tailed); EFRD is Extent of financial ratio disclosure; Industry4 are the four major categories of industry (Tower *et al.*, 1999) namely Resources, Manufacturing, Services and Financials.

Table 6 displays the correlation coefficients for Pearson (top right) and Spearman (lower left). As expected, there is a positive relationship between EFRD and each of three key sub-categories; *Share Market Measure*, *Profitability* and *Capital Structure* both for Pearson (r=0.783, r=0.791, r=0.771, p<0.01 respectively) and Spearman (r_s=0.798, r_s=0.795, r_s=0.745, p<0.01 respectively) correlations. This relationship is significantly higher as compared to the *Liquidity* and *Cash Flow* sub-categories.

Correlation insights can also be noted between the dependent and predictor variables. Both firm size and corporate governance (independent variables) are positively significantly correlated with EFRD. In addition, most of the control variables (leverage, profit/ loss firms, industry and audit type) also positively related. These results support H_1 and H_4, which link EFRD with corporate governance and firm size variables.

There is a positive relationship between firm size and leverage, non-audit fees, profit/ loss firms, and audit type for both Pearson and Spearman correlations. The larger the firm, the higher is the leverage and the non-audit fees ratio. Larger firms are also more likely to be profitable firms and audited by Big4 audit firms. In contrast, firm size is negatively correlated to auditor's name in both the Pearson and Spearman correlations.

Audit type is significantly correlated (p<0.001) with auditor's name in the opposite direction for both Pearson (r=-0.803) and Spearman (r_s=-0.860) correlations. As the correlation coefficient is above the critical limits of 0.80 (Hair *et al.* 2006) between these variables, multicolinearity may exist. Therefore, these two categorical predictor variables will not be included in the regression model simultaneously.

Table 6: Correlations between dependent, independent and control variables.

4.3   Multivariate Analysis

Table 7 presents the multiple regressions findings for the dependent variable (EFRD) and the possible predictor variables. The result reveals that the model is statistically significant (at 1% level) with F-value of 28.268. The adjusted R squared is 0.451 indicating that 45.1% of the variation in the EFRD can be explained by the model[346].

Corporate governance (CG) measured as composite measure of thirteen corporate governance items is not significantly related to the EFRD. The result indicates that this variable does not have any impact on the extensiveness of financial ratio disclosures in the annual reports. Thus, H_1 is not supported. Similarly, the level of financial ratio disclosures is not influenced by companies' capital management initiatives (capital raising, takeovers and mergers, overseas listing and international operations); H_2 is not supported.

In relation to Ownership concentration (OC), this variable is significant (at 5% level) with p-value of 0.040 negatively related to the EFRD. It appears that the higher the percentage of Top 20 shareholding, the lower the level of financial ratio disclosures. This results is consistent with expected direction, therefore H_3 is supported. Further, firm size (FSIZE) is found to be significantly (at 1% level) and positively related to EFRD (p-value of 0.000). Larger Australian firms disclosed more financial ratios in their annual reports. H_4 is then supported.

Table 7: Multiple Regression Results (EFRD)

---

[346] This study tests the interaction effects between categorical variables (PLF, IND and AUDTYPE) using the General Linear Model (GLM) menu in SPSS. The results show that there are no interaction effects between the three variables.

EFRD

Legend: *,**,*** Highly significant at the 0.01 level, Significant at the 0.05 level, Moderately significant at the 0.1 level respectively; 1-tailed and 2-tailed test is used for directional and non-directional association respectively; EFRD is Extent of financial ratio disclosures; CG is Corporate governance; CM is Capital management; OC is Ownership concentration; FSIZE is Firm size; LEV is Leverage; NAF is Non-audit fees; PLF is Profit/ loss firm; IND is Industry; AUDTYPE is type of auditor (Big4-NonBig4).

The control variables offer further insights into financial ratio disclosure patterns. The percentage of non-audit fees to the total fees (NAF) is significantly and negatively related to EFRD (at 1% level). This ratio is considered to be a measure of auditor independence. Companies audited by a more independent auditor disclosed more extensive financial ratio information. Another interesting result is found between profit/ loss firms and EFRD. The result suggests that the profit firms disclosed more financial ratios than the loss firms (with p-value of 0.000). This result is consistent with the univariate test. Finally, audit type (Big4-NonBig4 auditors) is significantly and positively related to EFRD. Again, this finding supports the earlier univariate test, where companies audited by Big4 audit firms more likely to communicate higher levels of financial ratios.

Legend: *,**,*** Highly significant at the 0.01 level, Significant at the 0.05 level, Moderately significant at the 0.1 level respectively; 1-tailed and 2-tailed test is used for directional and non-directional association respectively; CG is Corporate Governance; CM is Capital Management; OC is Ownership Concentration; FSIZE is Firm Size; LEV is Leverage; NAF is Non-audit Fees; PLF is Profit/ Loss firm; AUDTYPE is type of auditor (Big4-NonBig4).

Table 8 displays a summary of regression result for each of five key sub-categories of EFRD. For the *Share Market Measure* category, corporate governance and firm size is significantly related to EFRD. For control variables, non-audit fees, Profit/Loss firms and industry category are significantly associated with extent of ratios disclosed within the *Share Market Measure* sub-category. In addition, firm size is also significantly related to *Profitability* and *Capital Structure* sub-categories, while ownership concentration and leverage is only associated with *Profitability* ratio. Both Profit/Loss firms and Big4-NonBig4 audit firms are related to both *Profitability* and *Capital Structure*. Due to very small percentage of ratios disclosed within the *Liquidity* and *Cash Flow* sub-categories, the results for these models are very low.

5.0   Implications and Conclusion

According to agency theory tenets, it is believed that corporate governance, capital management initiatives, ownership concentration and firm size will influence voluntary disclosure of financial ratios. The descriptive statistics reveal that the extent of financial ratio is low in absolute terms. Only 5.3% of the 43 ratios are disclosed by Australian firms. Closer analysis shows that *Share Market Measure* sub-category are most disclosed by the firms, followed by *Profitability* and *Capital Structure* sub-categories. These finding is consistent with Watson *et al.* (2002) and suggested the possible reason is that these ratios are directly related and relevance to the shareholders. This finding is encouraging for stakeholders in that the *Share Market Measure* ratios are not readily calculated because of the non-availability of share price data in the annual reports. A lower disclosure score is evidenced for *Liquidity* and *Cash Flow* ratios. As suggested by Subramanyam and Wild (2009) and Dechow (1994), cash flow and liquidity information is less likely to directly impact share prices compared to net income information. Thus, companies may prefer to provide more information that has greater impact to their firms' value.

The statistical tests demonstrate that profit firms are more likely to provide more financial ratio information in the annual reports. This is consistent with Mitchell's (2006) argument that firms provide ratios to signal favourable financial performance. Firms audited by Big4 audit firms also communicate more financial ratios. The result implies that Big4 audit firms encourage firms to provide financial ratios in the annual report. This is consistent with the notion that Big4 auditors have better audit quality (Becker *et al.* 1998; Francis *et al.* 2005; Francis *et al.* 1999; Krishnan 2003), and possibly influence the reporting practices of the firms.

Resource firms provide the least financial ratios. This is consistent with Mitchell (2006) and Watson et al. (2002) who respectively found that mining firms and utility and media firms scored

the lowest levels of ratio disclosure. Watson et al. (2002) suggests that the firms believed that they do not need to disclose this information. This is possibly true for Resources companies because they may be concentrating on other non-financial issues such as reserve quantification, exploration and production, as well as environmental impacts. In contrast, financial firms contain more financial ratios in their annual reports. This is probably driven by the fact that they are in a high profile regulated industry, and therefore more likely provide more information to the users.

The results demonstrate that corporate governance and capital management initiatives are not associated with the extent of financial ratio disclosure. Corporate governance mechanisms are not reducing the information gap between the firms and stakeholders. Similarly, higher levels of capital management activities such as capital raising activities and international operations do not impact a companies' decision to disclose or not to disclose financial ratios.

Ownership concentration does impact on the financial ratio disclosure policy. The finding suggests that the more concentrated the shareholder structure, higher the level shareholdings, the lower the level of financial ratio provided in the annual reports. This result confirms the agency theory argument where concentrated ownership reduces the agency problem, and likely reduces the level of disclosure.

Finally, the bigger the firm, the higher the level of financial ratio reported. This finding is consistent with Mitchell (2006), Watson *et al.* (2002) and McKinnon and Dalimunthe (1993), who suggested that firm size could be associated with competitive advantage, information processing costs, proprietary costs, as well as political visibility and costs.

Several control variables (non-independence of auditor, profit-making firm and Big4 auditor) also provide predictive property towards the firms' decision in reporting the financial ratios in their annual reports.

In summary, the extent of financial ratio disclosure by Australian firms is low. Consistent with agency theory tenets, the decision to communication appears to be taken by larger firms with greater ownership dispersion. Harder to calculate ratios (such as share price data) is somewhat more disclosed then all other ratios. Overall, the findings in this research show a consistent pattern of opaque communication.

APPENDIX

Description of the Corporate Governance Items

CG1	Is chairman of the board an independent director? 1=Yes; 0=No
CG2	Are the roles of the chairman and chief executive officer performed by different persons? 1=Yes; 0=No
CG3	If percentage of independent directors on the BOD<median=0; if percentage of independent director on the BOD >=median=1
CG4	Does the nomination committee have a policy for the appointment of directors? 1=Yes; 0=No
CG5	Has the board adopted a formal code of conduct that deals with personal behaviour of directors and key executives relating to insider trading, confidentiality, conflicts of interest and making use of corporate opportunities (property, information, position)? 1=Yes; 0=No
CG6	Does the company have a formal plan, policy or procedures in respect of equity (shares and options) based remuneration paid to directors and key executives? 1=Yes; 0=No
CG7	Does the company have a remuneration policy that outlines the link between remuneration paid to directors and key executives and corporate performance? 1=Yes; 0=No
CG8	Does the audit committee have at least one member that has financial expertise (i.e. is a qualified accountant or other financial professional with experience of financial and accounting matters)? 1=Yes; 0=No
CG9	Has the board adopted a formal integrated risk management policy that deals with risk oversight and management and internal control? 1=Yes; 0=No
CG10	Has the CEO/CFO stated that the company's risk management, internal compliance and control systems are operating effectively and efficiently? 1=Yes; 0=No
CG11	Does the company have an audit committee (AC) charter? 1=Yes; 0=No
CG12	Does the company have a formal written continuous disclosure policy? 1=Yes; 0=No
CG13	If percentage of independent directors on AC<median=0; if percentage of independent director on AC >=median=1

Description of Capital Management Items

CM1	Has the company engaged in capital raisings such as a new share issue in the current year?
CM2	Has the company engaged in takeover or merger activity in the current year?
CM3	Is the company listed on an overseas stock exchange?
CM4	Does the company belong to a corporate group that has operations overseas?

EVALUATION OF INDONESIAN LOCAL GOVERNMENT FINANCIAL DISCLOSURE LEVEL YEAR 2007

Nanda Ayu Wijayanti, University of Indonesia
Yan Rahadian, University of Indonesia
Sylvia Veronica Siregar, University of Indonesia

ABSTRACT

In 2005 the Government issued Peraturan Pemerintah (PP or Government Decree) Number 24 Year 2005 about Standar Akuntansi Pemerintahan (SAP or Governmental Accounting Standard). This decree assigned the central and local government to report their financial transactions based on SAP. Although this decree will not be effective until 2011, but the preparation of central and local government in implementing the SAP has started since the release of PP No 24 in 2005.

This research acknowledged that up until now there have not been any empirical investigations about the development of central and local government's Financial Statement (FS) that refer to the SAP. Several previous researches focused on the theoretical assessment towards PP SAP, but not on the investigation of PP SAP implementation. The audit conducted by The Audit Board of Republic Indonesia (BPK RI) was also limited to the compliance of one FS or more with the guidelines in PP SAP, but not evaluating the government's FS in its entirety.

This research conducted an empirical investigation on the Financial Statement of Pemerintah Daerah (PEMDA or Local Government) in Indonesia in 2007. Initially, this research formulated and calculated the index of FS disclosure and FS components of each PEMDA with reference to SAP. The result showed that the disclosure level of Balance Sheet, Laporan Arus Kas (LAK or Cash Flow Statement) and Laporan Realisasi Anggaran (LRA or Budget Realization Report) tend to be high and consistent, whereas the disclosure level of Catatan atas Laporan Keuangan (CaLK or Notes to Financial Statement) tend to be low and consistent among all PEMDA.

Secondly, this research conducted an explorative investigation on factors influencing the disparity of FS disclosure level among all PEMDA and the quality variance of FS components. The consistency of PEMDA's FS disclosure level score showed that the influencing factors were common, faced by all PEMDA and not related with the unique characteristics of each PEMDA. The result of an in-depth discussion with regulators, standard formulators, practitioners and PEMDA staff showed that those factors were related to: (1) technical guidelines of CaLK formulation; (2) the effects of other regulations; (3) CaLK socialization and formulation training; (4) priorities and concerns toward FS; and (5) human resources.

Central government especially the Department of Finance and the Internal Affairs Department can use the result of this research to evaluate the readiness of PEMDA's FS disclosure in 2011. KSAP can utilize this research's checklist as an initial material in creating technical guidelines for CaLK formulation. PEMDA can use the result of this research for self-evaluation.

This research recommends strategic steps i.e.: (1) FS disclosure regulations integration; (2) career development for government accountants; and (3) empirical and academic assessments on legal outcomes/standards/regulations/ bylaws. Furthermore the tactical steps proposed by this research are: (1) CaLK technical guidelines formulations; (2) CaLK socialization and formulation training; and (3) prompt decision-making to solve current issues, such as fixed asset.

1. INTRODUCTION

Financial information disclosure and governmental financial disclosure practices have a considerable attention from all parties ever since 1998. This was caused by the policy of the Indonesian government to carry out an extensive reformation of all aspects especially the local financial aspect. This substantial reformation was marked by the change of government from the New Order era to the Reformed Order era. In local financial management, the reformed era was marked by the execution of decentralized government system specifically the local autonomy.

The research conducted by Halim (2002) revealed that local government financial reformation was marked by the implementation of UU no. 22 Year 1999 about Local Government and UU no. 25 Year 1999 about Financial Conformity of Central and Local Governments which replaced UU no. 5 Year 1974 about Local Governmental Items and UU no. 32 Year 1956 about Financial Conformity of the State with Self-Regulating Municipalities. Another package from the local (and central) government reformation was the release of PP no. 24 Year 2005 about *Governmental Accounting Standards* on 13 June 2005 that act as guidelines for the government, central and local, to perform accounting functions in the administration. Although PP SAP was released in mid 2005, the 2005 FS must be prepared according to PP SAP.

In his opening speech at the Training of Trainers (TOT) for SAP batch II, Mr. Timbul Pudjianto, General Director of *Bina Administrasi Keuangan Daerah* (BAKD or Local Financial Administration Guide) of the Internal Affairs Department, who was also the Consultative Deputy of KSAP, stated that of 476 PEMDA, whether it was province, municipality or town, only 212 PEMDA that had tried to present the 2006 FS according to SAP and *Peraturan Menteri Dalam Negeri* (Permendagri or Internal Affairs Minister Decree) no. 13 Year 2006 (http://www.ksap.org/detilberita37.php).

The aforementioned number was certainly expected to increase every year, so that in 2011 all PEMDA (and central government) can prepare and present an annual financial statement. Aside from the number, the FS quality is also expected to improve, in its

compliance with SAP as well as the reliability and relevance of the information presented and disclosed in the FS.

To ascertain that goal, an independent routine and periodical evaluation of the government FS preparation is needed. This evaluation is conducted comprehensively and is aimed to assess the completeness and quality of the FS as well as the subsequent strategic and tactical steps required to accomplish the 2011 target.

Apart from the review by BPK, until now there have not been any specific researches that evaluate the government FS preparation. Yuhertiana (2006), Bastian (2006) and Himawan (2006), for instance, focused their researches on the theoretical qualitative assessment of SAP technical bulletin which was issued by *Komite Standar Akuntansi Pemerintahan* (KSAP or the Committee for Governmental Accounting Standards), but did not conduct an empirical investigation on the FS preparation and presentation.

Meanwhile, the review by BPK focused more on PEMDA compliance level in their financial statement presentations with respect to various regulations, including SAP, but not evaluating comprehensively the readiness of PEMDA to present an extensive FS with quality. For example, several PEMDA had only prepared and presented one FS, but BPK gave an unqualified opinion as long as that FS complied with SAP. In other words, the assessment performed by BPK had not included completeness evaluation and the relevance of the information presented in the government FS.

Based on the abovementioned considerations, this research conducted the first empirical investigation on PEMDA's FS in Indonesia for 2007. At the first stage of this research a mapping of FS disclosure level of all PEMDA in Indonesia is performed, with regards to guidelines in PP no. 24 Year 2005. Afterwards, the factors that influenced the disparity of PEMDA's FS disclosure were investigated. Finally, a strategic and tactical proposal was formulated to increase the readiness and competence of PEMDA in presenting a reliable and relevant FS.

2. RESEARCH METHODOLOGY

The research procedure to calculate PEMDA's FS disclosure level is as such:

CHART 1 RESEARCH PROCEDURE AND DISCLOSURE QUALITY OUTPUT PEMDA'S

FS

The research procedure to explore the factors that influenced PEMDA's FS disclosure level was an in-depth discussion with the parties related to PEMDA's FS presentation. Conceptual framework is as such:

CHART 2 CONCEPTUAL FRAMEWORK OF PEMDA'S FS DISCLOSURE LEVEL

INFLUENCING FACTORS

After mapping PEMDA's FS disclosure level and identifying the influencing factors, eventually this research proposed strategic and tactical steps to improve PEMDA's readiness in presenting a relevant and reliable FS. This proposal is expected to help the government/regulators in formulating forthcoming policies to ensure the effectiveness of PP SAP implementation and other government regulations in 2011.

This research does not construct any hypotheses or research models to answer the research problems. The first research problem about PEMDA's LK disclosure level will be resolved by calculating the disclosure index. An analysis will be conducted based on the descriptive statistic result of the disclosure level index score.

For the second research problem about the influencing factors of PEMDA's FS, this research used an explorative approach, which was to freely identify those factors obtained from literature studies and interviews with parties related to the preparation of PEMDA's FS.

As for the third research problem about the strategic and tactical proposals to improve the quality of PEMDA's FS disclosure, they will be achieved by mapping the disclosure index and the influencing factors. Therefore in general it can be concluded that this research does not propose any hypotheses that will be tested or any research models to test those hypotheses.

The research variables used were local government's FS disclosure level index and the influencing factors. Local government's FS disclosure index is the FS disclosure index based on PP SAP. This research developed a checklist based on PP SAP. PEMDA's FS were evaluated based on the checklist and the score from the completed checklist was calculated. Each checklist component would get a score of 1 (one) if the information was disclosed or **Yes**, 0 (zero) if the information was not disclosed or **No** or **N.A.** (not applicable) if it was assumed that PEMDA did not have the related information. Disclosure level score is obtained from comparing the number of **Yes** with the number of **Yes** and **No**. The checklist consisted of the checklists for Balance Sheet, LAK, LRA and CaLK. Meanwhile the operating

variables that represent the influencing factors were obtained from literature studies and thorough interviews.

Research population was 530 PEMDA of provinces, cities and municipalities. Of this number, based on the data from BAKD and BPK's website (www.bpk.go.id), a sample research of such was obtained:

- 266 PEMDA with 2007 Balance Sheet (50,4% of total population);

- 269 PEMDA with 2007 LAK (50,8% of total population);

- 267 PEMDA with 2007 LRA (50,6% of total population); and

- 267 PEMDA with 2007 CaLK (50, 6% of total population).

This data was obtained directly from the Indonesian State Department's BAKD and BPK's website. The sample above had exceeded the number of all PEMDA with 2006 FS, which was 212 PEMDA. Meanwhile the data about influencing factors was acquired from interviews with parties related with the preparation of PEMDA's FS.

In overall this research used two data analysis techniques. The first was descriptive statistics to analyze PEMDA's LK disclosure level. The second was explorative to analyze the influencing factors by literature studies and interviews.

3. RESULT AND REVIEW

The initial result of this research was PEMDA's FS disclosure level, at provinces, towns and municipalities. This disclosure level was obtained from the checklist score (see research method sub-part variables operation). Disclosure level review below is presented based on FS components and on overall FS.

3.1 BALANCE SHEET DISCLOSURE LEVEL

Disclosure level average was fairly high at 84%. This showed that the information presented in the balance sheet had included all information required by PP SAP. The

deviation standard was very low at 5%, which showed that the balance sheet disclosure level among PEMDA was relatively consistent.

The highest score of 96% were the Pekanbaru, Ogan Komering Ulu, East Ogan Komering Ulu, Pagar Alam, Prabumulih, Batang, Landak, South Halmahera, Jayapura, Bau-bau, Jayapura and Nunukan; whereas the lowest at 60% was DKI Jakarta. The information disclosed by most local governments but not found in DKI Jakarta were: (1) inventory details; (2) receivables details; and (3) equity funds classification.

As for the ranks based on the average score per province, PEMDA from eastern Indonesia dominated the top 5: Papua, North Maluku, West Papua, West Sulawesi and East Kalimantan (average above 90%). However four of the five provinces had very low ratio of balance sheet issued and reviewed by BPK to total number of PEMDA in the province. Papua, for instance, although it had the highest score of 96%, there were only 2 provinces in Papua that had issued the 2007 balance sheets which had been audited by BPK, compared to the total 30 PEMDA in Papua province. Based on the ratio of number of PEMDA with issued FS to number of PEMDA in a province, then East Java, DI Yogyakarta, West Java, Bali and Gorontalo were placed on the top 5.

Meanwhile the analysis of the information component in the Balance Sheet showed 5 information with the lowest disclosure:

1. Name of reporting entity or other identification visible on every page;

2. Scope of FS entity, whether it was a sole entity or a consolidation of several reporting entities;

3. Scope of FS entity, whether it was a sole entity or a consolidation of several reporting entities, on every page;

4. Date of reporting or the period included in the FS in accordance with other components of the FS visible on every page; and

5. Reporting currency and quantifier visible on every page.

Of the abovementioned information, four did not have significance for decision making (although this had better be included in PEMDA financial reporting). The low disclosure level of point 2 is something substantial because it affects the readers of the FS greatly. The absence of this information may result in an error in comparing and analyzing PEMDA's performance.

3.2 LAK DISCLOSURE LEVEL

Research sample for LAK component was 269 PEMDA or 50.8% of total population. Like Balance Sheet, the average LAK disclosure level was high at 83%. This showed that the information presented in LAK had included most of the information required by PP SAP. The deviation standard was very low at 4% which showed that the LAK disclosure levels tend to be consistent.

The highest score of 96% was Landak, Rokan Hulu, Natuna, Malinau, Belitung and Tidore. Landak consistently showed high disclosure level, both Balance Sheet and LAK. The lowest score of 74% was Banten. Some information disclosed by most PEMDA but not by Banten was: (1) reporting currency and quantifier used; and (2) presented as comparative statement.

The top 5 provinces based on average score were West Sulawesi, North Maluku, West Papua, DKI and Riau (average score above 89%). Top 3 were North Sulawesi, North Maluku and West Papua, consistent with Balance Sheet disclosure. East Kalimantan and Papua were still in Top 10 (at 6 and 8). Riau was in fact consistent because it was number 6 in Balance Sheet disclosure. The contrary was DKI's LAK disclosure level at number 4, when its Balance Sheet disclosure level was at the lowest.

As with Balance Sheet, the top 4 provinces' ratio of number of PEMDA issuing LAK that had been audited by BPK to total number of PEMDA in the province was very low. West Sulawesi, although with the highest score at 95%, there was only 1 PEMDA issuing 2007 LAK that had been audited by BPK, compared to the total of 6 PEMDA in that province.

Consistent with the Balance Sheet result, the ratio of number of PEMDA with issued FS to number of PEMDA in a province showed DIY, Bali, East Java, West Java and Gorontalo at the top 5 with a high ratio at above 80%.

The analysis result of LAK's information components showed 4 points with the lowest disclosure:

1. Name of reporting entity or other identification visible on every page;

2. Scope of FS entity, whether it was a sole entity or a consolidation of several reporting entities;

3. Scope of FS entity, whether it was a sole entity or a consolidation of several reporting entities, on every page; and

4. Reporting currency and quantifier visible on every page.

This result is consistent with the Balance Sheet result and of those 4 points the low disclosure level of point 2 is substantial because it affects the readers of the FS greatly. The absence of this information may result in an error in comparing and analyzing PEMDA's performance.

3.3 LRA DISCLOSURE LEVEL

Sample number for LRA component was 267 PEMDA or 50.6% of PEMDA population. Unlike Balance Sheet and LAK, LAR's average is quite high at 78%. This showed that the information presented in PEMDA's LRA had included most of the information required by PP SAP. The deviation standard was very low at 5%, and showed that the LRA disclosure levels tend to be consistent.

The highest score of 90% was Pekanbaru, Natuna, DKI, Ketapang, Bulungan, Kendari, Bau-bau, South Halmahera, Jayapura, Manokwari and Bengkulu. The lowest at 60% was North Hulu Sungai. Information disclosed by most PEMDA but not by North Hulu Sungai was: (1) transfer; (2) surplus/deficit; and (3) net financing.

The top 5 provinces based on average score were DKI, West Sulawesi, NAD, North Maluku and Papua (average score above 84%). Other than NAD and DKI, 3 other provinces were consistent enough with high scores in Balance Sheet and LAK. DKI was consistent at LAK and LRA, while NAD, although not in the top 5 in Balance Sheet and LAK, but its score was consistently high, at above 80%.

Further analysis revealed that the top 5 provinces' ratio of number of PEMDA with LRA that had been reviewed by BPK to the total number of PEMDA in that province is very low. DKI, although with the highest score at 90%, had only 1 PEMDA with 2007 LRA that had been audited by BPK, compared with the total 7 PEMDA in that province. Consistent with the result in Balance Sheet and LAK, the ratio of number of PEMDA with issued FS to number of PEMDA in a province showed DIY, Bali, East Java, West Java and Gorontalo at the top 5 with a high ratio at above 85%.

The analysis result of LRA's information components showed 6 points with the lowest disclosure:

1. Name of reporting entity or other identification visible on every page;

2. Scope of FS entity, whether it was a sole entity or a consolidation of several reporting entities;

3. Scope of FS entity, whether it was a sole entity or a consolidation of several reporting entities, on every page;

4. Reporting currency and quantifier;

5. Reporting currency and quantifier visible on every page; and

6. Presentation of disbursement qualifications based on organizations.

This result is consistent with the Balance Sheet and LAK results. Point 6 needs particular notice because this information is needed by LRA users to evaluate the efficiency of organization unit, by comparing the realization and the budget.

3.4 CaLK DISCLOSURE LEVEL

Sample number for CaLK component was 267 PEMDA or 50.6% of PEMDA population. Unlike Balance Sheet, LAK and LAR, CaLK disclosure level was low at 47%. This showed that the information presented in CaLK had not included most of the information required by PP SAP. Standard deviation was low at 9% and showed that the CaLK disclosure levels tend to be consistent.

The highest score of 68% was West Sumatera, while the lowest at 11% was North Kolaka. The top 5 province based on average score were NTB, Bali, DIY, NTT and East Kalimantan (average score above 54%). This composition differed greatly from the result of Balance Sheet, LAK and LRA. Although those 5 provinces were not at the top 5 of Balance Sheet, LAK and LRA, but their disclosure levels were above 80%.

Further analysis showed the top 3 provinces, NTB, Bali and DIY had the highest ratio of the number of PEMDA with CaLK that had been reviewed by BPK to total number of PEMDA in that province. NTB had the highest CaLK score of 56% and the number of PEMDA with CaLK in 2007 that had been audited by BPK were 9 out of 11 PEMDA.

Besides that, consistent with the results of Balance Sheet, LAK and LRA, the ratio of number of PEMDA with issued FS to number of PEMDA in a province showed DIY, Bali, East Java, West Java and Gorontalo at the top 5 with a high ratio at above 83%.

Meanwhile the analysis result of CaLK information component showed low disclosure level. Of 286 checklists, more than 55% scored below 50% or nearly 75% scored below 70%. Based on an in-depth analysis of CaLK presentation it was discovered that although several information component had been presented, the contents were merely details of posts included in Balance Sheet, LAK and LRA, without other economical explanation (this research was not designed to provide substance over disclosure quality, merely to quantify the number of disclosures). Moreover, several information component of CaLK especially the part about the general policy of the disclosed information, had not illustrate the fiscal/financial policy and macro economy related to APBD (Local Revenue and Expenditure

Budget) and APBD accomplishments. This happened also on the information about performance.

3.5 OVERALL DISCLOSURE LEVEL

Overall this research analyzed the 2007 FS disclosure of 277 PEMDA (55.7% of total PEMDA in Indonesia). This number is improved compared to BAKD's data that stated that there were 212 PEMDA with FS in 2006. However not all PEMDA issued a completed and BPK-audited FS. The composition of sampled PEMDA based on FS components issued are as such:

1. 255 PEMDA issued all 4 FS components in 2007 and were audited by BPK (92.1% of total sample or 51.3% of total PEMDA population);

2. 10 PEMDA issued 3 FS components in 2007 and were audited by BPK (3.6% of total sample or 2% of total PEMDA population);

3. 7 PEMDA issued 2 FS components in 2007 and were audited by BPK (2.5% of total sample or 1.4% of total PEMDA population); and

4. 5 PEMDA issued 1 FS component in 2007 and were audited by BPK (1.8% of total sample or 1% of total PEMDA population).

The number and composition of this research sample is credible enough so that the result will be representative of the financial reporting condition of all PEMDA in Indonesia in 2007.

To see the overall disclosure level is to calculate the average score unweighted for the 4 components of FS in 2007. Result shows that the top 5 PEMDA are Pekanbaru (Riau), Dumai (Riau), Natuna (Riau), Malinau (Kaltim) and Nunukan (Kaltim). All 5 PEMDA consistently have high scores for Balance Sheet, LAK and LRA disclosure at above 90% and CaLK disclosure score at above 50%. Whereas the lowest 5 PEMDA are Lubuk Linggau (Sumsel), Bangka Barat (Babel), Pulang Pisau (Kalteng), Gorontalo (Gorontalo), South Minahasa (Sulut). These 5 PEMDA consistently have Balance Sheet, LAK and LRA disclosure score below 80% and CaLK disclosure level below 37%.

Evaluation based on average score of disclosure level for all FS components of PEMDA in each province showed the top 5 are West Sulawesi, North Maluku, Riau, East Kalimantan and Riau. However just like FS components analysis, the number of PEMDA in each province must be calculated to interpret those rankings. For Riau and East Kalimantan, disclosure score were obtained from the average of 6 and 8 PEMDA, so they are valid enough as the provinces with the highest disclosure level. Meanwhile 3 other provinces, West Sulawesi, North Maluku ad Riau, precautions must be taken when concluding that these provinces have the highest score, considering each were affected by less than 3 PEMDA.

3.6 FS DISCLOSURE LEVEL DETERMINANTS

This section will analyze the determinants or factors influencing the disparity of FS disclosure level among PEMDA and the difference among FS components. The analysis is based on the aforementioned disclosure level scores, literature studies and in-depth discussion with regulators, reviewers, standard formulators, consultants and PEMDA staff (discussion participants were invited as individuals and were not acting on behalf of any institutions, however opinions were assumed to reflect the institutions where they work).

Disclosure score for each component (Balance Sheet, LAK, LRA and CaLK) tend to be consistent among PEMDA. This is noticeable from the standard deviation of below 5%. The same applies for the standard deviation of all FS disclosure at 4%. Therefore this research concludes that the influencing factor of PEMDA's FS disclosure do not come from the unique characteristics of each PEMDA. In other words this research estimates that the factors influencing PEMDA's FS disclosure level are common and experienced by all PEMDA in Indonesia. Moreover, because the disclosure level of Balance Sheet, LAK and LRA are high and consistent enough, then the determinants analysis of disclosure level will be focused on CaLK.

These are the common factors that are assumed to influence PEMDA's FS disclosure level (specifically CaLK), which were identified in the Focus Group Discussion:

1. Existence and completeness of CaLK preparation guidelines

   SAP regulates the information required to be disclosed in CaLK (as checklist benchmark in this research). However until now no technical guidelines about CaLK presentation and disclosure are present. KSAP have not issued a Technical Bulletin regarding CaLK. A technical guideline for CaLK preparation is necessary for PEMDA in the early stages of FS preparation because CaLK (and Balance Sheet) are the reports known only after PP SAP was implemented. CaLK is qualitative, thus without technical guidelines PEMDA will face difficulties in preparation.

2. Influence of other regulations

   Besides to explain the posts in Balance Sheet, LAK and LRA in details, CaLK also conveys qualitative information related to the accountability and/or affects decision making. Those information are influenced by other regulation associated with local governments. Changes in regulations which happen frequently in recent years make it difficult for PEMDA to decide which information to disclosure in CaLK. Regulation clashes also cause difficulties for PEMDA in presenting a sufficient CaLK.

3. Socialization of CaLK preparation

   Related parties such as Finance Department, State Department and KSAP have not conducted sufficient socialization about CaLK. Various trainings that have been conducted only focused on Balance Sheet, LAK and LRA components. Therefore PEMDA staffs do not have adequate comprehension about CaLK.

4. Priorities and concerns of FS formulator and user

   Generally, both PEMDA and DPRD do not have sufficient concerns about FS (except LRA and LAK). DPRD usually does not consider BPK's opinion of FS when accepting or rejecting accountability report of head of local government. FS components priority of concern is: (1) LRA; (2) LAK; (3) Balance Sheet; and (4) CaLK. LRA and LAK get primary

concerns because these reports have been around for a while and are considered to have direct effect on the execution of PEMDA's activities/programs. Attention towards Balance Sheet was developed with the prerequisite to create an initial Balance Sheet with technical guidelines and sufficient socialization. CaLK is the FS component with the least priority and is not equipped with adequate socialization.

5. <u>Human resources</u>

    PEMDA has limited human resources in FS preparation. Aside from the lack of accounting graduates, an accountant's career steps in PEMDA have not been developed. Any staffs with additional education and SAP trainings are often transferred to other divisions so there is no knowledge transfer in FS preparation.

Aside from the factors above, FGD also revealed several opinions related to PEMDA's FS presentation, such as:

1. FGD participants also confirmed the result of this research, that PEMDA's FS disclosure level, especially CaLK is still low and not compliant with PP SAP. In fact, several FGD participants thought that the preparations of many PEMDA's FS were mostly copying previous PEMDA FS.

2. Legal outcomes/laws/bylaws, especially ones related to PEMDA's financial reporting, have not been tested academically and empirically by independent parties. This testing is necessary to objectively assess the implementation and limitation of related regulations so they can be perfected.

3. Other reports that PEMDA must prepare aside from FS are numerous and complex. This will affect the quality of the reports prepared by PEMDA. The number of reports to be prepared is organized by many conflicting regulations. Therefore it is proposed that research about various regulations related to these reports must be conducted to analyze the possibility of information convergence. If possible in the future PEMDA will only prepare one report which can fulfill the minimum amount of information needed by various parties.

4. Most PEMDA do not have a sufficient information system to support transactions documentation and financial reporting presentation.

5. Fixed asset is still the most dominant issue faced by PEMDA.

Overall it can be concluded that the factors influencing the disclosure level of PEMDA's FS are common and apply to all PEMDA. Therefore central government has an important a dominant role to resolve this problem.

3.7 RECOMMENDATIONS

In the attempt to achieve the 2011 target that all PEMDA may present a comprehensive and relevant FS, based on the aforementioned analysis, this research recommends 3 strategic steps (executed in less than a year) as such:

1. Regulations integration about financial reporting. To simplify FS preparation by PEMDA and to minimize the possibility of regulation disagreement, efforts to reassess and to integrate issued regulations are necessary.

2. Accounting career advancement in PEMDA. To give assurance to and attract PEMDA staff to have a career in Accounting, PEMDA (and central government) must develop career steps for an accountant. Therefore organization structure and compensation structure at central and local government must be evaluated to accommodate this need; and

3. Assessment of laws/ regulations/ bylaws, especially those related to PEMDA's FS. To ensure the effectiveness and efficiency of law outcomes, cooperation with academicians and researchers must be created to conduct academic and empirical testing.

Besides those strategic steps, this research also recommends tactical steps for the following year, such as:

1. Formulation of CaLK technical guidelines or bulletin. The checklist developed by this research can be used as initial material to construct CaLK technical bulletin. However, note that the current SAP base must be adjusted into accrual base;

2. Training and socialization of CaLK formulation. To complement the various FS preparation trainings and socializations, it is suggested to also conduct CaLK formulation training and socialization; and

3. Initiatives to solve the challenge of fast, accurate and conforming PEMDA's FS. To settle various issues in recent years, regarding fixed asset and information system, both PEMDA and central government must take prompt initiatives to address the problems immediately.

4. CLOSING

4.1 CONCLUSION

Calculation result of disclosure level score for Balance Sheet, LAK and LRA showed that PEMDA's FS disclosure level for three FS components is fairly high and the deviation standard is low, showing a consistency of disclosure level among PEMDA. Meanwhile CaLK score showed very low disclosure level that applied to all PEMDA in Indonesia. The consistency of PEMDA's FS disclosure level score showed that the influencing factors were common to all PEMDA and not related to the unique characteristics of each PEMDA.

Central government specifically Finance Department and State Department can use the result of this research to evaluate the readiness of PEMDA's FS presentation in 2011. KSAP can use the checklist of this research as an initial material in formulating the CaLK formulation technical guidelines. PEMDA can use the result for self-evaluation/

4.2 LIMITATIONS

This research is one the first empirical studies related to PEMDA's FS; therefore there were several limitations in this research, such as:

1. This research found difficulties in getting the FS issued by PEMDA aside from the ones in www.bpk.go.id. Most PEMDA's websites do not include FS. Direct procurement to PEMDA was improbable due to time constraint and bureaucracy. BAKD data source

was limited due to inadequate filing system. Consequently there are possibilities that several PEMDA's FS are not included in the research sample;

2. This research is aimed to reveal descriptively the disclosure level of PEMDA's FS, therefore the result of this research cannot provide any evaluation about the quality of information presented in PEMDA's FS; and

3. This research emphasize on the usage of secondary data of PEMDA's FS, literature studies and discussion with parties related with PEMDA's FS preparation. Due to budget and time limitation, this research did not conduct a broad confirmation to all sampled PEMDA.

4.3 SUGGESTIONS

Based on the aforementioned results, several things may be developed in subsequent researches, such as:

1. Conduct an empirical research about the integration of financial and non-financial reporting of PEMDA by reevaluating all regulations related to reporting;

2. Expand this research by using research methodology of case study or questionnaire; and

3. Develop this research by performing statistical testing about influencing factors and the effect of disclosure level towards decision making.

CORPORATE GOVERNANCE QUALITY, AUDIT FEES
AND NON-AUDIT SERVICES FEES

Mohammed Hudaib, University of Essex
Mahbub Zaman, University of Manchester
Roszaini Haniffa, Bradford University

ABSTRACT

Introducing a new composite measure of audit committee effectiveness (ACE), comprising independence, expertise and diligence, we investigate the relationship between corporate governance quality and auditor remuneration in the UK. In contrast to Carcello et al. (2002, Contemporary Accounting Research), we find that after controlling for board of director characteristics, there is a significant positive association between ACE and audit fees (AF). We also find that ACE has a negative significant effect on level of non-audit services (NAS) fees. Overall, our findings support regulatory initiatives aimed at improving corporate governance amid concerns about audit quality and impairment of auditor independence.

Keywords: audit committees, corporate governance, non-executive directors, audit fees, non-audit services, audit quality.

JEL codes: M41, M42, M48

1. INTRODUCTION

The purpose of this paper is to investigate the relationship between corporate governance quality, in particular audit committee effectiveness (ACE), and non-audit services (NAS) fees and audit fees (AF) in the UK. Following post-Enron regulatory reforms a number of US studies have provided evidence on the relationship between corporate governance and audit (e.g. Carcello et al., 2002; Larcker and Richardson, 2004) and NAS (e.g. Ashbaugh et al., 2003; Kornish and Levine, 2004; Krishnan et al., 2005) fees. There is limited evidence however from less regulated environments on the influence of governance quality on auditor remuneration. Given regulatory concerns about audit quality the influence

of corporate governance on auditor remuneration in the UK is an important research issue. First, there is no recent UK research evidence on this. We are not aware of any research since Collier and Gregory (1996) and O'Sullivan (2002), which is based on 1992 data for the UK insurance industry, that have sought to examine the relationship between corporate governance quality and auditor remuneration in the UK. The importance of this issue is also addressed in the Smith report (2003) which emphasised the quality and effectiveness of audit committee as an important condition for effective governance (sec.4.2) but it stopped short from clearly defining effective audit committees. Second, most recent ~~prior~~ corporate governance studies investigated the association between audit committee characteristics and the level of AF paid to the audit firm (Goodwin-Stewart and Kent, 2006) and the relationship between NAS fees and auditor independence (Hay et al., 2006a). This paper extends such literature by offering a composite measure for audit committee effectiveness as possible determinant to explain both audit and NAS fees.

Existing research mostly predates the corporate scandals of 2000/1 and while providing some evidence of corporate governance effects, they do not examine the influence of ACE on auditor remuneration after controlling for governance (/board) characteristics. There is now a significant body of research on audit committees (see DeZoort et al., 2002; Turley and Zaman, 2004), but research evidence on the relationship between governance quality and auditor remuneration is quite limited. In a meta-analysis of AF research, Hay et al. (2006b) observed that research examining the relationship between corporate governance and AF is not only limited but also preliminary findings indicate conflicting results. Similarly, in a review of the audit committee literature, Turley and Zaman (2004) found that despite the considerable volume of research on AF, evidence of audit committee effects on fees is rather limited. They noted that different rationales suggest that audit committees

could result in increased or decreased fees. If an audit committee seeks to enhance audit quality, the impact could be to increase the AF. Conversely, if existence of an audit committee is associated with increased internal control strength, a reduced fee would be expected.

Our focus in this paper is on examining whether governance quality, i.e. level of the control environment, is associated with higher level of AF and lower level of NAS fees. We seek to contribute to the literature relating to ACE through empirically testing for its influence on auditor remuneration. ACE is not a construct that can be easily modelled for empirical testing. The major constraint being the public availability of data and/or the ease with which it can be obtained and as such we focus on a composite measure of three dimensions of ACE – *independence* of audit committee members, the *financial expertise* of the audit committee, the *diligence* (number of meetings) of the audit committee. These three dimensions have been the subject of governance codes both in the UK (see for example Smith Report, 2003) and elsewhere but often discussed separately from each other. Regulatory requirements and recommendations concerning these dimensions of the audit committee are premised on their potential contribution to audit quality, which includes ensuring that auditor independence is not compromised by the potential influence of NAS fees. In empirically examining the influence of ACE on (a) AF and (b) NAS fees we use a composite measure for ACE, i.e. the audit committee has a member with financial expertise, meets at least three times a year, and is composed of non-executive directors. We expect ACE to be associated with higher level of AF as audit committees exercise greater oversight over the audit process. As noted by Abbott et al. (2003) audit committees can demand a greater quantity of effort from the existing external auditor and if greater effort (i.e. a wider audit scope) is associated with increased quality, then the audit committee's efforts will be

associated with increased quality. Research evidence suggests that audit committees can have a direct influence on the scope of the external audit (Carcello et al., 2002; Turley and Zaman, 2007). The joint provision of audit and NAS creates a potential perception that auditors might compromise their independence, and be unduly driven by a desire to maintain their clients to preserve their audit and NAS fee income. Effective audit committees are likely to be averse to high levels of NAS fees; we therefore posit that ACE will have a negative association with NAS fees.

Our analysis of the influence of ACE, using a sample of 400 company-year observations for the period 2001-2004 randomly drawn from the UK FTSE, confirms our expectations. We find that ACE has a significant positive association with AF. The influence of ACE on NAS fees is significant and negative, i.e. the higher the ACE, the lower the purchase of NAS by the audit client. Overall, our results are consistent with the view that effective audit committees demand higher quality audit and protect auditor independence.

2. PRIOR RESEARCH AND HYPOTHESES DEVELOPMENT

Corporate governance reforms are aimed at improving the quality of financial reporting and external audit. Recommendations concerning both board of directors and audit committee structures and processes in governance codes place greater emphasis on the need to ensure the reliability of financial statements. The scope of the external audit has potentially significant affect on the reliability of financial statements. Equally important as the scope of the audit is the potential impairment of auditor independence that may result from undue influence associated with the joint provision of audit and NAS to the client. The provision of NAS has been argued in many studies to impair auditor independence (see for example Barkess & Simnett, 1994; Beattie et al., 1999). Effective audit committees protect auditor independence by taking the responsibility of remunerating and appointing the auditor away from management, and providing an independent platform for auditors to express their opinions on management policies. They can also affect audit quality particularly through their influence on scope and conduct of the audit.

Turley and Zaman (2004) observe that despite the considerable volume of research on AF, evidence of audit committee effects on fees is rather limited. One difficulty is that different rationales suggest that the existence of audit committees could result in increased fees or decreased fees. If an audit committee seeks to enhance audit quality, the impact could

be to increase the AF. Conversely, if existence of an audit committee is associated with increased internal control strength, a reduced fee would be expected. Collier and Gregory (1996) examined these propositions and found a significant positive relationship for the first but no significant relationship for the second. The authors conclude that 'there is no conclusive evidence to suggest that (audit committees are) effective in engendering a stronger internal control environment that is reflected in reduced audit fees' (p.195). Evidence that the proportion of non-executive directors has a positive and significant impact on AF, which is consistent with increased non-executive representation encouraging more extensive auditing, is provided by O'Sullivan (2000) based on an examination of the 1992 fees of 402 UK companies. Intriguingly, however, this research did not test whether the presence of an audit committee affects AF, but a study by the same author (O'Sullivan, 1999) using the 1995 audit fees for a sample of 146 UK companies found no evidence that board and audit committee characteristics influence audit pricing. The study by Goodwin-Stewart and Kent (2006) based on a survey of 401 Australian companies found the existence of audit committee, more frequent committee meetings and increased use of internal audit are related to higher AF. However, they considered those variables independently and did not hypothesise them as being a composite measure for ACE and only considered the impact on AF only.

We extend prior work by considering UK data and incorporating into our research the interactive effects of the three AC elements viz. *independence*, *financial expertise* and *diligence* (number of meetings) as a proxy for ACE in both the AF and NAS models. We recognise that various explanatory factors suggested in the literature may intervene in the process and have complex relations with audit and NAS fees. Thus, we included in our models a number of control variables that were missing in the Goodwin-Stewart and Kent (2006) study but which were deemed necessary in AF and NAS fees literature. These variables are further discussed in section 2.2.

Given the paucity of research on the relationship between corporate governance quality and auditor remuneration in the UK, we believe that our paper makes an important contribution. Specifically, in this paper we examine the influence of audit committee effectiveness (ACE) on both audit and NAS fees. Although individually independence of the audit committee, the possession of financial expertise, and frequent meetings are important considerations, we believe it is the interaction of such characteristics that is likely to have most impact on audit quality. We therefore focus on the joint effect of these dimensions as an empirical proxy for ACE. Below we develop our hypotheses and explain the models variables:

(i) AC Effectiveness (ACE) – the composite measure

We believe that for audit committees to be effective they must at least exhibit three characteristics. First, audit committees must be independent of management. Second, the audit committees must be active, i.e. meet at least certain times a year. Third, the membership of the committee must include a director with relevant financial expertise. We combine some independent variables, explained below, to form a new construct called ACE (audit committee effectiveness). ACE is thus a dichotomous variable equal to 1 when (i) the audit committee membership consists of all independent non-executive directors, (ii) has a member with financial expertise and (iii) meets at least 3 times a year. The remainder of this section develop our hypotheses relating to ACE that will be tested in the study.

Independence: Directors who are independent of management are expected to be more interested in auditor quality and are more likely to believe that the provision of high levels of NAS by the auditor may impair auditor independence. Prior research suggests that audit committees which are independent of management are likely to be averse to high levels of NAS. Abbott et al. (2003) noted, for example, that independent audit committee's concern for auditor independence can have a direct or indirect affect on the purchase of NAS. The perceived threat to independence could result in the audit committee monitoring the provision of NAS. Alternatively, an independent audit committee may not be directly involved in the purchase decision. Nevertheless it is possible that management may voluntarily reduce the level of NAS in anticipation of the potential concern of the audit committee. For this reason, we incorporated the independence variable in our composite measure for ACE.

Financial expertise: The financial expertise of the audit committee forms the second component of our test variable, ACE. Prior research has established that for audit committees

to be effective, their membership needs to include a member with relevant financial expertise. Corporate governance codes do vary as to the specification of the level or nature of financial expertise. Nonetheless, research shows that audit committee members without financial experience may not be strong enough to protect auditor quality (Knapp, 1987; DeZoort et al. 2002, Turley and Zaman, 2004). We expect that audit committees which have at least one member with financial expertise is likely to be concerned about audit quality and thus have a positive association with AF and a negative association with NAS fees. Thus, it is necessary to incorporate this variable in our composite measure for ACE.

Meetings: For an audit committee to be effective, it must be active. Audit committee meetings are thus the third component of our test variable ACE. Prior research has established the importance of active committees for the oversight of the financial reporting and auditing process. Regular meetings provide opportunity for the audit committee to monitor audit quality. Meeting frequency can be a signal of audit committee diligence (Menon and Williams, 1994) and has been associated with reduced likelihood of fraud (Beasley et al., 2000) and financial restatement (Abbott et al., 2003). We believe that active committees are likely to exert a positive influence on audit scope, which in turn will be reflected in higher AF and a negative influence on NAS. Thus, it is necessary to incorporate this factor as part of our ACE measure. Overall, based on the above discussions, we expect our composite measure, ACE, to have a negative effect on NAS fees and a positive effect on AF. Hence, our two hypotheses are as follows:

> H_1: *Ceteris paribus, there is a negative relationship between ACE and the level of non-audit services fees.*

> H_2: *Ceteris paribus, there is a positive relationship between ACE and the level of audit fees.*

In testing the above hypotheses we wish to control for additional corporate governance, in particular board of director related, factors which may potentially have an influence on the level of audit and/or NAS fees. In this respect our paper has a further secondary aim which is to examine whether ACE has influence on auditor remuneration after taking into account board of director effects. Here we note that the US study of Carcello et al. (2002) on board characteristics and AF based on a sample of Fortune 1000 companies with fiscal years ending between April 1992 and March 1993 found that "audit committee variables provide no incremental explanatory power when the board characteristics are included in the model". Their results showed that "none of the audit committee variables is significantly related to audit fees". We find the Carcello et al (2002) result puzzling. We believe that given that audit committees have specific oversight responsibility for financial reporting and external audit, after controlling for the board director and additional audit committee related characteristics, our test variable ACE will have a significant positive association with AF and a negative significant association with NAS fees.

(ii) Control variables

In testing for the influence of ACE we control for the following corporate governance and agency related variables. Our first two control variables are actually related to the audit committee chair which may potentially affect its independence and expertise. First, we include a variable *ACCS* (audit committee chair holds shares in the company) to test whether the shareholding has any affect on AF and NAS fees. Second, we also test whether the number of additional directorships (*TAD*) held by the audit committee chair exerts an influence on the level of audit and NAS fees. The holding of additional directorships has been used in prior research as a proxy for audit committee chair's expertise (Carcello and Neal, 2003); however its effect on auditor remuneration has not been investigated. Carcello et al

(2002) have used a similar concept, directorships – average number of outside directorships in other firms held by outside directors, in examining the influence of board characteristics on audit fees and found that it had a positive significant effect. The extension of our model to test for the effects of both *TAD* and *ACCS* is particularly relevant given that over time, governance codes have sought to tighten the definition of audit committee independence and restrict (or at least discourage) non-executive directors from holding shares in the company and from taking on too many directorship appointments in other companies (see Collier and Zaman, 2005). The latest Combined Code on Corporate Governance (FRC, 2006) in the UK for instance recommends that audit committees should consist entirely of independent directors with no interest in the company they serve.

In addition to the above two audit committee chair variables incorporated into ~~in~~ our model, we also control for the effect of number of board meetings. Similar to our discussion earlier about audit committee meetings, the number of board meetings (*BDM*) can indicate the level of diligence exercised by the board of directors. Carcello et al. (2002) confirmed high frequency of board meetings could indicate higher level of control in the company and thus could be associated with audit fees. The composition of the board of directors is also a potentially important factor affecting audit quality. We also control for the proportion of non-executive directors on the board (*PNED*). Non-executive directors have an interest in protecting their reputation and avoiding potential financial loss that may result from litigation by increasing audit quality (see Young (2007) for a discussion of non-executive directors). It is possible that in companies with a high proportion of non-executive directors, there will be a high level of concern about audit quality which in turn would be reflected in a positive association with audit and a negative association with NAS fees. We control for a third factor relating to board of directors – *duality* (whether the board chair is also the company's chief executive officer) that may potentially influence audit quality. As noted by Collier and Gregory (1996) board duality can have a potentially adverse influence on audit quality and audit committee activity.

Finally, following the literature on AF we control for a number of company related variables which have been hypothesised in the literature to be associated with auditor remuneration. These include: auditor type (*BigFour*), company size (*lnTA*), company complexity (*lnSubs*), level of risk proxied by leverage (long term debt to total assets) (*Lev*) and whether the company made any acquisitions *(Acq)* or incurred a loss *(Loss)* in the previous two years. Our final control variable relates to the concentration of ownership. Consistent with Firth (1997) we use a variable number of shareholders with 5% or more shareholdings *(NSH5)* to test if it has an influence on audit and NAS fees.

(iii) Regression Models

Consistent with prior literature on AF we use a single equation approach to test our hypotheses relating to the influence of ACE on audit and NAS fees. The OLS regression models are as follows:

$$\ln NAS_{it} = \beta_0 + \sum_{i=1}^{3} \delta_{itx}(ACE) + \beta_2 TAD_{it} + \beta_3 ACCS_{it} + \beta_4 PNEDB_{it} + \beta_5 BM_{it} + \beta_6 Duality_{it}$$
$$+ \beta_7 NSH5_{it} + \beta_8 Size_{it} + \beta_9 Lev_{it} + \beta_{10} \ln Sub_{it} + \beta_{11} Big4_{it} + \beta_{12} Loss_{it}$$
$$+ \beta_{13} Acq_{it}$$

Model 1

$$\ln AF_{it} = \beta_0 + \sum_{i=1}^{3} \delta_{itx}(ACE) + \beta_2 TAD_{it} + \beta_3 ACCS_{it} + \beta_4 PNEDB_{it} + \beta_5 BM_{it} + \beta_6 Duality_{it}$$
$$+ \beta_7 NSH5_{it} + \beta_8 Size_{it} + \beta_9 Lev_{it} + \beta_{10} \ln Sub_{it} + \beta_{11} Big4_{it} + \beta_{12} Loss_{it}$$
$$+ \beta_{13} Acq_{it} + \varepsilon_{m1}$$

Model 2

Where:

Independent variables	
lnNAS	– natural logarithm of non-audit services fees
lnAF	– natural logarithm of audit fees

Dependent variables:	
ACE:	– Audit Committee Effectiveness. An audit committee is effective when $[(ACI = 1) + (ACX = 1) + (ACM \geq 3)]$:

ACI = Audit committee independence. Dichotomous with 1 if all AC members are non-executive directors and 0 otherwise.

ACX = Audit committee's financial expertise. Dichotomous with 1 if the audit committee contains a member with financial expertise and 0 otherwise.

ACM = Number of audit committee meetings held during the financial year.

TAD	– Audit committee chair's total additional directorships. The number of additional directorships the audit committee chair holds, including executive and non-executive positions. TAD = $[(ACCXD$ = AC chair holds additional executive position in another company) + $(ACCnXD$ = AC chair holds additional non-executive position in another company)].
ACCS	– Audit committee chair's shareholdings. Dichotomous with 1 if the audit committee chair holds the company's shares and 0 otherwise.
PNEDB	– The proportion of non-executive directors to total number of directors on the board of the company.
BM	– Number of board meetings held in the financial year.
Duality	– Chief executive is also chair. A dummy variable equal to 1 if the chief executive concurrently holds the position of chairman, 0 otherwise.
NSH5	– Number of shareholders with= >5% Shareholdings. This is the number of shareholders holding 5% or more of the company's shares.

Size	– The natural log of total assets.
Lev	– Leverage of the company measured by the ratio of long-term debt to total assets.
lnSub	– Natural logarithm of number of subsidiaries.
Big4	– Big 4 as auditor. A dummy variable equal to 1 if the company employs a big 4-auditing firm as their auditor, 0 otherwise.
Loss	– Whether the company made a loss in the 2 previous financial years. A dummy variable equal to 1 if the company made a loss in the 2 previous financial years, 0 otherwise.
Acq	– Whether the company made an acquisition in the 2 previous financial years. A dummy variable equal to 1 if the company made an acquisition, 0 otherwise.
ε_{m1}	– Standardised residuals$_{m1}$: The computed residuals for model 1.

The dependent variable of interest (*lnNAS*) is the logarithm of NAS fees. Data regarding audit and NAS fees were obtained manually from the notes to the accounts in each of the companies' annual reports. For the AF related hypotheses, we replace the *lnNAS* dependent variable in the above equation with the log of audit fees (*lnAF*). Since, most factors influencing *lnAF* also influence *lnNAS* fees and that the relationships between AF, NAS fees and the other explanatory variables suggested in the literature are complex, we therefore incorporated the standardised residuals (ε_{m1}) of *lnNAS* from Model 1 into Model 2 to control for the incremental effect of NAS fees on level of AF.

Our test variable ACE is coded 1 if the following conditions are met: the audit committee is composed of non-executive directors, at least three audit committee meetings are held per year; and the audit committee has at least one member with financial expertise. The Smith Report (2003) defined expertise as follows:

At least one member of the audit committee should have significant, recent and relevant financial experience, for example as an auditor or a finance director of a listed company. It is highly desirable for this member to have a professional qualification from one of the professional accountancy bodies (para 3.16, p.9).

For the purpose of our models we regarded the audit committee has having financial expertise if one of its member had experience as an auditor, finance director or had a professional accounting qualification.

To summarise, the dependent variables used in the test is the level of NAS fees (*lnNAS*) and level of AF (*lnAF*). The main independent variable of interest is ACE (audit committee effectiveness) which consists of AC independence (*ACI*), financial expertise (*ACX*), and number of meetings (*ACM*). The control variables include: AC chairman's total additional directorships (*TAD*) and whether they hold shares in the

company (*ACCS*). Board characteristics related control variables included the proportion of NEDs on the board (*PNEDB*), number of board meetings (*BM*), and duality (*Duality*). We also control for ownership, the number of shareholders holding 5% or more of the company's shares (*NSH5*). Finally, company related control variables include the size of the company (*lnTA*), its leverage (*Lev*), the number of subsidiaries (*lnSub*), whether the company uses a big-four auditor (*Big4*) and whether in the last 2 years the company made a loss (*Loss*), or an acquisition (*Acq*).

3. EMPRICAL RESULTS AND ANALYSIS

(i) Descriptive Statistics

The sample used in the paper is drawn from non-financial companies in the FTSE-350 which represents a good mix of the largest UK companies and relatively smaller companies and covers the period 2001 to 2004. We use a random sample of 400 company-year observations to test our hypotheses relating the influence of audit committee effectiveness (ACE) on audit and NAS fees. Table 1 provides the descriptive statistics for the dependent and continuous independent variables used in our models.

TAKE IN TABLE 1

The analysis of residuals, plots of the studentised residuals against predicted values as well as the *Q-Q* plot indicate no problems of homoscedasticity and linearity. Residuals of standard tests on skewness and kurtosis indicated a problem with the normality assumption and therefore the dependent variables *lnSub* is transformed into normal scores. Table 2 presents the correlation matrix for the dependent and the continuous independent variables. It does not indicate any multicollinearity problem, as the correlations are relatively low.

TAKE IN TABLE 2

(ii) Regression Results

Model 1 tests which independent variables viz. the composite measure of ACE, AC chair's total additional directorships (*TAD*) and shareholding in the company (*ACCS*), the proportion of NEDs on the board (*PNED*), number of board meetings (*BM*), role duality (*Duality*), number of shareholders holding 5% or more of the company's shares (*NSH5*), and control variables viz. size of the company (*lnTA*), its leverage (*Lev*), number of subsidiaries

(*lnSub*), type of audit firm (*Big4*), loss made within the last 2 years (*Loss*) and acquisition (*Acq*), are associated with NAS fees. We run the model three times, referred to as Model 1a, 1b, and 1c. The results are shown in Table 3. The *F*-value for each model is significant at the 1% level and the adjusted R^2 for each of the three models is between 21% and 23%.

TAKE IN TABLE 3

Results in Model 1a show that board meetings, role duality, company size, type of audit firm and the test variable ACE are all found significantly associated with level of NAS fees but no significant relationship for the other variables tested. The fact that board meetings, role duality, company size and type of audit firm are significant suggest that large companies chaired and managed by the same director, audited by big-four and with frequent board meetings tend to buy more NAS. As predicted the negative coefficient and significance level for the test variable indicate that the probability of higher purchase of NAS decreases with ACE.

In Model 1b, we substituted *TAD* and *ACE* with *ACCXD* and *ACCnXD* for the former and *ACM*, *ACX* and *ACI* for the latter. As can be seen in Table 3, the overall findings are similar to the earlier model except that *ACX* was found to be significant and negatively associated with *lnNAS*. The result suggests that financial expertise in the audit committee team is the main driver for reducing the demand on NAS. As for model 1c, all variables are similar to model 1a except for TAD and ACE. In this model, we substituted TAD with *ACCXD* and *ACCnXD* (as in model 1b) and replaced ACE with a new refined ACE i.e.

refined.ACE = ACE less *ACCS*[347]. The results are again similar to model 1a but leverage is now found to be significant. We further found the newly defined variable (*refined.ACE*) to be significant and negatively associated with NAS. This is an interesting finding as it supports the position of the Smith Report (2003) which considered independence of the audit committee i.e. members drawn from outside the company rather than not holding shares as important for audit committee effectiveness.

Hence, our results in all three models show that the existence of effective audit committees, as measured by ACE, exerts a significant negative influence on the level of NAS fees, thus supporting our hypothesis 1 i.e. there is a negative relationship between ACE and the level of NAS fees.

Table 4 shows the results of Model 2 which focuses on the association between audit fees, the composite ACE and the control variables. As in Model 1, we also run this model three times and refer to them as Model 2a, 2b and 2c.

TAKE IN TABLE 4

In Model 2a, results indicate role duality, large shareholdings and gearing to be significantly associated with AF but with negative coefficients. Audit committee chair's shareholdings, number of board meetings, size, type of audit firm, residuals and the composite test variable ACE were also found to be significant but with positive coefficients.

---

[347] Smith Report confines independence of audit committee to only those drawn from outside the company and did not address the issue of their shareholdings. As such, we exclude from the sample non-executive directors who hold shares in companies where they act as AC chairmen and we refer to this variable as *refined.ACE* in Model 1c.

This suggests that the propensity to increase audit fees is associated with companies having highly diffused shareholders, low gearing and with role duality. However, large companies audited by large audit firm tend to pay higher audit fees due to the size effect. In addition, companies with highly effective audit committee and those chaired by directors with shareholding (*ACCS*) also tend to demand higher audit service and consequently, higher audit fees. The significant residual variable which is used as one of the control variables in the model suggests that the purchase of NAS is often associated with the increase likelihood of buying audit.

In Model 2b, we substituted *TAD* and *ACE* with *ACCXD* and *ACCnXD* for the former and *ACM*, *ACX* and *ACI* for the latter. As can be seen in Table 4, the overall findings are similar to the earlier model except that role duality and *ACX* are not significant. We found ACM and ACI to be significant and positively associated with higher AF, suggesting that audit committees with such characteristics demand wider audit scope, thus increasing the AFs. As for Model 2c, we found the results to be similar to Model 2b with the exception of gearing. We also found *ACCXD* to be significantly associated with AF, but in the negative direction. This suggests that AC chairs who are executive directors in another company tend to reduce AF, suggesting that such chairs perceive AF as unnecessary burden and hence tend to demand lower level of AF. We further found the newly defined variable (*refined.ACE*) to be insignificant with AF, suggesting that AC chairs who have no shareholdings do not affect the level of AF.

Hence, our results in all the three models show that the existence of effective audit committees, as measured by ACE, exerts a significant positive influence on the level of AF,

thus supporting our hypothesis 2 i.e. there is a positive relationship between ACE and the level of AF.

4. SUMMARY AND DISCUSSION

Our results show that the existence of effective audit committees, as measured by *ACE* in our models, exerts a significant negative influence on the level of NAS fees implying that such audit committees are likely to be concerned about protecting (perceived) auditor independence and thus purchase lower levels of NAS from the incumbent auditors. Our results also show that number of board meetings, duality, company size and big-four auditor have a positive significant association with levels of NAS fees.

To test the effect of governance quality, in particular of AC effectiveness, we run the regression with AF as our dependent variable. The results show that our AF models are statistically significant (at the 1% level) with an adjusted R^2 between 66% and 68% and *ACE* (audit committee effectiveness) has a positive significant association with audit fees (*lnAF*). This suggests that high quality audit committees are likely to subject the financial reporting and audit process to greater scrutiny and demand higher level of audit which is in turn reflected in higher AF. Our findings are consistent with the US study of Abbott & Parker (2000) who noted that active audit committees are more diligent and therefore require higher audit quality in order to protect themselves from financial and reputational loss. It is noteworthy that in contrast to the US study of Carcello et al. (2002) who concluded that audit committee variables provide no incremental explanatory power when board variables are included in the audit fee model, we provide evidence that *ACE* has a significant positive effect on AF after controlling for board characteristics. It is possible that the Carcello et al (2002) findings are insignificant with respect to audit committees because their data relates to

1992 when audit committees may not have had relatively significant oversight responsibility for financial reporting and audit. Consistent with Carcello et al. (2002) however the variable for board meetings in our model has a significant positive association with audit fees. We also find that *ACCS* (audit committee chair holding shares), *lnTA* (company size), lnSubs (number of subsidiaries), and auditor type (*Big4*) all have a significant positive association with AF. Consistent with Firth's (1997) findings, *NSH5* (number of shareholders owning 5% or more shares) has a significantly negative association with AF which may suggest that large shareholders may use different methods to monitor managerial actions as opposed to heavily relying on the audit and so defused shareholding companies relied more on external audit function. The negative relationship of leverage seems to contradict the findings in Parkash & Venable (1993) and Firth (1997) where audit fees were seen to increase with higher leverage. This is interesting and provides an area for further investigation as many studies on audit fees have found leverage to be positively associated with audit fees (Hay et al. 2006b).

We undertook a number of additional tests relating to our hypotheses concerning the influence of *ACE* on audit and NAS fees. We replaced *ACE* in the NAS fee model (*lnNAS*) with the individual components of *ACE*, i.e. with *ACI*, *ACX* and *ACM*. The adjusted R^2 is unaffected and the model is still significant at 1%. However, we find that only audit committee financial expertise (*ACX*) is significant suggesting that an audit committee's financial expert contributes positively to greater monitoring. Audit committee independence (*ACI*) is negative, but not significant. Contrary to our expectations, audit committee meetings (*ACM*) has a positive, but not significant, association with NAS fees. When testing the NAS fee model using the individual components of *ACE* the control variables which were found to be significant and positive in the composite *ACE* model still remain positive and significant. Similarly, we also tested our AF model, replacing *ACE* with its individual components. The

results are unchanged, except that only audit committee independence (*ACI*) and audit committee meetings (*ACM*) components have a positive significant association with AF. Results from the individual analyses of *ACE* components do not change our overall conclusions regarding the influence of *ACE* on audit and NAS fees.

Our initial models of audit and NAS fees did not take into consideration the possible joint determination of auditor remuneration. To test for this we included the standardised residuals (ε_{m1}) of *lnNAS* (Model 1) as one of the independent variables for *lnAF* (Model 2). We also included *lnAF* as dependent variable in our model of NAS fees (results not reported in table). We found that AF have a positive significant association with level of NAS fees. Our results with respect to the significance of *ACE* are largely unchanged − *ACE* is still significant and negative and the adjusted R^2 marginally increases from 21% to 23%. When *lnNAS* is included as an additional independent variable in our model of audit fees (results not reported in table), we find that *lnNAS* has a significant positive association with AF. *ACE* however, as expected, still remains significant.

To summarise, this paper aimed to examine the influence of corporate governance quality on auditor remuneration. It provided evidence of audit committee effectiveness (*ACE*) having a positive significant effect on AF after controlling for board of director characteristics. Thus in contrast to the prior findings of Carcello et al (2002) for the US and Goodwin-Stewart and Kent (2006) for Australia, this paper has shown that audit committee quality does make a difference, even after controlling for board characteristics. Additionally the paper also provided evidence of the audit committee effectiveness (*ACE*) having a significant negative association with levels of NAS fees. Overall the results in the paper

provide evidence that effective audit committees, as measured by ACE, protect audit quality

by exerting a positive influence on the scope of the audit and restraining the purchase of NAS.

Although in contrast to Carcello et al (2002) this paper has demonstrated the significance of

ACE, further research is needed to better understand the factors which contribute to audit

committee effectiveness in different regulatory and institutional contexts. Our findings are

also relevant to regulators in other countries who are considering adopting measures to

enhance corporate governance, particularly the effectiveness of audit committees.

MEASUREMENT OF AUDIT QUALITY THROUGH REAL-ACTIVITY EARNINGS MANAGEMENT

Hyuk Shawn, Syngkyunkwan University
Hyoik Lee, Syngkyunkwan University
Sanghyuk Moon, Yeungnam University

1. Introduction

Net income consists of cash flows from operating activities (hereafter, CFO) and accruals. Because accruals match the timing of the accounting recognition with the timing of the economic benefits, with accrual-based earnings we can measure firm performance better (Dechow and Dichev, 2002). However, accruals are mainly based on assumptions and estimates that, if wrong, must be corrected for the future earnings (Dechow and Dichev, 2002). In particular, discretionary accruals can be used for the means of manager's earnings management. Therefore, to raise reliability of financial reporting, auditors are needed to detect discretionary accruals and recommend managers to correct their financial reports according to the materiality. From these viewpoints, prior researches used discretionary accruals as proxies for the audit quality. Meanwhile, there is a view of CFO used in earnings management in addition to accruals. As mentioned above, CFO as well as accruals is included in net income. Manager can use various means for earnings management. CFO is also one of the means.

Traditionally, there were a lot of studies about discretionary accrual earnings management (hereafter, DAM). However, after Bugstahler and Dichev (1997) who maintain that CFO can be the means of earnings management as well, studies on earnings management by the means of affecting CFO have proceeded actively. Especially, Roychowdhury (2006) defined the earnings management through affecting CFO as real-

activity earnings management (hereafter, RAM), measured by combining three elements, i.e. costs of goods sold (hereafter COGS), production costs, and discretionary expenses.

The recent researches focus on the relationship between DAM and RAM, and report that due to several factors which make it difficult to use DAM for the earnings management (for example, regulations by Sarbanes-Oxley Act, etc.), managers use RAM more than DAM (Cohen, 2008). Most of prior researches about RAM hold that managers use RAM so frequently that auditors have difficulties to detect earnings management as policies, such as SOX, have increased auditor's assurance responsibility.

If auditors conduct audits of high quality according to the auditing standards, RAM as well as DAM will decrease. In this way, auditors would improve audit quality by supplying reliable information, solving uncertainty by reducing earnings management, in any case of DAM or RAM. This implies that RAM just like DAM can be a proxy for audit quality. Therefore, this study investigates the relation between the audit quality and the abnormality of RAM, and analyzes whether RAM can be a suitable proxy for audit quality.

We organize the paper as follows: Section 2 reviews existing literature on earnings management and audit quality. Section 3 develops arguments for our hypothesis, and discusses our methodology. In Section 4, we present descriptive statistics and the results of the empirical test. Section 5 deals with the conclusion and discusses the contribution and limitation of the results in this paper.

2. Hypothetical Backgrounds

Audit quality is defined to be the market-assessed joint probability that a given auditor will both discover frauds and errors in the client's financial statements, and report the ones as they are (DeAngelo, 1981). But, it is impossible to measure audit quality as the above definition because the elements of audit quality are determined by auditors whose view tends to be subjective rather than objective, and audit quality is not instantly perceivable. In addition, because of various circumstantial variables such as auditor, contract, and audit fee which influence audit quality, it is almost impossible to measure this as the definition. As a result, prior research used several proxies to measure audit quality.

DeAngelo (1981) used accounting firm's size as a proxy for audit quality. As its size gets bigger, inputted costs (fixed costs) increase the audit-related experience and knowledge of auditors, and they also increase an economic quasi-rent. Meanwhile, as the weight of depending on a certain company applied to external audit for an auditor, whose economic quasi-rent is big, gets smaller, it increases the probability that the auditor detects frauds and errors and reports them honestly. Therefore accounting firm's size can be a good proxy for audit quality. And auditor's size is also relatively easy to measure when using various tools like auditor's sales amounts, total assets size, the number of its clients and total audit fees, etc. And the measurement costs are so inexpensive that the size variable has excellent several conditions as a proxy for audit quality.

Chung and Kallapur (2003) used the absolute value (size) of DAM for measurement through Adjusted Jones Model (1995) as proxy for audit quality. It is an unavoidable matter, due to the inherent limit of audit, that earnings management may be included partially in the financial statements although they were audited by external auditors.

However, because an auditor may decrease managers' earnings management through auditing efficiently and effectively, magnitude of earnings management that is included in the assured financial statements can be a basis to be used as proxy for audit quality.

Khurana and Raman (2004) studied whether high audit quality of Big 4 is due to a litigation risk or it is needed for its auditor's reputation matters. They used an implied cost of equity capital to measure the reliability of financial information as a proxy for audit quality. It is thought that the reliability of a company's financial statements decreases as an implied cost of equity capital cost increases because information asymmetry between information users is reflected in this cost of capital.

Traditionally, most of studies on earnings management are involved in discretionary accruals, but studies on real-activity earnings management that affects cash flows have existed partially. Bartov (1993) proved that managers conduct the act of income smoothing because they have discretionary powers to control the disposal timing of fixed assets and investment assets.

Mande et al. (2000) proved that managers use short-term decision making of discretionary controlling the expenditure for research and development expenses according to economic conditions. Gunny (2005) investigated four types of earnings management i.e. research and development expenses, selling and administrative expenses, gains on disposal of long-term assets and investment assets, and diminishment of COGS through RAM of current period exert a negative influence on future operating activities. Roychowdhury (2006) developed a model of measuring RAM which aims to increasing earnings through price cutting, over-production of inventories and reduction of discretionary expenditures.

Zang (2006) confirmed that DAM and RAM can be used as substitutes for each other. And he confirmed that there is the sequence between these two, i.e. using RAM firstly, then DAM secondly. And a company's manager who has litigation risks switches using DAM to depending on RAM, from this result, it can be asserted that there exists the trade-off relationship between RAM and DAM. This hints that RAM is a type of earnings management that is hardly exposed than DAM.

Mizik et al. (2008) insisted that the market does not properly evaluate a company that carries out earnings management at the time of seasoned equity offerings. It is because the earnings management through RAM aiming higher income report is carried out more than through DAM. According to Edelstein et al. (2008), American investment companies in real estate have to pay out 90% of net income for the current year by the federal law, and he showed that these companies increased expense and reduced net income using RAM to reduce amounts of their obligatory dividend.

Coulton et al. (2008) confirmed that a manager use RAM in the fourth quarter mainly to meet earnings objectives. And they added the type of earnings management can be altered according to the purpose of financial reporting. Cohen and Zarowin (2008) showed that RAM as well as DAM is used at the time of seasoned equity offerings and these have significant negative (-) correlation meaning these have a relation of contradiction. Cohen et al. (2008) proved that types of earnings management are changed to RAM from DAM after implementation of SOX, and they insisted as the reason that compensations to managers are mainly a type of share compensation such as stock option before the implementation of SOX.

3. Hypothesis & Methodology

3.1 Hypothesis development

Net income is an index of a company's management results for current years, and consists of cash flows from operating activities and accruals. Accruals are applied for the accrual basis which is a basic principle in accounting areas. And they matches the accounting recognition with the timing of events which are the causes of cash inflows and outflows rather than the timing of actual cash inflows and outflows; accruals are regarded as an indispensable factor to deliver useful information to information users. However, accruals are frequently based on assumptions and estimations; this feature is criticized for a means of earnings management by adjusting values listed in financial statements. That is, discretionary accruals can be used by manager's earnings management means. Therefore, to raise reliability of financial reporting, auditors have responsibilities of detecting discretionary accruals which make it possible to distort financial reporting, and they are required correcting these ones according to the level of materiality. From these viewpoints, many prior researches used discretionary accruals as a proxy for audit quality.

However, CFO as well as accruals is included in net income. CFO is also used in earnings management, isn't it? It may be possible. Earnings management is implemented according to the discretionary powers given to managers; means of earnings management for which managers use accruals or CFO come under other problems. That is, manager can use various means to earnings management. CFO can be one of the means. For example, it is an adjustment of accounting numbers related to accruals that manager recognizes what should be treated as development costs (asset) as routine development expenses (expense); it shall be earnings management influencing on the current year's cash flows that managers increase routine development expenses to decrease net income.

Both these two methods of earnings management affect net income, but there is a difference between the former (the adjustment of time recognition), which does not affect cash flows, and the latter (the adjustment of an amount of expenses), which does affect cash flows.[1]

Traditionally, there were a lot of studies about earnings management using discretionary accruals (hereafter, DAM). While these studies suppose that CFO is difficult to be used by the means of earnings management, Bugstahler and Dichev (1997) argued that CFO should also analyzed empirically because CFO can be the means of earnings management. Accordingly, recent studies about earnings management that affects CFO are proceeding actively. Especially, Roychowdhury (2006) and his followers analyze earnings management affecting CFO known as real-activity earnings management (hereafter RAM), and measure the value of RAM by combining three elements of sales amounts, production costs, and discretionary expenses.

Many recent researches focus on the relation between DAM and RAM, and report that due to several institutional factors (seasoned equity offerings, hereafter, SEO and Sarbanes-Oxley Act, hereafter SOX, etc.), it is empirically shown that managers are using RAM more than DAM (Cohen, 2008). This result means that managers use RAM a lot as a means of earnings management, for it is hard to be detected by the auditor as policies, such as SOX, have increased auditor's assurance responsibility.

If an auditor conducts audit properly according to GAAP (generally accepted accounting standards) and GAAS (generally accepted auditing standards), RAM as well

---

[1] In the case of earnings management using discretionary accruals, a company may also have a change of cash flows when considering the corporate income tax because discretionary accruals might affect income tax expenses which eventually change cash outflows. But, in this paper this effect will be disregarded.

as DAM will decrease. In this way auditors solve uncertainty problems by reducing discretionary earnings management by a manager (even if it is earnings management through DAM or through RAM), and supplying reliable information; this aims to improve audit quality. This implies that RAM as well as DAM can be a proxy for audit quality.

Therefore, this paper analyzes whether RAM can be used as a proxy for audit quality by measuring the size of discretionary (abnormal) RAM, and how RAM is related to other proxies for audit quality.

Hypothesis

Ceteris paribus, as the level of audit quality increases, the value of RAM decreases.

3.2 Methodology

3.2.1 Measure of Real activity-based Earnings Management

One of most favored proxies of real activity-based income adjustments is the model used by Roychowdhury (2006), which is intended to capture the abnormality level of cash flows from operating activities (CFO), production costs and discretionary expenses. And Zang (2006) and Gunny (2006) increased the validity of this method by verifying this proxy of Roychowdhury (2006) empirically.

The details of real activity-based income adjustments from those three variables in the above can be stated as follows:

1) CFO : A company can accelerate point of sales by price discounts or relief of credit   conditions

2) Production costs: A company can lower the cost of sales by increasing production volumes.

3) Discretionary expenses: A company can reduce cash outflows by decreasing discretionary expenses including advertising expenses, research & development expenses and selling and administrative expenses.

Roychowdhury used the method of the actual amounts minus the normal amounts which are considered as not exercising real activity-based income adjustments, to measure abnormal amounts of *CFO,* production costs and discretionary expenses. Meanwhile, the normal amounts of *CFO,* production costs and discretionary expenses are computed from the method developed by Dechow, Kothari and Watts (1998) as it is. In the viewpoint of Dechow, Kothari and Watts, the normal *CFO* is tacitly considered to have a linear relationship with the sales amounts and the change of sales amounts. And the details of equations are as follows:

$$\mathbf{CFO_{it}/A_{i,t-1} = a_0[1/A_{i,t-1}] + b_1[Sales_{it}/A_{i,t-1}] + b_2[\Delta Sales_{it}/A_{i,t-1}] + \varepsilon_{it}\ (1)}$$

A_{it-1}: total assets in year t-1

$Sales_{it}$: Sales in year t

$\Delta Sales_{it}$: $Sales_{it}$ - $Sales_{it-1}$

The cost of production is defined as the sum of the cost of goods sold *(COGS)* and the change of inventories. We can derive this below equation from equation (1), as it is

acceptable that the relationship between the *COGS* and sales of certain year is almost linear.

$$CFO_{it}/A_{i,t-1} = a_0[1/A_{i,t-1}] + b_1[Sales_{it}/A_{i,t-1}] + \varepsilon_{it} \ (2)$$

The change of inventories can be derived as follows:

$$\Delta INV_{it}/A_{i,t-1} = a_0[1/A_{i,t-1}] + b1[\Delta Sales_{it}/A_{i,t-1}] + b_2[\Delta Sales_{i,t-1}/A_{i,t-1}] + \varepsilon_{it} \ (3)$$

When using equation (2) and equation (3), the normal costs of production can be derived as follows:

$$Prod_{it}/A_{i,t-1} = a_0[1/A_{i,t-1}] + b_1[Sales_{it}/A_{i,t-1}] + b_2[\Delta Sales_{it}/A_{i,t-1}] + b_3[\Delta Sales_{i,t-1}/A_{i,t-1}] + \varepsilon_{it} \ (4)$$

The normal discretionary expenses are the sum of advertising expenses, research & development expenses (R&D) and selling and administrative expenses (SG&A). In this paper, we consider the normal discretionary expenses in the current year have a linear relationship with sales in the prior year as we adopt the method used by Cohen et al. (2007). If we apply sales in the current year in the model, it will be difficult to capture the decrease in the residual for a case that the management exaggerates sales amount which is not actually occurred; we may have very little residuals in that case, as a result, sales in the prior year is used in the equation. The details of the equation are as follows:

1896

$DisExp_{it}/A_{i,t-1} = a_0[1/A_{i,t-1}] + b_1[Sales_{i,t-1}/A_{i,t-1}] + \varepsilon_{it}$ (5)

From this equation (1)~ (5), we can calculate the abnormal *CFO,* the abnormal production costs and the abnormal discretionary expenses. And, in using these three factors to output the proxy of the real earnings management, we calculate the standardized variable by connecting all of these three factors to be denoted as *RAM* suggested by Cohen and Zarowin(2008) through equation (6).

RAM_Proxy=Abnormal CFO×(-1)+Abnormal Prod+Abnormal DisExp×(-1) (6)

The reason that abnormal CFO and abnormal DisExp are given the negative sign(-) in equation (6) is to homologize sign of earnings management through real activity. Concretely, RAM and abnormal CFO, abnormal Production costs, and abnormal discretionary expenses have following relativity.

First, Because acceleration of the timing of sales through increased price discounts or more lenient credit terms increases credit sales than cash sales, account receivables increases. Therefore, acceleration decreases firm's CFO. Increasing of production costs too decreases CFO. On the other hand, decreasing of discretionary expenses can increase CFO itself, but decreasing of sales promotional, advertisement, and R&D expenses in current period can decrease sales and CFO in next period.

Considering above, It is expected that there is a negative(-) relation between CFO and real-activity earnings management.

Second, reporting of lower cost of goods sold through increased production increases production costs. Therefore, lower cost of goods sold through increased production has positive(+) relation with real-activity earnings management.

Third, because it is meaning to increase earnings through real activity to decrease discretionary expenses including advertising, R&D, and SG&A expenses, discretionary expenses have negative(-) relation with real-activity earnings management.

RAM_ Proxy's value itself means direction of earnings management. Exactly, if RAM_Proxy has positive(+) value, it means that manage earnings upward through real-activity. In contrary, value has negative(-) value, it means that manage earnings downward through real-activity.

But, we used absolute value of RAM_ Proxy to measure earnings management. It is because upward and downward management of earnings have same meaning in earnings management to auditor.

3.2.2 Measurement of Audit Quality

Audit quality is defined as the joint probability of detecting and reporting material financial statement errors (DeAngelo, 1981), which will partially depend on the auditor's independence. On the other hand, if audit reports are limited as an end result produced by auditors, auditors' opinion will be recognized as the audit quality depending on contexts.

However, it is difficult to measure audit quality using the above-mentioned definition; auditors' subjectivity prevents factors of audit quality from fair and objectively estimated ones. In addition, various circumstantial variables, such as the condition of contract between the auditor and the auditee, and the audit fee, etc., influence audit quality, it is almost impossible to measure this as the definition.

So, prior researches used several proxies to measure audit quality as follows: First, auditor's reputation can be a suitable proxy for audit quality. Auditor's reputation is essential for keeping current audit clients and attracting major new clients. Besides, auditor's reputation brings augmentation of audit fee, and can offer the auditee incentives to prevent or detect oneself frauds or errors. In summary, auditor's reputation has a positive relation with audit quality. Second, it is auditor's size. DeAngelo (1981) used the size of audit firm as proxy for audit quality. As an auditor's size grows bigger, economic quasi-rents of the auditor also increase; these rents are good things to be explained for the auditor's suitability and independence. As an auditor's size grows bigger, inputted costs (fixed costs) increase auditor's various experience and knowledge, and also increase economic quasi-rents. In other words, for an auditor whose economic quasi-rents are big, the possibility of fairly stated opinion becomes higher by the promoted independence; consequently, an auditor's size will be a good proxy for audit quality.

Auditor's size has various ways to be measured, like auditor's sales amounts and assets size, the number of auditees and total audit fees, etc., and the measurement cost is so inexpensive that it has excellent several conditions to be used as proxy for audit quality.

Third, it is possible to measure audit quality through the magnitude of earnings management. It is an unavoidable matter, due to the inherent limit of audit, that earnings management may be included partially in the financial statements although they were assured by external auditors. Nevertheless, the magnitude of earnings management that is included in the assured financial statements can be a basis to use as proxy for audit quality, for it will be possible that an auditor reduces earnings management by auditing efficiently and effectively. Generally, discretionary accruals are used to capture earnings

management. And Jones Model (1991) is used mostly to measure discretionary accruals, in which normal (non-discretionary) accruals are measured by time-series or cross-sectional analysis and the value of DAM is calculated through total accruals minus non-discretionary accruals.

Fourth, litigation risk can be a proxy for audit quality. Auditors are liable to be sued by many kinds of law. For it is necessary to protect information users who make their own decisions on the basis of the assured financial reporting by external auditors. As a result, auditors are needed to avoid litigation risk by performing higher-quality auditing. Litigation risk may be measured through the number of litigation cases.

Finally, there is a proxy such as the reliability of financial information. This is like logic of earnings management because the reliability of financial statements is assured by external auditors. The reliability of financial information can be measured by CAR of the ERC Model at the time of public announcement, analyst-expected information, or cost of owner's capital.

The purpose of this paper is to provide RAM as proxy for audit quality, and to prove the validity of RAM through comparing this with existing proxies for audit quality. So, in this paper we are willing to compare RAM with as many other proxies as possible. Existing proxies used in this paper are auditor's reputation (Big 4 or non-Big 4), auditor's size (auditor's sales amounts, assets, audit fees and audit hours, etc.), implied cost of capital, which is a measure of the reliability of the financial statements, and DAM, which is often used in the prior studies as a proxy of earnings management measured by Jones Model (1991).

When we compare DAM to RAM, although DAM just like RAM is used for the purpose of earnings management and DAM have an innate relationship with RAM, there may be some differences between them because of certain conditional variables of companies subject to external audit.[1] For this reason, we may have a high value for RAM against a low value for DAM, and vice versa. In conclusion, both are proxies of earnings management, but they have different characteristics and meanings; although they can be independently used as proxies of audit quality, it is meaningless to inspect the relationship between the two or to compare values of the two for a company. Therefore, it is appropriate to study in which cases DAM has different directions or values from RAM.

One weakness of recognizing RAM as a proxy of audit quality is that RAM will be an inadequate variable to influence the audit opinion of a company, if the manager claims that the decision-making of the management was inevitable to deal with change in the corporate environment in response to the demand of an auditor to disengage earnings management from real activities including the acceleration of sales by price discounts or relaxation of credit conditions and increase of production volumes or the ending of inventories, which of the manager are within the discretion of the manager.

And another weakness of RAM, as compared to DAM, is that, although we use total non-discretionary accruals in the financial statements inclusively to calculate the value of DAM (Top-down Approach), for RAM, we should separate out the abnormalities in every account and then sum them up to compute the value of RAM (Bottom-up

---

[1]The innate reason is that there is a negative (-) relation between CFO and accruals. On the other hand, according to the circumstances of clients, the relationship between DAM and RAM can have a positive (+) or a negative(-) value. For example, in the case of owner -managers, there is the possibility of making greater use of DAM which does not influence cash flow rather than utilizing RAM which has a negative influence on cash flow. We will explain again the relationship between DAM and RAM by undertaking additional analysis in Chapter 5.

Approach); there may therefore be the possibility of omitting some parts of RAM related to non-operating income or expenses. However, most auditors focus on three factors which make up the Roychowdhury Model, and RAM can be a means of capturing frauds and errors that might not be recognized using DAM. Consequently we consider that the utility of f RAM is adequate.

3.3 Regression Model

$$|RAM_{it}| = a_0 + b_1 PROXY\_AQ_{it} + b_2 \Sigma YR_{kt} + b_3 \Sigma IND_{jt} + b_4 LEV_{it}$$

$$+ b_5 \ln\_SIZE_{it} + b_6 GROW_{it} + e_{it} \ (7)$$

$|RAM_{it}|$: absolute value of real-activity earnings management in year t

$PROXY\_AQ_{it}$: proxy of audit quality in year t

YR_{it}: dummy variable set to 1 if the year is k year, 0 otherwise

IND_{it}: dummy variable set to 1 if the industry is j industry, 0 otherwise

LEV_{it}: debt to equity ratio in year t

$\ln\_SIZE_{it}$: natural logarithm of total assets

$GROW_{it}$: growth rate of total assets in year t

Predicted signs of variables are as follows:

Variables	PROXY_AQ							LEV	In_SIZE	Grow
	Fame	Size of Auditors				Credibility of	Size of			
	Auditor (1 if audited by the BIG4,	Sales Amounts	Total Assets	Auditing Hours	Auditing Fees	Financial statements (Cost of owner's	Discretionary Accruals (DAM)			

	otherwise 0)					equity)				
Predicted Sign	-	-	-	-	-	+	?	+	-	+

As auditor's reputation becomes higher, the value of RAM will decrease. For the auditor will try to decrease the degree of earnings management to elevate his or her own reputation.

In addition, we expect the magnitude of RAM will tend to decrease as the size of the auditor group increases, since the scale of an audit company or partnership is considered to elevate audit quality. As the cost of the owner's equity of an audited corporation increases, an increase in RAM is also to be expected because the information asymmetry between management and other information users gets larger, which results in a reduction in the credibility of the financial statements and makes it difficult to detect RAM, one of the causes making for asymmetries of information. In the above table, our expectation for the predicted sign of the size of discretionary accruals is a question mark. The reason is as follows: DAM and RAM are tools for \ the measurement of earnings management for accruals and for the measurement of cash flows from operating activities, respectively, which results in their innately negative (-) relationship. In many prior research papers, it was found that these two variables are negatively correlated (Zang, 2006, Cohen, 2008). But, when there is the possibility that the manager uses both DAM and RAM for earnings management, is not unreasonable to expect these two variables to have a positive (+) relationship.

Meanwhile, some variables like a term dummy, an industry dummy, the leverage of liabilities (LEV), the asset size of a firm (SIZE) and the growth rate of total assets

(GROW), all of which are considered to influence the size of RAM, are also included in this model as control variables. DeFond and Jiambalvo (1994) claim that if the debt leveraging is increasing, managers will tend to increase their reported income. According to Watts and Zimmerman (1986), the larger the size of a firm, the greater the likelihood of its being a political target; an increase in political costs provides managers with an incentive to underreport accounting profits. When deducing the size of the firm *(SIZE),* sales are usually used, but in this study, the logarithm of total assets is applied because t strong correlations exist between real activities manipulation *(RAM)* and sales amounts. Soonseok Yoon (2001) explained that if the growth rate of the firm *(GROW)* is high, managers will be inclined to report higher returns for tax purposes. We use the annual growth rates of total assets as proxies for growth patterns.

4. Results

4.1 Sample selection

The sample consists of all firms with available financial data from TS-2000 (Korea Listed Companies Association). The sample includes non-financial firms that are traded on Korea Stock Exchange and KOSDAQ. We exclude firms in the financial industry because accounting rules are different for these firms. And the sample includes annual data for firms covering years from 2003 to 2007. The final sample consists of 5,222 firm-year observations.

4.2 Empirical Results

4.2.1 Descriptive statistics

Table 1 represents the descriptive statistics of RAM and its components for the each year covered by this study. Contrary to our expectations, CFO has slightly positive coefficients. Coefficients of production costs (PROD) and discretionary expenses (DE) are positive and negative, respectively, which is consistent with our expectations.

Every component moves in direction consistent with RAM from 2003 to 2007, but the values of the coefficients do not keep up increasing or decreasing in the time series [as time goes by]; this indicates that the Accounting Reform Act, which was introduced in 2003, has hardly any influence on the size or direction of earnings management.

Panel A: Annual Descriptive Statistics of RAM

| | Components of RAM | | | | | | Total RAM | |
| | CFO | | Prod | | DE | | | |
Year	Average	Standard Deviation	Average	Standard Deviation	Average	Standard Deviation	Average	Standard Deviation
2003	0.035	0.197	0.842	0.641	-0.033	0.181	1.121	0.765
2004	0.791	4.046	8.961	31.46	-0.007	0.090	8.905	31.313
2005	0.081	0.378	1.234	1.313	-0.030	0.171	1.344	1.420
2006	0.030	0.213	0.866	0.657	-0.028	0.165	1.087	0.738
2007	0.010	0.199	0.824	0.647	-0.026	0.161	1.096	0.717

Panel B: RAM and Its Components

Description	Average	Standard Deviation	Min Value	Max Value
CFO	0.04572	0.14824	-1.03023	59.34589

RAM	1.00843	0.66321	0.01153	8.51596
DAM	-0.00063	0.21721	-4.75608	5.98581

<Table 1> RAM and Its Components, and Descriptive Statistics of DAM

Table 2 presents Pearson correlation coefficients between RAM and its components and DAM.

	CFO	PROD	DE	RAM	DAM
CFO	1	0.1261 (0.000)	-0.0016 (0.906)	0.1168 (0.000)	-0.1503 (0.000)
PROD		1	0.0039 (0.779)	0.9817 (0.000)	0.1244 (0.000)
DE			1	0.0071 (0.607)	0.0011 (0.934)
RAM				1	*0.1137 (0.000)*
DAM					1

<Table 2> Pearson Correlation Coefficients between RAM and Its Components and DAM

Zang (2006), Cohen and Zarowin (2008) argue that RAM and DAM are substitutes for each other from their finding of s strongly negative correlations between RAM and DAM. However, as can be seen from Table 2, RAM is positively correlated with DAM in the case of South Korea. This indicates that in Korea managers conduct earnings management making use of both DAM and RAM.

4.2.2 Analysis of RAM and a Proxy of Audit Quality

Table 3 displays regression coefficients for each item when comparing RAM with BIG4.

Variable	Intercept	PROXY_AQ (1 if audited by Big4, and 0 otherwise)	LEV	ln_SIZE	GROW	$\sum$Year	F Value	Adj. R^2	Number of Samples
Predicted		-	+	-	+				

Sign									
Actual	1.366	0.050	0.792	-0.06	0.01				
	(10.66)	(2.62)	(18.08)	(-8.37)	(42.06)				
Result	***	***	***	***	***	-	144.85	0.165	5087

<Table 3> Relationship between RAM and the Reputation of Auditors (Whether they are big4 or not)

We have results which have signs consistent with our expectations for the control variables of LEV, In_SIZE and GROW, and adjusted R-square is 0.161.In an analysis undertaken to examine the relationship between the reputation of auditors and audit quality, RAM and the status of auditors (BIG4 or not) are slightly positive correlated (0.005), which is to in contrast expectation and would lead to the rejection of the hypothesis that Big4 and RAM are negatively correlated. Possible reasons for this result are as follows: First, there may be limitations to the model we introduce. Or it may be possible that because of limitations of Roychowdhury's Model, we could not capture all of real-activity earnings management, which caused our results to contradict our expectations. Second, according to these results, because it is generally difficult to detect RAM as compared to DAM, Big4 cannot detect real-activity earnings management well. In fact, many cases of accounting fraud have been found in firms audited by Big4. This may be taken to imply that auditors, whether Big4 or not, pass over real-activity earnings management.

4.3 Additional Analyses

4.3.1 Additional Analysis of RAM's Components

(1) Comparison with Components of RAM

We analyze the relations between audit quality and three components that make up RAM, i.e. abnormal CFO, production costs and discretionary expenses. The results in Table 4are as set out below:

Variable	Intercept	PROXY_AQ (1 if audited by Big4, and 0 otherwise)	LEV	ln_SIZE	GROW	F Value	Adj. R^2
CFO	2.167 (37.73) ***	0.001 (0.17)	0.152 (8.82) ***	-0.090 (-29.60) ***	0.002 (20.03) ***	76.19	0.2924
PROD	0.969 (5.84) ***	0.095 (4.51) ***	0.614 (12.33) ***	-0.020 (-2.28) **	0.004 (14.03) ***	38.34	0.1702
DE	2.159 (44.96) ***	0.025 (4.12) ***	0.002 (0.18)	-0.097 (-38.27) ***	0.002 (26.25) ***	142.07	0.4397

<Table 4> Relationship between Components of RAM and Big4

The components of RAM and Big4 are positively correlated; for the Big4, we get higher values of RAM.

(2) Analysis of Including

Abnormal Cash Flows from Investing Activities within RAM As stated above, the value of RAM consists of abnormal CFO, production costs and selling and administrative expenses, which are components of the income statements. This means that although there may be some possibility of real-activity earnings management through items within the category of selling and administrative expenses in the income statements, these types of earnings management tend to be excluded. Therefore, to supplement to these facts in this study, we include real-activity earnings management, which is exercised through

within the category of selling and administrative expenses in RAM, and the equation of the model is as follows:

$$CFI_{it}/A_{i,t-1} = a_0[1/A_{i,t-1}] + b_1[Sales_{i,t-1}/A_{i,t-1}] + \varepsilon_{it} \quad (8)$$

In this above equation, it is implied that managers carry out earnings management by using acquisitions of assets like equipment and gains (or losses) on disposal of assets. We calculate expected CFI on the assumption that cash flows from investing activities have a linear relation with sales, and we deduct the expected CFI from the real CFI, which results in abnormal CFI (Ab_CFI) being included in RAM. The results are as follows:

Variable	Intercept	PROXY_AQ (1 if audited by Big4, and 0 otherwise)	LEV	ln_SIZE	GROW	$\sum$Year	F Value	Adj. R^2	Number of Samples
Predicted Sign			+	-	+				
Actual Result	1.833 (13.73) ***	-0.051 (2.62) ***	0.79 (18.18) ***	-0.04 (-5.89) ***	0.01 (26.60) ***	-	296.94	0.285	5087

<Table 5> Analysis of the Relationship between the Reputation of Auditors (Whether auditors are BIG4 or not) and the RAM Containing Ab_CFI

Although we include abnormal CFI, the robustness of our results is effective, i.e. the coefficient of Big4 is positively correlated with RAM. And, adjusted R-square is found to be 0.285 which is a higher value compared to the basic model.

5. Conclusion

Audit quality may be seen as combination of the possibilities that auditors may detect errors or frauds and one that they may report their findings in full. For the estimation of this the reputation or size of the auditors and the degree of earnings management are used as proxies for audit quality. In prior research studies, discretionary accruals have been used to measure earnings management, but this method is only a fraction of measurements of earnings management, which is irrelevant to cash flows of a firm. Therefore, in this study, we examine whether real-activity earnings management as an alternative to discretionary accruals can be used as a proxy of audit quality. We find that the reputation of auditors is positively correlated with the size of RAM. Meanwhile, DAM and RAM when exercised by managers tend in Korea toward a relationship that is complementary rather than one of substitution. This implies that that Korean managers tend to make use of DAM and RAM at the same in order time to adjust their earnings.

6.3 Social and Environmental Accounting
ETHICAL VALUES
AND CORPORATE SOCIAL RESPONSIBILITY
IN INDONESIA: AN EXPLORATORY STUDY

Ainun Na'im, Universitas Gadjah Mada

Abstract

Ethical values are important for accounting profession. The implementation of the values in the profession depends not only of the profession itself but also depends on the business communities. This study explores the existence of ethical values in Indonesian firms, based on the extent to which the firms disclose the values in their web sites.

Analysis of the contents of ethical values and orientations among Indonesian firms indicate that they have similar orientation toward customers, employees and stockholders. The differences are those between oil and gas and non-oil and gas industry where the latter have more attentions on the issues of environment and work safety. This indicates that different stakeholders require different approaches of the firms with respect to the ethical values and CSR. Compared to U.S. and global firms, Indonesian firms have similar ethical values and contents, especially with respect to general values, orientation to customers, employees and stockholders. The differences are that Indonesian firms provide more attentions to community and economic development, employment, and small business development. Further, Indonesian firms also focus on the issues of ethnic groups and less on gender issues, while competition has the least attention since market mechanism and Law on Fair Competition is just recently introduced in 1999.

Keywords: Business ethics, corporate social responsibility and Indonesian firms.

INTRODUCTION

This study intends to explore the extent to which Indonesian firms and firms doing business in Indonesia have formally codes of ethical values and conducts, and programs to enforce the ethical values and to fulfill the corporate social responsibility. The ethical values and corporate responsibility have been discussed in public media and have become one of the foci of attentions by social interests group and governmental institutions recently. The 1997 crisis and efforts to improve the economic recovery have been strengthening the public attention to the issue. Ethical values have been believed as important fundamentals for effectively applying the principles of good corporate governance and to improve the efficiency of the economy (Friedman 1970; Mulligan 1986).

Ethical values and social responsibility have become an integral part of human life. Both have a significant rule in order to appreciate human rights and become parameters to evaluate every activity. Human behavior is not only evaluated by the result, but also by the way to achieve it and their responsibility to others. Ethical values and social responsibility rely on this side. People, companies, and government need to implement ethical values and social responsibility in their every activity. Good corporate governance has known as a universal parameter to evaluate performance of companies. Ethical values and social responsibility are inherent in principles of good corporate governance that concentrate in company policies to pay attention to the rights of stakeholders.

The important of ethics has also been contended by Stewart (1996) that proposes the opinion of Thomas Hobbes that states that although the intention to

pursue self interest is obstructed by laws such as law for anti monopoly and environmental protection laws, still, everyone would be at war with everyone else. The impact of this is the emergence of uncertainty. People will always stay alert and they disbelieve to each other. However, Hobbes thinks that everyone is going to search a way out from the uncertainty condition considering that people live in a society. Hobbes proposes that such passion can incline men to peace and will encourage them to arrive at such ethical principal.

The government of Indonesia today has a concern to the implementation of good business practice. They start to encourage the companies in Indonesia to implement the principles of good corporate governance. Indonesian Capital Market Supervisory Agency as the regulator of capital market also encourages companies and institutions which business related to or listed in the capital market to apply the principles of good corporate governance.

There are a lot of studies analyzing the contents of corporate ethical values and codes in industrialized countries (such as those of Chatov, 1980; Centre for Business Ethic, 1986; White and Montgomery, 1980; Benson, 1989; and Sweeney and Siers, 1990). Similar studies in ethical values in developing countries like in Indonesia are very rare. This study may close the gap of literature in business ethics. This study is also important for policy making decision by regulators, mapping the development of ethical practice, and contributing to the business and economic research.

The rest of the paper is organized as follows. Section two discusses the concepts of ethics and the importance of ethics in business, and previous studies

in business ethics and corporate social responsibility, especially in identifying corporate values and codes of ethics. The research problem this study would like to answer is also provided in this section. Section three explains the research method, and section four discusses the results and analysis of the findings. The last section provides conclusion and suggestions for future research.

LITERATURE REVIEW

Literature on business ethics is fragmented where studies in the area have different and independent foci of interests. This section provides a review on some of the theories and studies to provide a basic figure about what has been done regarding research in business ethics, what determines ethical behavior, the importance of ethics and corporate social responsibility in business, and identification of values and codes of business ethics.

Concepts and Development of Business Ethics

Ethics is about right and wrong regarding a human behavior and decision. Ethical problems or problems whether a certain behavior is right or wrong are decided based on certain values. Values refer to beliefs upon which humans act by preference, and ethical values are prescriptive beliefs about what is "right" and "wrong" (Fritzsche 2005). Values are frequently associated with moral principles and standards, meaning that they are foundations and measures to judge whether a certain behavior or a decision is ethical or unethical. Values may be based on rules such as those prescribed by religious beliefs, rights principles (e.g.

human rights), and justice principles and are referred to as the deontological beliefs (or nonconsequentialist principles). Values may also be based on perceived outcomes such as utilitarianism that evaluate whether a decision results in maximum benefits for the largest number of people, and are referred to as teleological beliefs (or consequentialist principles).

Business ethical (decision) is the process of evaluation of behavior and decisions with respect to the moral values, standards and principles, either before or after the behavior or the decision is being made or executed. Even there are not always exact rules, either consequentialist and nonconsequentialist principles are used in business situations. Consequentialist principles evaluate a decision based on the results the decision has, while nonconsequentialist principles evaluate the decision based on certain rules. For example, Cavanagh (1990) cites six rights that he believes are basic to business activities: life and safety, truthfulness, privacy, freedom of conscience, free speech and private property. More specifically, Arrow (1975), pointing out the importance of truth in business, stated that, "virtually, every commercial transaction has within itself an element of trust." Another example, in financial service business, the firms insure the customers about their privacy, information about the products and consents. On the other hand, analysis of business decisions based on cost efficiency, the effects of the decisions on customers, share holders and community reflects the use of consequentialist principles.

Business ethics developed and implemented from various origins and settings such as cultures, religions, personal values, and profession or business

organization. Individual ethical behavior in business is determined by societal culture, organizational culture and his or her personal traits. The case of Lincoln Electric in the U.S. illustrates how the Christian values inspire the founder in enforcing ethical values in business (Anthony and Govindarajan 1998). The founder, James F. Lincoln wrote:

> "The Christian ethic should control our acts. If it did control our acts, the savings in cost of distribution would be tremendous. Advertising would be a contact of the expert consultant with the customer, in order to give the customer the best product available when all of the customer's needs are considered. Competition then would be in improving the quality of products and increasing efficiency in producing and distributing them; not in deception… Pricing would reflect efficiency of production….."

Studies in organizational and societal cultures indicate the influence of the cultures on ethical behavior. Based on Hofstede's cultural typology, Blodgett et al. (2001) found the positive effect of cultural dimension of level of uncertainty avoidance; and the negative effect of cultural dimension of power distance and individualism/masculinity on the ethical sensitivity toward the stakeholders. The effect of organizational culture on ethical behavior is provided by Victor and Cullen's (1987, 1988) studies. The study identified five ethical organizational culture/climate types: *instrumental* (maximization of self-interest on the individual or organizational level), *caring* (maximization of joint interests on all levels), *independence* (use of personal ethical principles), *rules* (use of organizational ethical principles), and *law and code* (use of ethical principles from outside the organization).

The importance of organizational culture in ethical decision is also described in Trevino's (1986, 1992) widely cited model of ethical decision-making in organizations. The model proposes that ethical decision-making is the result of an interaction between individual and situational components, with the individual's way of thinking about ethical dilemmas, being moderated by three individually-based moderators (ego strength, field dependence and locus of control) and three situational moderators (immediate job context, organizational culture and characteristics of the work itself).

A number of other empirical studies have examined the relationship between individual or personal values and ethical decision-making. Rosenberg (1987) examined the effect of managers' value systems on ethical decision-making behavior using a complex international management game to simulate a competitive business environment. He found that the personal value systems of managers were subordinated to the goals of the company and any conflict between the two was resolved on the basis of utility rather than on ethical or moral grounds.

The role of individual values on ethical decision is also examined by Fritzsche (1991, 1995) and Barnett and Karson (1987). Fritzsche (1991) developed a model of ethical decision-making incorporating personal values of the decision-maker. The personal values are dominant individual-level input into the decision-making process, which are mediated by organizational culture. Subsequent empirical work (Fritzsche, 1995) demonstrated the association of differing personal value systems with ethical and unethical responses to ethical dilemmas.

Barnett and Karson (1987) presented a series of vignettes to managers and found that, in most cases, the decision could be predicted by the personal values of the respondents, the exceptions to this finding involving relatively minor, everyday issues. They also found that the propensity toward ethical action appears to be situationally specific and is likely to decrease in situations where one's actions would not be discovered by others. Finally, those whose personal value systems were relatively more associated with economical than ethical or political issues were found to become more ethical as the level of responsibility increased.

The studies enrich others that have been developed earlier such as cognitive Moral Development (CMD) of Kohlberg (e.g. 1969) and Elm and Weber (1994). CMD describes an individual's general orientation towards solving moral problems. Based on a longitudinal study of American boys, Kohlberg identified that individuals' ethical behavior appeared to develop sequentially through six stages. The theory is extended to other cultural settings and subjects including those of managers with mixed results (Gilligan 1982 and Marnburg 2001).

The studies reviewed above provide valuable theoretical bases and development of theories and research in business ethics. However, they are only of limited value when it comes to efforts to apply ethical theory to real-life situations (e.g. Bowie, 2000; Cornelius and Gagnon, 1999). In this connection, Maclagan (1995) has suggested that business ethics research still need to recognize the complexity and disorder of real-life management practice and adopt methods of investigation, theoretical and conceptual frameworks that allow

for effective implementation of ethical values, in addition to analyzing the abstract concepts of philosophical ethics theory.

Business Ethics and Corporate Social Responsibility

Corporate social responsibility (CSR) is a concept related with but different from ethics. CSR is a concept meaning that the corporations are responsible for their activities that affect people, communities, and environments. To some extents CSR is related with business ethics when it concerns with issues such as human rights and the benefits and costs of a decision to people. The decision of CSR is dynamic, that it develops according the dynamic of development and complexity of business and economy (Pinskton and Archie 1996).

Friedman (1970) stated that, "there is one and only one social responsibility of business–to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, …… without deception or fraud (ethical values)." There is no controversy on the importance of compliance of business to ethical values and regulation, such that Friedman said. However, when come to the issues of social responsibility in more detailed measures such as degree of unemployment, inflation, environmental conservation, clean air and social welfare, there are two different views from an extreme profit oriented, private property and free market view without paying attention to social issues, to the other extreme view that look a firm as a member of society and has social duties as other members of the society.

The first view, profit oriented, private property and free market view argue that the issues of social responsibility belong to the government (politicians) and politician who have duties to collect taxes, to redistribute wealth, and to take care of public goods and services. The government is elected by public and should be responsible for the social issues to the public. The CEOs, management of the firms, are elected by shareholders and should be responsible to the shareholders for making profit. It is unfair for the CEOs to be responsible for social issues, because it is the duties of government.

The other view (corporate social responsibility) looks social actions by firms as integral element of the firms' strategic and operational business management and do not conflict with the duties of the firms to the shareholders (Mulligan, 1986). The role of management in social issues is part sound management practices. The firms have activities such as purchase, production, and sales to achieve their business goals. The activities involve directly and indirectly community members like labors, investors, consumers, government and others. These communities are known as stakeholders for the firms meaning those have interests to the firms. The importance of corporate social responsibility is to maintain the firm relationship with these stakeholders and to achieve the firm long term growth.

The corporate social responsibility view sustained, as studies indicate the positive relationship between levels of firms' implementation of social responsibility duties with their performance. A press release in January 12, 1999 reported that Domini 400 Social Index (DSI) gained 7.5% in December, greater

than that of S&P that gained 5.82%. On annual basis, DSI resulted in total returns of 26.08%, outperformed S&P that had 24.07% in 1998. DSI is a market-capitalization-weighted common stock index that includes 400 corporations that pass multiple, broad-based social screens. DSI serves as a proxy for the universe of stocks from which social investors might choose and as a benchmark for comparison with unscreened universes.

The importance of ethics and social responsibility is more prevalent for certain industries such as those operating in sensitive environments and community development. Firms in chemical industry, oil and gas and energy should pay attention to issues relating to safe environment and natural conservation, otherwise they may be sued for environmental problems. Similarly, a firm operating in a remote and undeveloped area where the community is still undeveloped and very traditional such as in Papua (Indonesia) should have a community development program to hinder social unrest. The experience of Freeport Indonesia indicates the importance of this issue. The company failure to address social and economic problems of the community where the company operates (copper and gold mining) results in social unrest that disturbs sustainability of the company.

Corporate social responsibility is also important for promoting long-term profitability of business. Firms' social initiatives such as donations for educational programs and other public facilities and benefit became investments for them. The case of Barlow et al. v. A.P. Smith Manufacturing (1951) in Post et al. (2002) illustrates the impact of company social program to their long-run profitability.

Furthermore, firms grow in parallel with their responsiveness to social issues, adopt principles of corporate citizenship, and apply quality standards that include firms' awareness to social and ethical issues (Ackerman and Raymond 1976, Davenport 1999, and Global Reporting Initiatives 2006). More specifically, Clarkson and Deck (1992), based on data on corporate ethics and CSR indicated that corporate focus on ethical values, CSR and stakeholders' interest are important for their economic and social performances. Without the balanced social performance, the data showed that the corporations will not achieve above-average profits.

Corporate Ethical Values, Codes and Social Responsibility

Implementation of ethics in business has been enforced in all functions such as accounting, finance, marketing, production, and human resources, at national and international levels. The issues being addressed are also widely spread into economic development, technology transfer, regulatory action, employment, human rights, environmental protection, consumer protection, and political action. Various international organizations and authorities put their efforts to develop ethical codes to be complied by multinational business. These organizations include International Chamber of Commerce (ICC), Organization for Economic Cooperation and Development (OECD), International Labor Organization (ILO) and United Nations on Transnational Corporation (UN/CTC).

For certain functions of business such as accounting and finance, ethical values are enforced formally through the accounting profession codes and

standards. These codes include values such as integrity, objectivity, independency, professional due cares. These codes of ethics are recognized either at national as well as international level of the profession association.

Numerous studies have examined the extent to which corporations implement ethical values and corporate social responsibility (CSR). One of the most recent studies is that of Snider et al. (2003). They examine the extent firms communicate their commitment to CSR to their stakeholders. They analyze qualitatively the legal, ethical and moral statements of the sample firms in Forbes Magazine's top 50 U.S. and top 50 multinational non-U.S. firms. Based on stakeholder theory, they reveal that U.S. and multinational non-U.S. firms concentrate their attention on a similar set of stakeholders and have approximately the same CSR issues. Both set of firms share CSR messages in similar manners and act similarly in their use of general value statements, orientation to satisfy customers and to meet their stockholders expectation, and concerns to (local, national and global) society.

The study found that the U.S. based firms give more explanation on diversity issues in employment and commitment to work-life balance to attract and retain employees. The firms provide a broad and flexible leave policy and focus more explicitly on work safety than non-U.S. firms. The study also found that competitors are the stakeholder group which gets the fewest number and variety of CSR messages. In this issue, fair competition is the most common message the firms deliver.

The current study extends the previous studies, especially that of Snider et al. (2003) by examining the firms doing business in Indonesia. The implementation of ethical values are identified based on the firms explanation of the values in the forms of general value statement, codes of conducts, code of practices, enforcement systems and firms' achievements in ethics and CSR.

RESEARCH METHOD

This research uses secondary publicly available data at the company websites. The sample consists of firms listed in the Jakarta and Surabaya Stock Exchange whose web sites are available at January 2006. The sample also uses firms operating in oil and gas business, registered at The Government Agency for Upstream Oil & Gas Business for oil and gas companies (BP Migas-GAOG). The reason for including firms in the oil and gas industry is that industry has high sensitivity to ethical and social issues, while at the same time it also provides significant contribution to the country economy.

There are several reasons for the use of websites of the firms as the sources of data. First it is convenient, and it has been used for some previous studies. Second, the web sites are widely used by the firms to communicate important information to stakeholders. Third, the web sites have been used by the business community to access information, and fourth, the websites can be updated and accessed more quickly and timely.

I Identify 426 listed firms in various industries in services including financial services and banking, manufacturing, mining and oil and gas, and 44 non-listed

firms operating in oil and gas business registered in The Government Agency for Upstream Oil & Gas Business (hereafter GAOG). Each firm is coded based upon the following information: (1) Name, legal establishment, status as local, multinational, private of state owned companies., (2) Industry the companies do business, including firms in financial services, (3) Ethical values stated in their vision and mission, and natures of the values, (4) Codes of conducts and codes of practices the companies apply, and (5) Enforcement system of the values and codes, and (6) Awards and achievements the firms have had.

The natures of the values are then categorized into the orientation of the values as follow: (1) general ethical value statement, (2) values oriented to environmental issues, (3) values relating to customers, (4) employees, (5) stockholders, and (6) communities either at local, national and global level. General ethical values are defined as universal ethical values such as those relating to human rights, personal freedom, honesty, trust and unfair discrimination. Other categories of values are relating to specific group interests such as employees, customers, stockholders, and environment.

Codes of ethics are statement of mission, purpose, or vision, usually in the forms of normative standards, used by the firms in controlling and evaluating their business activities. Codes of conducts more specifically state the rules that managers and employees must (or must not) do. Codes of conducts usually consist of a list of rules, stated either affirmatively or prohibitively (Clarkson and Deck 1992). Codes of practices are interpretation of corporate ethics in more

operational ways; it functions as guidelines for employees in making decision or performing certain activities.

The information is analyzed qualitatively and descriptively based on the similarities and differences among industries with regard to the ethical orientations, and the extent to which social issues are being addressed by the firms in the industries. Stakeholder theory is used for the identification of the social issues being addressed by the companies.

RESULTS AND DISCUSSION

Ethical Values, Codes of Conducts and Codes of Practices by Industries

The results indicate that for listed firms in Jakarta and Surabaya Stock Exchange, 165 firms (60% from firms observed) express the company ethical values in their vision and mission statements, 75 firms (27%) states the codes of conduct in doing their business, 75 firms (27%) states the codes of practices, 35 firms (13%) states their enforcement system for ethical values, and 77 firms (27%) report that the companies have achievement and awards relating to their compliances on ethical values and corporate social responsibility. This finding indicates that the firms had been realized the importance of the ethical values (as shown by the greater percentage of firms expressing their ethical values), but lack in implementation of the values and corporate social responsibility.

Oil and gas firms registered in GAOG have different pattern. The number of firms who state their ethical values in their vision and mission and codes of conducts is 17 out of 30 firms (56%), while the number of firms who state the

code of practices and enforcement is 25 (83%). This may be explained that firms in oil and gas industry tend to have code of conducts and practices because they are relatively more regulated, especially with regard to safety, environmental issues and community development. Thus the industry practices (with regard to ethical values and CSR) are more driven by rules and regulation instead of their corporate values. In summary, the data are presented in table 2 below.

Natures of Ethical Values, Orientation to Environment and Other Stakeholders

The current study also identifies the natures of the values and corporate social responsibility, whether they are general value statement, orientation toward environment, interest of stockholders, employees, competitors, society, local, country and global issues. The result is presented in table 3. The finding indicates that 84 firms (31%) states general value statement, 67 firms (24%) express their values oriented to environment, 165 firms (60%) provide value statement relating to the interests of costumers, 137 firms (50%) relating to employees, 98 firms (36%) relating to the stockholders, 24 firms (9%) relating to the competitors, 74 firms (27%) relating to the interests of local society, 65 firms (24%) relating to the society at national level, and 11 firms (4%) relating to the society at global level.

The data indicate that most of the firms pay attention to their customers, while the number of firms who express their value orientation to global issues and competition issues are the least. The reason for the fewer firms pay attention to competition issues is that fair competition, i.e. regulation for fair competition and

antimonopoly has just been recently applied. The lack of firms who pay attention to international issues is because of that the firms are probably more exposed to local issues relatively. Social, regulatory and economic reform in the country may absorb their attention more than the international issues.

Comparing the two groups of firms, it is interesting to note that there are more oil and gas firms expressing their orientation toward the environment, employees, and local community (76% - 84%), and less oil and gas firms expressing their orientation toward customers (53%), than the non-oil and gas firms do. The social exposure of the oil and gas firms explains this. The oil and gas industry is more sensitive to environmental and community development issues than that of other industries. Oil and gas firms also usually operate in remote areas with least infrastructures, so that they should build them. The remote areas also have less economic development so that the companies should consider this to reduce the social risk.

Analysis of Ethical Values, Codes of Conducts and Code of Practices and CSR Programs of Specific Firms

The sample firms express general ethical values relating to truth, honesty, integrity, professionalism, excellences, keeping promises and benefits to the society. For examples, PT Abdi Bangsa, a publishing company that publishes daily newspaper 'Republika', states that they intend to put universal values as

priority in their business. PT Antam, gold, nickel and mineral mining company states: "We want to shed the image of a closed-door state-owned company by providing as much information about the company as possible. Our goal is high transparency and disclosure to allow our shareholders to make well-informed decisions." This statement reflects the efforts of the company to build trusts. Asahimas, a glass manufacturer, depicts their values from numerous of values living in the company, which is described further based on the Company's corporate culture i.e. pioneering and cooperation spirit, honesty, integrity and creative thinking. Eventually, the Company formulates its Mission and Vision as: "To Build the World a Better Place for Living."

Astragraphia, a company in information technology industry, states about their work ethics they intend to pursue as follow:

- Customer Satisfaction. Customer satisfaction spirit is implemented thoroughly within the whole internal process at Astragraphia Document Solution.

- Professionalism, Joy and Fulfillment. Devouring each working process as the center of inspiration and put perfection in quality in all the service and products, first.

- Team Work. Reward individual performance to build a more solid and synergic team work.

- Business Innovation. Always becomes the pioneer in maximizing knowledge and technology through practical approach as the base of the development of our product and service.

- High Ethical Standard. Implement a high ethical standard within working environment.

- Social Responsibility. Develop knowledge as our backbone through intensive educational training.

Astra Agro Lestari, a firm in plantation industry committed to the development of the country and work ethic. The company states that "Any individual belonging to Astra Agro Lestari is expected to uphold the Planters Culture, a work ethic representing our true spirit. It consisted of Honesty and Responsibility, Discipline, Working Fanatic, Care, Control, Supervision and Esprit de Corps". In 2002, we then added and emphasized on Innovativeness.

The firms in banking industry emphasized their values on their commitment to fight against money laundering and illegal banking, consistent with the country campaign against corruption and unethical and illegal business practices. The industry is publicly exposed for their problems in high non-performing loan and degree of compliance to regulation, problems that become one important factor causing the crisis in 1998.

Commitment to education is expressed by several companies such as Sampoerna, PT Hero Supermarket, Bank Niaga, and Aqua Golden Mississippi. They have CSR programs in providing scholarship to students and cooperation with schools and universities. In oil and gas industry, firms are driven by the government regulation to allocate their budget for educational and community development.

Commitment to develop and partnership with small business is mentioned by Bank Danamon, Bukopin, BRI, PT Hero Supermarket (reporting that the firm has more 500 small business firms operating in their supermarket), and Unilever Indonesia. Commitment to develop small business, in addition to meeting their ethical duty, also relates directly to their business objectives. For the banks, commitment to the small business is related to their selection and their focus on the small business consumers, while for the trading firms, this may relate to their business strategy.

Firms in cement industry such as PT Semen Gresik and Indocement state that they support the country industrialization, economic development, improving employment and clean environment program. More specifically, Indocement states that, "Indocement is committed to the idea of a sustainable cement industry which centers around economic growth, ecological balance and social progress. A concrete manifestation of this commitment is the Clean Development Mechanism (CDM) project that Indocement has undertaken in cooperation with Prototype Carbon Fund (PCF), a pioneer in the market for project-based greenhouse gas emission reductions within the framework of the Kyoto Protocol. This represents the first undertaking of its kind in Indonesia, and one of the first in the cement industry throughout the world." As explained in their website, to support the CDM, the company applies Clean Energy Technology, uses alternative materials to reduce clinker that eventually reduces the consumption of energy and decarbonation, applies Energy Diversification and Conservation with

alternative fuels to reduce the consumption of fossil fuels, and substituting coal with biomass and other wastes.

A mining firm, International Nickel Indonesia (PT Inco) has similar tones of ethical values and CSR as that of Indocement, with the difference in that PT Inco also indicates a close relationship with educational institutions for their community educational development program, and their concerns with and programs in community (public) health.

With respect to the rights of consumers, employees and stockholders, the sample firms in general provide similar ethical statements. For the customers, they attempt to deliver quality and competitive products and services, timely delivery, accuracy of information, satisfaction and long-term relationship. For the employees the firms intend to provide safe working environment, teamwork, trust, and respect, health, safety and clean environment program, and respect the diversity. For the shareholders the firms promise for high returns and economic values, transparency and reliable information.

In term of diversity among the employees, Lontar Pulp and Paper a part of Asian Pulp and Paper state the following:

> "Many people representing different ethnic, racial and language groups have made the APP their employer. An environment that welcomes and encourages the benefits of diversity often increases profitability and productivity in business. Hence, the diversity in the company is a tremendous asset. Valuing all employees as unique individuals leads to a more productive and fulfilling work environment. Here at APP, we embrace and celebrate the unique qualities of our employees including race, gender, age, religion, disability, sexual orientation and national origin. We also recognize that our company is

enhanced by employees' various opinions and viewpoints. Diversity enriches our work environment and results in our being able to better meet the needs of our customers and our shareholders. We value the diverse contributions of all people, regardless of their position, sexual preference, family status, age, race, sex, disability, religion or national origin. All employment practices are based on ability and performance. We understand the value of diversity in our workforce and actively seek opportunities for incorporating diversity within our company".

It is interesting to note about the extent APP presents their ethical values and CSR because, while the company seems to intend to commit to ethical values and CSR, at the same time the company has serious financial problem especially with their debt holders. This indicates two important issues: first, that the effectiveness of ethical vision of a firm is complex, and second, debt-holders is a group of stakeholders the firms should also concern.

In summary, the contents of the ethical values and codes of the sample firms are as the following.

- General ethical values: truth, honesty, integrity, professionalism, justice accountability, transparency, excellences, and keep promises.

- Environments: concerns to clean environments, public health, minimize environmental damages, comply to certain standards (emission level, decarbonation, energy consumption and alternatives, and efficiency).

- Customers: satisfaction, quality, price, delivery, relationship, excellences, understand their expectation.

- Employees: safety, continued education and skill development, reward and motivation, respect and value diversity (among ethnic groups), and equality of opportunities for minorities.

- Stockholders: returns, economic value added, shareholder welfares, transparency and accountability.

- Competitors: partnership and legal compliances.

- Community: economic development, partnership and development of small business, employment, education and human resources, public health, fighting against poverty.

CONCLUSION, LIMITATION AND EXTENSION OF THE RESEARCH

I conclude the analysis of the ethical values and codes of the sample firms as follow:

- There are similarities among firms and industries in the contents of ethical values and orientations of the values for customers, employees and stockholders. However, there are also differences in focus between oil and gas and non-oil and gas industry relating to the environment and work safety, where the latter have more weights on the issues. This indicates that different stakeholders require different approaches of the firms with respect to the ethical values and CSR.

- Compared to studies using U.S. and global firms (Snider et al. 2003), Indonesian firms have similar ethical values and contents, especially with

respect to general values, orientation to customers, employees and stockholders.

- There are differences where Indonesian firms provide more attention to community and economic development, employment, and small business development. In term of diversity, Indonesian firms focus on the issues of ethnic groups and less on gender issues.

- Competition has the least attention since market mechanism and Law on Fair Competition is just recently introduced (1999).

The limitations of this study rests on two aspects: first, he use of websites as the data source may under- or over-value the ethical perspective of the firms. Second, codes of conducts and practices may not be well explained and well presented in their websites, even though the firms have and implement the codes. The limitations of the study can be resolved by extending the study. Specifically this study may be extended by using more systematic and statistical methods to identify the ethical variables and organizational, economic and cultural variables. Other approaches are using other sources and methods of data collections such as survey, news and direct observations.

STAKEHOLDER ENGAGEMENT: THE RELATIONSHIP BETWEEN CORPORATE SOCIAL RESPONSIBILITY, CORPORATE STRATEGY AND FINANCIAL PERFORMANCE IN AUSTRALIAN FIRMS

Ainul Huda Jamil & Kate Harris
University of Adelaide

Abstract

There has been limited research in Australia that examines the relationship between corporate social responsibility (CSR), corporate strategy and financial performance. This study is based on some international studies that have used stakeholder theory to develop management models to test these relationships. Using Australian data, the results provide support for the proposition that managers engage with stakeholders in order improve financial performance, and that it is beneficial for companies to take into account their responsibility towards stakeholders in their strategy to better the fiscal position of the company. There was no support for the intrinsic management model. Corporate strategy was found not to mediate the relationship between corporate social responsibility and financial performance which suggests that companies which engage with stakeholders do so to maximise the firm's profitability, rather than for ethical reasons.

Introduction

Corporate social responsibility (CSR) is based on a concept which recognises that companies are responsible for their social and environmental effects and should consequently seek to manage and monitor those effects. Patricia Russo, CEO of Alcatel-Lucent has stated that "Corporate Social Responsibility is part of who we are and how we do business every day"[350]. The idea of 'who we are and how we do business is consistent with the concept that corporate social responsibility has a close relationship with the stakeholders of the company. Stakeholders

---

[350] Reported in the press release on http://www.alcatel-lucent.com

are increasingly demanding that companies be accountable for their actions and companies are responding to those demands.

A firm's business strategy is a scheme for handling the firm's relationships with the environment in which it operates. All firms are part of a rich network of relationships. To be socially responsible, companies should engage with the stakeholders ensuring that relationship with the stakeholders is part of their business strategy.

According to Hutton (2000) and Curran (2006); over the course of nine years, Members of Parliament in the UK have changed their priorities when making judgements about a company. The trend shows that social responsibility is considered as a relatively more important attribute than financial performance (Curran, 2006). Recent research also suggests that there is a positive relationship between a company's CSR actions and consumers' attitudes toward that company and its products (for example Brown and Dacin, 1997; Creyer and Ross, 1997; Ellen, Mohr. and Webb, 2000 and Sen, 2001).

Furthermore, Berman, Wicks, Kotha and Jones (1999, p. 489) argued that a company's engagement with stakeholders plays an important role in corporate decision making and hence corporate strategy. Corporate social responsibility in some way influences a company to shape its strategy that is best for all stakeholders in order to maintain the performance and reputation of the company. Thus, corporate strategy is significant for the firm financial performance and complements its corporate social responsibility.

Two possible motivations for stakeholder engagement are considered. Firstly, firms engage with stakeholders in order to achieve firm objectives, including performance objectives – the instrumental approach – and secondly firms see stakeholder engagement as a moral commitment rather than a means to improve financial performance – the intrinsic approach (Donaldson and Preston, 1995, Berman et al, 1999).

This study uses the Dow Jones Sustainability World Index (DJSI World) as a proxy for corporate social responsibility and stakeholder engagement to investigate the relationship between

corporate strategy, stakeholder engagement and financial performance. A sample of Australian firms with a DJSI World ranking are used to test these relationships. Such a study has not been done using Australian data. The direct relationship between the variables and financial performance, as well as the effect of the interaction between CSR and strategy on financial performance test the proposition that the motivation for stakeholder engagement is to improve financial performance. If ethical considerations motivate stakeholder engagement, then corporate strategy will mediate the relationship between CSR and financial performance (Berman et al, 1999). This proposition is also tested.

The was a strong positive relationship between CSR and financial performance, consistent with some previous studies (for example Berman et al, 1999, Tsoutsoura, 2004), and the interaction between corporate strategy and CSR affects financial performance, and the relationship is more complex than the direct effects. There was no support for the intrinsic or ethical perspective of stakeholder engagement. Thus it seems that managers engage with stakeholders because of the effect this can have on financial performance. This is consistent with the perspective of Friedman (1970) who argued that social responsibility of firms is to increase profits.

The remainder of the paper is organised as follows; A review of the literature precedes a section on hypothesis development, followed by a discussion of the research method and data collection. Next, the results are discussed, and lastly the conclusions from the findings of this study.

Prior Research

Nowadays, there is greater demand for corporations to be socially responsible. "More and more business leaders recognize that their company's future is increasingly tangled with the needs and demands of society. What many executives don't understand is how best to manage that changing relationship" (Stanford Social Innovation Review, 2007, p. 2). Today, the world's entire top multinationals are engaging in corporate social

responsibility (CSR) in some form and there are few countries in which businesses have not taken up the challenge of CSR in some way (Hennigfeld, 2006). Thus, CSR is one of the key global challenges for today's business leaders.

A global reporting survey conducted in 2004 by the Association of Chartered Certified Accountants and Corporate Register found that the number of corporate social, environmental, and sustainability reports increased from fewer than 100 in 1993 to more than 1,500 in 2003[351] (ACCA Global, 2004). This significant increase in companies' disclosures is due to increasing demand for companies' social and environmental performance from customers, investors, and a wide range of other stakeholders. Failure to meet stakeholder demands can impact detrimentally on a firm.

CSR is most frequently defined as a concept whereby companies integrate social and environmental concerns in their business operations and in their interactions with stakeholders on a voluntary basis (European Commission, 2002). Companies which conform to CSR are not merely satisfying legal expectations, but also going beyond compliance and investing 'more' into human capital, the environment and the relationship with stakeholders. Freeman (1984, p.25) defines a stakeholder as "any group or individual who can affect or is affected by the achievement of the firm's objectives".

Hennigfield et al (2006) suggested that in order for a company to achieve complete incorporation, transparency and efficacy, and to make significant contributions to sustainability, activities need to be integrated strategically into the organizational structure of the company. More specifically, CSR involves a business identifying its stakeholder groups and incorporating their needs and values within the strategic and

---

[351] Survey done by Association of Chartered Certified Accountants (ACCA) and Corporate Register

day to day decision making process of the company. This links CSR with stakeholder theory and the strategic management of an organisation.

Stakeholder Theory provides a framework for investigating the relationship between corporate social performance and corporate financial performance (Ruf, 2001). Stakeholder theory posits that firms possess both explicit and implicit contracts with various stakeholders, and are responsible for honouring all contracts (Freeman, 1984; Donaldson and Preston, 1995; Ruf, 2001). It is concerned typically with how the organization manages its stakeholders. Fulfilling the needs of various stakeholders may involve consideration by the company of economic, social and environmental criteria.

Friedman (1970) argued that 'the social responsibility of business is to increase its profits'. He protested against the notion of the emerging social responsibilities of corporations to act in the best interest of other stakeholders, not just shareholders or investors. He also argued that acting for the benefits of other stakeholders represents a betrayal to the special responsibility of the firms to their shareholders, and thus symbolizes a theft of the shareholders' money.

However, Freeman (1984) provides two reasons to support the importance of other stakeholders. Firstly, investors or shareholders are not the only group that has a legal interest in the corporation. Companies have lawful, compulsory contracts with employees, suppliers, or customers, and also to the society as a whole. Secondly, it was argued that if we consider the problems of negative externalities, we would find that it is not only investors that are affected, but also the employees, customers, suppliers, the environment, government and many more stakeholders. For example, pollution released by a factory that spoils the surrounding environment affects the health of nearby residents and of the natural environment.

Stakeholder engagement is therefore an essential capability for companies that wish to be socially responsible. Given that socially responsible companies aim to identify and

manage their social impacts they need to ensure that managers in all parts of the organisation have the ability to recognise and deal appropriately with all the stakeholders of that organisation.

Stakeholder engagement is an integral part of a company's effort to align its CSR strategy with its business strategy. It is perhaps an often overlooked function of CSR, yet one that is critical to the success of an organization's sustainability strategy.

Firms with proactive environmental strategies tend to engage and respond to a wider range of stakeholders as compared to firms with reactive strategies that tend to respond to pressure mainly for regulators and stakeholders on whom they are resource dependent. The capability of integrating knowledge from stakeholders such as suppliers and customers will help firms design products with the certainty of an acceptable environmental impact (Hart, 1995).

Thus there is a clear link between stakeholder engagement and CSR and the business strategies of the organisation. Ullman (1985) outlined a framework based on the stakeholder approach to a strategic management. Further, Bryson (1995, p.10) has stated that 'Strategic planning is a formal process that is the cornerstone of a strategic management system. A strategic planning process involves mission verification using stakeholder analysis, clarification of organizational commands, systematic assessment of an organization's internal and external environments, identification of strategic issues, strategy development, and development of an organization's vision statement". Through strategic management, organizations could improve their engagement with stakeholders, so as to achieve business success. "Doing well by doing good" is the famous slogan used by researchers to introduce the importance of corporate strategic management for firms that have a social responsibility to achieve some larger social goals, and can do so without a financial sacrifice (Karnani, 2007).

One component of strategic management is the corporate strategy. Corporate strategy is principally about the choice of direction for a firm as a whole and the management of its business or product portfolio. Corporate strategy deals with three key issues facing the

corporation as a whole. First, *Directional Strategy* that is the firm's overall orientation toward growth, stability, or retrenchment. Second, *Porfolio Strategy* is concerned with the industries or markets in which the firm competes through its products and business units and lastly, *Parenting Strategy* the manner in which management coordinates activities and transfers resources and cultivates capabilities among product lines and business units (Wheelen and Hunger, 2008, p. 164). Examination of these three key issues suggests stakeholder engagement is important in developing corporate strategy. Corporate strategy can provide the business with a spring for sustainable competitive advantage. The strategy must be acceptable to the wider environment and society in which the firm competes to ensure the sustainability. Preferably, leaders should address stakeholder concern in methods that brings strategic benefits for the firm. CSR is not about things that are unrelated to a firm's operations. Instead, CSR is about the economic, legal, ethical and discretionary issues that stakeholders view as affecting the firm's performances and actions (Werther and Chandler, 2006, p. 10). Therefore integrating CSR into corporate strategy is one of the important elements in maintaining corporate sustainability. Barton (1987) argued that top management must incorporate more than economic goals; they must recognize the multifaceted region of the firm and the resultant implicit multiple social and behavioural goals. Success is not assured solely by achievement of shareholder wealth maximization, but through the arrangement by management of major factors that have an impact on the firm (for example management values and aspirations, environmental threats and opportunities, and values imposed by society at large) in order to achieve the specific goals of the organization (Andrews, 1980; Barton, 1987). If strategic benefits result from engaging with stakeholders and incorporating this into corporate strategy, then it might be expected there would be a positive link between corporate strategy, stakeholder engagement and firm performance.

The perspective that firms engage in stakeholder engagement because of the positive impact it may have on firm performance is related to the 'organised centred' perspective of stakeholder theory that considers the diverse stakeholder groups in society, and how best the firm can

managed to meet the organisation's goals (see for example Gray, Owens and Adams (1996).

From a similar perspective – the instrumental perspective - Donaldson and Preston (1995) focus on the proposition that stakeholder management will lead to better financial performance. Both these perspectives see stakeholder management as important in furthering the interests of the organisation. This conforms to Friedman's (1970, 32) position that "the social responsibility of business is to increase its profits".

An alternative perspective of stakeholder theory is corporate accountability which can be tied to a 'normative' or ethical perspective. For example Gray, Owens and Adams (1996) have argued that society has a right to be informed about a corporation's operations that could impact on that society – that it is accountable to that society for its actions. Donaldson and Preston (1995) and Bermann et al (1999) have labelled this an 'intrinsic' approach to stakeholder commitment. Each group of stakeholders has worth, and the interests of one group of stakeholders (for example shareholders) should not predominate. In other words, a firm should not manage the needs of a group of stakeholders in order to further their economic performance, but because it is the intrinsic right of all stakeholders to be treated fairly.

These two perspectives of Stakeholder Theory form the basis for the development of the hypotheses.

Hypothesis development

Proponents of CSR claim that it is in the enlightened self-interest of business to undertake various forms of CSR. The forms of business benefit that might accrue would include enhanced reputation and greater employee loyalty and retention (Moir, 2001, p. 17). According to Waddock and Graves (1997), Berman et al (1999) and Tsoutsoura (2004), a further benefit of CSR is the positive association with corporate financial

performance. This implies a direct effect on financial performance of stakeholder engagement and is consistent with the proposition that firms engage with stakeholder groups to further the interests of the organisation. This leads to the first hypothesis:

H1: Corporate Social Responsibility (CSR) performance has a positive association with corporate financial performance.

Empirical evidence suggests that firm strategy is important for enhancing financial performance (Barton,1987; Youndt, Snell, Dean and Lepak, 1996), implying a direct effect on financial performance of firm strategy. Consistent with the above argument, the second hypothesis states:

H2: Corporate Strategy has a positive association with corporate financial performance

CSR is a key element of business strategy. Integrating both CSR and business strategy will enhance the performance of companies (Berman et al, 1999).

Strategy theorists such as Andrews (1980, p. 29) identified the relationship between corporate strategy and "the economic and *non economic* contribution [the firm] intends to make to its shareholders, employees, customers, and communities". This implies corporate strategy has a relationship with both CSR and financial performance. Based on prior literature (for example, Berman et al, 1999), both CSR and corporate strategy have some effects on financial performance. By integrating economic, social and environmental responsibility in firm strategy a stronger firm financial performance could result (Karnani, 2007).

Merging CSR and corporate strategy reflects the interactions between both CSR and strategy. They are believed to complement each other. Thus, this study investigates whether, by integrating CSR and corporate strategy, there will be a positive impact on

financial performance. The third hypothesis is based on the above argument and is stated as:

H3: The integration of CSR and Corporate Strategy has a positive impact on financial performance

The studies that examine the relationship between CSR, Corporate Strategy and Financial Performance have found a mixed results. Hills and Snell (1988) recommended the importance of studies which address the issue of how corporate strategy might be a mediator in the relationship between CSR and financial performance. The mediation effects of corporate strategy on the relationship between CSR and financial performance is based on the *Intrinsic Stakeholder Commitment Model* (Berman et al, 1999). They argued that the interests of stakeholders have intrinsic value, enter a firm's decision making prior to strategic considerations, and form a moral foundation for corporate strategy. This means that CSR would not have direct impacts on the financial performance. According to Berman et al (1999), the intrinsic stakeholder commitment model means a firms's commitment to corporate social responsibility is based on moral principles rather than on a desire to use stakeholder engagement solely to maximise profits. In short, a firm establishes certain fundamental moral principles that guide how it does business (i.e. how it treats stakeholders) and use the principle to drive corporate strategy (Berman et al, 1999, p. 492).

The mediation effect of firm strategy on the relationship between CSR and financial performance is expressed in the fourth hypothesis:

H4: Stakeholder engagement will drive corporate strategy, which in turn will affect firm financial performance.

Research design
Sample and data

This study focuses on the companies that are publicly listed on the Australian Stock Exchange (ASX).The sampling period is for four fiscal years from 2004 to 2007. Since there are no government regulations that make corporate social responsibility reporting compulsory, the selection of companies depends on the companies also being listed as a member of the Dow Jones Sustainability World Index (DJSI World), which is used as the measure of corporate social responsibility performance of companies.

The Dow Jones Sustainability Indexes are cooperation between the Dow Jones Indexes, STOXX Limited[352] and SAM Group[353]. By bringing together the expertise of two leading index providers and the world-renowned pioneer in sustainability investing, the DJSI has a strong foundation to meet the growing market demand for professional, objective and reliable sustainability benchmarks.

The Dow Jones Sustainability World Index (DJSI World) comprises more than 300 companies that represent the top 10% of the leading sustainability companies out of the biggest 2500 companies in the Dow Jones World Index. The DJSI World is free float market capitalization-weighted — i.e. based on the number of free float shares outstanding for each of the component stocks[354]. Companies which do not disclose the information or data required in this study were eliminated from the sample. This is to avoid any misrepresentation in the data analysis. The sample also removes firms which at the time of the data collection had not published the annual report for 2007.

---

[352] STOXX Limited is a joint venture of Dow Jones & Company for the development, maintenance, distribution and marketing of the Dow Jones STOXX® indices. STOXX Limited issues licenses for the commercial use of the Dow Jones STOXX® indices. The design, development and delivery of the Dow Jones STOXX® indices ensure that they are investable, tradable and transparent; key factors that underlie their commercial success. Dow Jones STOXX® indices are licensed to companies around the world as the basis for investment products.
[353] SAM Group, an independent Sustainable Asset Management Group, a company which based in Zurich, Switzerland. It was established in 1995 and was among the first asset managers to specialize in the field of sustainability-driven investments.
[354] Information is available in the Dow Jones Sustainability Indexes website; http://www.sustainability-indexes.com/07_htmle/indexes/djsiworld_keyfacts.html.

Tilt (1994) tested hypotheses on the environmental disclosure performance by using industry sectors to avoid any biasedness that may exist in the data. However, there is no elimination made for any specific industries or sectors in this research. Firstly, industry is a major consideration in developing the DJSI World and the different industry characteristics of companies are accounted for by including the industry variable as a dummy variable in the regression model.

The initial sample was the top 100 companies listed on the ASX which also were members of the DJSI World. The top 100 companies are ranked based on the market capitalization in 2007. Due to the lack of required financial data in the annual reports in 30 of the companies, the final sample size is 70 firms. Data from these firms was collected for the years 2004 to 2007, for a total sample size of 280.

Data was obtained from the Dow Jones Sustainability Index (DJSI) for a measurement of CSR for companies in the sample. The Dow Jones Sustainability Indexes are the first global indexes tracking the financial, social and environmental performance of the leading sustainability-driven companies worldwide. DJSI is prepared by the SAM Group, an independent Sustainable Asset Management Group, a company which based in Zurich, Switzerland. It was established in 1995 and was among the first asset managers to specialize in the field of sustainability-driven investments. The CSR data was requested from the SAM Group itself with a signed agreement between the author and the SAM Group as the data is protected and secured and only available for authorised individuals or parties. The data that was received is the total company scores from the Corporate Sustainability Assessment Results of DJSI invited companies for the period of 2004 to 2007.

For other variables, data was obtained from the company Annual Reports which were accessed from Connect4 available at the University of Adelaide e-Library. Connect4 is the database which has a compilation of annual reports. The Annual Report Collection

in the Connect4 is a selection of the Top 500 annual reports from companies which are listed on the Australian Stock Exchange.

Experimental design

There are four hypotheses that will be tested in this research. The first three hypotheses are based on a strategic stakeholder management perspective in which it is assumed that the objective of managers is to maximise profits, not to advance the morally legitimate claims of stakeholders other than shareholders (Freeman, 1984; Berman et al, 1999). In other words, managers care for other stakeholders merely to realize the goal of maximising shareholders' wealth. The models are known as the direct effects model and the integration effects model. In the direct effects model, managers' effort towards the stakeholder orientation (or engagement) is assumed to have a direct effect on corporate financial performance independent of corporate strategy. While in the integration effects model, the managerial orientation toward stakeholders by complying with corporate social responsibility does impact financial performance via integration with corporate strategy to give stronger impact on the financial performance (Berman et al, 1999). The third hypothesis is based on the ethical or intrinsic perspective of Stakeholder Theory. The model used to test this hypothesis is the mediation effects model. In this model, "managerial relationships with the stakeholders are based on normative, moral commitments rather than on a desire to use those stakeholders solely to maximise profits" (Berman et al, 1999, p. 494). This perspective investigates how stakeholder engagement (represented by CSR) contributes to a better affiliation with the environment and society and enters the decision making of the firm prior to strategic consideration which in turn impacts on the financial performance (Berman et al, 1999).

Most researchers use the Direct Effects Model to find the relationship between CSR and financial performance (Waddock and Graves, 1997; Tsoutsoura, 2004).

The direct effects models assume that corporate strategy and the level of CSR will have a direct effect on corporate financial performance. CSR and corporate strategy will have a direct effect on corporate financial performance separately and independently. These models can be expressed as;

Financial_Performance$_{it}$ = β1 + β2 CSR$_{it}$ + β3Size$_{it}$ + β4Risk$_{it}$ + e$_{it}$ **Model 1**

Financial_Performance$_{it}$ = β1 + β2Corporate_Strategy$_{it}$ + β3Size$_{it}$ + β4Risk$_{it}$ + e$_{it}$ **Model 2**

In the integration effects model both CSR and Corporate Strategy are argued to complement each other to have a more positive impact on financial performance. This model thus includes the interaction effect between corporate strategy and CSR.

*Financial_Performance$_{it}$ = β1 + β2 CSR$_{it}$ + β3Corporate_Strategy$_{it}$ + β4Σ (Corporate_Strategy$_{it}$ * CSR$_{it}$) +*

β5Size$_{it}$ + β6 Risk$_{it}$ + e$_{it}$ **Model 3**

The mediation effects model assumes that CSR is a variable which merely impacts on corporate strategy but not financial performance, and that corporate strategy is the only variable that will impact on financial performance i.e. corporate strategy is a mediator between CSR and financial performance. Perfect mediation is achieved when CSR does not have any impact at all on the firms' profitability. Two models are used: Model 1 examines the direct effect on financial performance of CSR and Model 5 includes corporate strategy. Corporate strategy will be a perfect mediator if the results show that the CSR variable has no effect on financial performance in Model 4 (Berman et al, 1999).

Financial_Performance$_{it}$ = β1 + β2 CSR$_{it}$ + β3Corporate_Strategy$_{it}$ + β4Size$_{it}$ + β5 Risk$_{it}$ + e$_{it}$

Model 4

There are three major variables that form the basis of the hypotheses; corporate social performance, corporate strategy and financial performance. Financial performance is the dependent variable and the measure is the accounting based Return on Assets (ROA) (Return on Equity (ROE) is used as a robustness check). Accounting measures are used for ease of comparison with empirical studies (or example, Tsoutsoura, 2004, Lee, 2006 used both ROA and ROE as the proxies for financial performance). In addition, accounting measures of performance can provide information about how earnings respond to differing managerial policies (Cochran and Wood, 1984; and Lee, 2006). Accounting measures can also have the added advantage of signalling the success of CSR in terms of productivity increases, asset utilisation and the returns afforded to both debt and equity holders, as is often hypothesised by CSR supporters. Finally, McGuire, Sundgren and Schneeweis (1988) have demonstrated that accounting returns (ROA) are superior predictors of CSR relative to market measures. Market measures of financial performance are the obvious alternative, but they suffer from the weakness of being too comprehensive, in the sense that they impound future expectations, including returns attributable to monopoly power and managerial performance. Thus, this research is consistent with Waddock and Graves (1997), Berman et al (1999), Tsoutsoura (2004) and Lee (2006), in using accounting measures of financial performance

A summary of the measurements for these variables is presented in Table 2.

Independent variables used in this study are corporate social responsibility and corporate strategy. The Total Company Scores from the Corporate Sustainability Assessment Result prepared by the SAM Group are used for the measurement of CSR performance. The scores reflect the actual company's performance across economic,

environmental and social criteria and also represent the stakeholder engagement performance of a company. The higher the total score, the better the measurement of Corporate Social Responsibility performance. The maximum total score can be achieved by a company is 100. The company total score is comprised of the dimension scores which are measured based on the criteria shown in Table 1.

Table 1
Corporate Sustainability Assessment Criteria

Dimension	Criteria	Weighting (%)
Economic	Codes of Conduct / Compliance / Corruption&Bribery	5.5
	Corporate Governance	6.0
	Risk & Crisis Management	6.0
	Industry Specific Criteria	Depends on Industry
Environment	Environmental Performance (Eco-Efficiency)	7.0
	Environmental Reporting*	3.0
	Industry Specific Criteria	Depends on Industry
Social	Corporate Citizenship/ Philanthropy	3.5
	Labor Practice Indicators	5.0
	Human Capital Development	5.5
	Social Reporting*	3.0
	Talent Attraction & Retention	5.5
	Industry Specific Criteria	Depends on Industry

*Criteria assessed based on publicly available information only

As shown in the table, industry specific criteria for each dimension comprised 50% of the total weighting. The criteria vary across industry as different industries have different values and characteristics. For example for Amcor Ltd (materials industry), the industry criteria for social dimension consists of a standard for suppliers which will be different

from the criteria in the banking industry because of diverse business activities and products.

Sam Group collected the DJSI data by using the information from the following sources:

SAM Questionnaires

SAM Questionnaires specific to each of the DJSI sectors are distributed to the CEOs and heads of investor relations of all the companies in the DJSI investable stocks universe. The questionnaire is designed to ensure objectivity by limiting qualitative answers through predefined multiple-choice questions. The completed company questionnaire, signed by a senior company representative, is the most important source of information for the assessment.

Company Documentation

Documents analysed include: Sustainability reports, environmental reports, health and safety reports, social reports, annual financial reports, special reports (e.g. on intellectual capital management, corporate governance, R&D, employee relations), all other sources of company information; e.g. internal documentation, brochures and website.

Media and stakeholder reports as well as other publicly available information

Analysts review media, press releases, articles, and stakeholder commentary written about a company over the past year.

Personal Contact with Companies

Each analyst personally contacts individual companies to clarify open points arising from the analysis of the questionnaire and company documents. This contact is made either via telephone, company visits or meetings with the company at either the SAM office or at public events.

Corporate strategy is measured using similar variables employed by Hambrick (1983) and Berman et al (1999). They are selling intensity, capital expenditure, capital intensity and efficiency. Selling intensity shows the willingness of firms to spend on marketing

and selling related activities in an attempt to differentiate itself from its rivals. If the company is aiming to be successful in its strategy, it must have the ability to charge above the market price because it will stimulate customer insight that the product is special (Berman et. al, 1999). Selling intensity also reflects the strategy of a company to advertise its business in order to compete with its rivals and to improve its financial performance. The higher the selling intensity, the more the company concentrates on the marketing strategy relative to the sales revenue.

Capital expenditure refers to the funds used by a company to acquire or upgrade physical assets such as property, industrial buildings or equipment. This type of outlay is made by companies to maintain or increase the scope of their operations. In terms of accounting, expenditure is considered to be a capital expenditure when the asset is a newly purchased capital asset or an investment that improves the useful life of an existing capital asset (Investopedia, 2007). Capital expenditure reflects the strategy of the company as the amount allocated to the capital expense illustrates the company's enthusiasm to invest on a project that may benefit the company after planning investigations and consultation with stakeholders.

Capital intensity is the amount of fixed or real capital present in relation to other factors of production; especially labour. It is the willingness of the company to spend more on capital (assets) resources than labour resources. A higher investment on capital resources indicates that the company is moving towards a higher productivity of labour. Since the use of tools and machinery makes labour more effective, rising capital intensity pushes up the productivity of labour. This reflects a strategy of the company to increase the productivity of labour and improve the corporate social performance as well as corporate financial performance.

The final measurement for corporate strategy is the efficiency ratio. The efficiency of a company reflects the degree of profitability of that organization. This also indicates the strategy of that organization in reducing the cost per unit of output. This study uses the efficiency ratio as a strategy proxy, not a financial performance proxy because what is intended to be highlighted here is how well the company does in reducing the cost per unit of output.

The measurement of these variables is summarised in Table 2.

Table 2
Variables and their measurement

Variables	Measurement	Denoted by:
Financial Performance		
Return on Assets	Net Profit After Tax /Total Assets	ROA
Return on Equity	Net Profit After Tax /Total Equity	ROE
Corporate soclai responsibility (CSR)	Total Score of Dow Jones Sustainability World Index	TOTAL_SCORE
Strategy variables		
Selling intensity	Marketing, advertising, selling expenses/net sales	SELLING_INTENSITY
Capital expenditures	(Net capital expenditures / net sales) x 100	CAPITAL_EXPENDITURES
Capital intensity	Total Assets / Number of employees	CAPITAL_INTENSITY
Efficiency	Net Profit / Net sales	EFFICIENCY
Control variables		
Risk	Total liabilities/Total equity	RISK
Size	Log of total assets	SIZE
CSR*Corporate strategy		
CSR*Selling intensity		CSR_SELL
CSR*Capital expenditure		CSR_CAPEX
CSR*Capital intensity		CSR_CAPIN
CSR*Efficiency		CSR_EFF

Control variables used in this study are risk and size, consistent with Waddock and Graves (1997), Berman et al (1999) and Lee (2006). Risk is believed to impact significantly on the company's performance, thus is an important control variable for this

study. Weston and Brigham (1981) pointed out that the debt/equity position of a firm represents the *financial* risk to which the firm is exposed. The value of taking such risk is that a higher return on investment for the firm's owners can be achieved. Therefore, the characteristic of return is directly related to financial risk. This suggests that the debt-equity ratio – the financial risk – may influence financial performance in either positive or negative associations. Practitioners see financial risk as the most important concern when formulating the firm's financing mix . Thus, most top management is concerned primarily with financial risk and decision making control when assessing the debt-equity policy of the firm (Donaldson, 1961 and Barton, 1987).

Firm size can impact significantly on financial performance. The Dow Jones Sustainability Index composite group of leading Corporate Social Performance (CSP) firms are found to exhibit much larger market capitalisations when compared to the lagging CSP firms, thus firm size is expected to, and has been shown to play a significant role in distinguishing leading and lagging CSP firms (Lee, 2006). Moreover, Lee (2006) argued that the only non-performance variable consistently found to characterise leading CSP firms is firm size. In addition, size can also impact significantly on the financial performance of a firm since generally bigger firms have higher profits than smaller firms. Therefore, this variable is also controlled in this study. The measurement of these variables is described in Table 2.

Industry, company and year characteristics would have some effects on the relationship between CSR, corporate strategy and financial performance. Different industries, companies and years face different portfolios of stakeholders with different degrees of activity in different areas (for example Rowley and Berman, 2000). While there is considerable debate regarding the magnitudes of industry, company and year level

effects (Powell, 1996; Rumelt, 1991), the agreement is that those factors "matter," in the sense that they explain a non-negligible percentage of the variation in profitability across firms (McWilliams and Siegel (2000). Thus, 'industry' should be included in the model, along with 'company' and 'year', as dummy variables.

Data analysis

The data was analysed using Panel Generalized Least Squares Regression in EViews version 5.1. The data is in the form of panel data of 70 Australian companies for the period 2004 to 2007. The pooled cross-time data requires regression analysis to be in the form of panel least squares in order to consider the effect of variation in the cross section (companies) and over time (years).

Tests on the data indicate there are probable violations of the heteroskedasticity and serial correlation assumptions. Panel GLS corrects for both cross sectional heteroskedasticity and serial correlation[355].ensuring that the estimates are best linear unbiased estimators. In addition, the large sample size (n=70) should mitigate any normality problems with the data as the Central Limit Theorem predicts that for larger sample sizes (n>30) the distribution of the sample would approach normal (Gujarati, 1995, p.103.). In addition, tests for multicollinearity indicate there is no significant correlation between the explanatory variables. Additional assumptions need to be made with panel data, as one individual year may be different from other years, and individual firm and industry characteristics may not be captured in the existing independent variables. These unobserved effects would be captured by the error term. If the unobserved effects are correlated with the any of the independent variables, the

---

[355] GLS incorporates the nature of heteroskedasticity and autocorrelation in the estimation by tramsforming the variables with each firm weight. Ordinary Least Squares (OLS) does not do this. If there is no heteroskedasticity or autocorrelation, the estimates given by OLS and GLS should be the same (Gujarati, 1995)

estimates given from the regression could be biased and inconsistent since the error term is now also correlated with the independent variables (Gujarati, 1995). To test the validity of the assumption that coefficients and intercepts of the firms are constant across time the models are estimated in E Views using fixed effects. The fixed effects estimates include all dummy variables for each firm, industry and year. The redundant fixed effects likelihood ratio indicates that fixed effects[356] are not necessary to include in the models i.e. the models should not incorporate all dummy variables for each firm, industry and year. However, some firms, industries and years show significant association with both ROA and ROE. The coefficients for these dummy variables are statistically significant. In effect, this is partially controlling for firms, industries and years that show significant heterogeneity, and it also avoids omitted variable bias.

Results and discussion

The results from descriptive statistics of the dependent variables are presented in Table 3. The mean and median values for both ROA and ROE are reasonably consistent across the four years of the study, although the standard deviation suggests a wide range of values in each year.

Table 3
Descriptive statistics

Variable	Mean	Median	Std. Dev.
ROA	0.0743	0.0614	0.0734
ROE	0.1574	0.1551	0.3595
TOTAL_SCORE	37.4900	30.6854	20.2227
SELLING_INTENSITY	0.05734	0.0350	0.0674
CAPITAL_EXPENDITURES	0.0844	0.0224	0.1585

---

[356] By including fixed effects, E Views would include dummy variables for each firms and each year. It could be manually done by including dummy variables for each firms and year in ordinary regression as to see their significance. By doing it manually, we could select which companies that show significant homogeneity to be included in the final model.

CAPITAL_INTENSITY	91.9942	84.8929	261.8953
EFFICIENCY	0.2635	0.1262	0.4328
RISK	4.5120	1.1603	23.1670
SIZE	6.7832	6.7069	0.6769

The mean and median scores for CSR show an increase from 2004 to 2005, but are reasonable consistent in from that year. For the strategy variables, there is a wide variation in the results across all years, although the mean and median values are reasonably consistent, except for both capital intensity and selling intensity which show a substantial increase in 2006 and 2005 respectively. These annual peaks may explain some of the significant yearly fixed effects. The measure for risk shows a substantial variation, particularly in 2005, whereas the mean and median of the size variable are consistent over all years.

The regression results testing the hypotheses with ROA as the dependent variable are summarised in Table 4. The results using ROE were done as a robustness check and produced similar results.

Table 4
Regression results with ROA as the measure of firm performance

Durbin-Watson stat	**1.526873**	**1.536502**	**1.860211**	**1.808375**

Hypothesis 1 investigates the relationship between corporate social performance and corporate financial performance and is tested using Model 1. The results show there is a positive and significant relationship between the total score of corporate social responsibility and the financial performance. The result is consistent with most US studies (for example Waddock and Graves, 1997, Berman et al, 1999, and Tsoutsoura, 2004), although these studies used another measure for corporate social performance – the KLD Sustainability ratings. When compared with other Australian studies, the results are inconsistent with Wright and Ferris (1997), and McWilliams and Siegel (2000), who found either a negative association or an inconclusive relationship between CSR and financial performance. McWilliams and Siegel (2000) used a dummy variable[357] to measure the corporate social performance. Although this method is valid for statistical inferences, it is not a strong measurement of the social performance of firms since it is difficult to identify whether the company is socially responsible without a thorough investigation.

The second hypothesis examines the relationship between corporate strategy and financial performance and predicted that corporate strategy has a significant effect on the financial performance of a company. The results are shown in Table 3 as Model 2 and suggest that some elements of corporate strategy do have a significant impact on financial performance. Capital expenditure is significantly negatively associated with financial performance. A heavy capital investment is claimed to act as a barrier to exit from unprofitable businesses (Berman et. al, 1999), and so capital expenditures generally have negative associations with financial performance. According to Berman et. al (1999), environmental responsiveness can enhance firm efficiencies and drive down operating costs. As a result, efficiency has a positive

---

[357] The variable had a value of one if the firm adopted corporate social responsibility and a value of zero if it had not

relationship with firm financial performance. This is consistent with the results of this study where efficiency has a significant positive association with financial performance. Capital intensity is predicted to have a positive association with financial performance because it can lead to an increase in the productivity of labour by utilising the assets for production. Such actions improve the firm's overall cost structure and hence operating performance. The results show a positive but insignificant relationship between capital intensity and financial performance. Selling intensity has a negative, but not significant association with financial performance. The expectation would be that spending on advertising and related selling costs should improve financial performance.

Integrating corporate social performance with corporate strategy may have positive impacts on the financial performance. This is the basis of the third hypothesis. The results (Model 3) show that with the addition of the interaction effect between corporate social performance and corporate strategy, the model is significantly improved, with an increase in R^2. Two of the interaction variables are significantly related to financial performance (namely selling intensity and capital intensity), which suggests that stakeholder relationships interact with firm strategy to affect financial performance. This is consistent with Berman et al (1999).

 The final hypothesis was based on an ethical perspective of Stakeholder Theory and predicted that strategy variables would mediate the relationship between stakeholder engagement and financial performance. Mediation would exist if the stakeholder engagement variable had no relationship with financial performance when the strategy variables were included in the regression. The results are shown in both Model 1 and Model 4 in Table 4 and show there is no mediation effect of corporate strategy on the links between corporate social performance and financial performance. Corporate social performance has a positive and strong effect on the financial performance and is still

significant when corporate strategy variables are included in the first model. This is consistent with McWilliams and Siegel (2000) and Berman et al (1999).

Conclusions

There were four hypotheses that were tested in this study in order to investigate the relationships between CSR, corporate strategy and firm financial performance. Tests investigated the direct effect of stakeholder engagement (estimated using CSR scores) and corporate strategy on financial performance. The results suggest that better corporate social responsibility contributes to an increase in firm financial performance. In other words, it is important for companies to engage with stakeholders to ensure the company financial performance is maximised. There were two variables of firm strategy (capital intensity and efficiency) that showed an association with financial performance. Capital expenditure is significantly negatively associated with financial performance as predicted and efficiency positively associated with financial performance. A heavy capital investment can act as a barrier to exit from unprofitable businesses hence reducing financial performance and efficiency can reduce operating costs. That different strategies can affect financial performance in different ways has important implications for management.

The integration between CSR and corporate strategy and the effect of this integration on corporate financial performance was also tested, and showed that, in general, integration effects can impact on financial performance. This suggests that it is beneficial for companies to take into account their responsibility towards stakeholders in their strategy to better the fiscal position of the company.

The mediation effect of corporate strategy on the CSR – financial performance relationship was also investigated. No mediation effects were found. Corporate social performance was found to be positively associated with financial performance before and after the inclusion of firm strategy into the model. This suggests that a company which engages with stakeholders is doing so to maximise the firm's profitability, rather than for ethical reasons, affirming the opinion of Friedman (1970) that the social responsibility of firms is to maximise shareholder returns.

This research contributes to the literature on the relationships between stakeholder engagement, corporate strategy and financial performance, in particular for Australian companies. It adds to our understanding of the relationship between the firm and stakeholders, and the motivations for firms to engage in corporate social responsibility. One of the major limitations to this research is the choice of indexes to measure the sustainability performance of companies. Various measurements have been used in other studies and cause uncertainty in the actual level of social performance among companies. Thus it is difficult to the compare results of research studies. In addition, Epstein and Roy (2001) claimed that the recognition and measurement of social and environmental strategies is particularly complicated as they are usually related to a high level of uncertainty, a long time horizon and impacts that are often difficult to quantify. However, despite the DJSI having some possible shortcomings, my review, alongside a recent study by Beloe et al (2004), suggests the DJSI (i.e. SAM) provides amongst the world's best CSR (sustainability) ratings to date (Lee, 2006). Furthermore, the results of this research would indicate that the DJSI ratings are of sufficient quality to convey information that has significant economic value. The limited sample period was because of the difficulty in getting the secured data from SAM Group. The single index for CSR is also a limiting factor in the study. Using a firms relationship with different group of stakeholders would further our understanding of the interactions between stakeholder

engagement and firm performance. There were also some omitted variables identified in this study that may cause some bias in the results of the hypothesis testing. For example, controlling for the operating environment may have improved the regression results, although some of this variation may have been captured in the risk and size control variables, as well as industry classification, year and cross sectional variation among companies. Using a market measure of financial performance, for example total shareholder returns could also be used as a robustness test for the regression results (McWilliams and Siegel, 2000).

Empirical Evidence on
Management Forecast Disclosures in Thailand

Sirada Jarutakanont, Thammasat University
Somchai Supattarakul, Thammasat University

June 2009

Abstract

This study provides empirical evidence on management forecast disclosure practices and investigates the information content of management forecast disclosures in Thailand. We hand-collect 4,483 management forecast disclosures of listed companies in the Stock Exchange of Thailand during January 2005 – June 2007. Our results show that (1) almost 70% of Thai listed companies voluntarily disclose their management forecasts; (2) over 60% of forecast firms disclose more than five forecasts within one-year period; (3) almost 70% of management forecasts are disclosed prior to the end of accounting period; (4) 46% (10%) of management forecasts are stand-alone annual (quarterly) forecasts while 44% of management forecasts are concurrent annual-quarter forecasts; (5) stand-alone quarterly (annual) forecasts are more likely to be forecasts of earnings (revenues); quarterly forecasts issued simultaneously with annual forecasts are more likely to be forecasts of revenues and annual forecasts issued simultaneously with quarterly forecasts are more likely to be forecasts of revenues as well;(6) 44% (64%) of quarterly revenues (earnings) forecasts are in qualitative form and 40% (33%) of quarterly revenues (earnings) are in semi-numeric form while 43% (44%) of annual revenues (earnings) forecasts are point estimates and 24% (22%) of annual revenues (earnings) forecasts are in semi-numeric forms.

Consistent with prior research, our empirical evidence shows that absolute cumulative market-adjusted returns surrounding management forecast date are significantly positive, suggesting that management forecast disclosures of Thai listed firms are informative. Industries the forecast firms are in, forecast timing, and forecast horizons do not seem to affect information content of management forecasts.

1. Introduction

A management forecast (MF) is one type of voluntary disclosures released prior to an

earnings announcement date. Literatures on management forecasts traditionally examines (i)

the information content of management forecasts [e.g., Patell (1976), Nichols and Tsay (1979),

Penman (1980), and Waymire (1984)], (ii) management motives to issue management forecasts

[e.g., Cox (1985), Imhoff (1978), Ruland et. al. (1990), Kasznik and Lev (1995)], and (iii)

differential market reactions to management forecasts [e.g., Pownall et. al. (1993), Libby and

Tan (1999), Atiase et. al. (2005, 2006a and 2006b)]. The studies are limited to US firms.

There are a few studies done in other countries but most of them are limited to management forecasts which are disclosed on a mandatory basis such as management forecasts issued by IPO firms which are required to provide management forecasts in prospectuses. These studies investigate management forecast disclosures provided by Taiwan IPO firms [Jaggi et. al. (2006)], Malaysian IPO firms [Jelic et. al. (1998)], and Danish IPO firms [Gramlich and Sorensen (2004)]. Kato et. al. (2006) examine management forecast disclosures in Japan in general setting. However, management forecast disclosure in Japan is a mandatory disclosure.

Management forecast disclosures in Thailand, provided on a voluntary basis, remain unexplored. Therefore, this study aims at providing empirical evidence on management forecast disclosures in Thailand as well as information content of the management forecast disclosures.

We hand-collect management forecast disclosures issued by companies listed on the Stock Exchange of Thailand (SET). Our sample includes 4,483 management forecast disclosures issued during 12-month period starting January 2005 and 12-month period starting July 2006. Our results show that 68% of Thai listed firms voluntarily disclose their forecasts at least once during our sample periods. On average, each forecast firm issues 8-9 forecasts each year. Firms in property and construction, resources, and technology sectors are more likely to issue management forecasts than are other firms. Specifically, on average, each forecast firm in these sectors issues 10-12 forecasts each year. A plausible reason is that most of firms in these industries have a large number of analysts following and thus firms may maintain a good relationship with financial analysts by issuing management forecasts.

Moreover, this study examines how early forecast firms issue their forecasts. We find that almost 70% of total management forecasts, regardless forecast horizon, are disclosed before end of accounting period, rather than after end of accounting period. A plausible reason is that the SET does not encourage firms to disclose short term forecasts. Our results show that forecast firms issuing quarterly forecasts prior to (after) the end of accounting period, on

average, issue their forecasts 6 weeks prior to (3 weeks after) the end of accounting period. For annual forecasts, forecast firms issuing their forecasts prior to (after) the end of accounting period, on average, issue their forecasts 6 months prior to (one month after) the end of accounting period.

Additionally, this study investigates forecast horizons and forecast items firms choose for their forecasts and documents that forecast firms are more likely to issue annual forecasts, as opposed to quarterly forecasts, and that forecast firms are more likely to issue their quarterly forecasts concurrently with their annual forecasts than they do separately. As for forecast items, our results show that annual forecasts (both stand-alone and concurrent annual-quarter forecasts) are more likely to be revenue annual forecasts; stand-alone quarterly forecasts are more likely to be earnings quarterly forecasts while concurrent annual-quarter forecasts are more likely to be revenue quarterly forecasts. Overall, regardless forecast horizons, firms are more likely to provide revenue forecasts than earnings forecasts. A plausible reason is that the SET does not encourage firms to issue earnings forecasts.

In addition, this study examines forecast forms firms choose for their forecasts and finds that quarterly revenue and earnings forecasts are more likely to be in the qualitative and semi-numeric forms; annual revenue forecasts are more likely to be point estimates and in semi-numeric form while annual earnings forecasts are more likely to be in the qualitative form. We also document that most of earnings forecasts, both quarterly and annual, reveal net income figures.

Finally, this study investigates whether management forecasts of Thai listed firms are informative and documents that absolute cumulative abnormal returns surrounding management forecast dates are significantly positive, suggesting that management forecast disclosures are informative. Our results are consistent with prior studies on information content of management forecasts of US firms. Partitioning the sample in various subsets, our empirical evidence shows that industries forecast firms are in, forecast timing, and forecast forms do not seem to affect

information content of management forecasts. Specifically, management forecasts of firms in all industries are informative; management forecasts issued prior to and after the end of accounting period are both informative; and management forecasts in all forecast forms are informative.

The study is the first study that provides empirical evidence on management forecast practices and the usefulness of management forecasts in Thailand. Our results provide contributions to many parties, namely, capital market participants, management, and the Stock Exchange of Thailand.

This study also provides a contribution to the academic literature, specifically to accounting research in Thailand. This is the first study to explore management forecast practice and examine the usefulness of management forecasts in Thailand. The findings will assist academic researchers in investigating other aspects of accounting research on management forecast disclosures.

Discussion of prior research on management forecast disclosures is presented in section 2. Research methodology and data collection are described in section 3. A discussion of empirical results is shown in section 4 while conclusion and contributions are discussed in section 5.

2. Prior Research

2.1 Management forecast disclosure in practice

Management forecast is an important source of information to market participants since management has access to superior information which is not generally available to outsiders. Firm has several alternatives to strategically disclose its management forecasts on forecast characteristics such as forecast frequency, forecast horizon, forecast timing, forecast item, and forecast form. Firms can discretionarily choose how frequently they disclose management forecasts. Prior study shows a sporadic pattern of management forecast disclosures. McNichols (1989) shows that 69% of her sample firms provide only one forecast during five-year

sample period (1979-1983). However, recent study shows that number of forecast firms gradually increases. Collecting data from First Call database during 1994 to 2003, Anilowski et. al. (2007) find that both number of forecasts and forecasting firms increase over the sample period. The number of forecast firms increases from 95 firms (2%) in 1994 to 1,211 firms (27%) in 2003. Moreover, they also show that forecast firms frequently more frequently provide management forecasts ranging from one forecast per year in 1994 to 5 forecasts per year in 2003.

For forecast horizon, firms may provide quarterly or annual management forecasts. According to 444 management forecasts issuing during 1980 to 1987, Pownall et. al. (1993) document 183 forecasts (41%) are quarterly forecasts while 261 forecasts (59%) are annual forecasts. However, recent study finds that a trend for US firms to increase the extent to which they provide quarterly forecasts. Anilowski et. al. (2007) find 55% of 31,230 management forecasts disclosed during 1994 to 2003 are quarterly forecasts while 45% of them are annual forecasts. Disaggregating their samples in each testing year, they also find that firms are more likely to provide quarterly forecasts than annual forecasts.

Alternatively, firms can choose to disclose management forecasts before or after end of accounting period (i.e., forecast timing). Partitioning management forecast samples issuing in 1994 to 2003 by forecast timing, Anilowski et. al. (2007) find 51% of management forecasts are disclosed before end of accounting period while 49% of them are issued after end of accounting period.[358] Pownall et. al. (1993) show number of days between forecast date and end of accounting period of quarterly forecasts is longer than that of annual forecasts. On average, number of days for quarterly forecasts is 71 days while that of annual forecasts is 201 days.

To disclose their management forecasts, firms can provide management forecasts with any items in income statements (e.g., revenue, gross profit, or net income). Prior study documents that firms are more likely to provide earnings forecasts than revenue forecasts.

---

[358] They provide empirical evidence on forecast timing only for quarterly management forecasts.

Investigating management forecast issuing in 1978 to 1982, Han and Wild (1991) find of 263 forecast samples, 162 forecasts (62%) are earnings forecasts while 101 forecasts (38%) are earnings and revenue forecasts. Collecting 3,459 management forecasts during October 2000 to July 2002, Feldman et. al. (2003) find 59% of their samples are earnings forecasts while 41% of them are revenue forecasts.

Firms can select to issue management forecasts in quantitative or qualitative forms. Quantitative management forecasts are numerical such as point, range, open-end (e.g., minimum or maximum) while qualitative management forecasts are non-numerical which are provided only trend for a given forecast period. An extensive literature on management forecast mostly focus on quantitative estimates (e.g., point and range) (e.g., Penman (1980), Ajinkya and Gift (1984), Waymire (1984), and Pownall and Waymire (1989)) because these forecast forms are easier to measure forecast bias. However, recent study provides descriptive evidence that more than half of management forecast samples are in qualitative form. Kasznik and Lev (1995) show that more than half of their management forecast samples are in qualitative disclosures. Investigating management forecast disclosures in Netherlands, Dorsman et. al. (2003) find that over 60% of listed companies in Netherlands release qualitative management forecasts.

2.2 Information content of management forecast disclosures

A long-standing prior research finds empirical evidence that management forecasts are informative. Early empirical research investigates price reactions to management forecasts. For example, Patell (1976), Nichols and Tsay (1979), and Penman (1980) find that good news forecasts are associated with significant positive stock price reaction around forecast date while they do not observe significant negative stock price reaction for bad news forecasts. Waymire (1984) examines the information content of both good and bad news forecasts by using analyst's forecasts as a proxy for expected earnings and finds good (bad) news forecasts are

associated with significant positive (negative) abnormal returns around the date of forecast. Ajinkya and Gift (1984) also document informativeness of management forecasts. They find that financial analysts revise their forecasts in response to management forecast disclosures.

More recent study also finds the information content of management forecast disclosures. For example, Kasznik and Lev (1995), Atiase et. al. (2005, 2006a, and 2006b) and Supattarakul (2003) find a positive association between earnings news convey through management forecasts and price reaction around forecast dates. Prior studies mentioned above are limited to management forecasts of US firms. There are a few studies done in other countries but most of them are limited to investigate management forecasts issued by IPO firms. Most of IPO firms in many countries are required to provide management forecast in their prospectuses. Therefore, most of management forecasts of IPO firms are on a mandatory basis, not a voluntary basis. Jaggi et. al. (2006) examine 759 management forecasts issued by Taiwan IPO firms from 1994 to 2001. They find that firms are likely to provide optimistic forecasts than conservative forecasts. To meet their targets, those firms subsequently manage reported earnings instead of revise their forecasts. Gramlich and Sorensen (2004) investigate 58 Danish IPO firms that issue management forecasts between 1984 and 1996. Their evidences strongly support that Danish IPO firms engage in accrual management to meet their management forecasts. Jelic et. al., (1998) examine the accuracy of earnings forecasts in IPO prospectuses of Malaysian firms and find that on average, the absolute forecast error is 55%.

Kato et. al. (2006) examine management forecast disclosures in Japan in general setting, not restrict to IPO firms. However, management forecast disclosures in Japan are provided on a mandatory basis. Examining management forecasts issued in 1997 to 2006, they find that management forecasts in each year are over optimistic. In spite of their systematic over-optimism, management forecasts in Japan are also informative, although the stock price reaction to these forecasts is not as large as is typically observed in US.

In summary, prior studies document that management forecast disclosures are informative. However, most of them are restricted to management forecasts issued by US firms or management forecasts are provided on a mandatory basis. Management forecasts of Thai firms which are disclosed on a voluntary basis remain unexplored. Therefore, this study aims at providing empirical evidence on information content of management forecasts of firms listed on the Stock Exchange of Thailand (SET).

3. Research Methodology and Data Collection

The main objective of this study is to explore management forecast disclosure practices and investigate the information content of management forecast disclosures in Thailand. Samples in this study are management forecast disclosures issued during two 12-month periods: (1) 12-month period starting January 2005 and (2) 12-month period starting July 2006.[359]

We hand-collect management forecasts issued during the specified periods from the NEWSCENTER database and the SETSMART database. In Thailand, other than the Stock Exchange of Thailand (SET) channel (i.e., the SETSMART database), management mostly releases its forecasts through the business press. The NEWSCENTER database is a database containing news articles published in Thailand.

In the collection process, we set the criteria to collect management forecast data as follows: (1) the forecast must contain various keywords such as "expects", "estimates", "targets", etc. and (2) the forecast must be attributed to company officials.

For criterion 1, we define keywords to ensure that an article discloses a management forecast since some articles release the actual performance and criterion 2 ensures that company forecasts in any articles are not estimated by news reporters or financial analysts. As

---

[359] The Stock Exchange of Thailand (SET) issued the disclosure guidelines for listed companies in March 2006, therefore, we exclude management forecast disclosed three months before and after the issuance of the disclosure guidelines.

described in Table 1, our initial sample consists of 4,483 management forecast disclosures issued by management of 287 companies listed in the SET.

```
=================================
         Insert Table 1 here.
=================================
```

4. Empirical Results

Table 1 provides sample construction for descriptive statistics. We require data on the firm-quarter level to analyze characteristics of forecast firms.[360] We remove management forecasts of each firm which are redundant forecasts in each quarter. In doing so, we obtain 1,368 firm-quarters in our sample. We also remove 98 firm-quarters without returns data available in the DATASTREAM database and exclude 79 firm-quarters without earnings data available in the DATASTREAM database. Finally, we obtain 1,191 firm-quarters from 263 firms.

Table 2 separately provides descriptive statistics of all Thai listed firms, forecast firms, and non-forecast firms. In addition to means and standard deviations, Table 2 also summarizes various percentile values for price -deflated unexpected earnings (UE), earnings variations (SD_NI), return variations (SD_RET), and market capitalization (MV).

```
=================================
         Insert Table 2 here.
=================================
```

Mean of UE of forecast firms is positive (UE = 0.294) while that of non-forecast firms is negative (UE = -13.140). However, mean of UE for forecast firms is insignificantly different from mean of UE for non-forecast firms (t statistic = 0.390). This is inconsistent with the notion that larger earnings surprise firms are more likely to provide management forecast than are smaller earnings surprise firms [Ajinkya and Gift (1984), Kasznik and Lev (1995), and Supattarakul (2003)]. Mean of SD_NI for forecast firms is significantly greater than mean of SD_NI for non-forecast firms (t statistic = 7.583) suggesting that higher earnings variation firms are more likely

---

[360] Prior studies on firm's forecast choice also use firm-quarter level in their analysis [Kasznik and Lev (1995) and Supattarakul (2003)].

to provide management forecasts than are lower earnings variation firms. This evidence is inconsistent with prior studies which find that forecast firms have less earnings variability than non-forecast firms [Imhoff (1978), Cox (1985), and Waymire (1985)]. The plausible reason is that high earnings volatility firms are likely to reduce their risk by providing more relevant information to align market expectation. Mean of SD_RET for forecast firms is insignificantly greater than mean of SD_RET for non-forecast firms (t statistic = 1.420). This evidence is inconsistent with prior studies which find that higher return variation firms are more likely to issue management forecasts than are lower return variation firms [Supattarakul (2003), and Chen (2003)]. Finally, Mean of MV for forecast firms is significantly greater than mean of MV for non-forecast firms (t statistic = 8.245). This is consistent with the notion that larger firms are more likely to issue management forecasts than smaller firms [Imhoff (1978), Cox (1985), Kasznik and Lev (1995) and Supattarakul (2003)].

4.1 How do Thai listed companies disclose their management forecasts?

Most prior studies of management forecasts are limited to US firms. This study explores management forecast disclosure practices in Thailand. Specifically, we explore management forecast disclosure practice by addressing the following questions: (1) how many firms issue management forecasts?; (2) how frequently do they issue their forecasts?; (3) when do they issue their forecasts (e.g., before or after the end of an accounting period)?; (4) in what horizon do they employ for their forecasts (e.g., quarterly or annual forecasts)?; (5) what type of information is disclosed (e.g., revenue or earnings forecasts)?; and (6) in what form do they issue their forecasts (e.g., quantitative or qualitative forms)?. Answers to these questions provide empirical evidence of management forecast disclosure practice in Thailand.

Results in table 3 suggest that 68% of Thai listed companies voluntarily issue their management forecasts to the public at least once during our sample periods. On average, each firm issues approximately 8.46 forecasts per year. However, most firms issue only one forecast

per year during the sample periods. Results also suggest that firms in the property and construction (93%), resources (88%), and technology (86%) sectors have the highest tendency to release management forecasts while firms in the non-performing group (25%) have the lowest tendency to release management forecasts. A plausible explanation is that most of firms in property and construction, resources, and technology industries are in SET50 (i.e., firms in top fifty ranking which have high market capitalization) and have a large analyst following. These firms may maintain a good relationship with analysts and investors by providing more information via their management forecasts [Skinner (1994), Supattarakul (2003), and Chen (2003)].

```
================================
           Insert Table 3 here.
================================
```

Results in table 4 reveal a majority of forecast firms in our sample issue one to fifteen management forecasts during the sample period. Specifically, 39% of forecast firms issue one to five management forecasts, 26% of forecast firms issue five to ten management forecasts, and 21% of forecast firms issue ten to fifteen management forecasts. On average, forecast firms disclose approximately 8-9 forecasts per year.

```
================================
           Insert Table 4 here.
================================
```

Since management forecasts are provided before earnings announcement dates, management may decide to issue a forecast before or after the end of accounting period. Table 5 presents results on forecast timing (e.g., before or after the end of an accounting period). Since financial statements are prepared for quarterly and annual period, we additionally disaggregate forecast timing by forecast horizon (e.g., quarterly or annual forecasts). The results indicate that most management forecasts (69%) are disclosed before the end of accounting period, rather than after the end of accounting period. Specifically, 3,105

management forecasts (69%) are issued before the end of accounting period while 1,378 management forecasts (31%) are issued after the end of accounting period. Of 2,373 quarterly management forecasts, 1,333 management forecasts (56%) are issued before the end of accounting period while 1,040 management forecasts (44%) are issued after the end of accounting period. Of 2,110 annual management forecast, 1,772 management forecasts (84%) are issued before the end of accounting period while only 338 management forecasts (16%) are issued after the end of accounting period. Results also suggest that firms are more likely to issue annual forecasts than quarterly forecasts prior to the end of accounting period while firms are more likely to issue quarterly forecasts than annual forecasts after the end of accounting period. A plausible explanation is that the SET does not encourage firms to release short term management forecasts. Therefore, most of management forecasts are issued before end of accounting period, rather than after end of accounting period. We also document that forecast firms issuing quarterly forecasts prior to (after) the end of accounting period, on average, issue their forecasts 6 weeks prior to (3 weeks after) the end of accounting period, and that forecast firms issuing annual forecasts prior to (after) the end of accounting period, on average, issue their forecasts 6 months prior to (one month after) the end of accounting period. Since quarterly financial statements are announced more frequent than annual financial statements and submission date of quarterly financial statements dues before that of annual financial statement, number of days of quarterly management forecasts is shorter than that of annual management forecasts.

```
=================================
            Insert Table 5 here.
=================================
```

According to forecast horizon (e.g., quarterly or annual forecasts), management may provide forecast for quarter (i.e., stand-alone quarterly management forecast), annual (i.e., stand-alone annual management forecast), or both of quarter and annual (i.e., concurrent management forecast) in such disclosure. For stand-alone quarterly (annual) management

forecast, management may provide forecast for a given quarter (year) (i.e., single period management forecast), or for multiple quarter (year) (i.e., multiple period management forecast). For concurrent management forecast, management simultaneously provides a set of quarter and annual management forecasts in such disclosure.

Table 6 shows the distribution of management forecasts by forecast horizon and forecast item. Of 4,483 management forecasts, 423 forecasts (10%) are stand-alone quarterly forecasts, 2,089 forecasts (46%) are stand-alone annual forecasts, and 1,971 forecasts (44%) are concurrent quarterly and annual forecasts.[361] Proportion of stand-alone quarterly forecasts is the lowest since The SET does not allow firms to provide quarterly forecasts. Of 423 stand-alone quarterly forecasts, 359 forecasts (85%) are those revealing information for a given quarter; 58 forecasts (14%) are those revealing information for two quarters; 5 forecasts and one forecast are those revealing information for three and four quarters, respectively. For stand-alone annual forecasts, of 2,089 forecasts, 1,460 forecasts (70%) are those revealing information for a given year; 622 forecasts (29%) are those revealing information for two years; and 7 forecasts are those revealing information for three years. Finally, for concurrent quarterly and annual forecasts, of 1,971 forecasts, 1,312 forecasts (67%) are those revealing information related to one quarter and one year; 340 forecasts (17%) are those revealing information for one quarter and two years; and 242 forecasts (12%) are those revealing information related to two quarters and one year.

=================================
Insert Table 6 here.
=================================

Management might provide forecasts that vary in level of disaggregation of accounting items, ranging from revenue to earnings numbers. Results in table 6 also suggest that stand-

---

[361] Stand-alone quarterly forecasts are forecasts which are provided only for quarter period (e.g., one quarter, two quarters, and etc.). Stand-alone annual forecasts are forecasts which are provide only for annual period (e.g., one year, two years, and etc.). Concurrent forecasts are forecasts which are simultaneously provided for both quarter and annual periods.

alone quarterly (annual) forecasts are more likely to be forecasts of earnings (revenues); quarterly forecasts issued simultaneously with annual forecasts are more likely to be forecasts of revenues and annual forecasts issued simultaneously with quarterly forecasts are more likely to be forecasts of revenues as well. Specifically, of 494 stand-alone quarterly forecasts (2,725 stand-alone annual forecasts), 46% (10%) of them are provided only earnings forecasts, 32% (71) of them are provided only revenue forecasts, and 22% (19%) of them are provided both revenue and earnings forecasts. Of 2,327 concurrent quarterly (annual), 53% (71%) of them are provided only revenue forecasts, 31% (9%) of them provided only earnings forecasts, and 16% (20%) of them provided both revenue and earnings forecasts. Overall, over than half of forecasts, regardless forecast horizon, are more likely to be forecasts of revenue.[362] A plausible explanation is that the SET does not encourage firms to voluntarily reveal earnings forecasts.

Management can provide its forecasts in various forms such as point estimates, range estimates, open-ended, or qualitative forecasts. Prior studies mostly focus on point and range forecasts since it is easier to measure forecast accuracy [Lev and Penman (1990) and Rogers and Stocken (2005)], while there is no explicit approach to measure forecast accuracy for open-ended and qualitative forecasts [Hirst et. al. (2006)].

In this study, we classify forecast form into three categories: quantitative, qualitative, and sales volume. Quantitative group consists of four forms: point, range, open-end, and semi-numeric.[363] Results in panel A of table 7 suggest that quarterly revenues forecasts are more likely to be in the semi-numeric and qualitative forms while annual revenues forecasts are more likely to be point estimates and semi-numeric forecasts.

===============================
Insert Table 7 here.
===============================

---

[362] 64% (18%) of total management forecasts are provided only revenue forecasts (both revenue and earnings) while 18% of them are provided only earnings forecasts.
[363] For semi-numeric form, management provides performance trend for a given period by referring to performance figures of last period.

Results in panel B.1 of table 7 suggest that firms are more likely to issue quarterly earnings forecasts in the qualitative and semi-numeric forms.   Moreover, results for annual earnings forecasts are consistent with those for quarterly earnings forecasts. Additionally, point estimates are another form of forecasts frequently used for annual earnings forecasts as well. Taken together, the results of forecast form for revenue and earnings management forecasts show that most of annual revenue and earnings forecasts are provided in more explicit form (i.e., semi-numeric to point estimate) while quarterly revenue and earnings forecasts are provided in less explicit form (i.e., semi-numeric to qualitative form). According to the disclosure guidelines, the SET does not allow firms to provide quarterly management forecasts. However, if firms need to disclose quarterly management forecasts, firm can issue forecasts in non-financial form. Therefore, most of quarterly revenue and earnings forecasts are in less numeric form.

In addition to exploring forecast forms used for earnings forecasts, this study also looks at information disclosed through earnings forecasts. Panel B.2 of table 7 shows results on information disclosed through earnings forecasts. Of 2,899 total earnings forecasts, most of them, 2,388 forecasts (81%), are net income forecasts. Results suggest that firms are more likely to disclose "net income" in quarterly earnings forecasts and they are more likely to disclose "net income" and "gross profit margin" in annual earnings forecasts. Of 1,431 quarterly earnings forecasts, 1,372 forecasts (96%) contain net income number; of 1,468 annual earnings forecasts, 966 forecasts (66%) contain net income number and 356 forecasts (24%) are gross profit margin. Since earnings number is a summary figure which represents overall firm performance, it is interested for investors in their decision making. Therefore, firms are more likely to provide net income in both quarterly and annual earnings forecasts.

4.2 Are management forecasts informative?

In addition to exploring management forecast disclosure practices, this study also investigates the information content of management forecasts by examining the market reaction

to management forecasts when they are released. The market reaction can be measured by absolute cumulative market-adjusted abnormal returns (ACAR) around management forecast release date.

Table 8 provides a reconciliation of the sample data and reports the sequential filters applied to obtain the final observation. From the 4,483 management forecasts obtained from the NEWSCENTER database, we remove 2,028 forecasts which have other events in 14 days surrounding management forecast release date. Next, we remove 91 forecasts which have unavailable stock returns in the DATASTREAM database. Finally, we obtain 2,364 management forecast disclosures from 260 firms.

=================================
Insert Table 8 here.
=================================

Consistent with prior study which found that management forecast disclosures provide useful information for capital markets, results of total management forecasts on three-day (-1,+1), five-day (-2,+2), and seven-day (-3,+3) windows centered on management forecast date reported in table 9 reveal the significant market reaction to management forecast disclosures surrounding management forecast release date. Specifically, ACAR in all three windows are significantly positive in the sample period.[364]

=================================
Insert Table 9 here.
=================================

According to the distribution of management forecast disclosures in section 4.1, we find that firms in property and construction, resources, and technology industries are more likely to provide management forecasts than others. Most of firms in these industries are large firms (i.e., have high market capitalization). Prior study suggests that market differently react to accounting

---

[364] We also employ the market-model abnormal returns using a 100-day estimation period (from day t-107 to day t-8) for beta estimation. Results (not reported) are qualitatively identical.

numbers of firm depend on its size [Freeman (1987)]. We find that forecast firms are more likely to disclose management forecasts prior end of accounting period than after end of accounting period. Prior study documents that timing of forecasts affect information content of management forecasts [Anilowski et. al. (2007)]. Additionally, we also find that half of management forecast disclosures are annual management forecasts. Pownall et. al. (1993) indicates that quarterly management forecasts are more informative than annual management forecast. Therefore, we provide additional test to examine whether industries the forecast firms are in, forecast timing, and forecast horizon affect informativeness of management forecasts.

To do so, we partition our samples by forecast firm industry, forecast timing (e.g., before or after the end of an accounting period), and forecast horizon (e.g., quarterly or annual forecast). For forecast firm industry, empirical evidences in table 9 show significantly positive ACAR for all three windows. Therefore, management forecasts of all firm industries are informative.[365] To assess forecast timing, we classify management forecasts into two groups: forecasts which are issued before and after end of period. The results in Table 9 shows that the timing of forecast is not affected to information content of management forecasts. We also observe significantly positive market reaction in all three windows. Therefore, timing of forecast is not matter since management forecasts which are disclosed before or after end of period are also informative.[366]

Finally, we investigate forecast horizons by dividing management forecasts into three groups. Forecasts in the first group are stand-alone quarterly forecasts. Forecasts in the second group are stand-alone annual forecasts. Forecast in the last group are concurrent quarterly and annual forecasts. Again, we also find significantly positive ACAR in all three windows.[367]

---

[365] Unreported results indicate that ACARs of all firm industries are insignificantly different.
[366] Unreported results show insignificant difference in ACAR between forecasts issued before and after end of period.
[367] Unreported findings show that information content among forecast horizons is insignificantly different.

5. Conclusion and Contributions

This study aims at providing empirical evidence on management forecast disclosures in Thailand as well as information content of management forecast disclosures. We hand-collect 4,483 management forecast disclosures of listed companies issued during 12-month period starting January 2005 and 12-month period starting July 2006. Our results show that almost 70% of Thai lasted firms voluntarily disclose their forecasts at least once during our sample periods and on average, each forecast firm issues 8-9 forecasts each year. Firms in property and construction, resources, and technology sectors are more likely to issue management forecasts than are other firms. Specifically, on average, each forecast firm in these sectors issues 10-12 forecasts each year. A plausible explanation is that most of these firms have a large number of analysts following and therefore they maintain their reputation by voluntarily issuing management forecasts.

This study also examines how early forecast firms issue their forecasts The results show that most of quarterly and annual management forecasts are issued before end of accounting period rather than after end of accounting period. As expectation, since the SET does not encourage firms to disclose short term information, firms are more likely to issue management forecast before end of accounting period than after end of accounting period. Forecast firms issuing quarterly forecasts prior to (after) the end of accounting period, on average, issue their forecasts 6 weeks prior to (3 weeks after) the end of accounting period, and that forecast firms issuing annual forecasts prior to (after) the end of accounting period, on average, issue their forecasts 6 months prior to (one month after) the end of accounting period. Obviously, number of days of quarterly forecasts is shorter than annual forecasts, regardless timing of forecast (e.g., before or after end of accounting period).

Additionally, this study investigates forecast horizons and forecast items forecast firms choose for their forecasts and documents that forecast firms are more likely to issue stand-alone annual forecasts and concurrent quarterly with annual forecasts than stand-alone quarterly

forecasts. Since the SET allows firms to disclose only annual forecasts, firms are less likely to provide stand-alone quarterly forecasts. As for forecast items, this study documents that annual forecasts (both stand-alone annual and concurrent annual forecasts) are more likely to be revenue forecasts; stand-alone quarterly forecasts are more likely to be earnings forecasts while concurrent quarterly forecasts are more likely to be revenue forecasts. However, overall distribution show that most of management forecast, regardless forecast horizon, are more likely to be revenue forecasts. The reason is because the SET does not permit firms to disclose earnings forecasts.

Moreover, this study examines forecast forms forecast firms choose for their forecasts and finds that quarterly revenue and earnings forecasts are more likely to be in the qualitative and semi-numeric forms; annual revenue forecasts are more likely to be point estimates and in semi-numeric form while annual earnings forecasts are more likely to be in the qualitative form. According to the disclosure guidelines mandated by the SET, firms do not provide quarterly forecasts.   Compared to annual management forecasts, therefore, quarterly management forecasts, regardless forecast item, are in less precise form. This study also documents that most of earnings forecasts, both quarterly and annual, reveal net income figures.

Moreover, this study investigates whether management forecasts of Thai listed firms are informative and documents that absolute cumulative abnormal returns around management forecast dates are significantly positive, suggesting that management forecast disclosures are informative. Results are consistent with prior studies on information content of management forecasts of US firms. Additionally, the information content of management forecast is not affected by industry forecast firms are in, forecast timing, and forecast horizon.

The study is the first study that provides empirical evidence on management forecast practices and the usefulness of management forecasts in Thailand. Our results provide contributions to financial analysts and investors, management, and the Stock Exchange of Thailand.

The findings in this study directly contribute to the SET. The empirical evidence on management forecast disclosure practices reveals that firms have many alternatives on forecast characteristics to disclose their forecasts. This is beneficial to the SET in issuing its future policy.

Finally, this study provides a contribution to the academic literature, specifically to accounting research in Thailand. The findings in this study present management forecast practices and the informativeness of management forecasts in Thailand and therefore the findings will assist accounting researchers in investigating other aspects of accounting research on management forecast disclosures.

[a] Absolute Cumulative Abnormal Returns (ACAR) is computed by compounding abnormal returns on selected windows and then taking the absolute term on cumulative abnormal returns.
[b] We classify forecast timing into two groups. The first group consists of management forecasts which are provided before end of accounting period while the second group consists of management forecasts which are provided after end of accounting period.
[c] We classify forecast horizon into three groups. The first group consists of management forecast disclosures which are provided stand-alone quarterly forecasts. The second group consists of management forecast disclosures which are provided stand-alone annual forecasts. The final group consists of management forecast disclosures which are concurrently provided both quarterly and annual forecasts.

IS AN EVENT RESPONDED BY INVESTORS AS A NON-EVENT? INQUISITIVE EVIDENCES WHEN DIFFERENTIATED BETWEEN FOREIGN AND DOMESTIC INVESTORS' REACTIONS

Bambang Riyanto LS & Sumiyana
Universitas Gadjah Mada

Abstract

This research investigates that merger and acquisition (M&A) announcements are able to stimulate abnormal return, rank of excess return and abnormal trading volume. Based on efficient market hypothesis and microstructure theory, it is predicted that price or return and trading volume will react to the M&A announcements. In this study, the market reactions are further examined for each type of investors: domestic and foreign. More specifically, the price movements of each of these two types of investors are analyzed thoroughly to explore if domestic investors have superior access to information than the foreign investors.

This study finds that market do not react to the M&A announcement. It means that M&A news does not lead to positive abnormal return, rank of excess return and abnormal trading volume. This may suggest that M&A announcement has no information contents. Consequently, it also has no value relevance. It is argued that M&A announcements may have been fully anticipated by investors before it is made public (announced). Therefore, this study suggests that an information leakage exists in It is further argued that information leakage exists in Indonesia Stock Exchange (IDX) whenever M&A news announced. Finally, this study concludes that the information leakages are dominantly carried out by domestic investors as actors of insider trading.

Keywords: *event study, domestic and foreign investors, abnormal return, rank of excess return, abnormal trading volume, information leakage, information contents, value relevance, insider trading*

JEL Classification: G-11, G-14, M-41

1. Introduction
Objective and Motivation of the Paper
This study attempts to examine the extent to which investors react to the news issued by firms in the Indonesian Capital Market. It is argued that the market may not perceive news issued by companies has information content. Fama (1978, 1991) argues that if investors believe that the news issued by firms conveys new information, then stock prices should immediately adjust to the new information. Alternatively, the market may not react to the news issued by firms. The debate about whether or not investors react to new information issued by companies is still going on; and the empirical evidence does not conclusively support the thesis that investors react to the new information, especially when the investors are classified as domestic and international. As Dvorak (2005) argues, foreignor domestic investors tend to destabilize the market to exploit short-run returns.

It is posited in this study that stock prices will not adjust to new information issued by companies. Investors do not consider such information reflects important events for three main reasons. First, the market is not efficient (i.e., efficient in the weak form) which suggests that stock prices are not associated with firms' values (Bhattacharya et al., 2000). Second, there is a possibility that the new information does not stimulate investors to react. Third, even if the market is efficient, the new information may have been anticipated by the market long before it is announced (Huberman & Schwert, 1985). To test the hypotheses, this study uses market volatility, volume of trade, and bid-ask spread to capture the market reactions.

The sample is taken from *Indonesia Stock Exchange (IDX).* As an emerging capital market, foreign investors may not expect to generate substantial returns from the Indonesian Stock Exchange. This is because foreign investors develop their portfolio in integrated (Bhattacharya, et al., 2000). Furthermore, in emerging markets, there may be unequal access of information among investors: domestic investors have superior access of information than foreign investors, which then drives the price changes. To examine this differential access of information, we use intraday data to identify whether investors are domestic or foreign. This is is because records about foreign and domestic investors are not systematically available at the IDX.

The type of *firm-specific announcements* investigated in this study is M&A announcements. Examining price changes associated with type of announcements (instead of only one firm-specific announcement) allow us to expand the sample and detect variety of announcements (Skinner & Sloan, 2002; Lopez & Rees, 2001). In other words, the findings will be robust across types of announcements. It also allows us to make inference about the characteristics of an emerging market, the Indonesia Stock Exchange, specifically about the extent to which foreign investors perceive that it offers less attractive returns than matured markets. To do this, we compare the market reactions of domestic investors. This comparison also enables us to test whether domestic investors over-react to announcements which will be reflected in the increase in the volatility of returns.

This study contributes to the literature in two ways. First, it examines the market reactions in terms of abnormal returns, volatility of returns, and bid-ask spreads. Second, it provides empirical evidence about the extent to which domestic investors possess superior access to information (relative to its foreign counterpart). This superiority enable them to react faster (capitalize on the opportunity), and make a fortune (at the expense of the foreign investors). In other words, domestic inverstors are more knowledgeable with alternative information sources and channels in IDX than foreign investors; they are able to get new information before it is officially released by companies, which enables them to react to the information earlier than the foreign investors. To some extent, the action of the domestic investors may be considered as

'insider-trading.' The early response of the domestic investors will be followed by all of the investors in the next period. This suggests that the event date (or event window) does not capture the market reactions properly.

The remaining of this study is organized in following order; Section 2 discusses the literature study and hypotheses development. Section 3 discusses the research methods used to examine all hypotheses. Section 4 discusses the research results and findings. The last Section 5 discusses the conclusion derived from analysis results and research findings.

2. Literature Study and Hypotheses Development
Announcements and Return

According to Foster (1986), there are three factors that determine if announcements have information content. First, the expectation of the market about the content of the information and the timing of the announcement. One of the important factors that determines the expectation of the market is the availability of competing sources of information. Investors are very uncertain about the content and timing of any information issued by companies. The higher the uncertainty, the more likely the prices of stocks will be adjusted. Second, the effect of the new information issued on the distribution of return in the future. The higher the expected revision of the firms' cash flows, the largers will be the revaluation of the stock prices associated with the new information. Third, the credibility of the information sources. The more credible the sources, the larger will be the revision of the stock prices.

Dontoh & Ronen (1993) define *information content* in terms of reaction on volume, prices, and expected belief dispersion, decrease in the dispersion on the individuals' conclusions about public disclosures, and increase in accuracy or precision of disclosures. This definition is supported by Pritami & Singal (2001) who argue that announcement of new information is associated with larger abnormal returns. When the information is consistent with the analysts' recommendation, the abnormal returns during 20 days is 3% to 4% larger for positive events, and -2.25% for negative events.

Ball & Brown (1968) examined the influence of the change of information content of earnings to investors' behavior at the New York Stock Exchange using a sample of 261 companies during 1946-1966. The investors' behavior is approximated by the level of the stock abnormal return. The investors' behavior is classified as positive change (positive news) and negative change (bad news). The results of their research show that there are close correlations between earnings change and cash flow with abnormal return. The companies with earnings increase (decrease) are followed by the stock price increase (decrease). After the annual financial statement published, the stock price index returns to flat from the zero month until the sixth month, that means the stock price has completely reacted against the whole earnings information, so that it is no longer reliable as a prosperous trading basics. This research is succeeded to discover evidences that there is a strong relationship between the earnings announcements and the stock market reaction.

Beaver (1968) examined the effect of earnings announcements on the volume of trading and the stock price movement using a sample of 143 companies during 1961-1965. It is found that earnings announcements are associated with trading volumes. Based on the findings, Beaver concludes that: (1) the investors sell or buy stock to optimize the earnings incomes and earnings expenses trade-off; (2) the investors buy or sell stock to maintain on a porftolio basis; (3) the investors buy or sell because (a) there are changes in their portofolio risk, or (b) the companies are within their prefered risk; (4) the investors buy or sell to minimize their taxes; (5) the investors buy or sell because there is new information that make them revise their judgement

about the possibility of return distribution. In his research, Beaver (1968) discovered that there is a dramatic increase in the trading volume and the variability of stock return during the week of earnings announcements. The variability of stock return is 67% higher during the day or the week of earnings announcements than non earnings announcements.

Watt (1978) examined using quarterly financial statements. He concluded that information contents of quarterly financial statements could be captured more perfectly by the market than annual financial statements. His research results show that there is abnormal return after quarterly earnings announcements showing weak market form. Foster (1977) also studies the interim and annual earnings announcements, and then shows abnormal return variance for two days since the earnings had been announced.

Morse (1981) investigates the price and trading volume volatility during a few days around quarterly and annual earnings announcements at Wall Street Journal (WSJ). The sample used in this research includes daily volume data and daily stock price during four years of 1973-1976 for the stock traded at NYSE (20 stocks) and ASE (5 stocks), and the stock traded at OTC. The results show that price volatility and trading volume increase before and during earnings announcements date at Wall Street Journal. The activity before the announcements date at WSJ may occur because the public announcements are misjudged. They are actually announced using broad tape on the day before WSJ issued.

Similar to earnings announcements, the M&A announcements can influence the stock price, either acquirer firm or target firm. The stock price variability of both firms reflects the stockholders' wealth level acquired from M&A announcements. The stockholders' wealth level is measured by abnormal return acquired by acquirer firm and target firm. Parkinson & Dobbins (1993) showed positive and significant abnormal return during 24 hour periods after bid announcements. The stock price of the target firm increases during acquisition announcements and acquisition process, meanwhile the investors of target and acquisitor firm gain high returns. Therefore, it could be concluded that stockholders' wealth increases by merger. Limmack (1991) studied the merger consequences to the investors' wealth level by examining the gains distribution to merger firms' investors. The results show that, even there are no totally decrease of their investors' wealth as a result of company acquisition, the acquirer firm could experiences a decrease in their investors' wealth level. Inversely, the wealth of target firms' investors could increase significantly.

Ghosh & Lee (2000) argued that abnormal return is correlated to target firms' performance which serve as underlying acquisition motives. The results finds high abnormal return for the target firm. Leeth & Borg (2000) suggests that target firms' investors during 1920s gained abnormal return from this acquisition more than 15%. Song & Walkling (2000) examined the merger effort sign which influence the non target firms in the same industry as the new target firm. The examination results shows that non target merger and acquirer firms get abnormal return around M&A announcements. Even though, abnormal return of non target firms are less than target firm. This is caused by the possibility that nontarget firms would become the next acquisition target.

Harris & Ravenscraft (1991) studied stockholders' wealth of 1273 firms in USA who do acquisitions since 1970 until 1980. The results show that for firms with intensive industry research and development, cross border acquisitions took place more frequently than domestic acquisitions. This research confirmed that target firms' wealth those are foreign firms are higher compared to the target which are domestic firms. Maquieira, Megginson & Nail (1998) studied 260 mergers which did the merger payment using stock from 1963 until 1990, and finds that merger paid with stock did not produce financial sinergy or stockholders' benefit. Amihud, Lev

& Travlos (1990) examined motivation which become the consideration to control other firms through investment paid by cash, debt or stock. The firm's values are reflected in investment paid using cash, debt, and stock. They documents that firm acquisition whose managerial ownerships are high tend to pay using cash. Additionally, negative abnormal return for the acquirer is related to payment using firms' stock whose managerial ownerships are low. Based on previous research described above, the hypothesis is formulated as follows.

H₁: *The M&A announcements induce positive abnormal return*

Announcements and Return Volatility
The stock price volatility begins with investors' assets re-evaluation. The re-evaluation process is conducted by estimating the expected income and risk to determine stock intrinsic value using most recent data. The result is then compared to the actual price to evaluate the price fairness. Based on this fairness evaluation, the decision to buy or to sell stock is made. There are two sides who have contradictive aim, namely the stock buyer who wants price increase after trading and the stock seller who wants price decrease. This contradictive aim causes stock price volatility. Each time the price has been concluded, then during the same time the balance between stock bid and ask occurs. The level of stock price volatility is comparable to stock intrinsic value fluctuation, and the information acquired by investors affects the stock price re-evaluation. Therefore, the stock price volatility can not be separated from new information acquired by investors. Public announcement is information recognized at the same time as the price is affected, before anyone can use it as trading strategies (French & Roll, 1986).

The public information signal is available for all traders but considered differently by various traders (Odean, 1998). The informed and non-informed investors trade, only when there is new information about future stock cash flow or about other variables such as wealth, preference, and investment opportunity. The investors' reaction against information occurs when information produced price change that reflects the investors' expected risk and benefit (Berry & Howe, 1994). Nofsinger (2001) studied the trading behavior of institutional investors and individual investors after firm specific information released by Wall Street Journal and macro-economics announcements. The investors tend to watch the released firm specific information especially about earnings and dividen. The institutional investors and individual investors buy stock after good economics news and sell them after bad ones. This phenomena show that public information released by Wall Street Journal and macro-economics announcements are greatly influence stock price volatility.

Balduzzi, Elton & Green (2001) signified that the impact of most public informations occur very fast (during 1 minute or less). Frino & Hill (2001) supported this signal. They state that the stock price behavior is greatly affected by public information announcements at Sydney Future Exchange (SFE). Price volatility, trading volume and bid-ask spread analysis indicates that adjustment to new information occurs very fast. The impact of announcements can be detected within 240 seconds. The bid-ask spread impact has shown within 20 seconds before and 30 seconds after public information. The increase of bid-ask spread is closely correlated with price volatility, which indicates market response against public information. Therefore, this research hypothesized as follows.

H₂: *The M&A announcements affects positively the level of return volatility*

The Impact of the Announcements to Trading Volume

The studies examining the relationship of price, trading volume and information are presented in studies by Bamber (1986), Barclay & Litzenberger (1990), Jain & Joh (1988), Morse (1981), and Winsen (1976). These studies found the relationship between trading volume and released information. Every new information is followed by trading volume increase that definitely affect stock prices. The reason is that released information can be either good news or bad news, the price change can be negative or positive, but the trading volume never negative.

The trading volume provides the intensity clue of an occuring stock price variability. The low trading volume is the characteristic of doubtful expectation that typically occurs during consolidation period (the period when the price change side within trading session). The high trading volume occurs when there is strong consensus that prices shift higher. The trading volume is a proxy of information inflows velocity, that affect stock price at the same time. The investors who have information do trading based on their acquired information. The more transaction done, the higher volatility is (Kyle, 1985; Admati & Pflederer, 1988). The investors who have information tend to trade more actively. Therefore stock price volatility rises after information disseminations.

Kyle (1985) explained the private information is formed by the end of trading day during which private information disseminated. The return variance during every interval reflects new information. Admati & Pfleiderer (1988) signified that two important motivations of trading at stock market are information or liquidity. Furthermore, the informed traders do their trading based on information that not every trader has. Whereas the liquidity traders trade without directly related to return on asset level in the future. Including within this category is big traders such as financial institutions, who their trading is conducted by showing the client need or in order to balance their portfolio. After the clasification of the two types of traders, it is shown that both types of traders choose to trade when the market is during thick transactions, that is when their trading has little influence against stock prices.

The concentrated attention to the similarity of stock price and trading volume reactions because of published information tend to make researchers to consider them as the substitute of market reaction measure (Bamber & Cheon, 1995). This is because lots of previous studies found that published information causes stock price and trading volume reactions. Karpoff (1986) stated that even though investors give similar interpretation about public announcement, but trading could occur when investors have different expectation. The different expectation causes stimulation to trade by releasing their speculative shares. Holthausen & Verrecchia (1990) concluded that an announcement that contains information content can change investor's belief, so that the investors do trade. When the different interpretation was constant, new information release is not expected to revise investors' belief. This different interpretation is adequate to motivate the investors to trade. The trading volume is an increasing function of the absolute price change, which is reflected in the information availability (Holthausen & Verrecchia, 1990). The stock trading may occur when the investors have different accuracy against private information. Pre-disclosure information asymmetry causes the investors to develop pre-disclosure beliefs by differentiating the degrees of confidence. The difference occurs within the weight of public announcement causes the different investors' belief revision and finally causes the trade.

Beaver (1968) disclosed that, if correlated with stock trading volume, published financial statements (events) could have information content when the stock number is bigger during earnings announcement compared to the other times during the year. Therefore, it can be concluded that the information content causes the traded stock volume becomes relatively more when an event occurred. This happens if the announcements were bad news. Meanwhile, because

this research is limited to M&An announcements event (good news), then this research hypothesized as follows.

H₃: *The M&A announcements influence abnormal trading volume positively*

Insider Trading

Begin with the study by Ball & Brown (1968) which signified strong support that investors react against earning announcement. The firms' employee, the board of directors and other insiders has more information than public who only has a chance to gain abnormal return based on information released by the firms. Furthermore, the insiders with special access to earnings information have capability to predict expected earnings and finally are able to trade with more trading volume. The special access to earnings enables the insiders to trade based on earnings information (Park, Jang & Loeb, 1993).

Jaffe (1974); Finnerty (1976); Baesel & Stein (1979); Givoly & Palmon (1985); Seyhun (1986); Fowler & Rorke (1988); and Allen & Ramanan (1995) concluded that there is relationship between insider trading and published earnings announcement. The insiders do their trading activity based on information captured earlier about future events, such as merger, earnings, and dividend announcements. The insiders sell (buy) is not a perfect prediction to be considered as good (bad) news (Allen & Ramanan, 1995). Givoly & Palmon (1985) signified that there is a probability of insider trading during their market action to gain excessive return and at the same time, they spread the information about long term prospect of the firm.

If insider trading provided certain information, then there is big probability that the market evaluate the firm condition information disclosure. This prediction has been investigated empirically which signified that the insiders are able to acquire abnormal return when trading and at the same time they spread estimated earnings information (Penman, 1982). The firms' decision to sell stock is considered profitable by the market when the buying by insiders occurs within six months before announcement (Hirschey & Zaima, 1989). The market responds the dividend announcements more negatively when there is selling by the insiders first (John & Lang, 1991). The market reaction against the bankruptcy announcements are more negative for the firm when there is a significant and big proportion of selling by the insiders (Gosnel, et al., 1992). The market responds more positively to buy back stocks when there is buying by the insiders first (Lee, et al., 1992).

The inference concluded from all studies above is that there are information leakage evidences before announcements event. This condition can be considered as insider trading evidence. Insider trading may be conducted by either domestic or foreign investors. This study differentiate the investors types as domestic and foreign investors to determine whether all types of investors or certain type of investors commit insider trading. This condition is confirmed if return variance during the period before announcements event is related positively and in one way with return variance during the following period. Subsequently, the return variance during the following period is related positively and in one way with return variance during the next following period. As a note, the term in one way refers to return variance which influence following return variance, and not vice versa. Therefore, the hypothesis can be formulated as follows.

H₄: *The return variance during preceding window periods is related positively with return variance during the following periods, within consecutive lag, sugesting insider trading*

2. Research Method

This study uses transaction data from the Indonesian Stock Exchange (IDX). The IDX has begun automation since May 1995 using JATS (*Jakarta Automated Trading System*). The transaction data record each transaction at IDX since May 1995. The informations recorded at data are such as time stamp, stock code, transaction number, order number, transaction value, transaction price, buy or sell code, investor's identity (foreign or domestic), stockbroker code, stockbroker's identity (foreign or domestic), and transaction board (for example regular, negotiation). There is no information whether the transaction is done by the institution or individual. The foreign or domestic identity is recorded before economics crises during 1997. Indonesia applied a policy that foreign ownership is limited to 49% of outstanding stocks. This limitation has been abolished during mid 1997. However, foreign or domestic investors' identity recording is still ongoing until recently. To make the study direction clearer, this study uses 45 most liquid stocks at IDX (stocks included within LQ45 index). This sample is selected because foreign investors have greater possibility to trade stock with big capitalization and with high liquidity (Kang & Stultz, 1995).

This research is an event study, which study market reaction against event of which information is published as an announcement. The event study can also be used to examine the information content of announcement and to examine market efficiency form. Furthermore, this study is aimed to examine market reaction between foreign and domestic investors against announcements published by the firms. This reaction is measured by return as the value of stock price change or abnormal return. This research uses market model with estimated window periods of 91 trading days based on stock price observation within 80 days before announcement and 10 days after announcement. The research sample is the firms those did public M&A announcements based on purposive sampling method.

Research sample is stocks listed at IDX and fulfill the following criteria, (1) the sample is all stocks traded during research period, (2) did not apply stock split policy during observation period, (3) did not announce other policies such as right issue, bonus, or other corporate events during window period, and (4) identify transaction which stocks were originally held by foreign and domestic investors. This research uses public company secondary data listed at IDX during 1999-2007. The collected data include transaction data, transaction clearing data, firm type, stock identification, price, trading volume, trading value, time stamp, stockbroker, stockbroker origin, and investors' identity (foreign and domestic).

The analysis methods used are differentiated according to hypotheses examined. Hypotheses H1 and H3 are examined using the following stages (return examination notation P is replaced by TV (trading volume) to calculate abnormal trading volume). First, this research adjusts the return calculated using the following formula $R_{i,t0} = \dfrac{P_t - P_{t-1}}{P_{t-1}}$, where $R_{i,t0}$ is the adjusted stock return day t_0; P_t is stock price day t; P_{t-1} is stock price before day t. Second, determine abnormal return calculated using the market model. The estimated periods used to develop α and β parameters is 120 days. The window period is day -45 until $+45$ with total t equals to 91 days. The market model is used with the formulation $AR_{it} = R_{it} - (\hat{\alpha}_{it} + \hat{\beta}R_{mt})$, where AR_{it} is abnormal return of security i during the event period; R_{it} is actual return of security i during the event period; $\hat{\alpha}_{it} + \hat{\beta}R_{mt}$ is expected return of security i. Third, calculate the mean

abnormal return (MAR) using the formula $MAR_t = \dfrac{1}{N}\sum\limits_{i=1}^{N} AR_{it}$, and calculate the mean cumulative abnormal return (MCAR) using event period with the formula $MCAR_{t\text{-}s,t} = \dfrac{1}{N}\sum\limits_{i=1}^{N}\sum\limits_{q=t-s}^{t} AR_{i,q}$.

Fourth, statistical test (t-test) is conducted to determine the statistical significance of stock price change which has been adjusted to stock split. The standardized mean of abnormal return of security i ($SMAR_i$) is the calculated t-value for security i. The standardization is conducted by dividing the abnormal return value with the standard error of estimation (SEE) which $SMAR_{i,t} = \dfrac{AR_{i,t}}{SEE_i}$. The standard error of estimation (SEE) is calculated using the $SEE_{,t}$ formula which similar with the $SEE_i = \sqrt{1 + \dfrac{1}{T1} + \dfrac{(R_{mt} - \overline{R_m})^2}{\sum\limits_{j=t1}^{t2}(R_{mj} - \overline{R_m})^2}}$ with $SEE_{i,t}$ is standard error of estimation of security i during day t within event periods; SEE_i is standard error of estimation of security i; R_{Mt} is market index return during day t within event period; R_{Mj} is market index return day j during estimation period; $\overline{R_M}$ is mean of market index return during estimation period; and $T1$ is the number of days within estimation period. The next, the value of SEE_i is calculated using the formula $SEE_i = \sqrt{\dfrac{\sum\limits_{j\backslash t1}^{t2}(R_{i,j} - E(R_{i,j}))^2}{T1-2}}$ with SEE_i is standard error of estimation of security i; $R_{i,j}$ is return of security i during day j within estimation period; $E(R_{i,j})$ is estimated return of security i during day j within estimation period; and $T1$ is number of days within estimation period, namely from day t_1 until day t_2.

To examine hypothesis H2, this study uses the absolute value of return compared to observed event. This study hypothesized that the absolute value of return is higher during window event compared to normal period. The examination procedure uses nonparametric mean rank of return (Corrado, 1989; Bhattacharya, et al., 2000). This examination does not use normal distribution assumption, but focus on value rank instead. The examination stages are as follow. First, each stock i is ordered from 91 observation days using the absolute value of residual by descending order. Second, calculate the value of $\mu(K)$ for window event (day t_{-1} until t_{+2}) using $\mu(K) = \dfrac{1}{N}\sum\limits_{i=1}^{N}\left(\sum\limits_{t=-1}^{2}(K_{it} - 45,5)\right)$. Third, calculate the standard deviation $\sigma(K)$ during the 91 days event periods which are -80th day up to +10th day using following formula: $\sigma(K) = \sqrt{\dfrac{4}{91}\sum\limits_{t=-80}^{+10}\left(\dfrac{1}{N}\sum\limits_{i=1}^{N} K_{it} - 45,5\right)^2}$. Fourth, examine the calculated-t against absolute value of residual during the window event which is equal or unequal to the event period. The formulation is $T = \dfrac{\mu(K)}{\sigma(K)}$.

To examine the hypothesis H4 as the clue of information leakage or the indication of insider trading, this study uses the method by Bhaattacaraya, et al. (2000). First, we develop window period lag 1, 2, 3, 4 and 5. Second, this study conducts two regression tests to estimate statistically significant return variance as the clue of information leakage. The tests are

conducted for all lags. The regression equations are $a_t = \beta_{10} + \sum_{i=1}^{n} \beta_{11i} a_{t-i} + \sum_{i=1}^{n} \beta_{12i} b_{t-i}$ and

$b_t = \beta_{20} + \sum_{i=1}^{n} \beta_{21i} a_{t-i} + \sum_{i=1}^{n} \beta_{21i} b_{t-i}$, where a_t is stock return variance sold by domestic investors and b_t is stock return variance sold by foreign investors or inversely during day t with lag period i.

4. Statistical Analysis and Results
Descriptive Statistics
This study employed M&A event data from IDX during 1999–2006. Examination used intraday data collected directly from IDX news. Similarly, M&A announcements are also collected directly from IDX news. The detailed number of M&A announcements is presented in Appendix A. The number of M&A events is 54 times in IDX within the previously mentioned years. However, this research eliminated one sample data due to data incompleteness that is Jakarta Setiabudi International Co. Ltd. Later, this research filtered common stocks only. Research sample was also directed to filter companies who published M&A and still operational at IDX. The third filter select M&A announcements that were actually completed, not just rumors. Based on this filtering process, detailed data about abnormal return and abnormal trading volume are presented details in Table 1.

Using 80 days before and 10 days after M&A announcements, there are 4,605 daily return data for foreign investor analysis, and 4,550 data for domestic investor analysis. Meanwhile, daily trading volume data consists of 4,641 data for both foreign and domestic investor's analysis. It can be concluded that the mean of abnormal return is smaller for domestic investors than foreign investors. The range of abnormal return is from -0.2107 for the lowest point until 0.2537 for the highest point. However, the range of trading volume is wider for domestic investors, which is at -0.3169–0.7491, compared to foreign investors, which is at -0.2124–0.6012. The standard deviation of abnormal return for domestic investors is greater than foreign investors that is 0.0371 for domestic investor and 0.0210 for foreign investors. The standard deviation of abnormal trading volume showed similar result, which the domestic investors is greater than foreign investors. The descriptive statistic result shows initial indication that there is a great probability that reaction of domestic investors is greater (more reactive) than foreign investors.

Insert Table 1 about here

Impact of M&A Announcements to Abnormal Return
This study examined time series return to determine the impact of M&A announcements against abnormal return around the announcements date. The examination method employed in this study is the problem solving method by Bhattacharya et al (2000) and Brown & Warner (1985). The examination is conducted by observing abnormal return behavior around M&A announcements, 80 days before announcement until 10 days after announcement. Before examination using this method, this study observed the behavior of abnormal return by graphical method. The analysis result by graphical method is detailed presented in Picture 1.

This picture signify that the movement of abnormal return for domestic investors is different from the movement of abnormal return for foreign investors. The picture shows that before the M&A announcements, abnormal return for domestic investor's increases at wider range than abnormal return for foreign investors. The picture also shows that abnormal return for

domestic investors rises before foreign investors does. From the magnitude of movement point of view, the foreign investors show more fluctuate movement compared to domestic investors. The movement of domestic investors which is always precede and rises positively to anticipate the M&A announcements shows indication that domestic investors is better informed than foreign investor. Inference derived from this picture is that M&A announcements do not bring informational content to domestic investors, because domestic investors have already reacted before the realization of the M&A. This signifies the information leakage acquired by the domestic investors.

This study continued the description of previous picture by conducting abnormal return examination for day by day around M&A announcements. The examination result using market model is presented in Table 2 as follows. The examination result shows that there are no abnormal return that statistically significant around M&A announcements, for instance during t_0 with t-values (sig.) equal -0.0059 (-1.8966) for domestic investors and equal to -0.0069 (-1.4495) for foreign investors. Similarly, t_1, t_2, and t_n do not show abnormal return that is statistically significant. This results lead to a conclusion that hypothesis H1 is not supported. This conclusion refers to that M&A announcements are no longer reacted by domestic and foreign investors. In other words, M&A announcements does not bring informational contents to the stock market anymore.

This examination result denies or does not in support with the theory that states that M&A announcements brings informational content (Beaver, 1968; Foster, 1977; Parkinson & Dobbins, 1993). Otherwise, this study supports the probability of information leakage that is no longer able to create abnormal return around the announcements (Jaffe, 1974; Finnerty, 1976; Baesel & Stein, 1979; Givoly & Palmon, 1985; Seyhun, 1986; Fowler & Rorke, 1988; and Allen & Ramanan, 1995). This study also signifies the possibility of insider trading during announcements, so that the abnormal return is cancelled.

Insert Picture 1 about here

Insert Table 2 about here

Impact of M&A Announcements to Return Volatility

The result of examination of abnormal return which shows statistically insignificant result is re-examined absolute value of excess return. The employment of this measurement has different essence. The previous examination follows the logic of normal distribution t-test which has positive and negative direction toward abnormal return. This examination does not direct to distributional assumption, but correlates with the rank of observation result (Corrado, 1989; Bhattacharya, et al., 2000). Previously, this study investigates the behavior of the rank of excess return by differentiating the domestic and foreign investors as presented in Picture 2.

Insert Picture 2 about here

This graphical examination shows that there isn't clear difference around M&A announcements. If M&A announcements brought informational contents, then the fluctuation of rank of excess return should occur. However, this examination result does not show that.

Nevertheless, the picture shows that the rank of excess return for domestic investors is greater than foreign investors. This result shows that the reaction of domestic investors is greater than foreign investors. This condition also refers to that domestic investors are better informed and supports the difference of acquired information related to the measure of traders' reaction at IDX stock market (Odean, 1998; Berry & Howe, 1994; Nofsinger, 2001).

The graphical examination is continued with the examination using T (*big-T*) test to compare the mean and standard deviation of research sample during long windows 90 days period (Corrado, 1989; Bhattacharya, et al., 2000) as presented in Table 3. The examination result shows that each type of investor, domestic and foreign investors, does not have the difference of rank of excess returns that statistically significant. Therefore, hypothesis H2 is not supported. Even though the previous result shows that domestic investors are better informed and have higher rank of reaction, both types of investors do not show drifting reaction change around M&A announcements. This study once again supports the indication of the probability of information leakage which no longer able to create higher excess return around the announcements. Therefore, this study signifies and supports the possibility of insider trading during M&A announcements, and result in the inexistence of high rank of excess return (Jaffe, 1974; Finnerty, 1976; Baesel & Stein, 1979; Givoly & Palmon, 1985; Seyhun, 1986; Fowler & Rorke, 1988; and Allen & Ramanan, 1995).

Insert Table 3 about here

Impact of M&A Announcements to Trading Volume
The theory within microstructure formulates that announcements is related to trading volume increase (Bamber, 1986; Bamber & Cheon, 1995; Kyle, 1985; Karpoff, 1997). This subsection discusses the sensitivity test of previous examination using abnormal return and the rank of excess return. The examination of abnormal trading volume uses the concept by Bamber (1986); Bamber & Cheon (1995) and Batthacarya, et al (2000). The logical framework of this examination is that the movement of price and return serves as indicator of aggregate belief revision, while the movement of trading volume serves as indicator of the consequence of aggregate belief revision which has impact to the summing of trading activity. The detailed result of this graphical examination of trading volume movement as a result of M&A announcements is presented in Picture 3 as follows.

The graphical examination shows that the movement of abnormal trading volume during M&A announcements and the following days does not show increasing change. This condition refers to that neither domestic nor foreign investors are reacting after this announcement. However, the movement of abnormal trading volume during one and two days before M&A announcements greatly increases. This indicates that the investor's reaction is preceding the M&A announcements. This means that the investors have revised their belief and make higher aggregate activities to anticipate the M&A announcements.

This graphical examination is then continued with the statistical examination as presented in Table 4. The result shows that hypothesis H3 is partially supported, because it is the only one day before announcements which is more likely incidental for domestic investors. The result shows that domestic investors respond M&A announcements within one day before the announcement. This result is statistically significant with the mean of abnormal trading volume equals to 0.0138 which is significant at level of 1%, whereas foreign investors do not. Foreign

investors react to M&A announcements within two days after the announcement date. This difference shows that domestic investors have more information and trade in higher volume than foreign investors. Similarly, this statistically significant difference shows that information leakage of M&A announcements occurs for domestic investors. This also means that domestic investors more likely tend to have private information than foreign investors. Therefore, this study concludes that there is information leakage probability. It is shown that M&A announcements are no longer able to create abnormal trading volume after announcements and abnormal trading volume before the announcements (Jaffe, 1974; Finnerty, 1976; Baesel & Stein, 1979; Givoly & Palmon, 1985; Seyhun, 1986; Fowler & Rorke, 1988; and Allen & Ramanan, 1995). All those research also signify the possibility of insider trading during M&A announcements, so that abnormal trading volume after M&A news can not exist.

Insert Picture 3 about here

Insert Table 4 about here

The Existence of Insider Trading

Following the discussion of the movement of stock price and trading volume which are actually sensitive to M&A information, this study examined the impact of M&A announcements to determine the possibility of information leakage. The examination result shows that there are no abnormal return and abnormal trading volume that statistically significant. Therefore, this study formulates that there is a possibility of information leakage about M&A announcements. However, one bright side, the possibility of information leakage can be interpreted as a good anticipation by investors against information, so that the market take efficient position or the information of M&A announcements have informational content. However, one bad side, the possibility of information leakage has a consequence that the information does not have informational content which means having no value relevance or actually the information has leak because the information has been anticipated previously.

With the confirmation that there are no abnormal return and abnormal trading volume that is statistically significant (all previous three hypotheses do not proven statistically significant), this study formulates that, in one side, the information leakage is the greatest possibility. If so, there should be insider trading which brings private information previously whenever M&A occurs. In another perspective, the market participants have updated their belief before the announcement. The trading conducted by market participants implied to the stock prices that reflected this information leakage. Thus, M&A announcements had been fully anticipated, and it will not affect return and trading volume.

The prove the presume of information leakage, this study constructs relation-lag of price variance between the day of M&A announcements (t_0) and abnormal return during previous days t_{-n}. Price variance is used to examine the absolute measure of fluctuation within each trading day. If the absolute measure of return variance during the day of M&A announcements was positively associated with the absolute measure of return variance during previous days, then the information has been spillover during the days prior to the announcement or suggests the information leakage. Inversely, if the association was negative, then the market reacts against M&A announcements. Furthermore, the examination stays within the construct that differentiate

between domestic and foreign investors. This aim directs to the determinations of whoever brings the private information to IDX. The examination result is presented in detail in Table 5 as follows.

Insert Table 5 about here

The examination result shows that positive association is proven statistically significant for domestic investors. The examination result shows that domestic investors with association of absolute return variance during the day of M&A announcements with the previous days for lag 1 equals to 2.2955 which is significant at level of 5%, for lag 2 equals to 2.5574 which is significant at level of 5%, for lag 3 equals to 2.6536 which is significant at level of 1%, for lag 4 equals to 2.5036 which is significant at level of 5%, and for lag 5 equals to 2.2274 which is significant at level of 5%. This result refers to that the traders are already aware and able to anticipate the absolute measure of return variance due to M&A announcements. Because the one proven statistically is the domestic investors, then this type of investor's trade based on private information and choose to acquire gains from trading prior to M&A announcements. Therefore, this study also concludes the absence of value relevance of M&A announcements and there is anomaly of efficient market hypothesis because announcements does not reacted by price and return. Thus, hypothesis H4 is supported, which means that this study supports the possibility of insider trading during M&A announcements (Jaffe, 1974; Finnerty, 1976; Baesel & Stein, 1979; Givoly & Palmon, 1985; Seyhun, 1986; Fowler & Rorke, 1988; and Allen & Ramanan, 1995), marked by positive association between absolute return variance within consecutive lags.

5. Findings and Limitations
Stock trading at IDX shows no reaction against M&A announcements. This study found that there is no excessive reaction against M&A announcements, under the measures of abnormal return, rank of excess return volatility and trading volume. This research hypotheses that M&A announcements serve as positive stimuli towards abnormal return, rank of excess returns and abnormal trading volume around the date of announcement did not statistically proven. Therefore, this study formulates a statement that an event is reacted by investors as a non-event. This result indicates that M&A announcements did not give informational content at IDX. Furthermore, the absence of informational content also did not result in value relevance at IDX. The absence of informational content and value relevance may signify that the market is inefficient form or there is an anomaly in efficient market hypothesis at IDX.

With the unproven, this study found that the biggest probability is information leakages about M&A announcements. This information leakage also indicates insider trading at IDX. The examination result gives evidences that domestic investors utilize M&A announcements prior to foreign investors. In another perspective, domestic investors have superior information than foreign investors. Therefore, domestic investors are able to acquire gains from trading earlier before M&A news announced.

This condition gives image that the market does not have good enough integrity for all investors' interest. It is notable that market integrity becomes a problem for emerging market, such as IDX. Unlimited to IDX, the market integrity problem becomes the main focus within trading fairness. If this condition stays unsolved, the market face development problem that may result in discontinuation of nation wide economics development. The reason proposed is that investors give judgment to the market integrity by revising their belief about the sum of stock traded or the sum of fund invested which is only if it can be raised through the stock market.

Information leakage, insider trading and other factors having consequences against market integrity may imply the stock market regulation to regulate all three factors in integrated policy formulation. This policy is aimed to create trading fairness. One of the policies that may be applied is the magnitude of profit allowance for the investors during trading. The market policy only allow thin profit margin. The policy of profit margin allowance is enforced to all of investors, without exception. Because of it is hard to uncover insider trading, other policy may done by applying maximum penalty to the actors of insider trading, such as expulsion.

The accounting information related policy to control insider trading is urgency of disclosure. This urgency may reduce information asymmetry to the investors. The reason that supports the disclosure urgency is the ability to shift from private information to public information. This shift is able to inform announcements to become publicly known to the various types of investors. Further important is the policy that is able to control company information disclosure before the management do business activity, such as M&A.

This study poses limitation that may reduce its conclusion validity. First, the examination is conducted on wide-range window periods which may contain confounding event affecting the magnitude of abnormal return and trading volume. This problem actually may be solved by the employment of intraday data to measure abnormal return, rank of excessive return and abnormal trading volume. Second, the examination used only one event of M&A and one nation, Indonesia. Further examination should be based on nation by nation. Such examination provides comparison of market integrity, to ensure the behavior of investors among various countries. Especially, traders who tend to intelligently anticipate information dissemination. Third, if the market did not react against announcements, the research design model that is widely used to measure abnormal return, rank of excess return and abnormal trading volume in event studies is questionable.

6. Conclusion

This study concludes that there is no either abnormal return, rank of excess return volatility or trading volume as a reaction of M&A announcements. Research hypothesis that states that M&A announcements serve as positive stimuli towards abnormal return, rank of excess returns and abnormal trading volume around the date of announcement did not statistically proven. From the results of all three hypotheses, this study formulates in a statement that an event is reacted by investors as a non-event. This result indicates that M&A announcements do not give informational contents, did not affect value relevance, or the market is inefficient at IDX.

This research also suspects the information leakage. The hypothesis of information leakage is supported as shown by domestic investors. The domestic investors have private information previously and utilize it to trade during the period before M&A announcements. Thus, domestic investors may be suspected that they act as insider trading.

The information leakage and big probability of insider trading by domestic investors, is considered by this study to conclude that IDX market has not good enough integrity when M&A news announced. Consequently, the market integrity should be created by the policy makers to develop trading fairness. New policy can be applied by regulation of narrow profit margin allowance, and the regulation of the urgency of accounting information disclosure so that the information may be publicly known by investors urgently.

EVIDENCE ON HOW FIRMS COMBINE DIVIDEND PAYOUTS AND SHARE REPURCHASE PAYOUTS IN THE BURSA MALAYSIA

Mohamad Jais, *University Malaysia Sarawak*

Azlan Zainol Abidin, *University Utara Malaysia*
Ayoib Che Ahmad, *University Utara Malaysia*
Kamarul Bahrain Abdul Manaf*, University Utara Malaysia*

Abstract- This paper analyzes firms that combine dividend and repurchases payout using actual data, and finds that the frequency of repurchase activity is negatively (positively) related to firms that simultaneously increase (decrease) their dividend payouts. This means that dividend-increasing firms use repurchasing as a complement to dividends, while dividend-decreasing firms use repurchasing as a substitute for dividends.

Keywords: Dividend, Share repurchases, Bursa Malaysia

1. Introduction

Dividends and share repurchases are two of the most common payout methods used by firms to distribute cash to shareholders. In the U.S., dividends have long been the preferred choice of payout for firms, but since the 1980s, share repurchases have gained popularity as the preferred payout method (Grullon and Michaely, 2002). The percentage of dividend-payers dropped from 66.5% in 1978 to just 20.8% in 1999 (Fama and French, 2001). As of 2004, the aggregate dividends and aggregate repurchases reached the same level (Skinner, 2008). Grullon and Ikenberry (2000) attributed the popularity of share repurchases as an alternative form of payout to their flexibility to exploit the perceived undervaluation of the shares and to increase the liquidity of the shares, which may be the right strategy in a bear market.

Most of the finance literature has looked into the signaling effects and the firms' post-payout operating performance of both payout methods[368]. Increased dividend payout and repurchase activities are interpreted as a positive signal conveyed by the management; since the management knows better about their own firms, any positive distributions to shareholders are greeted positively by the stock market. However, the evidence on the post-payout operating performance of the dividend-increasing and repurchase firms is mixed.

Most studies have looked at the issues separately; only a few have investigated the two payout methods when they are combined[369]. In addition, although such studies are based on accurate data for dividends, they have encountered measurement problems in regards to actual share repurchase because, in the U.S. market, firms are not required to disclose how many shares they repurchase or the amount involved in the repurchase. Therefore, the repurchase measurement is based on estimations (e.g., the value of the repurchase announcement/monthly figure of shares outstanding). However, in the Bursa Malaysia, all firms are required to announce publicly via the Bursa Malaysia website the number of shares repurchased, the price paid, and the amount spent on the same day. These data can provide accurate measurements on share repurchase activity.

This paper uses actual data from the Bursa Malaysia to examine the factors that motivate the firms to execute both payout strategies simultaneously. The results suggest that firms increase dividends and simultaneously repurchase their shares when they have higher income shock and more stable prior income. Doing so indicates that firms do not want to increase dividends drastically but prefer to supplement the extra payout by repurchasing their own shares.

[369] See Jagannathan et al.(2000), Lie (2005) and Guay and Harford (2000).

This study proceeds as follows: Section 2 reviews the relevant literature, sample and methodology are discussed in Section 3, results and discussions are presented in Section 4, and Section 5 concludes.

2. Literature Review

The studies that have jointly examined dividends and share repurchases have focused on the relative efficiency of both methods as signaling devices and methods of distributing cash. Bartov et al. (1998) found that equity undervaluation, extensive use of stock options and heavy institutional investor relationships will make distributing cash through repurchase more favorable. Guay and Harford (2000) concluded that firms choose dividend increases to distribute permanent cash flow shock, while repurchase is used to distribute transient shock; the stock market reacts more favorably to announcements of dividend increases. Grullon and Michely (2002) suggested that the growth in repurchase activity in the US market is due to firms' substituting share repurchases for dividends. In their comprehensive study, they showed that many firms have initiated cash payouts through dividends, that many firms that have been paying dividends have initiated cash payout through repurchase, and that the stock market reacts less negatively when it perceives firms are substituting share repurchases for dividends. In almost identical studies, Jagannathan et al. (2000) and Lie (2005) looked into the financial flexibility, performance and corporate payout choice between dividend and share repurchases and came to similar conclusions: that firms that increase their payout have better financial flexibility and positive income shock, and that firms with higher operating cash flow prefer payouts through dividend, while repurchase is associated with higher non-operating cash flow. Although most studies have agreed on the financial characteristics and the performance of each payout method, there are two areas of this research that can be improved.

The first is the measurement problem. For repurchase payouts, the figure most commonly used in the analysis of existing studies is based on estimation only because repurchasing firms are not required to report how many shares they repurchase, the price paid, or the total amount involved. Many studies have estimated the repurchase figure from the announcement, when an announcement is just an intention, not an obligation for firms to repurchase their shares. Estimating in this way will lead to over-estimation of the repurchase value. To overcome this problem, Stephens and Weisbach (1998) proposed four methods with which to measure share repurchase activity. The primary measure they proposed is to look into the monthly decrease in shares outstanding reported by CRSP (Center for Research in Securities Prices). A similar measure can be constructed using the number of shares outstanding quarterly on Compustat. However, both of these methods will lead to underestimation of repurchase activity since, during the same period, firms may also distribute shares through stock options, benefit plans and stock sales. The other two methods use the purchases of common and preferred stock from Compustat cash flow data and the Compustat changes in Treasury stock. However, both of these methods use the aggregate of all securities purchases and retirements during the quarter, which will lead into overestimation since the purchase price and the quantity repurchase are unknown.

The second problem in the analysis of existing studies on the subject of repurchases and dividends is related to firms that combined both payout methods. Since the actual data on share repurchases is elusive, almost all of the studies have been silent on any empirical analysis of firms that combine both methods of payout, that is, those that simultaneously pay dividends and repurchase their shares.

In the case of the Bursa Malaysia, firms are required to announce their repurchase activity publicly online. The information contains the number of shares repurchased, the amount involved, and the price paid for the repurchased shares. Based on this information, this study:

(a) examines the type of payout choice using the actual data of share repurchases, and

(b) investigates factors that might influence firms to undertake both channels of payout (dividend and share repurchase), an area that has long been neglected in the literature of corporate payout policy literatures.

3. Sample and methodology

The sample period used in this study is from 1999 to 2005. The choice of the time period is based on the implementation of the share repurchase program in the Bursa Malaysia. This study utilizes the database from Datastream, Thomson Financial Services. To be included in the final sample, data must satisfy four criteria:

- The firm's financial data for four years are available on Datastream, Thompson Financial Services.

- Yearly data on dividends is available.

- Utilities, financial, closed end funds or REITs are excluded from the sample.

- Data on share repurchases available on the Bursa Malaysia website must include date repurchased, number of share repurchased, amount spent on repurchase and price paid for the repurchased shares.

A firm is defined to have increased (decreased) dividends in a given year if the annual dividend increases (decreases) relative to the prior year. Benartzi et al. (1997) defined an annual dividend as four times the last quarterly dividend and a dividend change as the difference between year t's annual dividend and year t-1's annual dividend. Guay and Harford (2000) considered that a dividend increased only when quarterly dividend changes within the fiscal year were either positive or zero. Lie (2005) and Jagannathan et al. (2000) defined dividend increases

(decreases) in a given fiscal year as occurring if the dividend per share increases (decreases).

A firm is defined to have repurchased shares in a given year only if it actually repurchased their shares, rather than simply making a repurchase announcement. The key determinant that is likely related to payout decision is earnings. Similar to Lie (2005) and Jagannathan et al. (2000), I constructed several variables for earnings before the potential payout occurs. *Prior Operating Income* is the average of operating income scaled by total assets during years t–2 and t–3. *Prior operating income volatility* is the standard deviations of operating income scaled by total assets from year t–3 to year t–1. *Operating income (OI) shock* is the difference between the operating income scaled by total assets during years t–1 and t-0 (the event year) and the operating income scaled by total assets during years t–3 and t–2.

To explain the situation in the Malaysian market, *Days of repurchase*, a dummy variable on the total number of days spent on repurchase activities, takes the value of 1 if more than 60 days are spent on repurchase in the calendar year, and 0 otherwise. I included this dummy in order to investigate whether firms use repurchase as a complement to or substitute for dividends. For example, firms that repurchase shares and increase their dividends should spend fewer days repurchasing their shares, in which case it can be concluded that these firms are complementing their dividend payout by repurchasing fewer shares.

Independent directors' composition is the total number of independent directors scaled by total board members. This variable measures whether the composition of independent directors affect the payout pattern of the respective samples.

The other control variables[370] are *Assets*, the book value of assets during the event year that serves as an indicator of firm size (measured in Ringgit Malaysia (RM'000)); *Cash and near cash*

---

[370] To mitigate the effects of outliers, I restrict the variables to the following conditions
    a. $0 \leq$ debt < 1
    b. $0 \leq$ retained earnings < 1

scaled by total assets and *total debt scaled by total assets* captures the financial flexibility of the firms.

Retained earnings scaled by total assets, which captures whether the probability of a firm's paying out its earnings through a particular payout channel is positively related to its accumulated earnings over the year, also indicates how long the firm has been operating. Fama and French (2001), Grullon et al. (2002) and DeAngelo et al. (2006) found that established firms are associated with a higher probability of paying dividends.

The final sample consists of 135 observations of increased dividends and repurchased shares and 92 observations of decreased their dividends and repurchased shares. Table 1 provides preliminary statistics on the two groups.

Table 1 Descriptive statistics

		Combination of repurchase and dividend increase	Combination of repurchase and dividend decrease
Assets (RM'000)	Mean	1,719,002	2,274,872
	Median	(645,996)	(730,008)
Cash	Mean	0.1401	0.1405
	Median	(0.1283)	(0.0888)
Debt	Mean	0.1673	0.2006
	Median	(0.1258)	(0.1721)
Prior operating income	Mean	0.0700	0.0595
	Median	(0.0643)	(0.0527)
Operating income shock	Mean	0.0082	-0.0136
	Median	(0.0089)	(-0.0142)
Prior operating income volatility	Mean	0.0251	0.0312
	Median	0.0194	0.0267
Retained earnings	Mean	0.3294	0.2827

	Median	(0.3208)	(0.2696)
Independent directors	Mean	0.3808	0.3788
	Median	(0.3750)	(0.3489)
Number of observations		135	92

Of firms that combined both types of payout, more firms increased dividends and repurchased than decreased dividends and repurchased. On the other control variable, firms that increased dividends and repurchased had higher cash and a lower debt ratio. On the operating income variables, firms that increased dividends and repurchased had higher prior operating income and income shock and more stable prior income, higher retained earnings, and more independent directors that firms that decreased dividends and repurchased.

The overall conclusion from this descriptive statistics is that the dividend-increase-and-repurchase group is the ideal candidate to undertake both positive payout methods, as they are financially superior and have better corporate governance structure.

4. Results and discussion

To examine the combination of both payout methods, I estimate the logistic regression between dividend increases and repurchases versus dividend decreases and repurchases.

Table 2 Correlation coefficient

	Prior OI volatility	OI shock	Prior OI	Log assets	Cash	Debt	Retained earnings
Prior OI volatility	1						
OI shock	-0.036	1					
Prior OI	-0.008	-0.303	1				
Log assets	-0.211	0.061	0.104	1			
Cash	-0.028	-0.032	0.075	0.101	1		

Debt	-0.061	-0.066	-0.193	0.329	-0.086	1	
Retained earnings	0.085	0.074	0.248	0.15	0.08	-0.571	1

Table 2 provides the correlation coefficients between pairs of independent variables used in the analysis to check for multicollinearity. The data indicates that there are no significant correlations between any of the independent variables.

Table 3 Logistic regression on the combined payout choice of dividend increases and repurchase versus dividend decreases and repurchase

	Model 1		Model 2		Model 3	
	Coefficients	p-Value	Coefficients	p-Value	Coefficients	p-Value
Intercepts	1.3145	0.4375	0.8446	0.6045	0.2237	0.8880
Log assets	-0.1436	0.6523	-0.0950	0.7615	0.0033	0.9914
Cash	0.0286	0.9794	0.2896	0.7973	0.0242	0.9825
Debt	-0.1683	0.8968	-0.1042	0.9370	-0.4417	0.7324
Prior operating income volatility	-13.6791	0.0489				
Operating income shock			13.0847	0.0003		
Prior operating income					1.6681	0.5233
Retained earnings	1.8674	0.1218	1.4132	0.2393	1.2633	0.2761
Days repurchase	-0.6134	0.0359	-0.7949	0.0078	-0.6886	0.0172
Number of observations	227		227		227	

Table 3 presents the logit regression analysis between firms that increase dividends and repurchase versus firms that decrease dividends and repurchase. For the dependent variable, firms that increase dividends and repurchase take the value of 1, while firms that decrease dividends

and repurchase take the value of 0. To mitigate the problem of multicollinearity, I run three separate logit regressions in which only one operating income variable is included in each regression.

Table 3 shows the empirical relationship that might explain why firms combine two positive payouts simultaneously. Unlike previous studies, this study utilizes the actual data on dividend and repurchase and examines the factors that may increase the probability of firms' increasing dividends and simultaneously repurchasing their shares. This area has rarely been discussed in the payout literature.

The coefficients on assets, cash, debt, prior operating income level and retained earnings are not statistically significant and cannot explain a firm's decision to increase dividends and simultaneously repurchase shares, although some of the variables do show the expected sign.

Two variables, operating income shock and volatility of prior income, show the expected signs and are statistically significant. The evidence indicates that firms will increase dividends and simultaneously repurchase their shares if they have higher income shock and more stable prior income; this evidence suggests that, when management is in a comfort zone, it can increase regular dividends because of higher income shock and, at the same time, repurchase their shares to distribute any extra income they have earned back to shareholders through both payout channels. As Lintner (1956) suggested, firms should gradually increase their dividends and should not drastically change their payout policy, but the availability of payout through repurchase offers another channel for firms to increase their payout.

The days of repurchase variable can explain the characteristics of the Malaysian market in particular[371]. The result shows that this variable has a negative relationship with firms that

---

[371] This is due to the availability of the timing of the repurchase activity, as well as other information, such as number of shares repurchased, amount of money spent, the average price paid and the repurchased

increase dividends and repurchase their shares and that it is statistically significant in all the regressions. This result suggests that firms that increase dividends complement their dividend payout by repurchasing fewer shares in the open market, while firms that decrease dividends compensate for the reduced dividends by actively purchasing more shares from the open market.

5. Conclusions

This study explores the determinants for the choice of combining the payout channels by increasing (decreasing) dividends and repurchase.The main contribution of this study is that the analyses are performed using the actual repurchase data.

This study investigates the characteristics that can explain the incidence of firms simultaneously increasing their dividend levels and repurchasing their shares. Higher income shock and more stable prior income motivate management to distribute cash through regular dividend increases and repurchases. The evidence also indicates that firms that increase dividends supplement extra cash payouts by repurchasing shares in the open market, while firms that decrease dividends compensate for the reduced dividend by repurchasing more shares in the open market.

6.5 International Accounting

JAPANESE RESPONSES TO THE EXPOSURE DRAFT ON THE CONCEPTUAL FRAMEWORK OF FINANCIAL ACCOUNTING BY IASB/FASB: THE INTERNATIONAL COMPARISON

Michimasa Satoh, Nagoya University
Aprilia Beta Suandi, Universitas Gadjah Mada

September 5, 2009

Abstract

The IASB / FASB published the *Exposure Draft of an Improved Conceptual Framework for Financial Reporting*, in May 29, 2008. In this ED, the Boards declared that they decided to adopt the entity perspective. The adoption of the entity perspective might bring a paradigm shift in financial reporting. In this paper, we review and analyze the 142 comment letters to the ED in order to find out the possibility of moving into entity perspective.

Most of the comment letters agree that the financial reporting should be prepared from the perspective of entity, rather than the perspective of the owner or proprietary perspective. However, only few of them mention their detail reasons behind their approval. As a person who translated Robert N. Anthony's book*, Future Directions for Financial Reporting* into Japanese, in which entity theory was explained almost clearly, Professor Michimasa Satoh (one of the writer of this paper) sent a comment letter to IASB to find out whether IASB/FASB understand the impact.

Anthony's entity theory is suitable to the co-operative society and to the companies which take care of all the stakeholders (stakeholder capitalism). It is believed that Japanese companies are conducted according to the stakeholder capitalism. Therefore, the comment letters which come from Japan should have welcomed the IASB/FASB decision to adopt entity theory.

1. Introduction

The purpose of this paper is to analyze the significance of the comment letter from Japan to IASB which decided to adopt the "entity perspective" in the Exposure Draft on the Conceptual Framework of Financial Accounting.

In July 2006, the U.S. Financial Accounting Standard Board (FASB) and the International Accounting Standards Board (IASB) published jointly the Discussion Paper, *Preliminary Views on an improved Conceptual Framework for Financial Reporting: The Objective of Financial Reporting and Qualitative Characteristics of Decision –Useful Financial Reporting Information*. That was the first publications jointly developed by the Boards as part of a project to develop the internationally acceptable conceptual framework for financial reporting. The Discussion Paper was issued for public comments until November 3, 2006.

There were 179 comments received as responses for the Boards' Discussion Paper. After the Boards' redeliberations of the issues being addressed in the first phase of the project and consideration of feedback received on the Discussion Paper, the Boards published *Exposure Draft of an Improved Conceptual Framework for Financial Reporting: The Objective of Financial Reporting and Qualitative Characteristics and Constraints of Decision –Useful Financial Reporting Information* in May 29, 2008. The Exposure Draft was also issued for public comment until September 29, 2008. As a result, 142 comment letters were received to comment on those two chapters.

It was epoch making that the term "entity perspective" appeared in the discussion paper and being explained more detail in the exposure draft, which was mentioned as more appropriate than proprietary (or perspective). Although vast majority of today's big business entities engaged in financial reporting have substance distinct from their stockholders, they calculate their income for stockholders (not for the entity) based on the proprietary theory. So it was a big surprise that the Boards decided to adopt entity perspective. However, different from proprietary theory that might have been widely understood, there are many interpretation of

entity theory. This might lead into different perception of what entity perspective is.   In   this context, Robert N. Anthony's book*, Future Directions for Financial Reporting*, in which entity theory was explained almost clearly, becomes very important. Three comment letters were sent to IASB from Japan: from ASBJ, JICPA, and form Professor Junichi Akiyama & Michimasa Satoh as are shown in the Appendix. The ASBJ strongly opposed to the adoption of entity theory (CL # 35), the JICPA was neutral (CL#55), while Professor Akiyama and Satoh agreed and asked to state clearly that all outside capital has a cost to the entity. (See the attached Appendix p.1)

In this paper, the 142 comment letters of the exposure draft are reviewed firstly, and then secondly, the possibility of moving into entity perspective will be analyzed.

2. Review and Analysis

There are 3 questions that were issued in Exposure Draft of Chapter 1: The Objective of Financial Reporting.

1) The Boards decided that an entity's financial reporting should be prepared from the perspective of the entity (entity perspective) rather than the perspective of its owners or a particular class of owners (proprietary perspective). (OB5-OB8 and BC1.11-BC1.16). Do you agree with the Boards' conclusion and the basis for it? If not, why?

2) The Boards decided to identify present and potential capital providers as the primary user group for general purpose reporting (OB5-OB8 and BC1.19-BC1.22). Do you agree with the Boards' conclusion and the basis for it? If not, why?

3) The Boards decided that the objective should be broad enough to encompass all of the decisions that equity investors, lenders, and other creditors make in their capacity as capital providers, including resource allocation decisions as well as decisions made to protect and enhance their investments. (OB9-OB12 and BC1.23-BC1.29). Do you agree

with that objective and the Boards' basis for it? If not, why? Please provide any alternative objective that you think the Boards should consider.

(1) Respondent Types and the Geographic Regions

IASB classified the comment letters received into 9 respondent types in order to enable the Board members to understand the perspective of the respondents and anticipate potential biases. The details of its classification are summarized in Table 1: Respondent Type.

Table 1.   Respondent Type

Respondent Type	Number of Respondents	Percentage
Professional Organizations	33	23%
Individuals	27	19%
Preparers	16	11%
National standard-setters	16	11%
Investors/ Analysts/ Users	12	9%
Accounting firms	7	5%
Academics	7	5%
Regulators	8	6%
Others (NFPs, public sectors)	16	11%
Total	**142**	**100**

The 139 respondents were classified by IASB as written in the 'Comment Letter summary: Objectives and Qualitative Characteristics." However, 3 more comment letters were received after the board meeting. Thus, we add those 3 comment letters according to IASB's classification.

Most of the respondents, 33 from 142 respondents or 23%, are professional organizations. Sequentially, 19% comment letters are from individual, and followed by preparers, national standard-setters, and other (NPFs, public sectors) with 11% per each type.

Furthermore, IASB also identified the respondents by their geographic regions, which are summarized in Table 2: Respondents' Geographic Region.

Table 2
Respondents' Geographic Regions

Geographic Region	Number of Respondents	Percentage
Europe	62	44%
North America	39	27%
Multi-regional	18	13%
Australia/New Zealand	10	7%
Asia Pacific ex. Australia/New Zealand	9	6%
Africa	3	2%
Middle East	1	1%
Total	142	**100%**

Similar to the previous classifications, IASB has classified 139 comment letters into 7 geographic regions. We add on 3 more comment letters which were later received by the Boards.

From the classifications, it could be seen that most of comment letters come from Europe, which is 62 from 142 respondents or 44%, followed by comment letters from North America (27%) and multi-regional (18%).

(2) Responses Regarding Entity Perspective

As to the first question, responses are summarized in Table 3: Responses Regarding Entity Perspective.

Table 3
Responses Regarding Entity Perspective

Responses		Addressee			Total
		IASB	FASB	Unknown	
A.	**Agree**				**63**
	1. Totally agree	29	5	1	35
	2. Generally agree, but recommend something	22	6	-	28
	(Generally agree, but need more discussion)	(3)	-	-	(3)
B.	**Disagree**				**22**
	1. Totally Disagree	6	1	-	7
	2. Disagree and recommend something	14	1	-	15
	(Disagree and need more discussion)	(4)		-	(4)
C.	**No Opinion**				**57**
	1. Blank	13	18	4	35
	2. Some suggestions	19	-	3	22
	(More discussion)	(9)	-	-	(9)
	Total	*103*	*31*	*8*	*142*

We divided the 142 comment letters received into three groups: agree (A), disagree (B), and no opinion(C). First group is those who agree that an entity's financial reporting should be prepared from the perspective of the entity (entity perspective) rather than the perspective of its owners or a particular class of owners (proprietary perspective). There are 35 comment letters who totally agree (A.1.) and 28 comment letters show agreement but also recommend something to the Boards at the same time (A.2.). Included in the second subgroup are comments who suggest in-depth discussion. Subtotal for Group A is 63 comment letters.

In A.1., each comment letter expresses its agreement differently. Some of them express it in a very simple way, such as comment from American Institute of Certified Public Accountants (AICPA) which explicitly writes, "Technical Issues Committee (TIC) supports the Boards' conclusion". Another type of comment A.1 is shown by expressing agreement with longer reasons, such as written by Cooperative Europe, "In our view, the entity perspective

should be the entity's financial reporting perspective. We fully agree with the boards' conclusion that an entity obtains economic resources in exchange for claims (its liabilities and equity) and information about the economic resources (its assets) from capital providers (equity investors, lenders and other creditors)."

In A.2., an example of comment letter is from Junichi Akiyama and Michimasa Satoh. It expresses agreement but also give recommendation to the Boards by writing, "We agree that the Boards decided that an entity's financial reporting should be prepared from the perspective of the entity (entity perspective) rather than the perspective of its owners or a particular class of owners (proprietary perspective). At the same time, we would like to propose to add the following sentence at the end of OB6, and just before (a), 'Funds provided by all capital providers have a cost to the entity'".

Group B classify comment letters with disagreement. There are 22 comment letters in the second group, with 7 'disagree' comment letters (B.1.) and 15 'disagree and recommend something' comment letters (B.2.). Included in B.2 are 4 comments which disagree and recommend the Boards to conduct a discussion such as an open debate.

Most of comments in Group B are in B.2, which express disagreement and also recommend something. An example of comment letter is written by Accounting Standard Board Japan (ASBJ). It states its disagreement in some parts of the comment letters, "The entity perspective is meaningless, if the claims are to be distinguished into liability and equity" and add some recommendation in another part of the comment letter, "We believe that the objective of financial reporting would be more easily achieved by focusing on the shareholders of the parent company who bear the final risks, rather than focusing on all classes of users."

The last group is Group C, which consists of 57 'no opinion' comments. 35 comment letters leave this part blank (C.1.) and the other 22 comment letters write some suggestions (C.2.). The Japanese Institute of Certified Public Accounting (JICPA) writes that

they "neither agree nor disagree" and suggest that there should be "some room and flexibility for possible reconsideration of this issue depending on the direction of future discussion should be provided."

It should be noted here again that three different comment letters were sent from Japan to IASB.

(3) Responses Regarding Present and Potential Capital Providers as the Primary User Group

For the second question, the answers are summarized in Table 4: Responses Regarding Present and Potential Capital Providers as the Primary User Group.

Table 4
Responses Regarding Present and Potential Capital Providers
as the Primary User Group

Responses		
A.	**Agree**	**63**
	1. Totally agree	29
	2. Generally agree, but recommend something	34
	(Generally agree, but need more discussion)	(-)
B.	**Disagree**	**23**
	1. Totally Disagree	11
	2. Disagree and recommend something	12
	(Disagree and need more discussion)	(-)
C.	**No Opinion**	**56**
	1. Blank	31
	2. Some suggestions	25
	(More discussion)	(1)
	Total	*142*

The classification of comment letters received for the second questions is similar to the previous question. In the first group, there are 29 comments which agree with the term 'capital providers' (A.1.) and 34 comments which generally agree but recommend something (A.2.). The subtotal in Group A is 63 comment letters. AICPA fully support the Boards' conclusion (A.1.) by writing, "Technical Issues Committee (TIC) supports the boards' conclusion." Comment Letter from Accounting Standards Boards (ASB) is one example in

A.2., "The ASB is in general agreement with the IASB that primary user group comprises the present and potential capital providers. However, there are a few inconsistencies in the way this has been expressed in the proposals in the ED…"

In Group B, subgroup B.1 (totally disagree) consists of 11 comments while B.2 (disagree and recommend something) consists of 12 comments. Subtotal for this group is 23 comment letters. Cooperative Europe is one of comments in B.2., "We disagree with the concept that IASB gives as a 'capital provider', which is divided into equity investors, lenders, and other creditors. The problem is that only capital provided by equity investors will be shown in the balance sheet. Moreover, cooperatives Europe would like to enhance the main problems with 'equity investors' definition…"

Being classified in Group C are those with no opinion regarding the term 'capital providers'. 31 comment letters do not give any comments (C.1) and 25 comments write come suggestion, including one comment that recommend more discussion (C.2). Subtotal for this group is 56 comment letters. European Financial Reporting Advisory Group (EFRAG) is included in C.2. In its comment letter, EFRAG writes, "It might be best to start by identifying the users of financial statements and their information needs, then, after considering what information general purpose financial reports could reasonably be expected to provide, narrow that down to a list of users' information needs that general purpose financial reports should be designed to meet; and then translate that into an objective for general purpose financial statements…"

(4) Responses Regarding Broad Decisions Goal

The results for the last question in chapter 1 are summarized in Table 5: Responses Regarding Broad Decisions Goal. We use the same classification to summarize responses in the last question. In Group A, there are 61 comment letters, with 35 comments in A.1 (totally agree) and 26 comments in A.2 (generally agree, but recommend something).

In A.1., there is Accounting Standards Executive Committee of the American Institute of Certified Public Accountants (AcSEC) which simply expresses its support by writing, "Agree with the Boards' conclusion and basis for it". In A.2., there is Association of International Accountants which writes, "AIA accepts the proposed objective and again urge the Boards to fully recognize the negative implications."

Table 5
Responses Regarding Broad Decisions Goal

Responses		
A.	**Agree**	**61**
	1. Totally agree	35
	2. Generally agree, but recommend something	26
	(Generally agree, but need more discussion)	(-)
B.	**Disagree**	**11**
	1. Totally Disagree	6
	2. Disagree and recommend something	5
	(Disagree and need more discussion)	(-)
C.	**No Opinion**	**70**
	1. Blank	40
	2. Some suggestions	30
	(More discussion)	(-)
	Total	*142*

Group B consists of 11 comment letters. 6 comments go to classification B.1 (totally disagree) and 5 comments in B.2 (disagree and recommend something). The last group or Group C, similar to previous sections, consists of comment letters with 'no opinion'. 40 comment letters do not write anything in this part, while 30 comment letters leave some suggestions. Example of comment in C.2 is the comment from BUSINESSEUROPE, "We recommend that: (a) Stewardship and accountability remain as a separate objective from decision usefulness, (b) The boards in standard-setting have the duty of identifying any information which would be relevant for such a purpose, and (c) Stewardship and accountability as a separate objective are dropped at the next revision of the framework if

bases for conclusions of future standards make it clear that no specific consideration needs to be given to the information needs they generate."

3. The IASB Update

Surprisingly, after the two documents that affirmed the entity perspective as the basic perspective, the Boards decided two amendments on the proposals of Exposure Draft in the IASB Update in March 2009 (Board Decision on International Financial Reporting Standards). One of the amendments was "to avoid using, when possible, the terms entity perspective, entity theory, and proprietary perspective *because they do not convey the boards' view*". The Boards also directed the staff to start drafting the final versions of the chapters on the objective of financial reporting and the qualitative characteristics of and constraints on financial reporting.

The update was the result of IASB meeting in March 2009, as written in the Information for Observers. IASB decision was based on the comments from respondents that "entity perspective (or entity theory), proprietary perspective (or proprietary theory) and parent company approach have different meanings to different people. In fact, the Boards itself think it is not clear whether the Boards used the terms with the same meanings in all cases. Therefore, it was recommended that the conceptual framework describe the Boards' view without labeling them, particularly in the objectives chapter. The idea could be described more clearly by saying that financial statements should focus on providing information about the financial position (and changes therein) of the entity itself".

FASB's minutes in April 2009 also mentioned similar conclusion regarding the use of the term entity perspective. Along with IASB, FASB staff recommended that the exposure draft described the Boards' view without labeling entity perspective, proprietary perspective, and parent company approach.

Besides appeared in the phase A (the objective and qualitative characteristics), the term "entity perspective" also appeared in the Discussion Paper of phase D (reporting entity concept).

Since in the phase A the Boards decided that financial reports should be presented from the entity perspective, in the context of a group reporting entity, financial statement are prepared from the perspective of that group, not from the perspective of the parent company's shareholders. The Boards now is drafting the Exposure Draft of the Reporting Entity Concept. The Exposure Draft of the reporting entity concept will then similarly delete all the explanations using this term.

4. The New Analysis of Equity Theory

The main reason of the confusion that happened on the Boards may be attributable to the fact that the new entity theory proposed by Robert N. Anthony was not clearly understood by many respondents.

The two most held views in corporation accounting, which affect how the businesses are managed, are proprietary concept and entity concept. The contrast between those two views will be first briefly explained. Subsequently, the new definition of entity theory by Robert N. Anthony will also be explained.

(1) Proprietary Theory

Proprietary theory might have been widely understood in an almost uniform viewpoint. According to this theory, company is owned by some persons or group, which is the center of interest, and also called as proprietor. Paul Rosenfield (2005) defined proprietor as, "a person or persons who are the ultimate beneficiaries of success or suffers of failure of the business and to whom duties of the business to transfer resources to them are discretionary". Moreover, Vatter (1947) also described, "For proprietary theorist the proprietor is the person to whom and for whom reports are made, and the concepts of net worth and profit are personal ideas, in that the proprietor's interest is the axis around which the process of accounting revolve".

The notion of proprietorship originally comes from the logic of the exposition of double-entry bookkeeping:

$$Assets - Liabilities = Proprietorship$$

All the assets of the firm belong to the owners or proprietors, and any liabilities are also their obligations. Thus, revenues received by the firm are increases of the proprietorship or net interest of the firm and, likewise, the liabilities born by the firms are decreases of the net proprietary interest in the firm (Hendriksen and Breda, 2001; Schroeder and Clark, 1998). As a result, proprietorship, which is considered to be the net value of the owners, is equal to the original investment and additional investment plus the accumulated net income (or minus net losses), after being deducted by withdrawn by the proprietors. Therefore, Hendriksen and Breda (2001) named it a wealth concept.

Furthermore, they explain, "Net income, the excess of revenues over expenses, accrues directly to the owners; it represents an increase in the wealth of proprietors. And since income is an increase in wealth, it is immediately added to the owner's capital or proprietorship. Cash dividends represent withdrawals of capital, and retained earnings are a part of total proprietorship. Interest on debt, however, represents an expense of the proprietors and should be deducted before arriving at net income to the owners. Corporate income taxes are likewise expenses in the proprietorship theory; however some argue that the corporation is acting as an agent of the stockholders in paying the tax that is really a tax on the income of the stockholders." (Hendriksen and Breda, 2001, p.770)

Bird, Davidson and Smith (1974) explained the contrast between Entity and Proprietary Theories and noted that proprietary approach viewed the enterprise as an agent of the owners and the records as an accounting by the proprietors for their own property. In this case, owners are not considered as outside parties. Thus, this theory is best for sole

proprietorships in which owners are also the managers of the business. When the businesses are getting bigger and more complex, proprietary concept might be less acceptable.

However, many of today's accounting practices are still affected by this concept. As Hendriksen and Breda write, "…many writers have chosen to look through the veil of the corporate form and describe the total of the invested capital stock and retained earnings as the net wealth of the stockholders, implying the proprietary theory. The comprehensive income concept adopted by the FASB, for instance, is based on the proprietary theory. It includes all items affecting proprietorship during the period except dividend withdrawals and capital transactions." (Hendriksen and Breda, 2001, p. 770)

(2) Traditional Interpretations of the Entity Theory

The entity theory views business as something separate and distinct from the entity's capital provider. It puts the business unit, rater than the proprietors, investors, or any other parties, as the center of accounting interest and financial reporting purposes. "Because accounts and financial statements relate to business enterprise rather than to owners, revenues and costs are defined in terms of changes in enterprise assets rather than as increases or decreases in proprietorship." (Patton and Littleton, 1940, p. 7)

The entity theory is expressed in the basic accounting equation:

$$Assets = Equities$$

Since assets and liabilities belong to the entity, and not the owners, revenue received will directly be the entity's revenue or property, and expenses incurred will be the entity's obligation. Thus, the profits resulted belong to the entity, as well as the revenue and expenses, and accrue to the stockholders only when dividend is declared. All the items on

the right-hand side, except the retained earnings, are claims against the entity's assets, either in the form of creditor claims or owner claims (Schroeder and Clark, 1998)

Similarly, Hendriksen and Breda also note that, "The net income of the enterprise is generally expressed in terms of the net change in the stockholders' equity, not including changes arising from dividend declarations and capital transactions. This is not the same as saying that the net income is the income to the stockholders, as is implied in the proprietary theory. Net income, in the entity view, simply represents a residual change in equity position after deducting all other claims, including interest on long-term debt and income taxes. It is personal income to the stockholder only if the value of the investment has increased or to the extent of a dividend declaration." (Hendriksen and Breda, 2001, p. 772)

(3) **The New Definition of Entity Theory by Robert N. Anthony**

Another entity theory is explained by Robert N. Anthony in his book, *Future Directions for Financial Reporting* (1984). It develops entity theory in most logic and clear way of thinking. Anthony's entity theory explains that if the accounting entity is viewed as an organization distinct from its owners that means the entity owns the assets, and the entity owes the amounts due to outside parties. As a result, the balance sheet of an entity should report the financial interests of the entity, not financial interests of its owners.

Anthony firstly explained the entity theory in similar way as previously explained entity theories. The right-hand side of the balance sheet reports sources of the entity's funds while the left-hand side report how those funds are invested. The balance sheet reflects the investment and financing of the entity as a whole, and thus making the basic accounting equation be 'Assets = Source of funds'.

"The view of the balance sheet is more realistic than the view implicit in current practice and corresponds to the nature of assets and liabilities as currently reported. The liabilities report the amount of funds furnished by lenders, by vendors (in the form of

accounts payable), by employees (in the form of accrued salaries and perhaps unfunded pension benefits), and by the government (in the form of deferred taxes)." (Anthony, 1984, p. 77)

In addition, Anthony also argued that earnings were earned not by the shareholder participants, but by the entity itself. The amount showed in the shareholder equity section of the balance sheet does not equal to the amount of funds supplied by the shareholders, because retained earnings are included. The paid-in capital shows the amount of shareholders supplied initially, but retained earnings were not contributed by shareholders.

Furthermore, Anthony mention three entity source of funds, which are supplied by creditors, shareholders, and the other one, is generated by the entity's own efforts. Funds supplied by creditors are liabilities, while funds supplied by shareholders are shareholder equity. Those two funds supplies have been widely known in the current accounting practices. Then, Anthony refers to the third type as *entity equity*.

Balance Sheet under the Entity Theory

ASSETS	Liabilities
	Shareholder Equity
	Entity Equity

However, Anthony insists that there should be cost of using shareholders funds to the extent that dividends have not been repaid. The cost of using shareholder equity fund is referred as *equity interest*. This is because, "Unpaid equity interest is a source of funds, just like unpaid debt interest. To the extent that shareholders receive preferred stock, and dividends on this stock correspond to the cost of these funds, unpaid preferred dividends is a

component of equity interest. Unpaid interest on common stock should appear on the balance sheet." (Anthony, 1984, p. 77)

"The amount of funds generated by an entity's own operations during a period is measured by net income. Net income should be calculated by as the difference between revenues (including gains) and expenses (including losses and equity interest). Each year's net income should be added to entity equity, just as net income is added to retained earnings in current practice. Because equity interest is recognized as a cost, however, the amount added to entity equity would be much smaller than the amount added to retained earnings as currently reported. Entity equity as of a given date is the sum of all net incomes to date." (Anthony, *Future* 1984, p. 78) In the other parts of the book, Anthony also proposes some rates to solve the measurement problems. Those are pretax debt rate, specified risk premium, and specified published rate.

Under Anthony's interpretation, the entity theory might bring radical consequences. However, Zambon and Land (2000) argue that, "Between the different interpretations of the entity theory, Athony's position seems the most consistent with the conceptual premises of the entity point of view: all the constituents are considered as 'third parties', and the 'beneficiary' of the accounting process is the firm itself. A consistent entity approach to income calculation should in fact be indifferent to the institutional form which is taken by a firm to run its business." Furthermore, they also added that, "Anthony's interpretation of the entity theory is the most easily and immediately applicable to the co-operative anomaly, since it does not require any adaptation at all. According to the different form of co-operative society, the expression of 'implicit cost' will be referred to as either the cost of labor in the workers' co-operative, or the sale revenue in the consumers' co-operative. The cooperative profit would appear, then, as the over or under price for the products transferred) to co-operative members, which has been permitted by the specific factor

combination achieved, and the organizational self-coordination realized, by the entity-co-operatives'".

It also should be noted here that the amount of the entity income, shareholder equity and Entity equity that are calculated by Anthony model are all relevant to stakeholders such as shareholders, creditors and employees.

5. Conclusion

Most of the comment letters agree that the financial reporting should be prepared from the perspective of entity, rather than the perspective of the owner or proprietary perspective. However, only few of them mention their detail reasons behind their approval, which commonly mention that current business entities engaged in financial reporting have substance distinct from that their capital providers. Furthermore, many comment letters urge the Boards to explain the entity perspective more fully, as well as the consequences of adopting this perspective. From their comments, it was hard to find that they understand the concept of entity perspective as explained by Robert N. Anthony in his book, *Future Directions for Financial Accounting*.

Anthony's entity theory is suitable to the companies which take care of all the stakeholders (stakeholder capitalism). It is believed that Japanese companies are conducted according to the stakeholder capitalism. Therefore, the comment letters which come from Japan should have welcomed the IASB/FASB decision to adopt entity theory. One of the comment letters that came from Japan, which is written by Professor Satoh and Professor Akiyama, did support the Boards' conclusion, while ASBJ did not. Meanwhile, the comment letter from JICPA did not give any opinion, whether agree or disagree.

The idea of adopting the entity perspective might be influenced by the recent trends of corporate governance. As written in the BC1.22 of the Exposure Draft, "The Boards concluded that a focus on a broader primary user group fulfills the needs of the full range of capital providers both in jurisdictions with corporate governance model defined in the context of shareholders and in jurisdictions with a corporate governance model that focuses on

stakeholders, which is a broader group of shareholders." Thus, the Boards proposed the entity perspective as the basic perspective underlying financial report in order to support the stakeholder model of corporate governance. However, either pros or contras comment letters showed extreme responds that might not be predicted before. The comment letter form Prof. Satoh is one of the examples of the supportive comment letter. Despite its agreement, it also reminds the Boards of the effect of adopting the entity perspective. Another kind of comment letters is the unsupportive comment letters, which strongly disagree with the Boards decision, such as ASBJ's comment letters. Therefore, the boards finally decided not to use the term entity perspective, but simply describe more clearly by saying that financial statements should focus on providing information about the financial position (and changes therein) of the entity itself.

Even though the term entity perspective would not be used in the conceptual framework, the possibility of accounting model of stakeholder capitalism, at least in Asian countries, should remain to be explored.

Appendix: Comparison of Some Comment Letters on the Exposure Draft
Conceptual Framework for Financial Reporting: The Objective of Financial Reporting

Comment Letter	Asia				
	Japan			Korea	China
	Junichi Akiyama and Michimasa Satoh (CL 96)	The Japanese Institute of Certified Public Accounting (CL 55)	Accounting Standard Board Japan (CL 35)	Korea Accounting Standard Board (CL 117)	Hong Kong Institute of Certified Public Accountants (CL 21)
(1) Entity Perspective	They agree that the boards decided that an entity's financial reporting should be prepared from the perspective of the entity rather than the perspective of its owners or a particular class of owners. They also purpose to add the following sentence at the end of OB6, and just before (a), "Funds provided by all capital providers have a cost to the entity".	1. Neither agrees nor disagrees. The explanation about conceptual foundation has been extended on why the entity perspective is more useful. However, the theoretical basis and explanation supporting is particularly insufficient. This is a truly fundamental issue in financial reporting and there are many different opinions about what is the most appropriate view. 2. Moreover, the boards state that they had not yet considered all the possible implications of that decision on future phases of the framework project. 3. Therefore, we believe that some room and flexibility for possible reconsideration of this issue depending on the direction of future discussion should be provided.	1. No logical relationship between the accounting point of view and the range of users, which the ED proposes to expand. 2. As one of accounting conventions widely accepted in the accounting world, there is convention of 'business entity', which regards an entity as independent of owners (shareholders). This has nothing to do with the accounting point of view. 3. The entity perspective is meaningless, if the claims are to be distinguished into liability and equity. 4. It may be harmful to predetermine the adoption of a particular accounting point of view which greatly affects the definitions of elements, separately from the consideration about how best to define elements. 5. The entity perspective is incompatible with the existing asset-liability approach and might have various effects on the existing accounting treatments. Its adoption should not be determined without thinking of those effects. 6. The capacity of the group reporting entity to generate future net cash flows is less relevant to decisions of creditors and shareholders of subsidiaries. Thus, consolidated financial statements should be prepared from the perspective of the parent company's shareholders	IASB states that adopting the entity perspective does not preclude the inclusion of information reflecting the views of the equity investors. Then, how to solve inconsistencies between framework (principles) and standards? There may be so many issues in standards besides earning per share and such problems would remain unresolved.	Support the boards' view that generally financial reports should reflect the perspective of the entity rather than the perspective of the entity's proprietors. However, this should not be necessarily construed as acceptance of the economic entity approach, which is the topic of the recently issued discussion paper and not this ED.

Comment Letter	Asia				
	Japan			Korea	China
	Junichi Akiyama and Michimasa Satoh (CL 96)	The Japanese Institute of Certified Public Accounting (CL 55)	Accounting Standard Board Japan (CL 35)	Korea Accounting Standard Board (CL 117)	Hong Kong Institute of Certified Public Accountants (CL 21)
(2) Present and Potential Capital Providers as the Primary Use Group			1. Necessity of the change in the basic view about the targeted users should be clearly explained both from the viewpoint of the disadvantages under the existing framework and the improvements expected from the proposed change. 2. If the range of the targeted users is expanded and only the information <u>commonly</u> needed by all of them is provided, the volume of the information provided would diminish. By focusing on shareholders who bear the ultimate risk and therefore need the largest amount of information, needs by other users can be basically satisfied.	1. The ED states that capital providers as the primary user group consist of equity investors and lenders including other creditors. This classification is not reasonable since the scope of rights and responsibilities between two groups are so different. 2. It should not pass over the fact that traditionally equity investors have been treated as the most important users of financial reporting, considering their financial responsibilities to the entity. 3. If there is no significant change in the terms of quantity and quality in financial reporting, it would be better to maintain the current concept without identifying special groups.	
(3) Broad Decision Goals			1. Although the ED emphasizes the importance about an entity's economic resources and claims to them, importance of information cannot be determined a priori and it becomes clear only by observing the behaviors of its users on the security market. Usefulness of profit information representing the business results of an entity has been evidenced by empirical facts and the conceptual framework should take into consideration. 2. It is erroneous to explain net income and gains and losses by linking them to the net change during a period in economic resources and claims on them.		1. HKICPA appreciate the board's effort in addressing specifically the stewardship responsibilities of management in the framework. However, we believe that the significance of the concept of stewardship should not be subsumed within a decision usefulness objective. 2. Majority of business entities in the private sector are small or medium-sized unlisted entities where one of the primary users of financial statements - existing shareholders - rely on financial statements to help them to monitor the management of the entity's operations. Without setting the concept of stewardship as a separate objective of financial reporting, HKICPA is doubtful as to whether financial reporting can help management in discharging their responsibilities.

Comment Letter	Asia				
	Japan			Korea	China
	Junichi Akiyama and Michimasa Satoh (CL 96)	The Japanese Institute of Certified Public Accounting (CL 55)	Accounting Standard Board Japan (CL 35)	Korea Accounting Standard Board (CL 117)	Hong Kong Institute of Certified Public Accountants (CL 21)
(4) Other comments	The reason of the proposal is because they believe that the boards do not intend to apply a specific thought of the financial accounting and reporting. However, they would like the boards to keep a flexibility to adopt, at the standards setting level, recognizing a capital cost on funds provided by all capital providers, such as one proposed by Robert N. Anthony, *Future Directions for Financial Accounting*, Dow-Jones-Irwin, 1984.	1. The purpose of the framework and its status within the hierarchy of standards should be defined prior to the discussion of its contents. JICPA believes that the common conceptual framework should be positioned above all standards. 2. OB16 of Discussion Paper included a description about the relationship between financial reporting and financial statement, which stated that financial and non-financial information other than financial statement could be included in the general purpose financial reporting as set forth in the framework. JICPA believes that it is doubtful that such information can satisfy the qualitative characteristics and auditable.	1. Replacement of the existing conceptual framework should be made at the completion of the systematic reconsideration of the whole of the conceptual framework. 2. Amendment of individual accounting standards affecting the conceptual framework should be undertaken in full conjunction with the work of the amendments to the conceptual framework.	**From 6 pages, 4 pages are blank/missing**	1. To ensure consistency and compliance with the principles in the framework, it must be given the appropriately high authoritative status. The boards should ensure the conceptual framework retains the same authoritative status it currently holds within IFRS. 2. The boards need to address the assumption of going concern in some project in this joint project.

Comment Letter	Europe				
	BUSINESSEUROPE (The Confederation of European Business) (CL 16)	Cooperatives Europe (CL 134)	European Financial Reporting Advisory Group (EFRAG) (CL 137)	Accounting Standards Board (ASB) (CL 120)	German Accounting Standards Board (DRSC) (CL 37)
(1) Entity Perspective	The boards very rapidly opt for the entity's perspective because it would be the only perspective consistent with the objective of serving a wide range of users' needs. BUSINESSEUROPE believes that it needs a more in-depth analysis and justification.	Agree that the entity perspective should be the entity's financial reporting perspective. Cooperatives Europe fully agree with the boards' conclusion that an entity obtains economic resources in exchange for claims (its liabilities ad equity) and information about the economic resources (its assets) from capital providers (equity investors, lenders and other creditors).	1. The proprietary perspective might not a satisfactory perspective to use when preparing general purpose financial reports. The basis for conclusion seems to imply that, if one rejects the proprietary perspective, one must adopt an entity perspective, while there are other possible perspectives, such as parent shareholder perspective. 2. The ED is proposing the adoption of the entity perspective even though, as the boards themselves have admitted, they do not know what the implications of this proposal are for the rest of the framework. 3. EFRAG thinks it is important that the IASB clarifies its position on how to align the entity perspective with the equity investor's interest in the reporting entity's ability to generate cash flows. 4. From all that reasons, EFRAG believes it is essential that there is a comprehensive and in-depth debate of this issue before a conclusion.	The entity perspective is sometimes depicted with the following simple equation: Asset = Liability + Equity Therefore, one could deduce from the entity's perspective any item on the balance sheet that is not an asset of the entity is a claim on those assets. This approach would not differentiate between liabilities and equity, both of which represent claims against the entity. This then begs the question as to why the differentiation between liabilities and equity is still maintained. This lie of reasoning can be used to justify the claims approach and an elimination of the distinction between equity and liability. Thus, ASB would recommend that the IASB considers this issue more thoroughly, taking into account all relevant issues, as well as engaging constituents in this debate before making any conclusions.	1. DRSC welcome that IASB expanded the description of its understanding of the entity perspective and the proprietary perspective and of its reasons for choosing the former as the basic perspective underlying financial reports in the Basis for Conclusions. 2. However, DRSC believes that these explanations do not provide a sufficient basis to comment on the question whether the adoption of the entity perspective is superior to the proprietary perspective. 3. In particular, the relation of determining a primary user group and adopting a reporting perspective remains unclear. 4. DRSC has concerns about adopting the entity perspective without discussing and deliberating the potential implications of that decision for decisions to be made in later project phases in other projects. 5. DRSC has concerns about adopting the entity perspective without discussing and deliberating the potential implications of that decisions to be made in later project phases and in other projects.

Comment Letter	Europe				
	BUSINESSEUROPE (The Confederation of European Business) (CL 16)	**Cooperatives Europe (CL 134)**	**European Financial Reporting Advisory Group (EFRAG) (CL 137)**	**Accounting Standards Board (ASB) (CL 120)**	**German Accounting Standards Board (DRSC) (CL 37)**
(2) Present and Potential Capital Providers as the Primary Use Group	1. The assertions (OB2, OB13) need more thorough research for credibility. 2. The very light description of users and their needs which is provided in OB6 would be valuably replaced by an analysis and description of what all these users have in common and where their needs differ or vary. From then on, the boards could have the ability to decide and explain why they identify primary categories and users and how they expect other user needs to be fulfilled. 3. At present no common understanding of the information which is relevant for assessing the ability to "generate future cash in-flows". 4. What is relevant to users is also relevant to management and vice versa, although not at the same level of detail. Management as well as investors and creditors make resource allocation decisions on the basis of the entity's data. 5. The definition of an entity's performance needs to be debated and understood.	1. Cooperatives Europe disagrees with the concept that IASB gives as a 'capital provider', which is divided into equity investors, lenders, and other creditors. The problem is that only capital provided by equity investors will be shown in the balance sheet. 2. Moreover, cooperatives europe would like to enhance the main problems with "equity investors" definition, (a) IASB includes as equity investor holders of equity securities, holders of partnership interest and other equity owners, but not members of cooperatives, (b) IASB framework concept strictly focuses on the business model of capital investors of corporations listed on regulated markets but does not take into account non-listed small and medium-sized entities with other legal forms like cooperatives".	1. It might be best to start by identifying the users of financial statements and their information needs, then, after considering what information general purpose financial reports could reasonably be expected to provide, narrow that down to a list of users' information needs that general purpose financial reports should be designed to meet; and then translate that into an objective for general purpose financial statements. 2. There are some unsupported assertions: (a) The information needs of capital providers are homogeneous, (b) the main focus should be on entity's ability to generate cash flows, (c) ED states that users need information that helps them make an assessment about future cash flows, but it does not go on to explain what sort of information that helps them make an assessment about future cash flows.	1. The ASB is in general agreement with the IASB that primary user group comprises the present and potential capital providers. However, there are a few inconsistencies in the way this has been expressed in the proposals in the ED. 2. The ASB would like to ensure that it is clear from the framework that management is primarily accountable to the equity investors. OB12 notes that 'management is accountable to the entity's capital providers for the custody and safekeeping of the entity's economic resources ASB would prefer to see the reference to 'capital providers' in that sentence and the last sentence in OB12 to be changed to 'equity investors'.	1. Different user groups have different information need, as the decisions these groups have to make are often dissimilar. Consequently, the most favorable information for one group is not necessarily the most favorable for other user groups as well. 2. There seems to be a big difference between equity investors providing risk capital and, therefore, having both up- and downside risks, and lenders/other creditors. This difference results in difference in information needs. DRSC believes that equity investors and lenders/creditors are too heterogeneous to be only combined into the primary user group, since the primary user group concept only works if there is sufficient homogeneity in the information needs within this user group. 3. It would be better to retain the current narrower approach of defining investors of risk capital as the primary user group, because meeting the investors' need will in many cases implicitly meet the needs of lenders and other creditors.
(3) Broad Decision Goals	Recommend that: 1. Stewardship and accountability remain as a separate objective from decision usefulness. 2. The boards in standard-setting have the duty of identifying any information which would be relevant for such a purpose. 3. Stewardship and accountability as a separate objective are dropped at the next revision of the framework if bases for	Agree with the inclusion of decision made to protect and enhance investment of capital providers as an objective of financial reporting is useful in assessing management stewardship. However, the general objective of decision usefulness is too narrow. Members in cooperatives primarily are not interested to 'protected and enhance their capital' but seek to reach their economic goals by joining a cooperative.	1. Agree in principle with the broader objective of general purpose financial reporting included in the ED. However, there are types of information of financial reports that are clearly general purpose that appear to have very different objectives ad/or qualitative characteristics. 2. There are different descriptions about management's responsibilities in OB12 and	1. The ASB agrees that the objective as identified in the ED is broad enough to encompass the decisions of capital providers. 2. However, the concern is in the relation to the not-for-profit entities which may not be as well served by the objective as identified. In this respect, ASB recommend that the IASB refers to the July 2008 report produced	Agree with the broader objective of general purpose reporting as set out in the ED. As capital providers' decisions on whether and how to protect and enhance their investments are directly linked to management's ability to protect and enhance capital providers' investments, DRSC are now more comfortable with the description of financial reporting's objective. The objective of financial

2072

	conclusions of future standards make it clear that no specific consideration needs to be given to the information needs they generate.		OB6(a) 3. Stewardship is more than just protecting (and maybe enhancing) the entity's resources. 4. Stewardship is not something that is owed to all capital providers; it is about being responsible to equity capital providers only, not to lenders.	by the chairs and senior staff of the Australian, Canadian, New Zealand, and United Kingdom Accounting Standards Boards on the implications for the not-for-profit sector of the framework proposals.	reporting set out in the Ed takes better into account past and future aspects of entities' economic activities, which are both relevant for capital providers' decisions.

Comment Letter	Europe				
	BUSINESSEUROPE (The Confederation of European Business) (CL 16)	**Cooperatives Europe (CL 134)**	**European Financial Reporting Advisory Group (EFRAG) (CL 137)**	**Accounting Standards Board (ASB) (CL 120)**	**German Accounting Standards Board (DRSC) (CL 37)**
(4) Other comments	1. IASB should have in mind that it now serves as the standard-setter for many jurisdictions in the world. Having set a fully debated conceptual framework should form for the IASB the necessary shared understanding with its constituents of the accounting model that future IFRS are to build or safeguard. 2. IASB leaves no room for debate on the most fundamental issues. The discussion paper includes too many assertions which are repeated in the basis for conclusions instead of being fully explored and debated. 3. The conciseness of the existing IFRS framework is being abandoned, while it gave the framework more strength and robustness. 4. For the time being the scope of the framework should remain limited to financial statements. 5. The going concern assumption should be reinstated.		1. It is difficult to comment effectively and comprehensively when it is not clear what the implications of the various changes being made in those earlier chapters are for later chapters. 2. Because the framework is part of the hierarchy, it is important that it should be coherent and consistent piece of work. 3. EFRAG recognize that the IASB has a difficulty: it wishes the changes it is making to be relevant for standard-setting and hierarchy purposes as soon as possible, but waiting for the whole framework to be finalized will mean that the changes will not be 'in place' for many years. 4. The link between what is relevant for external users and what is relevant to management is important, and should not be overlooked.	The ASB remains concerned at the IASB's proposals to finalize each chapter of the framework independently of the others so that some of the earlier chapters will be completed a long time in advance of the rest of the framework. There could be a number of years between the finalization of the earlier chapters and some and some of the later parts of the even being discussed. ASB therefore recommends that the IASB does not finalize any section of the framework until all parts are ready to be finalized.	DRSC generally takes the view that a framework should be the conceptual foundation not only for financial statements, but also for other means of financial reporting, e.g. the management commentary. However, it is necessary to define the term 'financial reporting' before widening the scope. As 'financial reporting; will be discussed and defined in a later phase of the project, DRSC feels unable to conclusively assess at this stage whether the framework's scope should be set as 'financial reporting' or 'financial statements'.

Comment Letter	USA			International Accounting Organization
	American Accounting Association (CL 99)	American Institute of Certified Public Accountants (AICPA) (CL 109)	Accounting Standards Executive Committee of the American Institute of Certified Public Accountants (AcSEC) (CL 129)	Association of International Accountants (CL 61)
(1) Entity Perspective	Agree that the entity's financial reporting should be prepared from the perspective of the entity. Capital providers consider various issues when deciding whether to allocate resources to an entity. A key issue for equity investors is determining the value of the entity. Using the discounted cash flow model discussed in many finance textbooks to value an entity, an entity's expected unlevered free cash flows are discounted at the entity's weighted average cost of capital. The weighted average cost of capitals equals the product of the proportion of debt to assets and the after-tax expected return on debt plus the product of the proportion of equity to assets and the expected return on equity. The value of the entity's debt is then subtracted from the entity's total value to determine the value of equity. Thus, to value the entity from the perspective of equity investors necessitates determining the value of the entity's debt. It follows that satisfying the information needs of the providers of equity financing requires satisfying the information needs of the providers of debt financing, or the information of other claimants. Therefore, it is concluded that adopting the entity perspective seems to best satisfy the information needs of all capital providers.	Technical Issues Committee (TIC) supports the boards' conclusion.	Agree with the Boards' conclusion and basis for it.	Yes, AIA accepts the focus on the entity perspective. This perspective increases "generality" (and incidentally is consistent with the logical basis of the balance sheet and the duality principle).
(2) Present and Potential Capital Providers as the Primary Use Group	1. Agree that present and potential capital providers should be identified as the primary user groups. 2. However, there might be circumstances in which the information needs of the different constituencies might conflict, and in those circumstances, the information needs of existing common shareholders should dominate those of prospective common shareholder and of other claimants. 3. It should be recognized that the providers of equity capital often do not have the same contractual ability to demand information as providers of debt capital. Thus, the committee recommends that the boards work to ensure that the information needs of providers of equity capital are satisfied.	Technical Issues Committee (TIC) supports the boards' conclusion.	Agree with the Boards' conclusion and basis for it.	AIA accept the emphasis on this primary user group, and urge the Boards to recognize the implications for what the regulations issued the Boards are not useful for.

| Comment Letter | USA | | | International Accounting Organization |
	American Accounting Association (CL 99)	American Institute of Certified Public Accountants (AICPA) (CL 109)	Accounting Standards Executive Committee of the American Institute of Certified Public Accountants (AcSEC) (CL 129)	Association of International Accountants (CL 61)
(3) Broad Decision Goals	1. Agree that the objective of financial reporting should be broad enough to encompass all of the decisions that equity investors, lenders, and other creditors make in their capacity as capital providers. Because the ED did not specify theses users' decision-making models, however, it is unclear whether the subsequent discussion in OB9 through OB12 sufficiently outlines the types of information that would meet these objectives. 2. Further, to the extent that different user groups have heterogeneous information needs as discussed in OB6, outlining the models that generate their different information needs is expected to give the boards and reporting entities greater insight into informational needs of financial report users.	Technical Issues Committee (TIC) supports the boards' conclusion.	Agree with the Boards' conclusion and basis for it.	AIA accepts the proposed objective and again urge the Boards to fully recognize the negative implications.
(4) Other comments	Agree that the objective of financial reporting should be broad enough to encompass all of the decision s that equity investors, lenders, and other creditors make in their capacity as capital providers, including resource allocation decisions as well as decisions made to protect and enhance their investments. However, it is unclear whether the subsequent discussion in OB9 and OB12 sufficiently outlines the types of information that would meet the objectives. AAA argues that thoroughly outlining capital providers' decision-making models could help assess their information needs. The committee's recommendation that the board examine the relation between decision-makes, their decisions, ad accounting information is not new: see, for instance, Devine (1960) and Bruns (1968)	TIC believes requirements for management explanations should be limited to those that enhance transparency for historical transactions and should not include footnote disclosure of forward-looking information or subjective factors underlying the entity's performance.	AcSEC believes that not-for profit organizations (NPOs) should be included in the scope of the project. Excluding NPO from the initial scope of the project, and then later considering the applicability of the conclusions to NPOs may result in different, and less appropriate, NPO GAAP than would exist if NPOs were considered in the initial phase of the project. If the boards agree wit this suggestion, resource providers should also be considered primary users for general purpose financial reporting.	

AN INTERNATIONAL INSTITUTIONAL COMPARATIVE ANALYSIS OF THE CHINESE APPROACH TO ACCOUNTING FOR BUSINESS COMBINATIONS

C. Richard Baker, Adelphi University
Yuri Biondi – corresponding author, Preg CRG – Ecole Polytechnique
Qiusheng Zhang , Beijing Jiaotong University
20 May 2009

Abstract

In 2006, the China Accounting Standards Committee (CASC) issued its Statement No. 20, which permits both the purchase and pooling of interests (or merger) method of accounting for business combinations. The decision of the CASC in Statement No. 20 stands in contrast to the decisions taken by the US Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB) which both eliminated the pooling of interests method. As a result of the issuance of CASC 20, along with similar pronouncements by the Japanese standard setters and other standards setting bodies, the goal of harmonizing international accounting standards has been faced with a lack of convergence in the area of accounting for business combinations. In this paper we examine the reasons for this lack of convergence in order to develop a reconciled framework. In particular, the Chinese standards setters have sought to develop an approach to accounting for business combinations which distinguishes between instances where the combining entities are under "common control" or not under common control. Using a relatively narrow definition of common control, both the FASB and the IASB have excluded business combinations among entities under common control from the scope of their respective pronouncements. The purpose of this paper is to analyze the reasons for the distinctly different approach taken by the Chinese accounting standards setters by comparing the provisions of FASB 141, IFRS 3 and CASC 20. Our analysis will show that the technical differences between the standards are based on different understandings of the underlying economics of business combinations (Anthony, 1987), which leads in turn to different representations of the combination process. We believe that a forthright recognition of these differences may lead to a reconsideration of the pooling of interests and merger methods in a new comprehensive framework.

Key words: business combinations, mergers and acquisitions, purchase method, pooling of interests method, international accounting convergence

Research paper presented to the following meetings:

Mergers and Acquisitions Forum 2007 on "Strategic M&A, Industry Restructure and Network Sinergy", hosted by the Center for China Mergers & Acquisitions Research, Beijing Jiaotong University, 15 July 2007, Beijing, China - http://www.chinamerger.org/

20th Asian Pacific Conference (APC) on international accounting issues, Paris - France, 11 November 2008 http://www.apconference.org/

INTRODUCTION

Recently, the FASB and the IASB have been actively working towards international harmonization and convergence of financial accounting standards. However, in the area of accounting for business combinations, international convergence has not yet been fully achieved. The consensus position of the FASB and the IASB prior to 2007 with respect to accounting for business combinations was that all business combinations ought to be accounted for using the purchase method[372]. However, the choice of the purchase method and the related treatment of goodwill, have prompted a certain amount of resistance. Strong objections to the FASB-IASB approach to business combinations exist, even within the United States and Europe (including the United Kingdom), and on the part of various national standards setting bodies.

For example, the French accounting standards setters (CRC) rejected the non-amortization of acquisition goodwill in two decisions (No. 2005-9 and 2005-10), issued in November 2005; these decisions were applicable to enterprises that not required to follow international standards, including individual companies and non-listed corporate groups[373]. The Japanese accounting standards setters also manifested their dissatisfaction with the purchase method in several comment letters issued in 2001, 2003, and 2005. The Japanese standards setters allow the pooling of interest method in their national standards, and they require amortization of acquisition goodwill. The Chinese, Japanese and Korean standards setting bodies have joined their efforts in an initiative which contemplates the continued use of pooling under certain circumstances. The German Accounting Standards Committee (GASC) states its disagreement with

some fundamental principles laid out in the objective of ED IFRS3amend and [does]

have major concerns about the main features of this draft. […] It seems that the ED is

a further step on the way to introduce the full Fair Value model without having a

proper discussion of the future accounting model in general. [The GASC does]

understand that the FASB has agreed upon the full fair value model as the relevant

---

[372] The purchase method necessitates revaluation of the net assets of the acquired company to fair values and recognition of acquisition goodwill, which is not amortized, but tested annually for impairment.
[373] See also the comment letter by the CNC, cf. IASB (2006: CL No. 146).

future model. The IASB, however, has not (yet) and has delayed this discussion since 2001, nevertheless the IASB follows this route. [The GASC does] doubt whether the further expansion of the fair value model was truly demanded by the IASB's constituents including investors and financial analysts and whether information usefulness is truly improved. […] Additionally, [The GASC does] not appreciate delaying further the research on the following issues of the project "Business Combinations II": the possible application for fresh start accounting and the accounting for business combinations involving entities under common control (IASB, 2006: CL No. 121, p. 1-2).

Furthermore, various respondents to exposure drafts issued by FASB and IASB have indicated their preference for a "net asset approach", which is a variant of the pooling method. For example, American Community Bankers, a lobbying organization for credit unions, stated:

"ACB maintains the position that the use of acquisition accounting, as described in the ED, is inappropriate for mutual combinations and will result in arbitrary and costly revaluations, and financial statements that will not truly reflect the essence of the underlying combination transaction. We are not advocating the maintenance of pooling-of-interests, rather we believe that FASB should require [mutual savings banks] to use a net asset value approach, or [a] similar variation of acquisition accounting, using estimations of the fair market values of assets and liabilities assumed" (IASB, 2006: CL No. 96, p. 7).

Interestingly, both the FASB and the IASB have recently recognized these resistant voices, but in a somewhat puzzling and implicit manner. Certain revisions to previously existing standards (FASB 141r, IFRS 3r, IAS 27r) as well as a newly issued standard (FASB 160) appear to reintroduce pooling as an exception to the purchase method. The exception is found in the

wording of several paragraphs in the revisions, and in some newly issued standards not directly related to business combinations, without seeking a reconsideration of the overall framework of accounting for business combinations. We believe that this approach based on scope exceptions adopted in the revised standards may lead to some confusion among preparers and users by effectively implying that "all horses are black, but some horses are white unicorns which are not horses". This confusion actually occurs at the very basis of FAS 141, especially on "scope exceptions". The former version of this standard stated:

This statement states that the term *business combination* excludes transfers of net

assets or exchanges of shares between entities under common control (FAS141,

D11).

Whilst it presently states:

This statement does not apply to combinations between entities or businesses under

common control (FAS141r, D8).

In the former version, operations that are usually understood as a type of business combination are excluded by the definition and viewpoint adopted by the standard, whilst, in the revised version, a whole category of operations now called "business combinations" is again excluded from the scope of the standard that is explicitly devoted to the accounting of "business combinations".

In order to respond to this impasse, this paper seeks to develop a reconsideration of the overall framework of accounting for business combinations based on a forthright discussion of the reintroduction of pooling as an allowable method of accounting for business combinations in certain cases. This discussion aims to take into consideration in a serious way the perspectives of the resistant parties, and it will especially draw upon the Chinese position. Business combinations constitute a critical issue in financial accounting regulation and practice, and the current treatment by scope exceptions based on multiplying the definitions of the underlying operations appears to be limited and hazardous. Instead, a more comprehensive framework ought to be developed to accommodate different kinds of combinations and appropriate methods of reference in a thoughtful way.

In particular, we argue that the positions of the national accounting standards setters which continue to allow the pooling of interests method may be based on different understandings of the underlying economics of business combinations as compared with the understandings contained in the FASB and IASB pronouncements. For example, the Accounting Standards Board of Japan (ASBJ) argued in its comment letter (2005, p. 5 and note 1):

"It seems that the IASB's proposed approach views business combinations as transactions similar to financial investments. In our view, assets are classified into financial investments and non-financial (business) investments according to the purpose of the investment. Non-financial investments are investments aimed at obtaining results through operating the business, and financial investments are investments aimed at obtaining gains from changes in the market price. We view business combinations as a form of non-financial investment."

In a similar manner, the Chinese accounting standards setting body (CASC) continues to allow the pooling of interests method when there is "common control" among the combining businesses, which is a significant factor in the industrial reorganization that is currently taking place in China[374].

The new comprehensive framework of accounting for business combinations ought to be capable of comprehending the different understandings in a coherent way.

Our methodology will consist in delineating the reasoning underlying the various standards using a common framework of analysis. We will analyze the reasons for the lack of international convergence by comparing the provisions of FASB 141, IFRS 3 and CASC 20. Since the FASB and IASB pronouncements are still being revised, we will pay special attention to the respective changes through 2006. The year 2006 was an important turning point in accounting for business combinations, and ultimately it may represent the greatest extent of divergence among the different perspectives.

This comparative methodology will allow an explication of the similarities and differences among the standards, and it will clarify the understandings of the underlying economics of

---

[374] Using a restrictive definition of control, both the FASB and the IASB have excluded business combinations among entities under common control from the scope of their respective pronouncements.

business combination. Our comparative analysis will show that the technical differences among the standards are based on different understandings of the underlying economics, thus leading to different representations of the combination process (Anthony, 1987). We believe our analysis will lead to a better comprehension of the standards, enhance comparability among the standards, and facilitate the process of international accounting harmonization. We believe that a forthright recognition of the differences among the standards could lead to a reconsideration of the pooling of interests method in a more comprehensive framework based on a broader perspective.

The remainder of this paper is organized as follows. The next section discusses CASC 20 and the distinctly different understanding of business combinations adopted by the Chinese accounting regulatory bodies. The Chinese distinctive way is presented by analyzing both accounting regulation (the standard and its authoritative interpretation), and the reorganization of the TCL Group, one of China's largest companies. The third section situates the Chinese position in a comparative analysis with the FASB and IASB pronouncements, taking 2006 as a year of reference, but also considering the revised pronouncements issued in 2007. The fourth section further refines this analysis by delving into the leading position of the FASB on the matter. The fifth section will sum up the constructive critique of the current situation and presents a new comprehensive framework that might respond to the current impasse. In particular, it offers some recommendations for improving accounting for business combinations by summarizing the main arguments of the paper and situating the arguments within the ongoing process of accounting standards setting and accounting regulation.

ACCOUNTING FOR BUSINESS COMBINATIONS IN CHINA
Background

The rapid rate of economic growth in China has caused a significant amount of change in accounting regulation (see Biondi-Zhang 2007 for further details). This change has been affected by: (i) reorganizations among state enterprises, (ii) expansion of private business activities, and (iii) a more welcoming attitude towards foreign investment and international business relationships. Increasing economic development has led to greater exposure by Chinese enterprises to foreign accounting practices, and it has created a need for new accounting practices to account for new modes of economic activity (Scapens and Hao 1995; Blake and Gao 1995 eds.). Among the issues addressed by the recent accounting reforms are:

accounting for consolidated entities, equity accounting, accounting for paid-in capital, fixed asset and depreciation accounting, intangible assets and goodwill, taxes and profit allocations. The case of business combinations is one of the more important issues, and it deserves special attention.

The Chinese Standard on Accounting for Business Combinations

CASC 20 was one of the new standards adopted by the accounting reform of 2006 (see Ernst & Young 2006 for an English summary; Chen, Sun, and Wang 2002). CASC 20 defines a business combination as "the bringing together of separate entities into one reporting entity". Two methods are permitted depending on the degree of common control:

- For business combinations involving entities under common control, the pooling of interests method must be applied;

- For business combinations involving entities not under common control, the purchase method must be applied.

In the first instance, a business combination would be recorded using the book values of the combining companies and no goodwill would be recognized. In the second case, the business combination would be accounted for based on the fair values of the net assets acquired, and goodwill would be recognized, subject to impairment tests, however the goodwill would not be amortized.

CASC 20 actually is a brief standard which provides no basis of conclusions for the approach chosen. In fact, since its establishment in October 1998, the China Accounting Standards Committee ("CASC") [375] has been dedicated to provide support on the development of Chinese accounting standards under the Ministry of Finance ("MOF"). The aim of the Committee is to provide advices and recommendations on setting and improving Chinese accounting standards. CASC finally is the advisory body for setting Chinese accounting standards that are legally established by the MOF. Following the CASC 20 (§5) and the interpretation of this standard offered by the Accounting Department of the MOF (AD MOF 2007, p. 292-293), a business combination under common control is defined as follows: "The combining enterprises are ultimately controlled by the same party or parties before and after the combination, and

---

[375] See the CASC web site: <http://extranet.casc.gov.cn/internet/internet/en/ZZWJJ/jigoujianjie.html>.

control is not transitory". The AD MOF offered the following authoritative interpretive guidance together with this definition:

1. The party which can carry out the ultimate control over the combining enterprises before and after the combination is usually the mother company of an enterprise group;

2. The parties which can carry out the ultimate control over the combining enterprises before and after the combination are usually two, or more than two, legal persons or other organizations which demonstrate the same viewpoint or position when voting on the invested entities' productive and operational activities. In effecting the combination, these legal persons may intend to enlarge their voting shares in the invested enterprises, or strengthen the control status of certain investors over the invested enterprises, according to an existing agreement among investors;

3. The combining enterprises were controlled by the ultimate controller for more than one year before the date of combination, and the reporting entity after the combination will be controlled by the same ultimate controller for more than one year.

Thus, according to CASC 20 and the authoritative interpretation offered by AD MOF, business combinations are considered to be reorganizations among ongoing economic entities, rather than capital market transactions. In particular, the presence or absence of "common control" is related to the structure of the continued relationship between the enterprise entities involved, and this criterion decides about the application of two different accounting methods, pooling (merger) of purchase (acquisition). This criterion especially distinguishes between combinations that are effected among related entities, and combinations that actually are the take-over of one entity on another unrelated entity.

According to Biondi and Zhang (2007), this Chinese perspective on business combinations may be explained in part by taking into account the massive industrial development that is taking place in China, and also on a "dynamic accounting" perspective which leading accounting theorists and Chinese regulatory authorities may wish to encourage (Aiken, Lu, and Ji 1995; Liu and Turley 1995; Liu and Eddie 1995; Xiao and Pan 1995). The following case illustrates the Chinese perspective.

The Reorganization of the TCL Group

In China, state-owned enterprises are often controlled by a specific governmental agency (xingzheng zhuguan bumen), colloquially known as the 'mother company' (mu gongsi). "Each state-owned entity typically owes a subsidiary's duty of loyalty to a number of administrative units" (Ruskola 2000). The mother company may list its most profitable subsidiaries on the stock exchange, while continuing to be the controlling shareholder. Other less profitable

subsidiaries may continue to be fully owned by the mother company. In 2004, this kind of state-owned or state-controlled enterprises accounted for 42.4% of the value-added by industry and 35.2% of the gross industrial output, while the private sector accounted for only 15.1% and 16.5%, respectively, and foreign owned enterprises (including those with ownership from Hong Kong, Macao and Taiwan) accounted for 27.8 and 31.4%.[3] The following case study illustrates the application of CASC 20.

In 2003, TCL Group ("Parent") and TCL Communication Equipment Co. ("Subsidiary") entered into an agreement whereby the state-owned Parent merged with its publicly traded Subsidiary. The Subsidiary was the first component of TCL Group to be listed on Shenzhen Stock Exchange in 1993. Huizhou Investments, a government owned, limited-liability company, located in the city of Huizhou, Guangdong Province (southern China), was the majority shareholder of TCL Group. Huizou Investments was in turn controlled by the city of Huizhou, where TCL group is headquartered. Huizhou Investments is a government agency created to foster the economic development of Guandong province. In 2003, TCL Group owned 106,656,000 non-circulating shares of TCL Communication Equipment Co., which represented 56.7% of the shareholders' equity of the Subsidiary. The other shares of the Subsidiary were traded on the Shenzen stock exchange. On 30 September 2003, TCL Group (the Parent) announced that it was going to combine with its Subsidiary through an exchange of shares. After the combination, the joint entity was listed on the Shenzhen Stock Exchange. The 81,452,800 circulating shares of the Subsidiary were exchanged for 404,395,944 shares of the Parent at an exchange price of 21.15 RMB, an exchange ratio of 4.965. The combination was completed on 7 January 2004 and the TCL Group was listed on 30 January 2004.

Pursuant to FASB 141 prior to the recent proposed revision, the reorganization of the TLC Group would have been accounted for as "an acquisition of a minority interest" (FAS141, A6 (a)); consequently the purchase method would have been required to be used (FAS 141, §14). Pursuant to IFRS 3 before the recent revision, the purchase method would also have been used, because pooling was not permitted by IFRS 3.

In contrast, following CASC 20, the pooling of interests method was used to account for the TCL Group reorganization, since the combination occurs under common control between two related enterprises. The press release issued to describe the transaction included the following reasons why the pooling method was used. Firstly, all or most of the shares of the combining entities were exchanged. Second, the shareholders of the combining entities became the shareholders of the combined entity. Third, the shareholders of the combining entities

collectively assumed all of the risks of the combined entity. Fourth, there were no resources flowing from the combining entities to other parties. Fifth, according to the projected exchange ratio, the equity owned by the controlling party (Huizhou Investments) did not change before and after the combination. For these reasons, the pooling of interests method was considered to produce a better representation of the underlying economics of the combination process.

Is the Chinese way to accounting for this business combination at least understandable? Let us explore further the potential impact on the economic representation provided by accounting numbers.

In the annual report for 2003 (see Table 1), the consolidated net income of TCL Group was reported to be 570.57 million *RMB*, which included 145.18 million *RMB* of the net income of TCL Communication Equipment Co. (the Subsidiary) from January to June[376]. The shareholders' equity was 2,263.38 million *RMB*, so the return on equity (ROE) was 25.21% (see Table 1). If TCL Group had applied the purchase method, these performance ratios would have been reduced. At the date of the combination, the book value per share of TCL Communication Equipment Co. was 3.07 *RMB,* while the exchange price was 21.15 *RMB*. Thus, the 'computed goodwill'[377] would have been 1,473 million *RMB* based on combining only the circulating shares without recognizing any control premium. This goodwill would have added 1,473 million *RMB* to the shareholders' equity. If the purchase method had been used, the net income of the Subsidiary before the combination date would not be recognized in the consolidated income statement, and the goodwill produced by the combination would not be amortized. As a result, the net income of TCL Group would be reduced by 145.18 million *RMB*, from 570.57 million *RMB* to 425.39 million *RMB*, while the shareholders' equity would be increased from 2,263.38 million *RMB* to 3,736.38 million *RMB*. Therefore, the return on equity (ROE) would be reduced from 25.21% to 11.39%.[378]

---

[376] The record date for recognition of the business combination was 30 June 2003, even though the combination was effected several months later.

[377] The calculation of the 'computed goodwill' is as follows: (21.15-3.07) $\times$ 81452800 = 1,472.67 million *RMB*. Because of the limited disclosure of data, the fair values of TCL Communication Equipment Co. cannot be utilized; this is why the 'computed goodwill' is used here instead of the actual goodwill.

[378] The above calculation of the 'computed goodwill' takes into account only the circulating part of the shares. If the TCL Group (the parent) did not hold the original 56.7% shares of TCL Communication Equipment Co (the Subsidiary), and if all the shares of TCL Communication Equipment Co. were combined at the same exchange ratio, the 'computed goodwill' would be of 3,401 million RMB. In that case, the net income of TCL Group in 2003 would be still 425.39 million RMB, but the equity would be raised from 2,263.38 million RMB to 5,664.38 million RMB; thus, the return on net assets would be reduced from 25.21% to 7.51%.

Furthermore, the solvency ratio would have decreased significantly (from 4.51 to 2.73) as a result of an increase in shareholders' equity, even though the liabilities of the Group would not change as a result of the combination. In fact, we are unable to account for the re-measurement of liabilities of the target to their fair values, as required by purchase accounting. This re-measurement may lead to reinforce the decrease of the solvency ratio of the enterprise group.

*** Insert Table 1 here ***

Finally, if the purchase method had been applied to the TCL Group reorganization there would have been a significant negative impact on the consolidated financial statements. The managers might not have proceeded with the combination, notwithstanding the important industrial and productive reasons for undertaking the combination. In addition, the negative effect on the performance ratios might have modified the initial public offering (IPO) price of TCL Group shares, and this may have affected the share price, whilst the overall effect on debt exposure and service might blurry the information on and representation of the underlying transaction. In the actual recording of the transaction, goodwill was not recognized. Therefore, the performance ratios reflected in the consolidated financial statements did not deviate substantially from those of prior years. Arguably this accounting approach produced a more proper representation the underlying economics of the combination process.

This Chinese understanding might be seen as an alternative type of capitalism or as a representation of an economic transaction which is more appropriate to the Chinese context (Jackson and Miyajima 2007; Biondi and Zhang 2007). As the case study of the TLC Group reorganization suggests, business combinations in China often occur among related entities (Huang et al. 2004: Pan 2002). This implies that the details of the business combination are determined by the same controlling parties, and ownership control does not actually change hands, even though material aspects of the overall enterprise and related minority interests may be affected by that operation. Some Chinese business combinations factually are not takeovers, but mergers instead, which, in turn, are congruent with the accounting representation provided by the pooling of interest approach. In this context, the use of pooling is sound not only from an accounting standpoint, it also reduces transaction costs. Furthermore, in a setting where the capital markets are often less than perfect (or absent) and "fair values" may not be reliable, the pooling of interests method appears to be the most appropriate measurement approach of accounting for business combinations. It is important to remember that many Chinese

corporations are not listed in capital markets[379], and, even in the case of listed corporations, a large portion of the shares is not circulating[380]. As of January 2007, of the total issued shares, the negotiable part was only 38.1% (based on the CSRC monthly report, http://www.csrc.gov.cn/).

Anyway, the Chinese understanding of the underlying economics of business combinations is different from the understanding contained in the FASB and IASB pronouncements through 2006. Interestingly, pursuant to the revisions of FASB 141, IFRS 3 and the new FASB 160, issued in 2007, the TCL combination would have been treated as an "equity transaction" and not as an acquisition. Therefore, the pooling method, which was eliminated by previous standards, seems to have been re-introduced, at least in some respects. In particular, the "equity transaction" method does not account for goodwill and does exclude any impact on the income statement. This reintroduction involves an implicit distinction between combinations where a change of control takes place, and combinations where there is no change of control. This distinction does not correspond exactly to the Chinese perspective and criterion, as the following section shall disentangle.

COMPARATIVE ANALYSIS

This section provides a comparative analysis of the key provisions of FASB 141, IFRS 3, and CASC 20. The key provisions of the pronouncements are summarized in Table 2. The provisions are divided into the following categories: (*i*) definition of a business combination; (*ii*) exclusions from the scope of the standard; (*iii*) key concept for its application; (*iv*) treatment for acquisition goodwill; (*v*) valuation of identifiable assets, liabilities and contingent liabilities; and (vi) the accounting method of reference.

Insert Table 2

---

[379] In 2005, the number of listed companies on the Shanghai and Shenzhen Stock Exchanges was 1 381 (834 and 547, respectively), while the number of large and medium-sized industrial enterprises (excluding construction and financial intermediation sectors) was 29 774.
[380] Holderness (2007) provides a relevant critique of dispersed shareholding in the US share market.

With respect to the definition of a business combination (point *i*), the FASB stated that the necessary pre-condition for the recognition of a business combination was a change of ownership control:

A business combination is a transaction or other event in which an acquirer obtains control of one or more businesses (FAS 141r, 3 (e))

This statement applies to all transactions or other events in which an entity (the acquirer) obtains control of one or more businesses (the acquiree) [omissis] (FAS 141r, p. i)

Control has the meaning of controlling financial interest in paragraph 2 of Accounting Research Bulletin No 51, Consolidated Financial Statements, as amended. (FAS 141r, 3 (b))

The usual condition for a controlling financial interest is ownership of a majority voting interest, and, therefore, as a general rule ownership by one entity~~company~~, directly or indirectly, of more than 50~~over fifty per cent~~ of the outstanding voting shares of another entity~~company~~ is a condition pointing toward consolidation. However, there are exceptions to this general rule. A majority-owned entity~~subsidiary~~ shall not be consolidated if control does not rest with the majority owner (~~as~~, for instance, if the entity~~subsidiary~~ is in legal reorganization or in bankruptcy or operates under foreign exchange restrictions, controls, or other governmentally imposed uncertainties so severe that they cast significant doubt on the parent's ability to control the

entity~~subsidiary~~). (FAS 160, Appendix A – "ARB 51, as amended by this statement",

§2).

As the previous quotations prove, according to the FASB, a business combination implies obtaining control, which is based on a "controlling financial interest" that, in turn, is mainly based on the "ownership of a majority voting rights". In contrast, the IASB developed a broader definition of a business combination which did not specifically mention a change of ownership control (IFRS3, BC6-BC9, BC 12). However, both IFRS 3 (§19) – now included, with adjustments, in IAS 27r (§13), the latter being the main reference for identifying the acquirer under IFRS 3 (§7) - insist on the majority of potential and actual voting rights as main guideline:[381]

> Control is presumed to exist when the parent owns, directly or indirectly through
>
> subsidiaries, more than half of the voting power of an entity unless, in exceptional
>
> circumstances, it can be clearly demonstrated that such ownership does not
>
> constitute control. Control also exists when the parent owns half or less of the voting
>
> power of an entity when there is [note: See also SIC-12 Consolidation—Special
>
> Purpose Entities]:
>
> > (a) power over more than half of the voting rights by virtue of an agreement with other investors;
> > (b) power to govern the financial and operating policies of the entity under a statute or an agreement;
> > (c) power to appoint or remove the majority of the members of the board of directors or equivalent governing body and control of the entity is by that board or body; or
> > (d) power to cast the majority of votes at meetings of the board of directors or equivalent governing body and control of the entity is by that board or body.

> (IAS 27r, §13).

---

[381] The analysis of the whole section (IAS 27r, §12 to §17) does not change this conclusion.

All the powers listed above are formal in nature: powers under (a) and (b) are legal; the power under (b) is contractual, and the power under (c) is institutional. Some substantial powers based on economic, financial, commercial, or organizational factors (formerly mentioned by IFRS3, 20) are now relegated in the application guidance (IFRS 3r, B14-B18). However, following the factors mentioned by the application guidance, an overwhelming problem of clear distinction between business combinations that are acquisitions and combinations that are not factually occurs.

The difference in the definitions of "control" has been maintained in the new releases by FASB and IASB. While FASB 141r mentions the words "controlling financial interest", the revised IFRS 3r defines control as "the power to govern the financial and operating policies of an entity so as to obtain benefits from its activities" (Appendix A). Nevertheless, both the FASB and the IASB excluded combinations among entities under common control from the scope of their pronouncements (point *ii*). In FASB 141r, this exclusion is continued, but it is based on a relatively narrow definition of "common control" (FASB141r, par.D1-D18; FAS 141, D11-D13). Neither an explicit understanding nor a thoughtful definition of common control is provided. The exclusion is based on a spare list of examples of combinations that are scoped out as exceptions. Most examples did address cases of formal changes in the legal relation between parent and subsidiaries, but the standard failed to consider cases where the underlying economics is impacted, either combinations between related entities and/or effected within corporate groups, whatever outstanding minority interests do change or not. In fact, during the revision of FAS 141, the previous FAS 141 (§14, D13) that applied the purchase method to "the acquisition of all or a part of the noncontrolling equity interest in a subsidiary" has merely disappeared, but the underlying issue is left in a vacuum indeed.

IFRS 3 shared this exclusion of combinations under common control, but the revision (IFRS 3r) does not mention the issue; it postpones discussion on this matter to a further project that is scheduled on mid-2008. No clear-cut definition of common control is provided by these standards.

With respect to point's *iii*, *iv*, *v* and *vi*, the FASB and IASB pronouncements are essentially the same. The pronouncements consider business combinations to be acquisitions, i.e. purchase transactions in which the consideration paid is based on arm's length bargaining between unrelated entities: essentially, a (efficient) market exchange. This leads to goodwill

being viewed as a permanent intangible asset that is recognized, but not amortized, but tested thereafter for impairment. An overall continuity is claimed through the different revisions of the respective standards, as the FASB explicitly states:

> This Statement replaces FASB Statement No. 141, Business Combinations. This
>
> Statement retains the fundamental requirements in Statement 141 that the acquisition
>
> method of accounting (which Statement 141 called the purchase method) be used for
>
> all business combinations and for an acquirer to be identified for each business
>
> combination. (FAS 141r, summary, i-ii).

In fact, both the FASB and the IASB allude to the existence of types of business combinations different from acquisitions, such as those where there is no consideration given, no change of control, a combination between a parent and subsidiary, or combinations among entities under common control. However, in an apparent desire to concentrate on a single method (i.e. the "purchase method"), these types of combinations were not included in the FASB and IASB pronouncements. In fact, the common wisdom about the purpose of new approach fostered by the FASB and IASB was and still is their joint desire to eliminate the pooling method, and then to extend the application of the purchase method as far as possible, by considering it as synonymous of the underlying economics of the business combination:

> The Boards concluded that having more than one method could be justified only if the
>
> alternative method (or methods) could be demonstrated to produce information that is
>
> more decision useful and if unambiguous and nonarbitrary boundaries could be
>
> established that unequivocally distinguish when one method is to be applied instead
>
> of another. The Boards also concluded that most business combinations are
>
> acquisitions and, for the reasons discussed in paragraphs B24–B28, that the
>
> acquisition method is the appropriate method for those business combinations (FAS
>
> 141r, B23).

However, the difficulty with the selection a single method is that it appears to imply that purchase accounting should be used for "virtually" all types of business combinations, even for those in which the purchase method and its underlying economics may not to be appropriate. In the recent revisions issued by the FASB and IASB (FASB 141r, IFRS 3r, and FAS 160) there is a possibility of accounting for some combinations as "equity transactions". In IFRS 3r, the pronouncement goes further by permitting recognition of the "proportionate share of the acquiree's identifiable net assets". Consequently, the efforts of the FASB and IASB to allow only one method of accounting for business combinations appears to have been somewhat compromised by allowing variations of the pooling method in certain circumstances. For example, pursuant to the new FASB 160, released together the revised FASB 141r, a combination between a parent and a subsidiary - such as in the TCL case- would be treated as an equity transaction, i.e., as "investments by owners and distributions to owners acting in their capacity as owners" (par 33). FASB 160 (p. ii-iii) justifies this change as follows:

> Before this Statement was issued, decreases in a parent's ownership interest in a subsidiary could be accounted for in one of two ways: as equity transactions or as transactions with gain or loss recognition in the income statement. A parent's acquisition of noncontrolling ownership interests in a subsidiary was previously accounted for by the purchase method. This Statement simplifies accounting standards by establishing a single method of accounting for these economically similar transactions. Eliminating the requirement to apply purchase accounting to a parent's acquisition of noncontrolling ownership interests in a subsidiary also reduces the parent's costs because it eliminates the need to value the assets and liabilities of the subsidiary on the date that each additional interest is acquired.

In the same spirit, pursuant to IFRS 3r, the acquiring company can measure the noncontrolling interest in the acquiree either at fair value or at its proportionate share of the acquiree's identifiable net assets (paragraph 19). The pooling method therefore seems to have been reintroduced, at least to a certain extent. This reintroduction actually appears to imply a key criterion that discriminates among acquisitions where control is acquired and other

acquisitions where there is no change of control, but the criterion is not addressed explicitly, and the main change of orientation is scarcely noticed.

In our opinion, the new approach may be confusing. The scope exception to purchase accounting may be deficient from an informational perspective, because it does not show the changes in the different classes of assets and liabilities and the overall impact on the financial position and economic performance of the related entities, consolidated or not. Furthermore, the focus on *change* of control *in terms of financial interests* creates problems with stepwise acquisitions, minority control and forms of control without ownership. More generally speaking, introducing exceptions to accounting pronouncements may offer a temporary solution, but this does not lead to international accounting harmonization, especially in such significant and sensitive matters as business combinations. The preferable solution would be to reconcile different positions in a more comprehensive framework for guidance and interpretation. The following sections will try to open the way to the development of this framework.

THE RATIONALE FOR FASB 141

While both the purchase and pooling of interests methods were permitted for many years under US Generally Accepted Accounting Principles (GAAP), the pooling method was eliminated in 2001 by FASB 141. The merger method, which was similar in many respects to pooling, was permitted by the International Accounting Standards Committee (IASC), but following the issuance of FASB 141, the IASB eliminated the merger method in 2004. In issuing these pronouncements, the FASB and the IASB adopted a quite similar approach to accounting for business combinations. The FASB and IASB pronouncements resulted from numerous meetings between the two standards setting bodies and various joint recommendations issued by a working group representing accounting standards setters from Australia, Canada, New Zealand, the United Kingdom, the IASB, and the FASB (commonly known as the G4+1; see G4+1, 1998).[382] The role of the FASB was central to achieving a consensus in this area of financial accounting.[383]

---

[382] The Group met approximately four times a year from April 1993 to January 2001 in order to analyze and discuss financial reporting issues. In January 2001, the Group agreed to disband, because of the start of activities by the newly restructured International Accounting Standards Board. See http://www.acsbcanada.org/index.cfm/ci_id/4345/la_id/1.htm> (December 17, 2006). On the important influence of G4+1 on international accounting convergence, see Street (2005).

[383] As stated by the G4+1 (1998, vii): "The principal author is L. Todd Johnson, senior project manager on the research and technical activities staff of the US Financial Accounting Standards Board. A significant contribution was made by Kimberley R. Petrone, FASB project manager. Other FASB staff members as

FASB 141 was issued as the successor to Accounting Principles Board (APB) Opinion No. 16, *Business Combinations*. APB 16 had been issued during the merger boom of the mid 1960s in order to prevent certain "abuses" associated with the restrictions imposed to the pooling method (CAP 1944; CAP 1953; Wyatt 1963; Rayburn and Powers 1991). Pursuant to APB 16, business combinations were required to be accounted for using either the purchase or the pooling method. The pooling method was mandatory if 12 criteria were simultaneously met; otherwise, the purchase method had to be used.[384] FAS 141 (summary, p. 5-6) provided the following reasons for eliminating the pooling method:

1. *Underlying economics*: Because the 12 criteria of APB 16 did not clearly distinguish between different types of business combinations, similar types of combinations (from an economic perspective) could be accounted for in different ways, thus resulting in different financial statement results;

2. *Comparability*: Financial analysts and other users of financial statements had difficulty comparing the performance of combining entities because different methods of accounting were permitted;

3. *Better information on intangibles*: Users of financial statements have a need for better information about intangible assets because intangibles represent an increasingly significant proportion of the assets acquired in business combinations. While the purchase method recognizes all intangible assets acquired (either separately or as acquisition goodwill), the pooling method does not recognize acquisition goodwill;

4. *Unlevel playing field*: Company managements argued that the differences between the pooling and purchase methods adversely affected competition in the markets for mergers and acquisitions.

The provisions of FASB 141 constituted a distinctly different approach to accounting for business combinations as compared with APB 16. The choice of a single method was based on the belief that "virtually all business combinations are acquisitions" (FAS 141, summary at pp. 5, 7; B19), and therefore, all business combinations ought to be accounted for in accordance with the "values exchanged". The FAS 141 (p. 6-7) argued that the use of the purchase method would improve financial reporting because financial statements would better reflect the underlying economics of the business combination. In particular (*ibid.*):

1. *Underlying economics*: Application of Statement No. 141 produces financial statements that reflect the full investment made in the acquired entity. This is
